Notice to the Reader

The opinions and conclusions expressed in this book are mine, and unless expressed otherwise, mine alone. The opinions expressed herein are based on my scientific research and on specific case studies involving my patients. Be advised that every person is unique and may respond differently to the treatments described in this book. On occasion we have provided dosage recommendations where appropriate. Again, remember that we are all different and any new treatment should be applied in a cautious, common sense fashion.

The treatments outlined herein are not intended to be a replacement or substitute for other forms of conventional medical treatment. Please feel free to consult with your physician or other health care provider.

I have indicated throughout this book the existence of pollutants in food and other products. These pollutants were identified using a testing device of my invention known as the Syncrometer®. Complete instructions for building and using this device are contained in this book. Therefore anyone can repeat the tests described and verify the data.

The Syncrometer® is more accurate and versatile than the best existing testing methods. A method for determining the degree of precision is also presented. However at this point it only yields *Positive* or *Negative* results, it does not quantify. The chance of a false *Positive* or a false *Negative* is about 5%, which can be lessened by test repetition.

It is in the public interest to know when a single bottle of a single product tests *Positive* to a serious pollutant. If one does, the safest course is to avoid all bottles of that product entirely; this is what I repeatedly advise. These recommendations should be interpreted as intent to warn and protect the public, not to provide a statistically significant analysis. It is my fervent hope that manufacturers use the new electronic techniques in this book to make purer products than they ever have before.

Dedication

I would like to dedicate this book to all the persons who visited me professionally, from the very first person in 1963, **Mrs. R. Biehl**, to the present. I learned so much from each of you and I appreciate your confidence, your intelligence and your reluctance to be defeated.

Acknowledgments

I would like to express my gratitude to my son, **Geoffrey**, who always listened to my “crazy ideas” on Sundays, right at suppertime. He was patient, kind, helpful and willing to share his expertise in electronics and computers. Without him, this book could not have been written.

A big thank you goes to **Frank Jerome, DDS**. Without the loan of his parasite slide collection many of my discoveries could not have been made, and without his development of metal-free dentistry, many of these patient histories could not have ended happily. Thank you to **Linda Jerome** for nurturing us both with personal interest and patience. And thank you to **Edna Bernstein** for her resourceful assistance.

Preface

The sick have been held hostage for their money or intangible assets since time immemorial. Doctors, even primitive and natural healers, surround themselves with mystery as they use herbs or chemicals and incantations or “prognoses” to help the sick recover. Today, the medical industry (doctors and their suppliers and insurers) takes a significant amount of the worker's earnings. Wouldn't it be nice if they could all go back to gardening or some other primitive and useful endeavor? Wouldn't it be wonderful if the sick could join them?

The most promising discovery in this book is the effectiveness of electricity to kill viruses, bacteria and parasites. Does this mean you can cancel your appointment with your clinical doctor? No it does not. Killing your invaders does not make you well instantly. But happily, at your next doctor visits she or he will be removing drugs, not adding them.

You might think that such an invention should be quickly patented. That was my universal advice. But I chose not to. It helps my children, my grandchildren, and me if you are well. The whole world needs to come out of the dark ages of medicine and illness. And to learn the true causes of infection and disease. We must and can usher in the **new age of disease-free living.**

No diabetes, no high blood pressure, no cancer, no HIV/AIDS, no migraines, no lupus and so on!

Not a single disease is left unconquerable with this new understanding!

The Promise

Step into a new world.
A world without chronic diseases.
Step out of your old world.
It has kept you a prisoner.
Try something new.

The prison has no walls. It has only lines that mark the ground around you. Inside the lines are your old ideas. Outside are new ideas that invite you to step over and escape your prison. Dare to try these new ideas and your illness promises to recede.

In a few weeks it can be gone.

If you are very ill or chronically ill you must have asked yourself many times: why have these problems chosen me? Will there never be a way to conquer them?

You may be quite familiar with your doctor's explanation of your illness or your child's illness. A *Coxsackie* virus has entered your child's brain causing inflammation (encephalitis) there. You pray that your child's immunity will overcome it. You may be familiar, but so very helpless against this microscopic invader.

If you had the proverbial 3 wishes they would be: 1) please spare my child's life; 2) please make it so my child doesn't have permanent damage; 3) please bless and guide the wonderful doctors and nurses who are keeping the oxygen tent going, and are watching my child's temperature and vital signs.

What if you could turn a dial and in 3 minutes kill every Coxsackie virus in your child's body?

What if this had no side effects?

What if the virus never came back?

In this book you will learn how to do that. You will also learn why your child

got encephalitis or other disease and how to prevent it forever.

If this is too mind-boggling, just take it a step at a time: First, learn about the radio-type broadcasting that all living animals do. Second, find the "station frequencies" that your particular invader(s) broadcast at. Third, learn how to "jam" their frequency until they **expire**: it takes only minutes!

Finally, learn how to make your own diagnostic and treatment devices. The instructions are simple enough for anyone. Only by putting this power in your hands will it be safe from government regulation, however well intended.

Only Two Health Problems

No matter how long and confusing is the list of symptoms a person has, from chronic fatigue to infertility to mental problems, I am sure to find only two things wrong: they have in them **pollutants** and/or **parasites.** I never find lack of exercise, vitamin deficiencies, hormone levels or anything else to be a primary causative factor**.** So the solution to good health is obvious:

Problem	**Simplest Cure**
Parasites	Electronic and herbal treatment
Pollution	Avoidance

It's a valiant quest: The quest for health**.** With optimism in one hand and determination in the other, you too can work the miracles for yourself that my clients accomplished in the case histories.

More good news is that it is not expensive**.** The cost will range from a few hundred dollars to only a few thousand in order to eliminate both problems and cure your chronic diseases.

Be A Health Detective

After curing your own diseases, teach your friends and family how it's done**.** Families are related and their problems are related**.** This should make the task easier**.** Keep a small notebook to become part of the treasured family legacy as much as photographs do**.** If your aunt, father and brother had diabetes as well as yourself and all were cured after introducing them to this concept and technology isn't this worthy of notes in your family's history?

Notice what a strong line of inheritance there can be, **not due to sharing genes** but due to sharing a roof, a table, a supermarket, and a dentist!

Many problems can be disinherited**.** Cure yourself of retinitis pigmentosa, Muscular dystrophy (the "inherited" kind), and break down your family's faith in the gene-concept for these diseases**.** Bring hope to your family by proving diseases' true etiology**.** Bring respect back for your loyal genes that bring you hair color, and texture, not hair loss**.** That bring you eye color, not eye disease**.** Your genes brought you the good things about your ancestors, not the bad things**.** Parasites and pollution brought you the bad things.

Killing all your invaders is just the first step, though**.** It is indeed the life-saving step**.** But getting well is more than saving your life. Next comes the more tedious task of finding their sources. Where did they come from? Why did they invade you so massively? Why you?

The story of your personal pollution unfolds as in a book. Look closely and you see the whole panorama of your numerous tiny invaders being held at bay by your valiant immune system, your white blood cells. You can see what they are fighting besides the invaders. Your ill-chosen diet and lifestyle products!

Your heart may go out to those tiny white blood cells. Never again, you may say, will you give them arsenic and mercury and lead…never again, cobalt and asbestos and Freon.

That great body of wisdom, your body, the same as listened to your three wishes, will reward you over and over as you cooperate with it, until you have had not 3 but 30 wishes granted, each one seemingly as impossible as climbing Mt. Everest.

- Your chronic yeast infection can go away.
- Your hair can stop falling out—might even grow back.
- Your body can become pregnant—when you had already given up.
- Your fatigue can vanish.
- Your insomnia can be gone.
- Your warts can fall off.

- Your sight and hearing can sharpen.
- Your constant hunger can disappear.

Health isn't just being free of sickness. Health is feeling great, feeling like laughing at funny things. Health is feeling grateful to be alive. It is feeling happy to see the sky and to see growing things and to feel confident in human society's progress. Health is remembering the good parts of childhood and believing you still have a lot of them.

The Discovery

What makes me think I can find things in the human body that a blood test can not? What new technology makes this possible? Why is electronic testing superior in many ways to chemical methods? What are my claims of electrically killing parasites based on?

In 1988 I discovered a new way to scan a body organ. It was electronic. We already can “see” an organ with a sonogram, X-rays, computerized tomography (CAT) scan, or with magnetic resonance imagery (MRI). These techniques can identify abnormal shapes in an organ without having to explore or guess. But my new electronic technique can check for viruses, bacteria, fungi, parasites, solvents and toxins, and in addition is simple, cheap, fast and infallible. Electricity can do many magical things; now we can add detecting substances in our body to that list.

The method rests on radio electronic principles.

If you match, very precisely, the capacitance and inductance properties of an external circuit so that its resonant frequency is the same as the emitted frequency coming from somewhere else, the circuit will oscillate. This means there will be *Positive* feedback in an amplifier circuit. You can hear it. Like when a public address system squeals.

The external circuit I use is called an *audio oscillator*, quite easy to build or buy. Your body provides the emitted frequencies. When you combine the audio oscillator circuit with your body, and you hear *resonance*, then you have detected a match! Something in your body matches something in the circuit on the test plate. By putting a laboratory sample of, say, a virus on the test plate, you can determine if your body has that virus by listening for resonance. Hearing resonance is easy if you're a radio technician or musician. Others must patiently practice. The details are given in the Bioelectronics chapter.

You do not have to be an expert in anything to learn the electronic detection method. But a keen sense of hearing helps.

In 1988 I learned a way to put anything on my skin, blindfolded, and identify it electronically in a few minutes. I could taste something without flavor and

identify it electronically. The system worked fine for detecting things in the skin and tongue. Would it be reliable for internal organs, too?

A whole world of discovery lay ahead of me. I wanted to know what was in my inner ear causing tinnitus, in my eyes causing pain, in my stomach causing indigestion and a thousand other things.

But behind the daily excitement of new discoveries, a gnawing question lingered in my mind. How is this possible without some pretty high frequency energy source, radio frequency in fact, running through my circuit? My audio oscillator was only 1000 Hz (*hertz*, or cycles per second); radio frequency is hundreds of thousands of Hz. And the phenomenon could be produced with an old-fashioned *dermatron*[1], too, that only puts out DC (direct current)—no frequencies at all!

High frequency energy had to be coming from somewhere, was it me? *Ridiculous*!

But there was a way to test. If my own body was putting forth the high frequency energy, it could be bled off and diverted into the ground with a correct size capacitor. This should stop the feedback oscillations. This turned out to be true; it was stopped. But *ridiculous* kept ringing in my ears and I tried another test. If there was indeed radio frequency (RF) running through my circuit I should be able to block it with the right snap-on choke. It did block. I thought of a third test. If this was truly a resonance phenomenon I should be able to add a capacitance to this circuit and see the resonance destroyed. Then add an inductance and see the resonance return. It did just that. I made graphs of the relationship between capacitance and inductance. They were entirely reproducible.

Then why couldn't I see the RF on my RF oscilloscope? Probably because it was high frequency energy, not high-energy frequency, and I didn't know how to amplify it above the background noise level. It was, nevertheless, not convincing …yet, much too tantalizing to ignore.

I thought of yet a fourth test. If I was really producing RF radiation that could be channeled through a circuit, I should be able to interfere with it by adding another RF radiation from an outside source. I added a frequency from my frequency generator, first at 1,000 Hz. Now there was no resonance. It interfered. Did this mean that my body was not producing radiation at 1,000 Hz? Or was my 1,000 Hz radiation being matched and canceled? I raised the

frequency gradually, from 1,000 to 10,000 to 100,000 to 1,000,000 Hz. There was no resonance anywhere, and I couldn't draw any conclusions. It was 5 o'clock on Sunday afternoon. Quitting time. But one last look at my generator reminded me that it could reach 2,000,000 Hz and I was just at 1,000,000. One more quick experiment wouldn't take much time. I cranked it to 1,800,000 Hz. And now a resonance screamed out! Was I “hearing things?” No more interference. I did it over and over. Why was it resonating now and not before? Had I arrived at my body's own *bandwidth* (transmission range), and this was the reason it no longer interfered?

I found the lowest frequency that resonated to be 1,562,000 Hz. All frequencies that I checked (about 2,000) from there up to 2,000,000 (my frequency generator would go no higher) also resonated.

A year later I purchased a better frequency generator to search for the upper end of my bandwidth. Any frequency between 1,562,000 and 9,457,000 Hz could be added to the circuit and produce resonance.

It seemed obvious, then, that the human body broadcasts electrically, just like a radio station, but over a wide band of frequencies and very low voltages, which is why it has not been detected and measured until now.

Everything Has A Unique Frequency

It was a busy year, now 1989. I was determined to find a bandwidth for other living things: I found them for flies, beetles, spiders, fleas, and ants. They were between 1,000,000 Hz and 1,500,000 Hz; cockroaches were highest amongst insects I tested.

Then came a dismaying finding; a dead insect had a bandwidth too! Much narrower, and near the top end of the same range it had when living, but distinctly present. So it wasn't altogether a living phenomenon.

But if dead things had a resonant bandwidth, then maybe a prepared microscope slide of a dead creature could be used, and my trips to the garden and telephone calls to abattoirs (for meat parasites) could cease. That was a lucky thought. My first slide was of the *human intestinal fluke*, a huge parasite and scourge of humanity. I had just found it to be present in the liver (not intestine) of every cancer sufferer I saw. The (dead) adult parasite had a resonant frequency around 434,000 Hz. Slides of that parasite's redia resonated nearby

(432,000 Hz), as did its other stages.

Dead things still resonated! The entire catalog of biological supply companies, hundreds of specimens of viruses, bacteria, parasites, molds, and even toxins, were now available to research with this new technique!

Suddenly an idea bolted out of the blue. If a person were to hold on to the frequency generator while it was generating 434,000 Hz, what would happen to the adult fluke, if you were infected with it?

I tested this plan that same week on myself, not with the fluke but with *Salmonella* bacteria and *Giardia* and *Herpes* that I carried chronically. After a 3-minute treatment, I retested myself. I could no longer find them in my organs! There were no emissions at their characteristic frequencies. I repeated and repeated. Were they really dead? Maybe they were just numbed or were suddenly hiding. But symptoms were gone quickly too. My *Herpes* lesion stopped tingling. It was all too simple and unbelievable.

But was it safe? Within three weeks I had reliable data regarding the necessary level of electrical treatment. It only took 5 volts for 3 minutes at the specific frequency. It is not as if you had to use house current which would kill you, along with the parasite.

Selective Electrocution

In 20 minutes (three minutes at six different frequencies) a whole family could get rid of this parasite. Cancer cases showed that in a few hours the universal cancer marker, *ortho-phosphotyrosine* could be banished from their bodies by killing this same parasite.

“Incurable” HIV cases lost their virus in a few hours, too. Laboratory retesting for HIV came back Negative! Most cases of pain got immediate relief if I could identify the correct “bug” and have its frequency found by the next office visit. This seemed to be absolute proof that living things had an essential high frequency output of some kind of energy.

What was actually happening to the bacteria or parasites? If I could kill something as large as an *Ascaris* worm or intestinal fluke, then perhaps I could kill something even larger, like an earthworm or flea, something I could see with my own eyes instead of having to imagine its demise inside my body.

Ten minutes at a frequency chosen near the top of their broadcast range seemed to anesthetize them. But they didn't die. Later I checked the body bandwidth (the range of frequencies they emit) of each. The earthworms had lost a lot of their bandwidth, both at the top and bottom. The fleas seemed hardier; they had only lost a little. However, they did not recover, even weeks later, from this loss.

Could it harm humans to douse them with RF frequencies **in their own bandwidth?** Quite probably if the voltage was high enough. There was no need to experiment, though, because the parasites we want to kill have characteristic frequencies that **do not overlap** the characteristic frequencies of a human. In fact, they are far away.

So my electronic method attacking illness was born. Find the resonant frequency of a bacterium, virus or parasite using a slide or dead bit. Treat the living invaders inside the human body with this frequency and in a matter of minutes they are no longer transmitting their own bandwidths—they are dead or sick and will be removed by our white blood cells.

It was a worrisome truth. Perhaps the department of defense would use this knowledge and develop super high voltage devices to kill people (“enemies”) somewhere in the world. But I couldn't let sick people suffer. Besides, it would probably require a voltage much like lightning to kill people from a distance. Possibly a way could be found to shield yourself from frequencies harmful to humans by wearing a choke (inductor) coil which suppresses these frequencies. Remember, there was no recovery, just a slow death for my experimental animals. It must not happen to humans!

Meanwhile, people must be alerted that they can safely kill their invaders and heal their chronic illnesses. Invaders that have been increasing exponentially due to lowered immunity in recent decades. possibly this is true for all species on our planet. The pollution of the entire biosphere has been increasing and with it the prospect of acquired immune deficiency syndrome (AIDS) for all of us.

Remember, though, that the true challenge is not to kill our invaders but to regain our health and immunity.

More than just parasites are making us sick! Pollution is too. Selective electrocution rarely makes people completely well. Sick people always have an environmental factor that must be corrected also.

How do we do that? The ship of “progress”, of increasingly complex, processed foods and products must be turned around and simplicity becomes our goal. Survival is in simplicity of food intake, simplicity of life habits. Did Ralph Waldo Emerson foresee this when he said “To be simple is to be great”? Or will daily parasite and pathogen electrocution become another crutch that makes us just enough better that we can continue a detrimental lifestyle? Is this yet another “Band-Aid” treatment for our poisoned planet?

Bioradiation

Strange as it appears, it now seems obvious that every living creature broadcasts its presence like a radio station, the sun, or the stars. I have named it *bioradiation*.

Perhaps it is the same energy as the Asian *chi*; perhaps it is merely related to it. Perhaps it is the energy that runs along the meridians discovered eons ago by Asian practitioners.

Perhaps it is the energy that faith healers and religious teachers know how to harness, perhaps not.

Perhaps it is the energy that psychics perceive and that drives occult phenomena, perhaps not.

What is truly amazing is that ordinary persons have discovered such energy well ahead of scientists. Persons using the “art” of kinesiology, pendulums, radionics, dousing rods and many other forms of “strange energy” have no doubt harnessed a part of this bioradiation. It is a tribute to the generally high intelligence of common people and to their open-mindedness that they discovered this energy, **in spite of** opposition from scientists of today.

Over a century ago the scientists of Europe proposed the existence of a “life force” called “élan vitale.” They were scorned out of existence (and out of jobs). Young scientists, (including myself) were systematically taught to scorn this idea. Of course we were also taught that a good scientist was unemotional, does not scorn ideas, has a completely open mind, and does not rule something out until it is disproved to their satisfaction. The youthfulness of college years is so susceptible to prejudices of all kinds, and the desire for acceptance is so great, that special effort needs to be made to teach neutrality, or at least to distinguish between emotion and fact. Where have these basic pedagogic principles gone? I

was indeed inspired with the phrase “search for truth” but then promptly led down the path of “search for acceptance.”

I do not know what bioradiation, this electrical broadcast from our cells, is made of. Only its frequency was noticed and caught (modulated) in such a way as to be measurable. And this frequency, 1,520,000 to 9,460,000 Hz (for a human infant) is in the radio frequency (RF) range[2].

Anyone who is experienced with RF knows its strange behavior. Not strange in the “unknown” sense but in the amazing sense. Circuits don't need to be complete or closed for it to travel. Bodies and objects can “pick it up” without being in the circuit. These amazing properties are due to the capacitive and inductive properties of objects all around us, including ourselves.

Zapping Bugs

By *zapping* I mean selectively electrocuting pathogens. For years I used a commercial frequency generator to “zap” one pathogen after another.

First I made a chart of the frequencies for most of the bacteria and viruses in my collection. Then I would test the sick client for each one of these, and hope they did not have one for which I didn't have a sample. Even persons with a simple cold typically had a dozen they tested *Positive* to (not just *Adenovirus*).

Next it was time to tune in the frequency generator to a dozen frequencies for three minutes each. The total process, testing and treatment, would take about two hours. They frequently got immediate relief. But often the relief would be temporary. What I didn't know at that time was that viruses could infect a larger parasite such as a roundworm. Until you killed your roundworm and your virus, you would keep getting the virus back promptly.

In 1993 my son, Geoffrey, joined me and we tried a new approach. He programmed a computer controlled frequency generator to automatically cover all the frequencies populated by all the parasites, viruses, and bacteria, from 290,000 Hz to 470,000 Hz. It spent about three minutes for every 1000 Hz it covered. This was more efficient, but it meant spending ten hours being zapped.

Again, the results were disappointing. Arthritis pain, eye pain, colds were improved, but not completely cured overnight. Months later I would find that organisms were transmitting as low as 170,000, and as high as 690,000 Hz. My specimen collection was obviously incomplete. To cover this larger range,

spending three minutes for every 1000 Hz, would take 26 hours. Still worth doing if it would indeed help all our illnesses. But even this method of zapping was not 100% effective for reasons yet to become clear.

In 1994 my son built a hand held, battery operated, and accurate frequency generator. The purpose was to enable everyone to kill the intestinal fluke at 434,000 Hz with a low cost device. Enough benefit would be derived from zapping at various frequencies that I thought everyone should know how to make one. When I tested it on one of my own bacteria, however, **three others at much different frequencies died also!** This had never happened before. When I tested it on others, even though they had dozens of pathogens, all were killed!

Subsequent testing showed it was not due to some unique design, or special waveform produced by the device. It was due to battery operation!

Any positively offset frequency kills all bacteria, viruses and parasites simultaneously

…given sufficient voltage (5 to 10 volts), duration (7 minutes), and frequency (anything from 10 Hz to 500,000 Hz).

Before this I had always set my commercial frequency generator to alternate between *Positive* and *Negative* voltage. Now I tried setting it to alternate between *Positive* and zero voltage (*Positive offset*). It was just as effective as the battery operated frequency generator my son designed.

It takes **three treatments** to kill everything. Why? The first zapping kills viruses, bacteria and parasites. But a few minutes later, bacteria and viruses (different ones) often recur. I conclude they had been infecting the parasites, and killing the parasites released them. The second zapping kills the released viruses and bacteria, but soon a few viruses appear <u>again</u>. They must have been infecting some of the last bacteria. After a third zapping I never find any viruses, bacteria or parasites, even hours later.

Generating *Positive* offset frequencies is the best way to kill all pathogens quickly.
But it takes more than one treatment.

Why didn't the virus inside the parasite die with the first zapping? It may be

because electricity travels on the exterior of things. The body of the parasite shielded the interior. This is why my earlier, promising work spending hours on a frequency generator gave only partial or temporary improvement—it was only done once, not three times. And it explains why a single treatment with a frequency generator or zapper frequently gives you a cold!

Zapping does not kill shielded organisms

…such as those that may be in the middle of your stomach or intestines. The electricity travels along the stomach or intestine wall, not through their contents.

So zapping is still not perfect, but can bring such manifest relief that everyone should buy or make one. Parts cost less than $25.00; the plans are in the next chapter.

The Bioradiation Spectrum

Everything emits a characteristic range of frequencies (bandwidth). In general, the more primitive the organism, the lower its bandwidth. Advanced animals have higher frequencies and the range is wider.

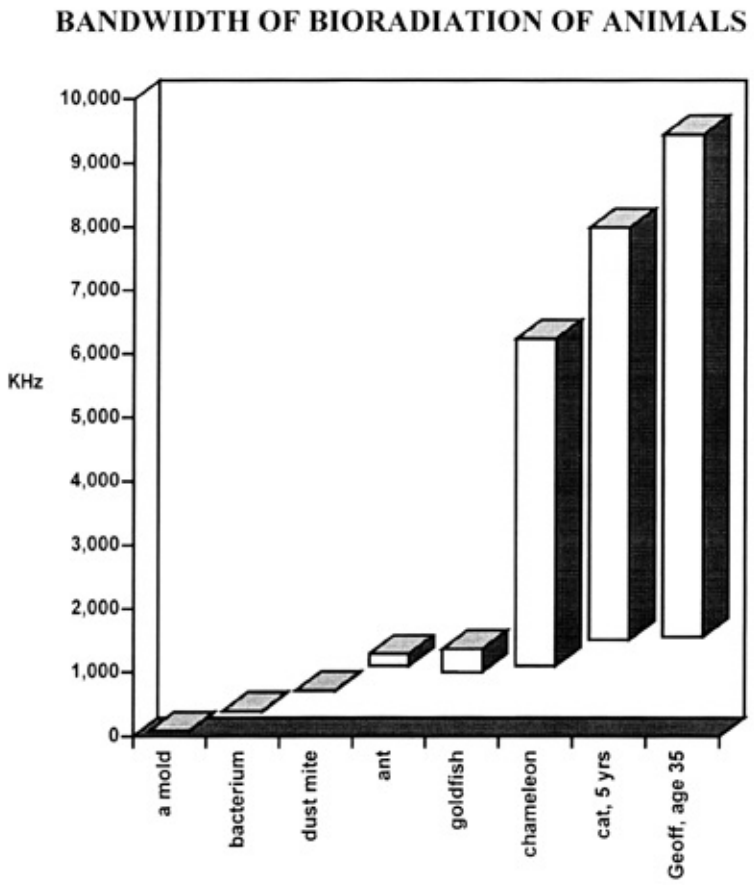

Fig. 1 Selected animal bandwidths

The human range is from 1520 KHz to 9460 KHz. Pathogens (molds, viruses, bacteria, worms, mites) range from 77 KHz to 900 KHz. Fortunately for us we can work on zapping pathogens in the lower ranges without affecting humans in the upper range.

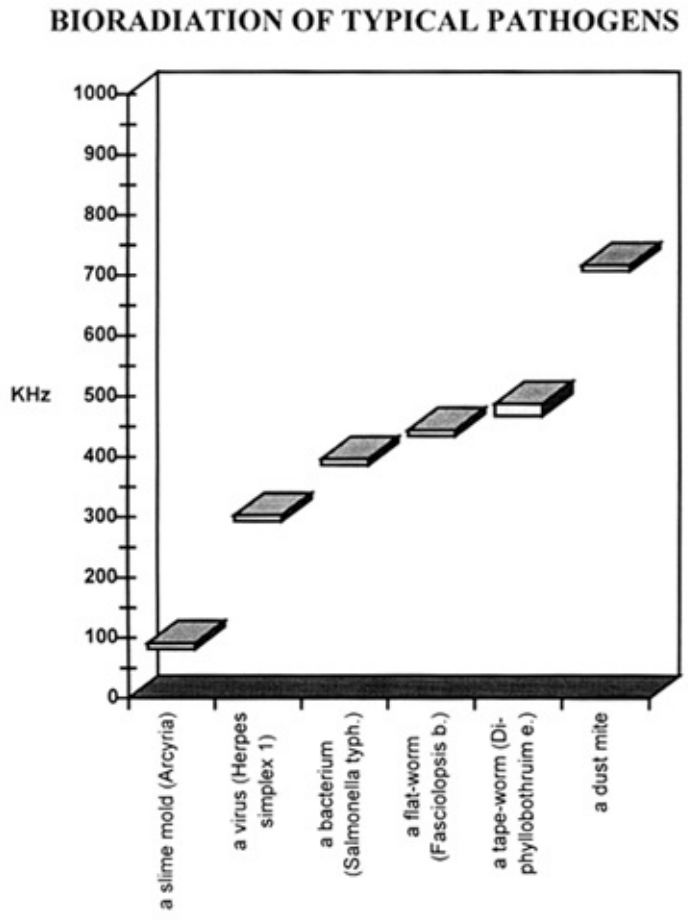

Fig. 2 Selected pathogen bandwidths.

Applying an alternating electrical voltage within an organism's bandwidth injures it. Small organisms with narrow bandwidths are extinguished quite readily (three minutes at five volts).

Positively offset frequencies can kill the entire range of small organisms (viruses, bacteria, parasites) in just 7 minutes.

Building A Zapper

Being able to kill your bacteria and other invaders with electricity becomes much more of a panacea when you can do it all in three 7-minute sessions. No need to single out specific frequencies or to sweep through a range of frequencies one KHz at a time. No matter what frequency it is set at (within reason), it kills large and small invaders: flukes, roundworms, mites, bacteria, viruses and fungi. It kills them all at once, in 7 minutes, even at 5 volts.

How does it work? I suppose that a *Positive* voltage applied anywhere on the body attracts negatively charged things such as bacteria. Perhaps the battery voltage tugs at them, pulling them out of their locations in the cell doorways (called *conductance channels*). But doorways can be negatively charged too. Does the voltage tug at them so they disgorge any bacteria stuck in them? How would the *Positive* voltage act to kill a large parasite like a fluke? None of these questions can be answered yet.

Other fascinating possibilities are that the intermittent *Positive* voltage interferes with electron flow in some key metabolic route, or straightens out the ATP molecule disallowing its breakdown. Such biological questions could be answered by studying the effects of *Positive* frequencies on bacteria in a lab.

The most important question, of course, is whether there is a harmful effect on you. I have seen no effects on blood pressure, mental alertness, or body temperatures. It has never produced pain, although it has often stopped pain instantly. This does not prove its safety. Even knowing that the voltage comes from a small 9-volt battery does not prove safety, although it is reassuring. The clotting of red blood cells, platelet aggregation and functions that depend on surface charges on cells need to be investigated. But not before you can use it. Your safety lies in the short period of exposure that is necessary. Viruses and bacteria disappear in 3 minutes; tapeworm stages, flukes, roundworms in 5; and mites in 7. One need not go beyond this time, although no bad effects have been seen at any length of treatment.

The first 7-minute zapping is followed by an intermission, lasting 20 to 30 minutes. During this time, bacteria and viruses are released from the dying parasites and start to invade you instead.

The second 7-minute session is intended to kill these newly released viruses and bacteria. If you omit it, you could catch a cold, sore throat or something else immediately. Again, viruses are released from the dying bacteria. The third session kills the last viruses released.

Do Not Zap If You Are Pregnant… Or Wearing A Pacemaker.

These situations have not been explored yet. Don't do these experiments yourself. Children as young as 8 months have been zapped with no noticeable ill effects. For them, you should weigh the possible benefits against the unknown risks.

That is all there is to it. Almost all. The zapping current does not reach deep into the eyeball or testicle or bowel contents. It does not reach into your gallstones, or into your living cells where *Herpes* virus lies latent or *Candida* fungus extends its fingers. But by zapping 3 times a day for a week or more you can deplete these populations, too, often to zero.

Killing The Surviving Pathogens

The interior of gallstones may house parasites inaccessible to the zapping. Eliminate this source of reinfection by flushing them out with *Liver Cleanses*.

Although the center of the bowel contents is often unaffected by electric current, which lets bowel bacteria like *Shigella, Escherichia coli (E. coli)* and parasite stages survive, sometimes it is nearly all sterilized by zapping. This results in considerable shrinkage of the bowel movement. Eliminate remaining parasites and bacteria with a single dose (2 tsp.) of Black Walnut Hull Tincture, Extra Strength.

There is no way of distinguishing between “good” and “bad” bacteria with either of these methods. However even good bacteria are bad if they come through the intestinal wall, so zapping targets mostly “bad” bacteria. The good news is that perfect bowel habits often result in a few days. Evidently, the good bacteria are benefited by killing the invasive ones. Homemade yogurt and buttermilk (see *Recipes*) are especially good at recolonizing the bowel. But it does not seem wise to culture yourself with special commercial preparations and risk getting parasite stages again when you can become normal so soon anyway. If you do decide to take some *acidophilus* bacteria to replenish your intestinal

flora make sure you test for parasites like *Eurytrema* first.

When a large number of parasites, bacteria and viruses are killed, it can leave you fatigued. Try to give yourself a low-stress day after your initial zapping. But there are no significant side effects. I believe this is due to the second and third zapping which mops up bacteria and viruses that would otherwise be able to go on a feeding frenzy with so much dead prey available.

To build your zapper you may take this list of components to any electronics store (Radio Shack part numbers are given for convenience).

Zapper Parts List

Item	Radio Shack Catalog Number
large shoe box	
9-volt battery	
9-volt battery clips	270-325 (set of 5, you need 1)
On-Off toggle switch	275-624A micro mini toggle switch
1 KW resistor	271-1321 (set of 5, you need 2)
3.9 KW resistor	271-1123 (set of 2, you need 2)
low-current red LED	276-044 or 276-041 or 276-045
.0047 uF capacitor	272-130 (set of 2, you need 1)
.01 uF capacitor	272-1065 (set of 2, you need 1)
555 CMOS timer chip	276-1723 (set of 2, you need 1)
8 pin wire-wrapping socket for the chip	276-1988 (set of 2, you need 1) Note: Radio Shack is discontinuing all wire wrap sockets. Find another parts store or use 276-1995 (but the legs are much shorter and harder to attach clips to).
short (12”) alligator clip leads	any electronics shop, get 6
Microclip test jumpers	278-017 (you need 2 packages of 2)
2 bolts, about 1/8” diameter, 2” long, with 4 nuts and 4 washers	hardware store
2 copper pipes, ¾” diameter, 4” long	hardware store
sharp knife, pin, long-nose pliers	

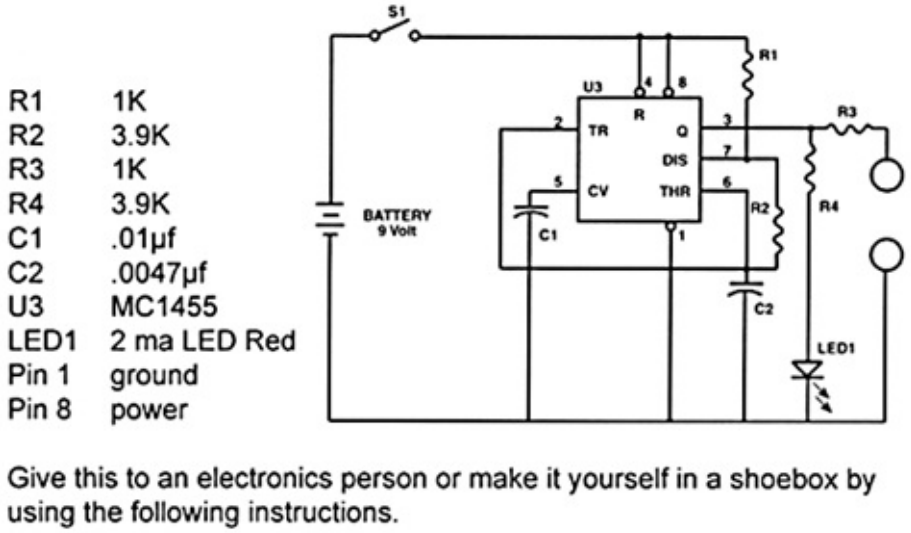

Fig. 3 Zapper schematic

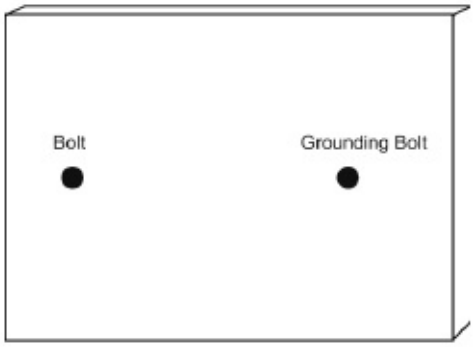
Hints for absolute novices: Don't let unusual vocabulary deter you. A "lead" is just a piece of wire used to make connections. When you remove a component from its package, label it with a piece of tape. A serrated kitchen knife works best, as does a large safety pin. Practice using the microclips. If the metal ends are L-shaped bend them into a U with the long-nose pliers so they grab better. Chips and chip holders are very fragile. It is wise to purchase an extra of each in case you break the connections.

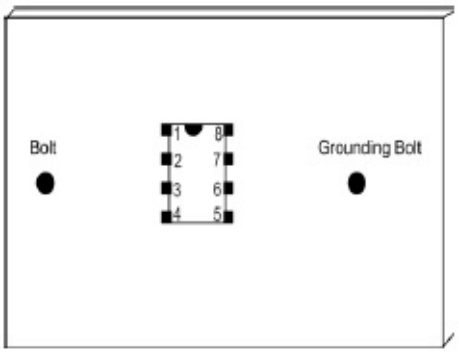
Assembling The Zapper

You will be using the lid of the shoebox to mount the components. Save the box to enclose the finished project.

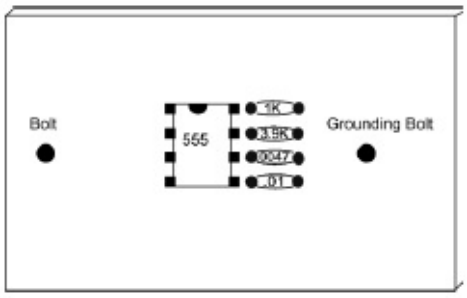
Pierce two holes near the ends of the lid. Enlarge the holes with a pen or pencil until the bolts would fit through. Mount the bolts on the outside about half way through the holes so there is a washer and nut holding it in place on both sides. Tighten. Label one hole "grounding bolt" on the inside and outside.



Mount the 555 chip in the wire wrap socket. Find the “top end” of the chip by searching the outside surface carefully for a cookie-shaped bite or hole taken out of it. Align the chip with the socket and very gently squeeze the pins of the chip into the socket until they click in place.



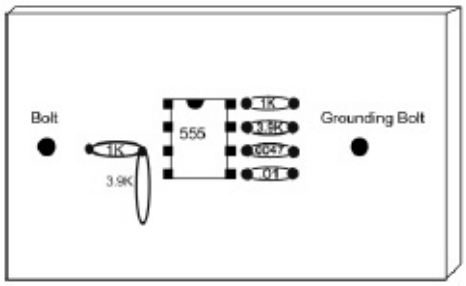
Make 8 pinholes to fit the wire wrap socket. Enlarge them slightly with a sharp pencil. Mount it on the outside. Write in the numbers of the pins (connections) on both the outside and inside, starting with number one to the left of the “cookie bite” as seen from outside. After number 4, cross over to number 5 and continue. Number 8 will be across from number 1.



Pierce two holes ½ inch apart very near to pins 5, 6, 7, and 8. They should be less than 1/8 inch away. (Or, one end of each component can share a hole with

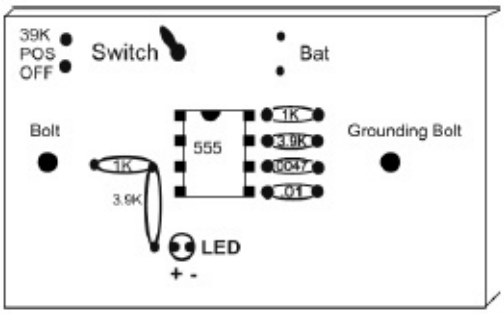
the 555 chip.) Mount the .01 uF capacitor near pin 5 on the outside. On the inside connect pin 5 to one end of this capacitor by simply twisting them together. Loop the capacitor wire around the pin first; then twist with the long-nose pliers until you have made a tight connection. Bend the other wire from the capacitor flat against the inside of the shoebox lid. Label it .01 on the outside and inside. Mount the .0047 uF capacitor near pin 6. On the inside twist the capacitor wire around the pin. Flatten the wire from the other end and label it .0047. Mount the 3.9 KΩ resistor near pin 7, connecting it on the inside to the pin. Flatten the wire on the other end and label it 3.9. Mount the 1 KΩ resistor and connect it similarly to pin 8 and label it 1K.

Pierce two holes ½ inch apart next to pin 3 (again, you can share the hole for pin 3 if you wish), in the direction of the bolt. Mount the other 1 KΩ resistor and label inside and outside. Twist the connections together and flatten the remaining wire. This resistor protects the circuit if you should accidentally short the terminals. Mount the 3.9KΩ resistor downward. One end can go in the same hole as the 1K resistor near pin 3. Twist that end around pin 3 which already has the 1K resistor attached to it. Flatten the far end. Label.



Next to the 3.9KΩ resistor pierce two holes ¼ inch apart for the LED. Notice that the LED has a *Positive* and negative connection. The longer wire is the anode (positive). Mount the LED on the outside and bend back the wires, labeling them + and - on the inside.

Near the top pierce a hole for the toggle switch. Enlarge it until the shaft fits through from the inside. Remove nut and washer from switch before mounting. You may need to trim away some paper with a serrated knife before replacing washer and nut on the outside. Tighten.



Next to the switch pierce two holes for the wires from the battery holder and poke them through. Attach the battery and tape it to the outside.

NOW TO CONNECT EVERYTHING

First, make holes at the corners of the lid with a pencil. Slit each corner to the hole. They will accommodate extra loops of wire that you get from using the clip leads to make connections. After each connection gently tuck away the excess wire.

1. Twist the free ends of the two capacitors (.01 and .0047) together. Connect this to the grounding bolt using an alligator clip.

2. Bend the top ends of pin 2 and pin 6 (which already have a connection) inward towards each other in an L shape. Catch them both with an alligator clip and attach the other end of the alligator clip to the free end of the 3.9KΩ resistor by pin 7.

3. Using an alligator clip connect pin 7 to the free end of the 1KΩ resistor attached to pin 8.

4. Using two microclips connect pin 8 to one end of the switch, and pin 4 to the same end of the switch. (Put one hook inside the hole and the other hook around the whole connection. Check to make sure they are securely connected.)

5. Use an alligator clip to connect the free end of the other 1KW resistor (by pin 3) to the bolt.

6. Twist the free end of the 3.9KΩ resistor around the plus end of the LED. Connect the minus end of the LED to the grounding bolt using an alligator clip.

7. Connect pin number 1 on the chip to the grounding bolt with an alligator clip.

8. Attach an alligator clip to the outside of one of the bolts. Attach the other end to a handhold (copper pipe). Do the same for the other bolt and handhold.

9. Connect the minus end of the battery (black wire) to the grounding bolt with an alligator clip.

10. Connect the plus end of the battery (red wire) to the free end of the switch using a microclip lead. If the LED lights up you know the switch is ON. If it does not, flip the switch and see if the LED lights. Label the switch clearly. If you cannot get the LED to light in either switch position, you must double-check all of your connections, and make sure you have a fresh battery.

11. Finally replace the lid on the box, loosely, and slip a couple of rubber bands around the box to keep it securely shut.

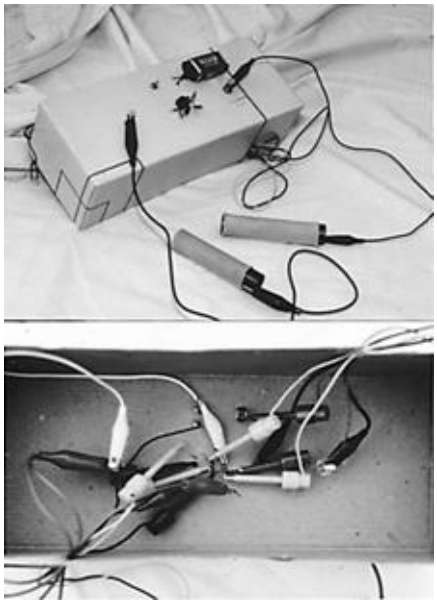


Fig. 4 Finished zapper, outside and inside.

- Optional: measure the frequency of your zapper by connecting an oscilloscope or frequency counter to the handholds. Any electronics shop can do this. It should read between 20 and 40 kHz.
- Optional**:** measure the voltage output by connecting it to an oscilloscope. It should be about 8 to 9 volts. **Note: a voltage meter will only read 4 to 5 volts.**
- Optional**:** measure the current that flows through you when you are getting

zapped. You will need a 1 KΩ resistor and oscilloscope. Connect the grounding bolt on the zapper to one end of the resistor. Connect the other end of the resistor to a handhold. (Adding this resistor to the circuit decreases the current slightly, but not significantly.) The other handhold is attached to the other bolt. Connect the scope ground wire to one end of the resistor. Connect the scope probe to the other end of the resistor. Turn the zapper ON and grasp the handholds. Read the voltage on the scope. It will read about 3.5 volts. Calculate current by dividing voltage by resistance. 3.5 volts divided by 1 KΩ is 3.5 ma (milliamperes).

Using The Zapper

1. Wrap handholds in one layer of wet paper towel before using. Grasp securely and turn the switch on to zap.

2. Zap for 7 minutes, let go of the handholds, turn off the zapper, and rest for 20 minutes. Then 7 minutes on, 20 minutes rest, and a final 7 minutes on.

Trying the zapper on an illness to see “if it works” is not useful. Your symptoms may be due to a non-parasite. Or you may reinfect within hours of zapping. The best way to test your device is to find a few invaders that you currently have (see Lesson Twelve, or Lesson Twenty Seven). This gives you a starting point. Then zap yourself. After the triple zapping, none of these invaders should be present.

Simple Pulser

If you are ill or want a reliable zapping, make the first model. However, there is another way to make a zapper if you can not afford to build the first model.

An ordinary battery is a source of *Positive* voltage. It is the *Positive* voltage that eliminates so many parasites at once, not a specific frequency. So although the zapper's frequency is about 30 kHz (thirty thousand “zaps” per second), even 5 Hz (five “zaps” per second), **about as fast as you can tap the battery with your hand, is moderately effective!**

You must be connected to both terminals. One will be marked + (positive) and the other — (negative). If you simply touch these terminals with your wet fingers, nothing much happens. That is because your resistance to the current starts going up right away, so less and less current passes through you.

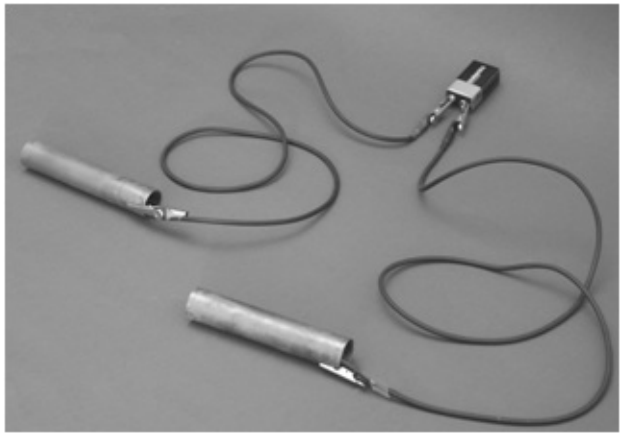

Fig. 5 Simple pulser

However if you tap the *Positive* terminal with your wet hand, and tap it at a fairly high rate, your body's capacitors come into play. Capacitors only take part in the flow of electricity when they are charged and discharged. Tapping the terminal starts and stops the voltage so capacitors charge and discharge. This kind of resistance to current flow is much smaller.

The faster you tap, the greater the frequency of current pulses and the lower this kind of resistance becomes. Now you can have a considerable sustained current flow through your body.

If you can tap even twice per second (2 Hz) for ten minutes without interruption you can give yourself a zapping that is moderately effective. Remember to take an intermission of twenty minutes and then repeat to avoid catching new viruses. After a second twenty-minute intermission repeat zapping a third time.

Using The Simple Pulser

9-volt battery
2 short (12”) alligator clip leads (from any electronics shop)
2 copper pipes, ¾” diameter, 4” long (from a hardware store)

1. Wrap each handhold with one layer of wet paper towel. Place each on a non-conductive surface, like a plastic bag.

2. Connect the *Positive* battery terminal to one handhold and the negative terminal to the other handhold using alligator clip leads.

3. Don't let the handholds touch.

4. Place a clock in front of you to time yourself.

5. Pick up the right handhold with your right hand.

6. Leave the left handhold on the table. Tap it with your left hand, preferably the fleshy part of the palm. You may brace yourself with your fingers on the plastic. Keep up a steady pace as fast as you are able.

7. When you get tired pick up the left handhold with your left hand and tap with your right hand. Keep changing off with the least interruption.

8. Repeat a second time 20 minutes later, and a third time 20 minutes after that.

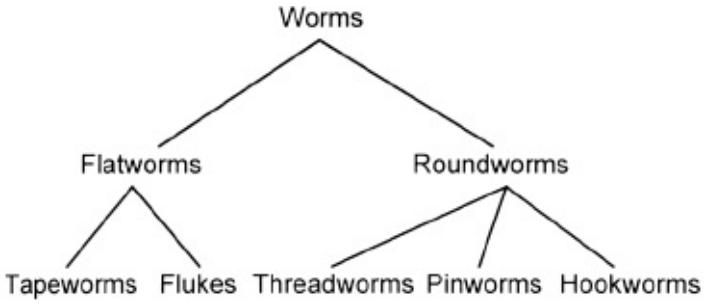
A single 9-volt battery will wear out rather quickly used this way. put two together, in parallel, for longer lasting power. This requires two more short alligator clips. connect *Positive* terminals of the batteries to each other, and the negatives also.

Parasites & Pollution

The word “parasites” is used in two senses. Everything living on you or in you, not just to perch, but to take its food from you is a *parasite*. No matter what its size, it can be called a parasite.

But in some way the big worms need to be distinguished from the medium-sized amoebae, the even smaller bacteria and the smallest of all—viruses. So often the term parasite is reserved for the bigger things, from amoebae on up. In this book, the word parasite will be used in both ways as usual. You can easily guess what is meant.

Parasitic worms are divided into *roundworms* and *flatworms*. Roundworms are round like earthworms even though they may be as thin as hairs (threadworms, *filaria*) or microscopically small (like *Trichinella*). Flatworms are more like leeches. They have a way to attach themselves sometimes with the head (*scolex*) like *tapeworms*, sometimes with a special sucker like *flukes.*



Worm parasites go through stages of development that can look very, very different from the adult.

Roundworms like *Ascaris* (common cat and dog roundworm) are simplest. The **eggs** are swallowed by licking or eating a bit of filth. They hatch into a tiny **larva**. The larva treks to the lungs. You cough it up and swallow it. Meanwhile it has molted a few times. It then crawls to the intestine where it becomes an adult, shedding eggs in your stool.

Fig. 6 Ascaris.

Worms usually have preferred locations. The favorite organ for *Dirofilaria* (dog heartworm) is the heart (even human heart). Sometimes the rules can be broken. My tests show *Dirofilaria* can live in other organs, too, if they are sufficiently polluted with solvents, metals and other toxins.

Flatworms like **tapeworms** are much more complicated in their life history. you could eat the eggs accidentally with dirt. After hatching, the tiny larva burrows into its favorite organ. Your body encases it with a cyst. the white blood cells have been taught never to attack your body...and the cyst case is your body! So the tapeworm stage has safe residence for some time. If you are a meat eater, you could eat such a cyst if it happens to be lodged in the meat you are eating! Your teeth break it apart as you crunch. the little larva is swallowed and tries to attach itself to your intestine with its head. Then it grows longer by making segment after segment. The segments with their eggs leave with the bowel contents. I often see dog tapeworm of the small variety in their human family.

Flatworms like **flukes** are also very complicated. The eggs, passed out with bowel contents, were not meant to be eaten as such. They were meant to hatch in a pond where snails and minnows eat them. The larva grows up in these new “secondary” hosts. Later, the snail sheds them and they attach themselves to foliage near the pond. They over-winter in a tough *metacercarial* cyst. An unsuspecting browsing animal now eats them. They come out of their metacercarial cyst as a small adult and quickly attach themselves to the intestine with a sucker. They now have “safe haven” and can go about maturing and laying eggs.

Four common flukes are: human intestinal fluke, human liver fluke, sheep liver fluke, and pancreatic fluke of cattle. Don't let the terms sheep and cattle mislead you. They are all found in humans.

(L to R) Human intestinal fluke, sheep liver fluke, pancreatic fluke, human liver fluke.

Fig. 7 Flukes

The Worst Parasite

Fasciolopsis buski is the fluke (flatworm) that I find in every case of cancer, HIV infection, Alzheimer's, Crohn's disease, Kaposi's, endometriosis, and in many people without these diseases. Its life cycle involves six different stages:

Stage	Normal Life Cycle	
1 Egg	Expelled with bowel movement onto soil. Washed by rain into ponds.	2 Miracidia	Hatches from egg in water. Has cilia, can swim vigorously and must find intermediate snail host in one to two hours or may be too exhausted to invade.	
	Develop inside miracidia as little balls until expelled. Those are “mother”	

3 Redia	redia, and each one bears “daughter” redia for up to 8 months, all still inside the snail, and living on the fluids in the lymphatic spaces. Similarly, daughter redia are continually developing cercaria.	
4 Cercaria	Have a tail, use it to exit from snail and swim to a plant. If the snail is feeding on a plant, cercaria can latch onto plant with sucker mouth and start to encyst (form a “cocoon”) within minutes. Tail breaks off and swims away to dissolve.	
5 Metacercaria	Two-walled cysts. The outer wall is very sticky. But as you eat the plant it is stuck to, the least pressure will break it, leaving the cyst in the mouth. The “almost unbreakable” inner cyst wall protects it from chewing, and the keratin-like coat prevents digestion by stomach juices. However when it reaches the duodenum, contact with intestinal juices dissolves away the cyst-wall and frees it. It then fastens itself to the intestinal lining and begins to develop into an adult.	
6 Adult	Lives in your intestine and can produce 1000 eggs per bowel movement and live many <u>years</u> .	

Fig. 8 Fasciolopsis' normal life cycle.

Note that the adult is the <u>only</u> stage that “normally” lives in the human (and then only in the intestine). *Fasciolopsis* depends on a snail, called a *secondary host,* for part of its life cycle. **But when your body has solvents in it, the other five stages can develop in you!**

If **propyl alcohol** is the solvent, the intestinal fluke is invited to use another organ as a secondary host—this organ will become cancerous. If **benzene** is the solvent, the intestinal fluke uses the thymus for its secondary host, setting the stage for AIDS. **Wood alcohol** invites pancreatic flukes to use the pancreas as a secondary host. This leads to pancreatic dysfunction, which we call *diabetes*. If

xylene (or **toluene**) are the solvents, I typically see any of four flukes using the brain as a secondary host. If **methyl ethyl ketone** (MEK) or **methyl butyl ketone** (MBK) are the solvents, the uterus becomes a secondary host and endometriosis a likely result.

This is a new kind of parasitism, based on pollution. I call the diseases caused by fluke stages in inappropriate locations **Fluke Disease**; it is discussed in more detail later.

Are tapeworms and roundworms affected by solvents this way too? This is a fascinating and very important question. Search for the answer and help others search for the answer. I do not know yet.

Pollution

Pollutants are all the dead things around us that should not get into your body because they interfere with its work. As long as they don't penetrate your tissues, they won't interfere, like plastic eyeglasses and clothing. But if they are invasive, your body must fight to remove them.

Pollutants can invade your body via the air you breath, the foods and beverages you eat, and the products you put on your skin.

The biggest tragedy is not recognizing when a pollutant is harming you.

Two people can use the same face cream. One develops a rash the other does not. The one who did not assumes the cream is not harmful to them...that they are like a bank vault, impregnable to that product. A better assumption is that the face cream is somewhat toxic, as evidenced by the rash that can develop, and they escaped the rash only because they had a stronger immune system. The immune system is like money, paid out of the bank vault, for every toxic invasion. When the money is gone, the bank (your health) fails.

Solvent Pollution

Solvents are compounds that dissolve things. Water is a useful, life giving solvent. Most other solvents dissolve fats and are life threatening, because fats form the membrane wall around each of our cells, especially our nerve cells.

The solvent that does the most harm is **benzene**. It goes to the thymus, ruins our immune system, and causes AIDS. The next worst solvent is **propyl alcohol**. It goes to the liver and causes cancer in some distant organ. Other major culprits of disease are **xylene**, **toluene**, **wood alcohol, methylene chloride**, and **trichloroethane** (TCE). I'll discuss each one later, with the ailment it's associated with.

Metal Pollution

Biochemists know that a mineral in raw element form always inhibits the enzyme using that mineral. Copper from the meat and vegetables you eat is essential. Inorganic copper, like you would get from a copper-bottomed kettle or copper plumbing, is carcinogenic[3] . Unfortunately, the inorganic form of metals is what pervades our environment. We put metal jewelry on our skin; eat bread baked in metal pans, and drink water from metal plumbing.

Another obvious metallic threat is tooth fillings. **Mercury amalgam fillings**, despite the assurances of the American Dental Association, are not safe. And sometimes the mercury is polluted with **thallium**, even more toxic than mercury! **Gold** and **silver** seem to have fewer harmful effects, but no one should have any pure metal in or on their body.

Other prevalent toxic metals include **lead** and **cadmium** from soldered and galvanized plumbing, **nickel** and **chromium** from dentalware and cosmetics, and **aluminum** from food and drink cans, and cooking pots.

Mycotoxins

Molds produce some of the most toxic substances known, called *mycotoxins*. One small moldy fruit or vegetable can pollute a huge batch of juice, jam or other product. Although molds are alive, and can be killed by zapping, mycotoxins are not, and must be detoxified by your liver.

But because mycotoxins are so extremely poisonous, a tiny amount can incapacitate a part of the liver for days!

Aflatoxin is the most common mycotoxin I detect. It is produced by molds that grow on quite a variety of plants. For that reason I am always cautioning people to eat only perfect citrus fruit, and never drink commercial fruit juice. Of the thousands of oranges that go into the batch of orange juice you drink, one is

sure to be moldy, and that is all it takes to give your liver a setback.

A heavy dose of vitamin C helps the liver recover quickly. It also helps get rid of aflatoxin before it is consumed, right in the food container. So keep a plastic shaker of vitamin C powder handy and use it like salt on all your food.

There are thirteen other mycotoxins I have searched for in our foods. They are described in the section on moldy food.

Physical Toxins

Breathing in dust is quite bad for you so your body rejects it by sneezing, coughing, spitting up and out. Imagine breathing in broken glass particles. They cut into the lungs in a thousand places and couldn't be coughed up. They would travel. Imagine swallowing a needle or open pin. If the tip was blunt it could move through the intestine. But because it is sharp it gets caught in your tissue, then works its way deeper and deeper.

Would we ever knowingly breathe in broken glass? We are justifiably afraid of it in our food or under our bare feet. We are unaware that it fills our homes when **fiberglass** insulation is left imperfectly sealed off. Any hole made through the ceiling or wall, even if covered with cloth, lets swarms of broken glass bits into the house air. Air currents flow inward, into your living space. So all holes leading to the attic or insulated spaces must be sealed airtight. Of course, fiberglass should never be used in home construction, draperies, or around water heaters. The best advice is to have it all removed while you are away and then vacuum and dust.

Occasional exposures by house builders working outdoors does much less harm. Chronic exposure from a single small hole in the ceiling does a lot of harm, leading to cyst formation. And that cyst is a perfect place for parasites and bacteria to settle and multiply. When the intestinal fluke settles there it becomes malignant!

Cancer patients with *solid tumors* have either fiberglass or asbestos in them.

Asbestos is another tiny bit, sharp as glass, which moves through your body like a swordfish, impaling your cells until it, too, gets routed into a cyst.

We have been led to believe that we no longer have asbestos in our homes because we have outlawed the fireproofing materials it was used in. While that may be true, the source I find most often is all too prevalent: the clothes dryer belt. As it gets hot the belt releases a blast of asbestos particles that are forced through the seams of your dryer, and also openings in your exhaust hose, by the high pressure formed inside. It is now in your air.

Chemical Toxins

Chlorofluorocarbons (CFCs) or **Freon** is the refrigerant in your air conditioner and refrigerator coils. CFCs are suspected of causing the ozone hole above the South Pole. All cancer sufferers test *Positive* for CFCs in their cancerous organ! I have preliminary evidence that it is CFCs that attract other pollutants—fiberglass, metals, PCBs—to form a growing tumor instead of allowing their excretion. This would make it a "super carcinogen." How could you detect CFCs leaking in your home? By the time your air conditioner or refrigerator needs recharging, you have been exposed for a long time. We desperately need an inexpensive, in-home test for this unsuspected killer.

Arsenic is used in pesticide. Why would we poison ourselves along with the cockroaches? Is it because we can't see it happening…just as we couldn't see the fiberglass floating in the air? Our diligent scientists have studied the mechanism of arsenic poisoning in great detail. Then why are we allowed to put it on our lawns to be carried into our carpets via shoes?

Polychlorinated biphenyls (PCBs), oily compounds with wonderfully useful electrical properties, were originally used in transformers until their inability to break down into less toxic substances in our environment was spotlighted. Banned from use, I find them in most commercial soap and detergents! Is transformer oil being disposed of by selling it to soap makers?

Formaldehyde is used to cure foam. As a result, foam furniture, pillows and mattresses give off formaldehyde for about two years after manufacturing. If you sleep with your nose buried in a new foam pillow all night, you are risking major lung problems.

Every cleanser in your house probably has a toxic warning on its label. Every fluid your automobile uses is toxic. Every pesticide, herbicide and fertilizer you put on your lawn is probably toxic. Every paint, varnish, wax, lubricant, bleach and detergent will send you to the hospital if even a small amount is ingested.

Why do we keep them around? See *Recipes* for safe, old-fashioned, alternatives.

If you are ill even after zapping, it is toxins still at work. Getting rid of them is a major step toward being well.

How We Really Get Sick

What if you invented a device that could search people for the presence of mycotoxins (extremely toxic substances made by food molds)? And what if you found that although many people had them, those who were sick with a cold always had at least one of them. Would you ask whether a sudden buildup of mycotoxins is what really lets colds develop? Why do some people in the same family get the cold while others do not?

- What if you found everyone with **cancer** had the human intestinal fluke in their liver, and no one else did?
- What if you found everyone with **diabetes** had the pancreatic fluke of cattle in their pancreas, and few others did?
- What if you found everyone with **environmental illness** tested *Positive* for *Fasciola* (sheep liver fluke) in their liver?
- What if you found everyone with **asthma** tested *Positive* for *Ascaris* in their lungs?

What if you always found every mysteriously ill person had some unsuspected parasite or pollutant?

The device is the Syncrometer®, and these "what ifs" are all true. They forced me to alter my entire outlook on what really causes some of our "incurable", mysterious diseases.

We used to believe that diabetes was caused by over consumption of sugars, a cold by a virus you caught from somebody, cancer from carcinogen exposure, depression from poor parenting. This multi-causal concept is what made the study of medicine so difficult that only a few could undertake it. And every year new syndromes are added to the list of human illnesses.

But these diagnoses are based on a description of what is happening at a particular place in your body. This is like calling a mosquito bite behind the ears

by one name and a mosquito bite behind the knee by another name. If you never see the true cause, a mosquito at work, this system could be excused as somewhat sensible.

And, until now, the profession of medicine has made some sense. The new truths, however, make the old descriptive system obsolete. You can now find the true causes of all your illnesses. And you can find them yourself by building the electronic diagnostic circuit!

Once you have seen a mosquito at work on your body you no longer need to go to the doctor for a red, itchy bump. You don't need to search for the correct diagnosis and an appropriate drug. **You put up screen doors and windows!**

Once you have seen how common house dust is implicated in the common cold you get rid of the house dust. Once you have seen the mold in your food facilitate the cold virus you throw out that moldy food. But only seeing is believing. Nothing is left to faith. The electronic resonance method described in this book will let you see all these things for yourself.

You are not a hapless pawn attacked by bacteria and viruses that dart at you from nowhere to make you ill. You are not at the mercy of diseases all around you, hoping, by chance, to escape, like a soldier hoping to come home from the war. Nature and your body make good sense.

There is no disease that can outwit you if you know enough about it. Not even Lou Gehrig's disease, nor asthma or diabetes!. Read how the people in the case histories made themselves well. Read why some people failed. You have an advantage they did not have. Their instructions were hard to carry out because they had to have faith in them. You don't. You can replace faith with your own hardheaded observations by building the diagnostic circuit (Syncrometer®). The great convincer is seeing it yourself. When you personally find the mold in your peanut butter, or *Shigella* in your cheese; you have the knowledge, not faith that convinces and guides you.

All illness comes from two causes, PARASITES and POLLUTANTS.

Only two causes! This is what simplifies the picture to make it possible for you to cure yourself.

We have been taught that illness is largely our own fault. That it is due to

“catching something”, not eating what we should, like roughage or vitamins, or not doing what we should, like dressing properly, exercising or going to bed on time. Somehow, it's our own fault. Either by doing something we shouldn't or not doing something we should. When absolutely no fault can be found we are told it's in our genes! True inherited diseases are extremely rare. Our genes have evolved over millions of years to produce healthy humans. Nor are genes that mutate during your lifetime at fault. Pollutants, which are known to be mutagens, are the real culprits.

Neither the parasites nor the pollutants in you are “your fault”. Notice that other people all around us are doing the same things or not doing the same things, and even share our genes and don't have our illness. The current concepts on disease causation blaming our actions and our genes are simply not logical.

But until now they appeared logical. Suppose a mosquito or flea bit 1000 people, it would always be in a different place, and if you were using the location and effect system to diagnose the problem you could have a thousand diagnoses listed for them, including a defective gene. Could you be persuaded to accept a gene replacement for your red itchy bumps? The new gene might be for antihistamine production so the welts don't become large, red and hot, or lead to impetigo. If you were the research doctor, you might be tempted to alleviate a thousand persons' distress with a new gene. Fortunately, you are not and only need to solve your own problems. You can be more logical.

After you have found the parasite interlopers hiding in your body you can kill them electronically. And after you have identified the pollutants stuck in your organs you can stop eating them, breathing them or putting them on yourself. In response, your body will begin to heal, just as surely as a mosquito bite heals.

Heal from multiple sclerosis, emphysema, and myasthenia? Yes!! Some healing will be swift. Some healing will be slow. Healing is not understood. It is much faster in young persons. But fast or slow you know it has begun. It will be an exciting adventure to watch yourself lose your symptoms and get stronger.

Self Health

The entire purpose of this book is to enable you to diagnose and treat yourself for any disease. You have three new approaches that make this wish a reality: the understanding that only pollution and parasites make you sick, the quick and inexpensive diagnostic circuit that lets you find which pollutants and

parasites they are, and the zapper or herbal recipe that kills the parasites.

Wouldn't it be nice not to have to go to the doctor for your aches and pains? And not to be dependent on the doctor to diagnose and treat you?

Self health means keeping yourself healthy. Doing it **yourself**.

Suppose your doctor has already diagnosed you as having “Atypical Lateral Sclerosis" or “Shoulder-Hip Girdle Metastable Aplasia". Could you re-diagnose this for yourself so as to treat and cure it? And be successful? Why not? You have already succeeded in many enterprises. You learned to talk, walk, read, and get along with people. These skills took a few years to master. Learning to keep well is a new skill. It may take a few years too. After you have learned these skills you may pass them on to your children. And so a new gift is given to humanity, like the gift of music or the art of cooking.

How To Heal

Your body has been trying to rid itself of its parasites and pollutants all your life! It had its own ways. It made stones, it made mucus secretions, it made itself toxic dumpsites. These were good tactics but now of course, they are no longer necessary. Can you help your body get rid of these accumulations and sweep itself clean again?

Sweeping your liver clean is the most powerful way of helping your body to heal itself after the parasites are gone. There are thousands of bits of “trash” accumulated in the liver bile ducts. They will turn into stones (gallstones) if left in place.

The kidney, too, has made numerous small stones in its effort to keep your body clear of lead, cadmium, mercury and other impassable pollutants. You can assist the kidney to expel all these.

In days, not weeks or months, you can feel the healing effects of clearing gallstones and kidney stones from your body. But there are miles of bile ducts (50,000 ducts) in the liver; the herbal recipes that do this are used over and over, patiently, until all the “trash” is removed. This can take several years.

So, although you can stop your disease very quickly from progressing, the healing process may not be complete for years.

Nevertheless, you are healthy again. This means your pains are either gone or greatly reduced. Your organs are functioning better. You have a new sense of well-being. Your energy is up. Your desire to live and accomplish something is back.

Organs that have been damaged beyond the ability of our simple methods to reverse can be treated with the magic of modern surgery. Cataracts, bunions, old injuries are examples. Possibly, these too, are “stone” formations. But no recipe has been found to clear them up simply and in a useful time frame.

Killing parasites, removing pollutants and clearing gallstones and kidney stones from your body is a powerful combination of treatments. It is so powerful you can change yourself into a new person in half a year. And then go on improving for years more.

Should you stop taking your prescription medicine while you are treating yourself? NO. Wait until you have cured yourself of the condition that required the medicine. Reduce your medicine and eventually go off it. Will your doctor approve? Find one that will. Remember that the medicine is buying you the time to cure yourself, something to be grateful for.

The Road To Wellness

To review our new understanding of health vs. disease:

- We have only two problems: parasites and pollutants. Parasites are things that live on us, using up our food and giving us their wastes. Pollutants are toxic things in us making it difficult for our organs to do their work. These two things are responsible for all our other problems.
- Our bodies have been trying to rid us of these by making stones, making secretions, giving us swellings, inflammations and benign tumors. We develop deficiencies and disabilities.
- Finally, some permanent damage is done. Our hair turns gray, we develop cataracts, the spine bends, nerves and muscles die. We weaken.

Our strategy to undo all this will be a logical one.

First, we will kill all parasites, bacteria, viruses and fungi.

Second, we will remove the toxic molds, metals and chemicals in our foods and body products.

Third, we will clear away and wash away the stones, secretions and debris already formed, that hinder healing.

Fourth, we will use herbs and special food factors to hasten healing, being very careful to use pure products. (These act more quickly when given intravenously but the emphasis in this book will be on oral consumption.)

Finally, for repairs that are beyond our abilities, we will seek help from health and medical professionals.

What could be more exciting than finding the tremor is out of your arm or the pain is out of your shoulder? Won't it be admirable to correct your pulse and your high blood pressure, by yourself? What an adventure it could be to get rid of all your warts.

But getting rid of pain seems like a first priority to me, since pain often undermines our morale, our initiative to do things, even our interest in getting well!

Many of our illnesses are caused by unsuspected sources. I have found pigeon tapeworm in humans, for instance. Their wastes contain pathogens. Keep children away from where feeding areas.

Fig. 9 Feed animals out of your yard

Pain From Toe To Head

I would rather die than endure excruciating, unrelievable pain. That puts **pain** at the very top of my priority list.

Fortunately for us, painkillers are at hand to get us through it and buy us the time it takes to solve the real problem behind it.

The pain killing industry also brought us the addiction industry. As we turn to electrical pain killing the need for addicting drugs should decline. There are other very useful painkillers: acupuncture, massage, and listening to music, feedback devices, contemplation, hypnotism, and prayer.

But we will focus on getting rid of the cause of pain and healing the organs that are in pain so none of these methods are needed.

I am not talking about the pain of a broken bone, twisted ankle, bee sting or sunburn. I am not talking about the pain of a misaligned vertebra or stretch trauma in your leg muscles or arm muscles. I am referring to pain that is in one of your organs and refuses to go away. For example, arthritis. Other pains are headache, foot pain, elbow pain, hip pain, chest pain. All of these may have special names like rheumatoid arthritis, cluster headache, fibromyalgia, bursitis, tennis elbow and so on, but they are all the same phenomenon.

Knowing that parasites and pollutants are the real culprits, let us get right down to the job of finding out which they are, where they come from, and how to get rid of them.

The parasites that cause pain are not the large ones, like worms or amoebas. Nor are they the very tiny viruses. They are *bacteria*. Bacteria are the right size to get into the doorways of our cells. Our cells try to keep their doorways tight-shut but, of course, they have to open to let food in, or hormones, or other life-signals. If bacteria are swarming around the outside of cells, some will manage to slip into a doorway while it is open. A battle begins. The cells refuse to let the bacteria in. The bacteria refuse to let go of the door latch. There is probably a specific electrical attraction between them and an exact physical fit. The body's extra forces, the immune system, are called in to help quell the invasion. The bacteria multiply as fast as they can. There is swelling. There is heat produced.

There is pressure against other organs. All together it is called inflammation and infection.

The answer is not to deinflame with drugs (like the cortisone variety). The answer is not to reduce swelling or body temperature. **The answer is certainly not painkiller.** The answer is to kill the bacteria. (Even this is not the ultimate answer. We must stop the source of the bacteria and your body's invitation to be invaded. We will get to this later.)

So **Step One** is to search for the bacteria nibbling at our painful regions and identify them. This gives us the clue to finding their source. **Step Two** is to exterminate them electrically. Within minutes they fall out of the doorways to our cells. Your white blood cells are waiting for them, and will gobble them up in a grand feast.

But, remember, there is another cause of pain, pollutants. **Step Three** is to find the pollutants and identify them because this gives us a clue as to their source. **Step Four** is to eliminate our pollution sources. **And the job is done. Pain is gone.**

An intriguing question will pop into your head as you search your organs for parasites and pollutants. Which came first? Pollutants can jam their way into your cell's doorways too. Does this allow the bacteria to swim in? Or do the bacteria come first, jamming open the doorways so the pollutants can enter? Both seem possible. Maybe both events go on simultaneously. Perhaps that is why bacteria and pollutants are always seen together. Viruses can land on your cell's doorways, too, and cause viral diseases, but they are not as often pain producing.

You will also notice something, as you keep testing and watching over your health. **Your body is very good at killing bacteria and viruses.** Your body kills them faster than a wave of a magic wand! The only ones that get away are those that are stuck in doorways and channels with pollutants in them! This seems like evidence that pollutants do the gate opening. But it isn't proof and we must keep all possibilities in mind.

Fortunately we do not have to know exactly how parasites and pollution make us sick in order to get well.

Searching For Bacteria

In order to find which organs have the bacteria and which bacteria are present you will need to learn the new technology that makes all of this possible. This technology is a simple electronic circuit that is capable of trapping frequencies in such a way that you can hear them. Your body's frequencies, the frequencies of bacteria, viruses and parasites are all different and can be heard as distinctly as a **moo**, **baah**, **tweet**, or **oink** coming from a farm yard.

But do you have to do all that?

No! You don't. You could simply electrocute all these tiny invaders. But how would you know what to avoid in the future? If your pain returned how would you know if it was the same old bacteria or a new one?

Learning to test takes the guesswork out of diagnosis.

My hope is that you will find it all so intriguing, so absolutely fascinating, that in spite of some chronic pain, you will feel compelled to make the searches yourself. Find someone willing to help. Trade your information. It is less difficult than learning to use a computer.

What You Will Find

First we will study and cure pains of all kinds, starting with the toes and working our way up the body. We don't need to be very specific about the location of the pain since bacteria and toxins flow over to nearby locations anyway.

For each kind of pain, we will look into the causes so you can eliminate them. Pain could come back in an hour if you didn't know the bacteria were coming from cheese and you had a cheese sandwich after *zapping* (killing parasites electrically). In fact, the pain may not have had time to go away before the next onslaught begins and you might conclude, wrongly, that this method doesn't work.

Parasites might also come back to your specially painful place from a few far away places that are hard to reach by your zapper's electrical current. The inside of your eyeball, the testicle, the interior of gallstones, the middle of a tooth

abscess or the bowel contents are such places. Your zapper current, because it is high frequency, prefers to “go around” these items, rather than through them. But with repeated zapping, and herbal parasite treatment, you can decimate them, too, and stop reinfecting the rest of your body.

In fact, it is such knowledge about reinfection and sources of our pollutants that is the most important contribution of the case histories.

After dealing with pains we will turn our attention to the diseases that aren't pain producing, like diabetes, myasthenia gravis, and so on.

Toe Pain

The ends of your feet get the poorest “service” from your blood supply. They are the furthest away. The blood here has the most accumulated acid and the least oxygen supply. The body produces quite a bit of *uric acid* and this should, of course, be excreted into the bladder by the kidneys. But if the kidneys are doing a poor job of this, levels in the body and blood stream rise. The blood can only hold so much. It holds even less in acid conditions such as the ends of your feet experience. Uric acid begins to settle out or precipitate at our feet.

Hippuric acid, too, is found where pain is found. Hippuric acid is made in large amounts (about 1 gram/day) by the liver because it is a detoxification product. It makes no sense to consume *benzoic acid*, the common preservative, since this is what the body detoxifies into hippuric acid. Read all labels on food you buy. Don't buy any beverages or baked goods preserved with benzoic acid. *Citric acid* is fine. The joints of the big toes are favorite places for pain to develop. This is made even worse when circulation is poor. Take a *cayenne* capsule with each meal to improve circulation. If you cannot find your pulse just below your inner ankle your circulation is poor.

The accumulation of uric and hippuric acid invites bacteria to feed on them. As bacteria multiply the tissue fights back with **inflammation**. Now the stage has been set for **pain**. Some people do not have pain although these acids and other deposits are present making their joints knobby and unbending. Bacteria have not found them yet or haven't multiplied sufficiently in them to invade your tissues. Perhaps there are other reasons as well.

If you have **toe pain** your course of action is this:

1. Kill all bacteria possible with your zapper. Repeat daily until no further benefit is seen.

2. Dissolve the deposits away. An herbal recipe, quite elaborate, is capable of doing this. It is called the *Kidney Cleanse*. Toe deposits are made of the same crystals as kidney stones, which is why the *Kidney Cleanse* works for toe pain. But because these deposits are far away from the kidney, it takes longer than merely cleaning up kidneys. It may take six months to make a significant dent on these deposits. This will at the same time remove kidney crystals so that these are no longer a source of bacteria.

3. Get teeth cavitations cleaned (cavitations are bone infections in the jaw where a tooth was pulled; it never healed; see *Dental Clean Up*). This can "magically" stop the toe pain the same day as they are cleaned. The effect lasts for days afterward showing it is not the dental anesthetic that is responsible. It also teaches you that the bacteria in the toes can come from the teeth. But pain may return as other bacteria find the deposits.

4. Clean the liver of stones using the *Liver Cleanse*. This, too, can give immediate pain relief in the toes showing you they are a source for bacteria. Liver cleaning may take you two years to complete! Meanwhile your toe pain is receding. And, of course, this pays extra dividends in health for your body.

5. Reduce the acidity in your toes. First, check your acidity with pH paper meant for testing urinary pH, called Nitrazine™ paper. Ordinary pH paper, as for fish tanks, is almost as accurate and will serve as well. Tear a ½ inch piece and hold it in the urine stream. Early morning is the time your urine is most acid. If this reads below 5.5 your feet must have been even lower in the night (lower is more acid).

Once deposits start, it is hard to stop them. If they start forming at 2 a.m., they are likely to continue for several hours even if the pH goes back up to normal. Your tactic will be to go to bed with an alkalizing action. Taking a calcium and magnesium supplement at bedtime, drinking milk at bedtime, using baking soda at bedtime are all remedies to be tried. They should raise your urinary pH to 6 in the morning.

Balance Your pH

Most persons with painful deposits anywhere in their feet have a morning urine pH of 4.5! At 4.5 it is safe to guess that a lot has precipitated again in the

night. During the day, your body's pH swings back and forth. The urine gets quite alkaline right after a meal; this is called the *alkaline tide*. Three meals a day would bring you three alkaline tides. During these periods, lasting about an hour, you have an opportunity to dissolve some of your foot deposits. But if you allow your pH to drop too low in the night you put the deposits back again. The net effect decides whether your deposits grow or shrink.

To alkalinize yourself at bedtime, choose one of these options:

1. Two oyster shell tablets, equaling 750 mg. of calcium plus a magnesium oxide tablet, 300 mg (see *Sources*). The magnesium helps the calcium dissolve and stay in solution. Taking more calcium at one time is not advised because it cannot be dissolved and absorbed anyway and might constipate you. For the elderly only one calcium tablet is advised. Take calcium tablets with vitamin C or lemon water to help dissolve (¼ tsp. vitamin C powder; adding honey is fine).

2. One cup of sterilized milk or buttermilk, drunk hot or cold, plus 1 magnesium oxide tablet, 300 mg. (adding cinnamon is fine).

If these two remedies work for you, your morning urinary pH will come up to 6.0 but if for some reason they don't, you need to take more drastic measures. Take the supplements and milk earlier in the day and reserve bedtime for:

3. ½ tsp. baking soda in water. This is *sodium bicarbonate*. But don't use baking soda from a store because most brands I have tested are polluted with benzene! (See *Sources* for safe baking soda.) Using a combination of sodium and potassium bicarbonate in a ratio of 2:1 is actually a much more healthful potion. You can make your own or ask a pharmacist to make it for you. Mix two parts baking soda and one part potassium bicarbonate (see *Sources*) in a jar. Keep tightly closed. Label it **sodium potassium bicarbonate alkalizer** (this potion is also very useful in allergic reactions of all kinds). Take 1 level tsp. in water at bedtime. If your pH reaches 6 in the morning continue each night at this dose. If it does not, take 1½ tsp. Keep watching your pH, since it will gradually normalize and you will require less and less. If you are using plain baking soda, instead of the mixture, watch your pH each morning, also, so you can cut back when the pH goes higher than 6.

Persons with a limit on their daily sodium intake must carefully count the grams of baking soda consumed in this way. Each tsp. weighs about 2 grams, of which half (1 gram or 1000 milligrams) is sodium. The sodium/potassium mixture would only give you half as much sodium (½ gram per tsp.). By

comparison, the usual daily intake of sodium is about 5 gm., although salt eaters consume twice that amount.

You have done five things to pull the rug out from under the bacteria living in and around the deposits in your toes. Now when you kill bacteria with your zapper, you can expect the pain to go away and stay away.

Locations at the base of toes may be painful due to a *neuroma*. Deposits and bacteria here are even more painful because this is the location of nerve centers. If the build-up is large, you may prefer some surgical help or cortisone shot rather than wait several years for solid relief.

Foot Pain

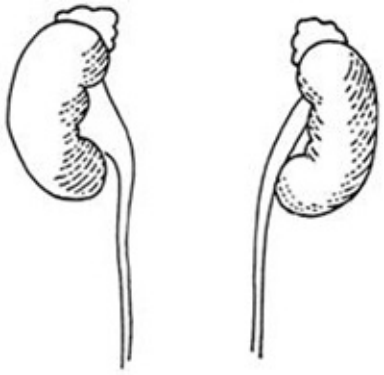
This kind of pain does not involve as much deposits as toe pain and is therefore easier to clear up. But trauma to the foot is more important. First, even though your shoes are comfortable, change them. Get wider shoes, longer shoes, and lower heels. Alternate two pairs of shoes in a single day. In your home take shoes off.

Keep feet very warm. Wear natural fiber socks, not synthetics. If your circulation is poor, take a *cayenne* capsule with each meal. When circulation is moderately poor, your feet get cold easily. When circulation is very poor, the heart pulse cannot be felt in your feet (take your pulse just below your inner ankle). Again:

- Get teeth cavitations cleaned (*Dental Clean Up).*
- Do the herbal *Kidney Cleanse.*
- Kill parasites and bacteria with a zapper.
- Then clean the liver.
- Check body pH in the morning upon rising using Nitrazine™ or other pH paper. Correct it as discussed in Toe Pain. If the urinary pH is 7 or higher, it means you have a bladder infection. Treat it immediately.

If there is any swelling around the foot or ankle, you are “holding water.” It may be called *edema*. This is due to poor adrenal and kidney function. The

adrenals are located on top of the kidneys and together they regulate how much salt and water stays in your body. Because they are situated so close together, they share their parasites and pollution. When the kidneys form *kidney crystals* the flow through the kidney tubes is hindered, and less water and salt can leave the body. It stays in your tissues as edema.



Your kidneys with the adrenal glands sitting like hats on top. The ureters lead to the bladder.

Fig. 10 Kidneys

The kidney herb recipe will dissolve the crystals. But you must remove toxins such as metal from tooth fillings and kill parasites. Continue doing the *Kidney Cleanse* after the original six weeks is up until all foot pain and edema are gone. Continue killing your tiny invaders with a zapper twice a week. You may need to cleanse the liver several times, too, before all the pain and edema are gone.

The supplement, *pantothenic acid* (see *Sources*), is particularly good for feet. Take 500 mg three times a day for several weeks to see if it helps. Massage and reflexology are also good for them.

Heel Pain

Sometimes heel pain is due to heel spurs; sometimes it is not. Heel spurs are due to deposits. The usual heel deposits are *uric acid* and various *phosphates*. Uric acid deposits become a breeding ground for bacteria. The phosphates give the deposits a rigid structure that is hard to dissolve. You may have to choose a painkiller, get specially built “orthopedic” shoes, or stop your daily walks to get relief from the piercing pains. These will not cure the problem but may “buy you some time” while you make basic changes in your lifestyle.

Stop drinking tea and cocoa because they contain *oxalic acid*. Stop drinking

coffee, decafs, fruit juice and soda pop because they are contaminated with solvents. All of these must be detoxified by your body and eliminated by your kidneys. We should spare the kidneys these extra tasks when we wish them to clean up heel spur deposits. You must first dissolve the deposits, and then help the kidneys eliminate them.

To dissolve them, you alkalinize your body's pH, watching over it carefully with pH paper or Nitrazine paper. To help kidneys eliminate them, use the *Kidney Cleanse* and drink lots of water. Only water, not a beverage, helps the kidneys to eliminate.

Drink a pint of water upon rising in the morning, and a pint of water between meals.

Do not buy “special” water. Use your cold tap water only. If you don't like the taste of your own tap water, get it from somebody else's tap. Use only glass or reused polyethylene jugs. Polyethylene is opaque, not clear. It has already lost its plasticizer into the water that stood in it earlier. (Somebody drank it!) Purchased water has traces of solvents from machinery and sterilizing equipment used in its bottling. Your own tap water is not pure (indeed it may have 500 toxic elements), but it never contains solvents in amounts I can detect.

Traces of solvents are worse than traces of other toxins.

Water filters are not the solution. They trap the pollutants and then allow a tiny amount to enter the water on a daily basis. Chronic toxin consumption is much worse for your health than periodic surges of toxins. You can use a small filter that gets changed every month without much risk. This would dechlorinate the water, at least, and improve the flavor. The pitcher variety (it should be made of hard, inflexible plastic) and the faucet variety are listed in *Sources*.

Bottled water is popular

…and tasty, and has appealing advertising, but it is just not safe.

Why is it easier for everyone to spend dollars per day, for the rest of their life, buying water instead of insisting that their water pipes are metal-free?

Another reason not to drink water from bottles, however convenient, is that it

is stagnant and is soon contaminated with our own bacteria from contact with mouth or hands. *Staphylococcus (Staph)* and *E. coli* are commonly seen. The solution is not to add still more chemical disinfectants; the solution is to drink from a flowing source, such as our faucets. If you must carry water, use glass containers; plastic is porous and much more difficult to wash clean (sterilizing in a dishwasher is effective, though).

By drinking a total of four pints of water in a day, the kidneys will notice the assistance. (Any single herb tea without added salt or sweetener counts as water.) The urine will stop having any odor and will become very light colored. This is especially important while you are dissolving the heel deposits since your body is now carrying these in the circulation.

Killing bacteria with a zapper may give you instant pain relief and is, of course, beneficial to your body. But you can't expect the pain to stay away until the deposits are gone and the source of bacteria is also removed. Go after the usual sources: teeth and stones. Another source is dairy food contaminated with *Salmonella* and *Shigella* bacteria. Sterilize all of it by boiling. Even the amount put on cereal in the morning or used in scrambled eggs is enough to reinfect you! Butter and heavy whipping cream also need boiling. Stop eating yogurt and cheese, which can't be boiled.

Phosphate deposits are a mixture of three phosphates: *monocalcium phosphate* ($CaH_2\ PO_4$), *dicalcium phosphate* ($Ca_2H\ PO_4$) and *tricalcium phosphate* ($Ca_3\ PO_4$). They are formed by eating too much (way too much) phosphate, relative to calcium.

Our high phosphate foods are meats, carbonated beverages and grain products like rice, cereals, breads, pastas and nuts.

The body's normal elimination tactic for phosphate is to combine it with calcium and magnesium in order to neutralize it first. Unneutralized phosphate is very acidic and would burn the delicate kidneys. But where shall the calcium and magnesium be taken from? Magnesium is often in very short supply since it comes from green vegetables in the diet and is not stored up in any special organ. So it falls on calcium to be used for this purpose since it is stored up (in your bones and teeth).

The acid condition created by phosphates dissolves your bones and allows large amounts of bone structure to be washed out with the urine: this can be directly seen with an analysis of urine (you can ask your doctor to order this at a

lab). If you catch all the urine in a 24-hour period you can measure all the calcium you have wasted. You should not lose more than 150 mg calcium in a day because this is all you can absorb in a day![4] If you do lose more than 150 mg in a day, you are dissolving your bones at a fast clip. This also means there is too much calcium in your blood and lymph, from dissolving so much bone so quickly.

Once you have dissolved your bones it is not so easy to put the calcium back into them. Your body will try to put it back as soon as possible—as soon as your acid condition is gone. But your bones can't do this without *vitamin D.* Vitamin D may “come from” sunshine and from vitamin D in milk but it isn't that simple. Vitamin D must be activated by your kidneys before it can go to work! Remember, though, it was the kidneys that had a problem in the first place, allowing deposits to form! With old kidneys, clogged with crystals, hampered by heavy metal and mold toxins, and beleaguered by bacteria and parasites, is it any wonder that sunshine and vitamin D fortified milk don't supply large amounts of activated vitamin D? It takes large amounts to put back into your bones the large amount of calcium that dissolved out during the acid state you put yourself in by over consuming phosphate food.

If you can't put the calcium back into your bones promptly where is it to go? It may attach itself to tissues that were never meant to be used this way. Your arteries fill with “scale,” your kidneys form calcium phosphate crystals, heels form spurs, and joints become knobby with deposits.

Young persons and children, with healthy unclogged kidneys, make—that is, activate—ample vitamin D, so even if they consume too much phosphate and develop an acid condition that dissolves their teeth and bones, **they can put the dissolved calcium back in its proper place.** They don't develop hardened arteries, heel spurs, and knobby joints, at least not at first. Their bodies can take a considerable amount of abuse without showing it.

In general, people eat way too much phosphate. Meat eaters eat too much meat. Vegetarians eat too much grain. Most everyone drinks phosphated beverages. In this way we set the stage for hardened arteries, joint disease, calcified tissues that no longer have flexibility. We all get kidney crystals that become stones. This is *aging*. All these deposits invite bacteria to live in them and on them, creating pain.

Old age and pain go together as if they were true partners. Yet it is just the result of bad food choices.

Try to undo as much of this false aging as possible.

1. Reduce your meat consumption. Switch to fish which supplies calcium in the tiny bones. It is true, these bones are made of calcium phosphate and one might expect, logically, to be getting a less effective calcium source. Logic isn't necessarily biologically correct. The bones of fish work nicely as a calcium source and their phosphate content is not too great. Such a diet has worked for many primitive societies. Further, I have never seen a case of mercury toxicity from eating fish; amalgam tooth fillings are our truly significant source.

2. Reduce your grain consumption. Instead of cereal for breakfast, add fruit and reduce the cereal to half. Cut bread consumption in half. Cut pasta consumption in half. Cut rice and corn consumption in half. Eat more bananas and other fruits. Eat more vegetables; always choose potato (not potato chips) instead of rice or macaroni. Always choose a leafy salad instead of pasta salad. At any restaurant or salad bar ask yourself: is this wheat, rice or corn? If so, choose potatoes or other vegetables. Choose coleslaw. Choose mixed fruit. You don't need to go off the grains, only reduce them to improve your condition.

3. Take vitamin D as a supplement. Nothing less than 40,000 units have any real impact by the time there are problems. This strength is available by prescription only (usually 50,000 units, which is close enough). To avoid getting a polluted product, ask your pharmacist to follow the recipe. (In the past some cases of poisoning by overdosing resulted in this regulation. If you overdose you will get joint and muscle pain and nausea but it is reversible.) Take one a day (not more), for the first three weeks, then two a week forever after.

4. Finally, toss the carbonated beverages right out of your diet or make your own (see *Recipes*). It is not the carbonation that is harmful; it is the added phosphate. Drink water, herb teas, homemade fruit and vegetable juices, milk or buttermilk.

Milk, like fish, is full of calcium in the form of calcium phosphate. Again, logic might speak against the effectiveness of this form of calcium. Again, logic is wrong. Evidently, the calcium and phosphate story must be much more complex than I am depicting here.

Milk works best as a calcium source, in spite of its phosphate content.

Possibly the *lactose* and other complexities of its composition contribute to this. My recommendation when deposits have formed anywhere in the body, such as heel, toe, arteries, joints, is to switch to milk as a beverage. Compare the calcium level of your urine before and after the switch (allowing several weeks first). Also compare calcium levels in your blood serum. It should move towards normal. This means **up** if it is too low (below 9.2). It means **down** if it is too high (10). If you are monitoring the effectiveness of the kidney herb recipe in dissolving away your phosphate crystals, notice that drinking milk keeps them from reforming. Taking calcium tablets does not! Taking nothing lets them reform the quickest.

The milk must be 2% or higher in butter fat to be effective.

With your body fluids at their proper acid level, with your kidneys able to flush out acids, with heavy metal toxins no longer settling in, with your bone-dissolving stopped, your heel deposits can shrink. Bacteria have no place to feed and breed. You can kill them several times more with your zapper to catch stragglers. And your heel pain becomes history. Be careful not to bruise the sensitive tissue with too much walking or running immediately after the pain is gone. Wear cushioning socks and well-cushioned shoes.

Names in the case histories have been changed to ones of the same sex, picked at random from a telephone directory. Other facts may have been altered in non-essential ways.

Walter Jones, a man of 67, was diabetic for 14 years. His feet and upper legs hurt so much for the past 13 years he could barely shuffle along now. They were also cold and clammy. The herb, juniper berry was added to the *Kidney Cleanse* recipe to make it even more effective for him and he was advised to stop smoking, using alcohol, and caffeine. He also started the parasite-killing program (at that time an *Herbal Parasite Program* was being used instead of a zapper) and a *Liver Cleanse* that yielded several hundred small gallstones. Three months from his first visit his legs were better and feet OK, although he still had some trouble walking due to pain in upper thighs.

Dinah Sagun, a minister's wife, had a lot of walking and standing to do besides traveling a lot. She had knee surgery 15 years ago to remove deposits but now they were getting bad again. Also her heels were sore. My tests showed she had phosphate and oxalate deposits in her kidneys. She was started on the *Kidney Cleanse* followed by the *Parasite Program*. She stopped using benzene-polluted items, especially her Chap Stick™. Her diet was changed to include milk and leave out store-bought beverages. In 4½ months her heel pain was gone along with the bad headaches we had not even started to work on.

Julie Fernandez came with a list of 10 serious problems including foot pain and ankle swelling. Her urinalysis showed crystals. My test showed they were uric acid crystals. Her parasites included *Trichinella*. There was a house cat. Her toxic metal test showed tellurium and platinum accumulation

from metal dentalware, and arsenic from pesticide. She was to start on a *Kidney Cleanse* and add the *Parasite Program* two weeks later. She was to remove all roach hives and other pest killers from her house and arrange for dental metal replacement. At her third visit, four weeks later, she could walk without pain although she still had *Trichinella* and arsenic problems. Two months later she was aching all over again and her kidneys hurt. She still had *Trichinella* and some dental work to do. She was to do a 5-day high dose parasite treatment and treat the cat also and repeat the kidney cleanse. This relieved her pain.

Dorothy Shelley had numerous pains including foot pain in the arch, lower back pain and cramps with her period. She had oxalate and uric acid crystals in the kidneys, so was started on kidney herbs. Three weeks later her foot pain and low back pain were gone.

Paul Longtin had toe cramps, calf cramps, and heel pain. After cutting down on smoking, quitting caffeine and soda pop and taking niacin (250 mg time release; 1 capsule each meal and upon rising in morning) and doing a kidney cleanse, all in three weeks, he was much improved and didn't even need his arch supports.

Juan Onley, age 58, came for his gout in both feet and one hand. He could hardly walk, in spite of soft shoes and painkiller. It started 7 years ago. He also had prostate pain and couldn't sit comfortably. My tests showed his kidneys were full of uric acid, oxalate and cysteine stones. His prostate was full of *Gardnerella* and *Campylobacter* bacteria. His wisdom teeth were harboring *plantar wart #4 virus* and *Coxsackie B4* virus. *Gardnerella* often comes with fluke parasites and indeed he had intestinal flukes in his kidney! He began with the kidney herb program, then the parasite-killing program. It took five months to clear them all. Then he could walk and sit without pain.

Leg Pain In Children

It is commonly accepted as normal in children to have pain in the shins or calves of the leg! They may even be called “growing pains.”Children may cry with the pain and never tell anyone the reason for crying. It happens mostly after napping. This may be caused by cramping of the leg or spasms of the blood vessels. *Lead toxicity* is a common cause of both. Test for the presence of both **lead** and **cadmium** in the tap water. only your own electronic tests are helpful. Water department tests are much too crude.

All disposable diapers I tested had mercury and thallium! These toxins can be absorbed through babies' skin.

Fig. 11 Disposable diapers

If either poison is found, test the water supply from each faucet in the house, in the morning, before it has been run. Find the offending sources; change the water pipes to polyvinyl chloride (PVC).

Also search for thallium or mercury in the child's saliva. If it is there, remove all dental metal. Stop using all commercial disposable diapers, dental floss, cotton swabs and bandages; they are polluted with mercury and thallium probably from manufacturing them in foreign countries where it is legal to sterilize with mercuric chloride. Test again, several times, after plumbing or dental work has been completed. To relieve pain:

- immerse legs in warm water
- massage legs gently
- give 25-50 mg niacin, not time-release, to dilate blood vessels.

Leg Pain In Adults

Leg pain in adults is usually associated with *cadmium* or *thallium*. Cadmium is present in tap water that runs through corroded galvanized pipes. The cadmium is probably a contaminant of the zinc used for galvanizing. Test the water, electronically, for cadmium. If you have all copper pipes but there is cadmium in the water, there must be a short piece (a **Y** or a **T** joint) made of old galvanized pipe lurking somewhere. Track it down by testing water from all your faucets.

Cadmium causes the blood vessels to spasm and it is made worse by smoking, that's why the condition is sometimes called **Smoker's Leg**. But extremely painful legs are due to chronic thallium poisoning more than any other cause!

It is very important to know exactly how toxic thallium is.

Where would you ever get thallium? From your very own mouth! The mercury in fillings is often itself polluted with thallium! Replace your amalgam fillings with composite.

Thallium has another source: it is riding along as a pollutant in cotton swabs, cotton balls, commercial bandages, toothpicks, floss, gauze, sanitary napkins, tampons, disposable diapers, and paper towels. Evidently these are being sterilized with mercuric chloride, which in turn, has thallium pollution.

Bandages

Sanitary napkins and tampons

Cotton swabs

Cotton balls

Floss

Toothpicks (the one on the right is ten years old and had no mercury or thallium)

Do not use any commercial personal products, the risk of pollution is too great.

Fig. 12 Personal products

- Line disposable diapers with a tissue
- Line sanitary napkins and pads with a tissue
- Use the polyester puff in the top of vitamin bottles in place of cotton balls.

Twirl some around a plastic stirrer for a swab.

- Use pieces of tissue and masking tape for bandages.

If you do have thallium in your white blood cells and you haven't used toothpicks, etc. earlier in the day, then it is in your tooth fillings and **you have no higher priority than getting the amalgams out.** Find a dentist immediately who will remove them, drilling deeply and widely not to miss a speck of it, thereby getting the thallium out, too. You cannot cure your leg pains without removing thallium.

Use cheesecloth in place of gauze.

Use monofilament fish line (2 or 4 lb. test) for floss

Fig. 13 Safe substitutes for personal products.

Leg Pain Protocol

1. Stop smoking.
2. Repair plumbing.
3. Do *Dental Clean Up*and chelate out the mercury and thallium that has gotten into your tissues with EDTA (see *Sources*). you will need to find a chelating doctor; ask a friendly chiropractor to help you locate one. Or at least take thioctic acid 100 mg, (2 three times a day) and vitamin C (5 gm or one teaspoon) daily for a month.
4. Take magnesium oxide 300 mg (take 1 twice a day).
5. Take niacin, as much as you tolerate—time-release varieties are less effective. Try 50 mg with each meal.
6. Change your diet to reduce phosphate and include milk (sterilized).

7. Do the herbal *Kidney Cleanse* followed by a *Liver Cleanse*.

8. Zap yourself on alternate days at bedtime. If this zapping makes no difference whatever, your problem is purely spasms.But if you get relief, even if it's very short lived, you must have killed something. Bacteria must come from somewhere. Concentrate your efforts on dental health and better diet.

Jean Booth, age 30, had sore, tired legs and severe three-day headaches. She would get stabbing pains in back of her thighs. After we found thallium and mercury in her kidneys she did a *Kidney Cleanse* and got all her metal tooth fillings replaced. She then felt fine for one year. Suddenly she got fatigue and heavy legs again with stabbing pain at the outer thigh. She had seen a neurologist.Her chiropractor suggested it was leftover mercury so she came back to us. Indeed, she was toxic with lead, mercury, thallium, but her dentist could not find the leftover metal in her mouth. Three cavitations were cleaned; she was put on thioctic acid; eight varieties of bacteria and viruses were killed with a frequency generator and her legs became well again. Our test showed thallium at 4 teeth, but it was not a big enough deposit to show up on dental X-ray. She may eventually choose to have these redrilled.

Charlie Snelling was a picture of pain: pain in arms, elbows, shoulders, wrist, hands, chest, low back, legs, knees, and feet.He was started on kidney herbs and a few pains were reduced. He was toxic with cadmium so he changed his plumbing to plastic. However, he continued to be toxic with cadmium and thallium throwing suspicion on his numerous old tooth fillings.He got them all replaced and cavitations cleaned. He used our frequency generator to kill *beta Streptococcus*, *Pseudomonas*, *Troglodytella* and *Staphylococcus aureus* all of which were under one tooth (#15).A year later he still had bouts of leg pain.He still had numerous bacteria under his teeth because the jawbone was not healing. He had not been taking vitamin D nor magnesium nor drinking milk for the necessary calcium. But he had improved enough to go back to work full time.

Victor Abhay, age 16, could no longer play in high school sports because of knee pain.It began “with a virus“ and high temperature two years ago. His knee started to bother him after that. He had *cysteine* kidney crystals and four parasites: *Cryptocotyl*, human liver fluke, *Echinococcus granulosus* cyst and *Echinostomum revolutum* in his white blood cells. He was to start the kidney herb recipe and follow this with the *Parasite Program*.Five months later, when we next saw him, his knee was fine.

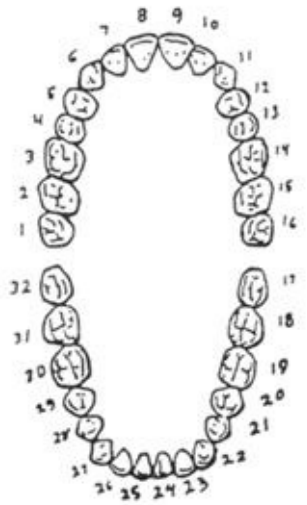


Fig. 14 Tooth numbering system

Kim Murphy, 45, had painful legs, feet and knees. They also were swollen and itched. She was parasitized by *Trichuris*, (dog whipworm). She also had tapeworm stages (*Taenia pisiformis*) and intestinal fluke in the intestine. She started on the kidney herbs, followed by the *Parasite Program*. She stopped using zirconium-containing products (deodorant) and barium (lipstick).She stayed out of bus exhaust. (She knew she was allergic to diesel exhaust.)In one month her leg pain and itching were gone; slight swelling remained.

Nancy Tong, 80's, had edematous legs. In fact she could get no stockings on. They appeared like pillars with no taper at all. She was on diuretic medicine from her doctor. It kept her blood pressure down but she was losing ground with water excretion. This raised her general toxicity (blood BUN[5]) which made her feel bad most of the time. Yet she drank enough water, curtailed her salt, used no caffeine and had no really bad habits. She had to wear several pads for incontinence.We found she was toxic with cadmium and lead, which were probably responsible for her huge accumulation of kidney stones.The metals were in her tap water and she was unable to resolve this problem since she lived in a senior citizen center. We advised her to move, or to have her tap water carried in, but she could do none of these. Although the situation was hopeless, she did the kidney cleanse, parasite-killing program and changed her metal rimmed glasses and wrist watch to plastic. She gained enough ground from these improvements to be able to wear elastic hose and thereby give some physical assistance to her body. This encouraged her to do a *Liver Cleanse*.She had a headache with the cleanse but immediately afterwards she fit into a smaller size “Keds” (elasticized stockings). A half a year from the beginning, her legs had taper to them; she didn't even mind wearing a dress.

Fibromyositis and Fibromyalgia

When pain is widespread, not just in joints or legs but in many muscles and soft tissues of your body your doctor may call it *fibromyositis* or *fibromyalgia*.

For bacteria to get all over your body, they must be riding along with parasites that get all over your body. Microscopically tiny roundworms can do this.

Trichinella is the most common cause of these diseases, but sometimes *Ascaris* larvae or *hookworms* or *strongyle* larvae are the main culprits. These wormlets bring hosts of **bacteria** with them, mainly “*Streps*“(*Streptococcus* varieties) and “*Staphs*” (*Staphylococcus* varieties), but also “*Clostridiums*” (*Clostridium* varieties) and “*Campyls*” (*Campylobacter* varieties). The bacteria are probably the pain causers. By killing all bacteria—*Staphs*, *Streps*, *Clostridiums* and *Campyls*—using a zapper, you may get relief for one hour!

Fig. 15 Trichinella larvae settled in muscles.

By killing *Trichinella* and *Ancylostomas* (worms) first, followed by the bacteria, you may get relief for several hours. By killing the parasites and bacteria in every household member and the pets at the same time and by never putting your fingers to your mouth, you can expect permanent pain relief. It is interesting to speculate why the other family members, who are also infected with these tiny roundworms don't develop *fibromyalgia*.Perhaps the larvae stay in the intestineor go to the diaphragm (causing coughing) or the eyes (causing "lazy" eye muscles).Perhaps they merely cause **anemia**. *Trichinella*, hookworms and *strongyles* are extremely difficult to get rid of in a family.

These roundworm larvae undoubtedly cross the placenta into the unborn child during pregnancy, too. So they can be "inherited."Try to clear up the whole family before the next pregnancy.

Clearing up pets of these parasites is even harder. The best advice is to give your pets away. They will continue to harbor them even though they are on a *Pet Parasite Program*.It is impossible to stay free of the parasites your pets have: they will move to your soft tissues immediately, giving you the bacteria and inflammation again.

The next most important advice is to keep fingers out of your mouth (read Hands). None of these parasites enter through your skin (this is in spite of teachings that hookworms enter this way), you must put them into your mouth somehow! Consider your mouth off limits to anything but food and kissing.

Finally, if there is a baby in diapers in the family, be patient. When diapering days are over you will have less bowel contact, giving you an opportunity to finish your own treatment. Meanwhile, wash fingernails in Skin Sanitizer (see *Recipes*) after cleaning up children's bowel movements, diapers and yourself. Use borax liquid for soap to leave an antibacterial residue on the skin.

Try to identify your parasites before killing them so you can be on the lookout for them in the future. Get slides or dead cultures of various pathogens and search in your white blood cells. If you can't do this, at least save a saliva sample of your own; keep it frozen or preserved. Also make a saliva sample for your pet. This gives you specimens to test yourself for later. You won't know which parasite is in this saliva specimen, but if you ever test *Positive* for it again you will know you got it back. Then zap yourself.

Brenda Byrd was diagnosed with myofibrositis two years earlier at the age of 36. Her blood test showed triglycerides slightly high (152 mg./DL), indicating the beginnings of urinary tract problems.Her urinalysis stated “hazy” (hazy with bacteria or crystals) instead of clear urine.It also listed white blood cells, red blood cells, and a few bacteria present in her urine. Our tests revealed mercury and numerous other heavy metals distributed in her thyroid, stomach, kidney, lungs, bones and bone marrow.She was also full of beryllium (usually from “coal oil”) contained in the hurricane lamps she kept in every room. She had numerous parasites, including *Strongyloides* and hookworms spread through her body tissues. She was thrilled to learn how to get her health back and started with the dental problem.

Marcia Cochran, 36, had muscles twitching all over her body. It was diagnosed as fibromyalgia.Her joints were tender and her chest felt “tight.”She had bronchitis twice a year. She was on Amytryptaline™ for muscle twitching and Bentyl™ to calm the intestine(spastic colon).She had depression with it and was on medicine for that. It all started with fever and chills that she thought were the flu but after they went away, she was left with a tremor. Sometimes she felt that little electric shocks were going through her. She had *Ascaris* and hookworm larvae widespread in her body. She had sheep liver flukes in her liver. She was started on the *Parasite Program*. She was also toxic with PVC and tellurium (dental metal). The PVC was traced to plastic storm windows applied to the inside of the window and to new shower curtains. Two months passed and she had not solved any of her problems. Then she did her first *Liver Cleanse* and got over 100 stones out. This instantly reduced her fibromyalgia to occasional attacks. She was so encouraged she decided to go ahead with *Dental Clean Up*.

Joint Pain or Arthritis

Two main kinds of arthritisare recognized clinically, *osteoarthritis*and *rheumatoid arthritis*. In osteoarthritisthe joints have bacteria living on the deposits left there. In rheumatoid arthritisthe bacteria come from larger parasites —wormlets actually living in these joints. The worms are the common little roundworms whose eggs hatch into microscopic wormlets that travel.

We have four common roundworms: *Ascaris*, *hookworm*, *Strongyloides*, *Trichinella*.Their life cycle normally directs them to travel to the lungs but in some people they travel through the entire body, including brain, muscles and joints.More research is necessary to explain this. My suspicion is that there are toxins, like **mercury**, **thallium**, **cadmium**, **lead**, as well as **solvents**, distributed through the body, lowering immunity and allowing the tiny larvae to reside there. Once the pathway (routing) to these organs has been established, it continues to be used by other parasites as well. Soon a variety of parasites, their

bacteria and viruses, and pollutants are all headed toward these organs.

Fig. 16 Hookworms, strongyles, and whipworms

Osteo or Common Arthritis

When joints are painful it is a simple matter to kill the bacteria with an electronic zapper.Treat yourself with a zapper daily until the pain is gone. Maybe it will stay away, but chances are the bacteria have a steady source.

The most common source for *Staphs* and *Streps* are small abscesses in the jawbone, under and beside old extractions, root canals and mercury fillings. You may get immediate pain relief just from a *Dental Clean Up*, and again disappointment may follow. *Staphs* and *Streps* are such ubiquitous bacteria; they may come not only from jawbone infections but also from gallstones, kidney stones and other parasites. The correct treatment for arthritisis a complete overhaul of body health: a diet clean up, a body clean up, and environmental clean up.

Start with the *Herbal Parasite Program* and zapping. Follow this with a *Kidney Cleanse*, then *Liver Cleanse*.If any toxin is overlooked, especially asbestos and fiberglass, it is sure to find your joints and permit bacteria to return and cause pain. Make sure to correct your body acid levels after doing pH measurements of the urine.

Arthritic deposits contain a large amount of phosphates combined with calcium. This calcium came from some other bone, such as the base of your spine or the wrist.Here the bones are getting weaker due to this calcium loss. Calcium was taken out of your bones for the simple purpose of neutralizing the excess phosphate in your diet.Reduce phosphate consumption (meats, soda pop, grains) by half, eating fish, milk, vegetables and fruit instead. Drink three cups of milk a day. If you are allergic to milk, do several *Liver Cleanses*, switch brands of milk, use milk digestant, and use it in cooking and baking. Cheese and cottage cheese are not substitutes for milk (the calcium stayed in the

whey).Dairy products must be boiled before consuming and should be no less than 2% butter fat. It takes bile to make calcium absorbable, yet milk with less than 2% butterfat does not trigger the gallbladder to empty it's bile at mealtime.

If you are not used to dairy products, start slowly and work up gradually to the 3 cups a day needed.

Carol Lachance was diagnosed with arthritis of her back and knees. (She had spurs in both places.) She was *Positive* for *Trichinella*, *Ascaris* and *Dirofilaria* (she also had pain over the heart). They had an outdoor dog. Her blood test showed a high phosphate and alkaline phosphatase level showing she was dissolving her bones. After changing her diet to include milk, extra oyster shell calcium (one a day), magnesium oxide and vitamin B_6, and reducing her meat and grain consumption her phosphate level went down to normal (below 4). She did the *Kidney Cleanse* and *Liver Cleanse* as well as *Parasite Program* but still had pain. A toxic element test revealed lead in her bones. It was traced to a drugstore variety multivitamin tablet she had taken daily for years. When she stopped these and added prescription vitamin D (50,000 units) for three weeks to help her bones heal she got relief.

Gail Hildebrand, age 62, had painful arthritic hands and gum disease. She had 12 parasites free-loading on her and was toxic with asbestos. This was traced to her clothes dryer. Four months later, after killing parasites, her hand pain and gums were much better. She had the dryer vent taped up tighter and this got rid of her asbestos problem. She started on kidney herbs and in one month saw that her enlarged knuckles were beginning to go down.

Norma Littrell, age 53, came in for her severe arthritis of six years. Her knees, shoulders and hands were painful. I explained to her that painful shoulders did not belong to the arthritis picture but had a gallstone etiology, which she could easily fix in a single night at a later time (*Liver Cleanse*). She also had mid-back, upper back and lower back pain; again the upper back pain belonged to the liver problem. She had tricalcium phosphate kidney crystals as well as uric acid crystals. She was told to go off coffee (no decaf either), decrease her meat and grain consumption (phosphate) and increase milk and use stone ground cornmeal products (genuine stone ground tortillas as well as pickled pigs' feet are high in utilizable calcium). She started on the kidney herbs. In 33 days her low back pain had improved a lot, she could wash her own hair again and she could sit down and get up from her living room floor without pain. She was elated but we recommended less stress than such exercises for her joints.

Fig. 17 Stone ground corn tortillas, high in calcium

Patricia Robinson, age 76, had pain in her knees, feet, lower back, hands and wrists. Also in her shoulders and upper back which is not part of the arthritis picture. She had swollen puffy eyelids which is a telltale sign of *Ascaris*. She had heartburn, cold feet and insomnia as well as high blood pressure. She was on

several medicines. We started her on the kidney recipe and ornithine (four to eight as needed at bedtime) for sleep. We hoped she could stop her Ativan™ drug soon. She was to go off coffee, tea and decafs. Her hands were knotted and misshapen at the joints, also tender. Two months later there was little change; her doctor had put her on Prozac™ and she hoped that would do a lot for her (so she stopped the kidney herbs) but it didn't. The parasite test still showed *Ascaris* and she was started on the *Parasite Program*. We also found fluoride (from toothpaste), iridium, samarium and palladium, all from her tooth implants. She was to remove as much metal as the dentist could replace, clean cavitations, and take thioctic acid, 2 a day, to help clear metal from her body. In four weeks the sharp pain in her back was gone and in three more weeks the pain in her hands was gone.

Lynne Snyder, 72, had pain in every joint and had to be on pain medicine to keep moving. Her potassium level was very low (3.6—an adrenal/kidney problem), and she was started on kidney herbs, carrot juice, vegetable juice and bananas. In ten days she could feel some new energy but her pains were terrible, especially her knees. She was taken off tomato juice, cranberry juice, citrus, pepper (she was using a lot), and given buttermilk as a beverage which she enjoyed. After three weeks of kidney herbs she was started on parasite-killing herbs. In another month her arthritis was much better. She was not on any pain medicine and could get to sleep without it. She thought it was mostly going off pepper that helped.

Rheumatoid Arthritis

When inflammation and swelling affect your joints, besides pain, it is called *rheumatoid arthritis*. In addition, a blood test may reveal “rheumatoid factor” to be present. In this case, the common tiny round worms have invaded your joints. These are *Ascaris*, *Ancylostomas, Strongyloides*, and *Trichinella*. Their eggs are everywhere around us, in dust and dirt and the filth under fingernails and our own bowel movements.

Superior sanitation is your first defense. Rinse fingernails in alcohol after cleaning up bowel movements or changing diapers. Never, never, tolerate long fingernails in any family member. If this discipline can't be enforced, do not allow food preparation by “long nails” unless gloves are worn. He or she may not be getting ill (yet) from the family parasites, but you are. Of course, you can kill them with a zapper (internally, not the ones under the nails) but that is <u>after</u> you have been infected. They are easily picked up again. It would be wise to zap for roundworms every week, just in case.

Make sure your pet is treated with parasite herbs or by zapper as well. A pet that goes outdoors will quickly (the very next day) bring these roundworms into the house again. Give away your pets if possible.

Check for dental problems. Do the *Dental Clean Up*. Then do a *Kidney Cleanse* and *Liver Cleanse*.

You may relieve your pain and begin to heal immediately after zapping but it is wise to do all the health programs, anyway. Change your diet. Reduce

phosphate, start using sterilized milk for calcium. Switch to fish from meats. Drink much more water. Use only harmless beverages (see *Recipes*) and foods. Switch to toxin-free body products. Live in a non-toxic house. Stay on a *Maintenance Parasite Program*of herbs, and zap regularly. Stay on the *Kidney Cleanse* for three to six weeks and repeat a one-week session every few months to keep removing deposits, which may also choose these sick joints to settle in. Knees are a favorite location for rheumatoid arthritis. Knees are very dependent on kidneys.

To summarize, do everything as for osteoarthritis, emphasizing the roundworm parasites for elimination.

Allergic Arthritis

A prominent food toxin that is said to affect knees is *piperine,* found in the pepper family, which includes black and white pepper (not cayenne). The *Solanaceae* family of plants (potatoes, tomatoes, eggplant, tobacco!) also has a common “allergen” that produces joint pain. Try going off these for two weeks to see if it helps. Two more chemicals that can trigger arthritis-like pain are *hippuric acid* and *phenylisothiocyanate* (PIT).

Your body makes large amounts of hippuric acid, up to a gram a day. It is the product of benzoic acid detoxification by the liver. Quite a few fruits contain natural benzoic acid. But we can easily triple and quadruple our benzoic acid intake by consuming commercial beverages and pastries where benzoic acid is used as a preservative. It is indeed a “natural” preservative. All of it must be detoxified, though, and this gives us way too much hippuric acid. The kidneys are unable to excrete such overloads of hippuric acid, so it distributes itself in our organs. I suspect a simple mechanism could explain its pain-triggering action: hippuric acid molecules could attach themselves to our cells conductance channels keeping the gates jammed open. This might invite bacteria and viruses to enter there. But there are also hippuric acid-loving bacteria that feed on it. Perhaps hippuric acid can cause pain without the help of bacteria. This requires further study. It is only sensible for persons with chronic pain not to consume benzoic acid (or benzoate) preserved foods.

PIT is a food chemical found especially in chicken, eggs, the cabbage family, peas. PIT is also part of the body's own chemistry, taking place in the liver, and involving detoxification of *cyanide*-containing foods. Many vegetables, notably the cabbage family, contain such cyanides, giving them protection from insects,

disease, and grazing animals. It can take the liver a week to detoxify a meal full of these cyanides: in the meantime, PIT levels are higher in the body. PIT is very reactive. In fact, it is the chemical used as a general reactant with amino acids in the well-known **Edman degradation** reaction. But now, your body is the reaction flask, supplying the amino acids. Since all organs supply amino acids, it is no wonder they can all react to PIT, giving you multiple allergic reactions and pains.

If you have any kind of arthritis, stop eating the high-PIT foods and clean the liver until you are free of all allergies you are aware of. This suggests that the liver is capable, again, of detoxifying the cyanides for you in a reasonable time and you may eat them again. These foods do have many benefits, of course.

Joint pain, or arthritis , was known in antiquity long before dogs and cats were household pets and giving us their parasites. Pigs and horses harbor these roundworms too and may have been the source at that time.

Herbs and treatments that help arthritis are, therefore, plentiful. Maybe they act by killing roundworms, bacteria, and viruses, or help metabolize hippuric acid and PIT. Homeopathic treatments, as well as massage, heat and electronic devices also help. With this wide range of effective treatments dating to the distant past, why is none of them a permanent cure? The answer is simple. The common roundworms are everywhere about us, sanitation is poor, and our civilized lifestyle leads to deposit formation that invites bacteria. But knowing this, you can stop your pain and remove the causes to become one of the first humans to achieve a permanent cure.

Verna Plumb, age 46, was diagnosed with rheumatoid arthritis four years earlier. Since then she had been continuously on methotrexate™ and prednisone™. This had caused her to gain a lot of weight from water retention. The drugs were no longer effective and she would need to do something else very soon. She had the typical causes: her body was toxic with mercury and nickel from tooth fillings. Her kidneys were full of five kinds of stones. She had numerous roundworm parasites including two kinds of *Ascaris*, two kinds of hookworm, *Strongyloides* and *Trichinella*. She would have to clean everything up to get relief. She started on the kidney herbs, killed parasites with a frequency generator and in two months noticed her swelling was receding.

Camille Franklin had hands that were swollen and hot and painful. She also had “arthritis “ in shoulders and knees. We explained that shoulders were not part of the arthritis picture. She could deal with that in a single evening, soon. She also had bone spurs at sinuses, which needed surgical removal. Her kidneys revealed tricalcium phosphate crystals. She was given a diet change; onto milk, fruits and vegetables, off other beverages, less meat and grains. She was started on kidney herbs. In five weeks all the swelling and redness and heat was out of her finger joints.

Thigh Pain

Inner thigh pain often stems from the *sciatic nerve*, which is suffering pressure at the lower back. If this is so, chiropractic adjustments should help. The correct treatment, after killing bacteria electronically, is to clean up the entire kidney area using the kidney herb recipe.

If this is not the correct explanation, (and you're not getting pain relief) you may have a trauma—perhaps you overstretched your leg in some exercise. The minor trauma invited bacteria to settle there and give you pain.

If the pain recurs after clearing it several times, there must be a chronic source of bacteria. Since the kidneys are already cleaned, consider the teeth, as well as recurring parasites, and the liver. Clean the liver every two weeks until 2000 or more stones have appeared and no more appear. This could take 1-2 years. Be patient. Do a *Dental Clean Up*. Keep killing the bacteria so they can't spread. And, of course, let the painful leg rest.

Hip Pain

Hip pain is always due to bacteria. In fact, these bacteria regularly come from two sources: the kidneys and the teeth. This simplifies the treatment since neither of these places takes a long time to clear.

Start yourself immediately on the *Kidney Cleanse* to clean your kidneys. Continue on the recipe until the *Dental Clean Up* has been completed. Both must be clean together to stop exporting bacteria to the hip.

The *Dental Clean Up* could take several weeks if extensive work is required. During this time, kill all parasites electronically. Keep killing bacteria, especially *Staphs*, *Streps*, *Clostridia*, *Campyls*.

The dental problem is not always on the same side as the hip pain. The jaw may be very fragile and porous, full of invading bacteria. Cleaning these cavitations may give immediate pain relief in the hip (proving the bacterial source). But, getting the jawbone to heal by taking up calcium again is not guaranteed by the cleaning process.

Give your jawbone every chance to heal:

- Start taking vitamin D (40,000 to 50,000 u.), every day for three weeks from the day of the dental work or before. After this, take it twice a week

forever. **Do not take more.**

- Take vitamin C (1+ gm a day) and B_6 (250-500 mg a day) for healthy gums.
- Get one gram of usable calcium in your daily diet.

Bone Strengthening

Vegetable calcium can't be dissolved by our stomachs (*ruminants,* like cows, can dissolve it—they have an extra stomach loaded with special bacteria that do the actual retrieving of calcium). Tablet-form calcium can't be dissolved well either, especially as we age. We need pre-dissolved calcium if a little is to go a long way.

Primitive people who lived on fish or stone-ground meal ate 4-6 grams of calcium a day.[6] Even if only 20% of this got dissolved, they would still have about 1 gram of utilizable calcium for themselves. Chances are good they dissolved even more, since they were young (life expectancy was less than 50 years). Their skull remains show beautiful, cavity-free teeth. They lived outdoors, mainly, so getting enough sunshine-derived vitamin D was not a problem. Their natural diet supplied enough vitamin B_2 to protect them from UV (ultraviolet) damage from sunshine exposure.

But these are civilized times. Our lives are stretched into old age, when our stomachs no longer produce enough acid to kill bacteria, nor to dissolve the minerals in our food. So they need to be dissolved for us. Milk is a beverage where the calcium has already been dissolved by the other ingredients. The lactic acid in milk formed during digestion gives the calcium the correct chelated structure for absorption by the intestine. Even the bile participates in calcium absorption. Milk also contains phosphate, but not too much to be useful. I recommend milk as a calcium-source to heal the jawbone after and before dental work. You need 1+ grams a day. One quart of milk has 1 gm (1000 mg) of utilizable calcium. You absorb only 250-400 mg. The rest is excreted and eliminated. Only the absorbed calcium can heal your jawbone. Use milk in cooking as well as a beverage. The calcium in it is indestructible.

Bones are not made of calcium alone. **Magnesium** is essential. Since magnesium is more soluble and easy to assimilate than calcium, the tablet form (magnesium oxide, 300 mg, see *Sources*) will do. If you are not absorbing the magnesium it will stay in your intestine and act as a laxative. If this happens acidify your stomach during meals: always add fresh lemon, vinegar, or vitamin

C to your food or drink to help digest milk and dissolve minerals for you. **Boron** (3 mg. once a day) and **manganese** (15 mg. once a day) are additional bone hardeners.

When your diet is improved, your dental problem is cleared, and your kidneys are clean, your hip pain will stay away and you can stop thinking about hip replacement surgery.

Mary Hammond, 48, had two painful hips. She was diabetic and drinking five cups of coffee a day. She had *Staphylococcus aureus* infections under three teeth that she no longer had. After going off caffeine (caffeine may spread bacteria by making tissues more permeable) and getting some dental work done, her right hip stopped hurting. When cavitations were cleaned, her left hip stopped hurting too, but after a week the pain returned. She still had parasites and their bacteria to kill. She had solvents to eliminate and a *Kidney Cleanse* to do but she was quite enthusiastic and enjoyed showing off how well she walked.

Groin Pain

Lymph nodes are situated here, as well as in armpits and around the neck. Lymph nodes are your best friends. They are hives of activity. Your white blood cells “nest” here. Lymph nodes sample your body fluids (lymph) at these locations; much like the water department and health department sample our milk and water, making sure they are pure and sterile. Of course, they never really are. But your white blood cells keep working at it. They are busy removing impurities like zirconium and titanium and pathogens like bacteria and viruses.

Fig. 18 Your lymph nodes are your best friends.

When an especially challenging dose of parasite or pollution arrives at the node, it enlarges, in order to handle the bigger sized task. This enlargement can

be felt. It may press against other organs and you feel the pain of pressure in the groin. This should alert you, of course, to the danger. Kill the parasites and pathogens immediately with your zapper. Start the *Kidney Cleanse*. Stop using toxic products and eating toxic food. If you are being effective, the lymph nodes will begin to shrink in a few days, relieving the groin pain. If it does not come back, you probably eliminated the main cause. But if it recurs, try to diagnose it accurately. Test yourself for HIV and AIDS and then to pet saliva, dairy products and other disease specimens. Stop reinfecting from humans or pets or dairy food. Assist your body by cleaning up your dentalware, and environment. Check all supplements for toxins before using them on a daily basis. (If they show up in your white blood cells a few minutes after eating them, there is a toxin.) If your groin pain doesn't go away, you probably missed something!

There are other causes of groin pain, though, such as **hernia**. A physician will help you identify it. Have it surgically repaired. The Shouldice Hospital[7] has the best surgical record and will disclose their statistics! You won't even need full anesthesia there.

Pain from the **ovaries** is often felt near the groin. Sometimes a large cyst in the ovary puts pressure on the sensitive nearby organs. The formation of cysts, *cystic ovaries*, is a common condition of cats, too. Obviously, something is not right in the ovaries.

Ovaries make hormones: **progesterone** and **estrogen**. If bacteria (like *Gardnerella*, *syphilis*, *gonorrhea*) are living there, the ovaries are handicapped and may under-produce or over- produce some hormone. The first treatment should be to kill parasites, especially the flukes. Then kill all other parasites and bacteria, especially *Gardnerella* and enteric bacteria that can migrate easily from intestine to ovary. In spite of all this, the cyst may not shrink. In order to shrink the cyst you must determine what is filling the cyst. Then stop filling it. The cyst will eliminate itself and shrink.

Many kinds of pollution can fill an ovarian cyst. Test for CFCs and PCBs. Gold is another favorite. Particulate pollutants like asbestos and fiberglass are often put into cysts by your body. Your body is wise. If these can't be eliminated through the kidneys or bile, it will at least keep them all together (in the form of a cyst) the same way a toxic dump spares the rest of the landscape. As long as you are adding to it, it cannot get smaller. Fortunately, your loyal white blood cells are trucking toxins away from your cysts every minute of every day and night. All you need to do is stop adding. Remove dental metal; clean up your

body, diet, and environment.

You will notice shrinking of cysts in three weeks. What you actually notice is absence of pain, implying shrinkage. Meanwhile pain relief by killing bacteria, herbal ovarian assistance (try wild yam), chiropractic, painkillers are all useful. Decongest the area by means of a kidney cleanse. If your cyst does not shrink you have missed the pollutants. After it does shrink, stay on a regular program of parasite-killing, herbal or electronic, and improved lifestyle.

Ovaries may be giving you pain even without a cyst present. By cleaning up parasites and pollutants you can eliminate it quickly; much more quickly than when a cyst has formed.

Synthetic hormones (Provera™, Premarin™, Ogen™, etc.) are often used to clear up ovary problems of various kinds. Don't continue to use them when the need no longer exists. Although they have low toxicity, there are disadvantages such as the need for liver detoxification, and risk of heavy metal pollutants. Cancer acceleration has been seen when taking estrogens.

Low Back Pain

We have been told that lower back pain originates in an inherited weakness of the spine at its base because we humans walk upright instead of on four legs. And we have been told that the bony hooks that keep the spine aligned are flatter in some families, making it harder for them to hold the spine together. We are also told that "proper exercises" could have kept this part of our bodies strong so lower back pain could be avoided.

These theories become obsolete when, without surgery, exercise or change in posture, lower back pain can be made to disappear quickly and permanently.

Acupressure massage and chiropractic can bring "miraculous" relief. The most severely crippled lower back pain sufferer can shuffle lamely into a chiropractor's office and walk out normally, without pain or painkiller after treatments. So although there has been slippage of disc or spine, apparently it goes back into place rather easily.

If muscle relaxation is the clue, we must ask why these muscles spasm so

easily. Any muscle will spasm if you irritate or injure it suddenly. In fact, your whole body spasms and flinches if a sliver or bit of broken glass is in your shoe. If you remove these objects, the leg can walk normally.

Oxalic acid crystals are as sharp as broken glass. Use the *Kidney Cleanse* to dissolve them and other stones.

All lower back pain can be cured by removing the sharp crystals in the kidneys. It takes about three weeks to dissolve them. In some very severe cases, it may take six weeks.

Whether you have suffered a year or 20 years, the permanent cure is only weeks away.

Our bodies make eight or more different kinds of kidney "stones." The oxalic acid variety is associated with sharp stabbing pains. In its effort to eliminate this extremely vicious acid your body neutralizes it with calcium first to make calcium oxalate. Your kidneys can keep a bit of calcium oxalate in solution but not a lot. The excess hardens into crystals. A glass of regular or iced tea (not herb tea or green tea) has about 20 mg[8] of oxalic acid—way too much for kidneys to excrete. Tea is a toxic drink, not to be considered a beverage. Chocolate is very high in oxalate, too, and should not be used as a beverage (as cocoa).

Children should never drink tea or cocoa. Their delicate kidneys should not be faced with the daily burden of excreting large amounts of oxalic acid. And calcium used to neutralize oxalic acid is wasted. Calcium is a precious nutrient. It should be conserved for children's bone development.

It isn't necessary to find which variety of kidney crystals is causing your muscle spasms. Different herbs dissolve different kinds. And by combining them into a grand herbal mixture you can be dissolving all varieties at the same time.

Wherever oxalate crystals have formed, a particular bacterium, *Proteus vulgaris*, can be found. Does that bacterium somehow thrive on oxalate crystals? Or even help them form? Does *Proteus* itself contribute to lower back pain? Is lower back pain in reality two pains in one—the sharp jabbing of glass-like particles plus the inflammatory effect of bacteria? Fortunately, you can kill *Proteus vulgaris* electronically.

By using your new diagnostic skills, you can test your kidneys for crystals. The kidney stone varieties I have tested for are: **calcium oxalate, uric acid, cysteine, cystine, monocalcium phosphate, dicalcium phosphate, and tricalcium phosphate.** All these varieties can be dissolved by the herbal mixture. But all can be formed again in a week!

To prevent **oxalate** formation stop drinking oxalic acid (eating oxalate rich vegetables is not significant—spinach, chard, rhubarb and sorrel all have their place in the diet). Also take magnesium and B_6 supplements (as directed in the kidney cleanse).

To prevent **phosphate** crystals from forming, reduce phosphate consumption and drink milk as a calcium source. Keep your kidneys squeaky clean with herbs and copious water drinking. After drinking one quart of sterilized milk, two pints of water, one-half glass of homemade fruit juice and one-half glass of vegetable juice, there is little desire for additional beverages.

I have no understanding of what may cause **cysteine** or **cystine** stones (the genetic theory does not explain them either, considering that people without *cystinuria* make these stones). Since they are sulfur-containing, and I have seen them appear after taking sulfa drugs, it may be wise to avoid use of sulfa drugs if you have a choice, or go on the *Kidney Cleanse* afterward.

If you have severe lower back pain you probably have several kinds of stones. Some persons have all seven kinds!

Rosie Zakar, age 30, came to see us because her mother was cured of lower back pain so severe she could do no housework for 30 years. Rosie had the usual crystals in her kidneys: oxalate, urate and phosphates. She was started on the kidney herb recipe. In three weeks she was so much better she would have missed her appointment if she had not wanted to cure her digestive problem and fatigue too.

Vera Vigneault, age 32, came mainly for help in getting pregnant but she already had lower back pain and mid-back pain. If she had gotten pregnant before clearing this up, she might have developed eclampsia and high blood pressure, which are kidney-related disorders. She was started on kidney herbs for these. She chewed gum a lot and had bleeding gums. She stated her bad teeth were hereditary (meaning other family members had bad teeth also). For this she was instructed to stop chewing gum, start drinking three glasses of 2% milk a day and take a vitamin A&D perle. She was to floss her teeth once a day. (All floss varieties are polluted with mercury and thallium. Use monofilament fish line, 2 to 4 lb. weight.) Immediately after flossing she was to brush them with a new very soft toothbrush with five drops of 17½% food grade hydrogen peroxide. She was to avoid brushing teeth with metal fillings to reduce erosion. She was to brush them a second time without flossing first, this time with five drops of white iodine (potassium iodide) made up by the pharmacist, again avoiding the metal. She had only oxalate kidney stones and was to stop drinking regular tea, replacing it with single-herb teas. In five weeks her gums were better although she was still chewing a little gum and the “peroxy” had been too painful for her to use. Her low back and mid-back pains were gone too.

Gerhard Rogers, age 39, came for his lower back pain and leg cramps. He had mono, di, and tricalcium phosphate crystals in his kidneys. His diet was changed to reduce phosphate (meat, cereal, breads, pasta, carbonated beverage) and increase calcium and minerals. He was to drink three glasses of 2% milk a day and to start the kidney herb recipe. In 25 days he had only minor improvement. He still had phosphate crystals. He was afraid to drink milk because he had heard so many bad things about it. He was told to boil it first to eliminate these “bad things”. A toxic element test showed a buildup of copper, arsenic, cobalt, cadmium, lead, thallium, vanadium and radon. This could easily explain his leg cramps, headaches and sleep problem, too. The arsenic came from pesticide, cobalt from detergent, thallium and copper from tooth fillings. The vanadium was fixed by having the gas pipes tightened, and radon could be reduced by improving the ventilation under the house. He was thankful for the information and set about cleaning up his body and environment.

Alberta Mellos, age 52, came in for lower back pain and upper back pain. It was explained to her that lower back pain was simply due to tiny stones cutting into her tissues but upper back pain was due to gallstones. She could clear her low back pain first. The kidney test showed she had oxalate and cysteine crystals. She was started on the kidney herb recipe. Nineteen days later she arrived with a cold but stated that her low back pain was gone.

Glenn Dirk, age 62, called on the telephone to say his urination had stopped, probably due to kidney stones. This had happened once before and now he was in a panic. He started our kidney herb recipe the same day and passed 117 stones the same night without bleeding or enough pain to need painkiller. After this, he could focus on his prostate enlargement and pain with sitting. He had intestinal flukes and other stages in his prostate gland as well as in his intestine. He also had *Clonorchis* (human liver flukes and their eggs) in his prostate. He had carbon tetrachloride, methyl butyl ketone and TC ethylene from food pollution accumulated there too. After stopping grocery store beverages and killing parasites with a frequency generator, he could urinate normally, freely and without pain.

Lower Abdominal Pain

The lower abdomen on the left side has the sigmoid colon as it comes down and bends. This is a favorite location for larger parasites to settle permanently. Flukes, roundworms, parasites of all kinds and their attendant bacteria and viruses can be felt if they produce gas and pain. Sometimes they live perfectly quietly, seemingly in harmony with us.

Moving the bowel more frequently expels them repeatedly and prevents their numbers from getting very high. Nature may help you with this by setting up diarrhea. Diarrhea is your clue that intestinal freeloaders are present.

The small intestine leads into the colon at your lower abdomen on the right side. At the junction is the ileocaecal valve that prevents backwash, and the appendix. The ascending colon goes up your right side then becomes the transverse colon that crosses your abdomen at the belly button level. The colon descends on your left side, leading into the sigmoid.

Fig. 19 Colon

E. coli and *Salmonella* and *Shigella* are “enteric” (they live in your bowel) bacteria that can give you severe abdominal distress and pain. In fact, you can become a chronic sufferer. They can live on hands and under your fingernails, so reinfection from yourself is the most important source. Never, never touch your fingers to your lips. Most importantly, don't try to stop your frequent bowel movements. They will stop on a dime when your parasites and bacteria are dead and gone.

Other sources of *E. coli* are personal water bottles, other people's hands, hands that have changed baby diapers or cleaned bathrooms.

Hands do everything. To eliminate their threat of reinfection, cut out the section on hands and paste it on your refrigerator.

Stomach Pain

Our dairy foods are polluted with *Salmonella* and *Shigella* bacteria. It is impossible to operate a dairy without getting some cow manure into the milk. Although udder wash contains antiseptic it does not kill all manure bacteria. Later, when milk is pasteurized, many heat sensitive bacteria are killed like the “friendly” *streps* and *staphs*, but not all the harmful *Salmonellas* and *Shigellas*. Some survive to colonize the milk, then later infect the consumer. only milk that is sterilized is safe. A commercial source of sterilized (safe) milk can sometimes be found on the shelf (unrefrigerated). If it had any bacteria, it would not survive

shelf life for more than one day!

You may not notice any discomfort from drinking milk, buttermilk, or eating yogurt without sterilizing it. Your stomach acids may be strong enough to kill them, or your liver able to strain them out of your body fluids and dump them, dead, into your bile ducts. Or they may live quietly in some part of the bowel where you feel no effects. Sterilize all your dairy foods by heating at the boiling point for 10 seconds, even if you have no symptoms.

If you are intolerant of milk it doesn't mean that you are lactase deficient, but that you are unable to kill any *Salmonellas* and *Shigellas*. These, in turn, can make you lactase deficient via frequent diarrheas. You can correct this situation by not eating any more bacteria. Give your body clean food, as intended by nature. Don't eat any deli foods, don't eat salad bar food or restaurant food unless it has been baked or cooked. Never eat chicken or red meat at restaurants. They are not thoroughly cooked.

Fig. 20 Keep personal water bottles sterile.

As soon as a new abdominal pain or discomfort, or a gassy condition appears, zap bacteria and try to eliminate your bowel contents. Use the herb, *cascara Sagrada* (follow directions on label) as a laxative, or Epsom salts if necessary. Also start the *Bowel Program*.

If you have chronic abdominal problems, make sure you eliminate the bowel contents two or three times a day. There are herbs that can kill enteric bacteria, known to our ancestors of various cultures. **Echinacea** was a treasured herb of American Indians. **Goldenseal** is another favorite. **Turmeric** can kill *E. coli* and some *Shigellas*. **Fennel** can also kill some. But a single dose of Black Walnut

Tincture Extra Strength seems to do the most. Make it yourself if possible (see *Recipes*).

If your body has lost its ability to kill *Salmonellas* and *Shigellas,* all the antibiotics and herbs and good bowel habits cannot protect you from these ubiquitous bacteria. You could ask how you lost your natural protection from them. There is evidence that common **antibiotics** that kill *Streptococcus* and *Staphylococcus* varieties are responsible.

A fraction of your bowel bacteria should be the friendly *Strep. lactis* and *Staph. epidermidis*. After repeated doses of penicillin-like antibiotics (that you may be taking for your strep throat) they are eradicated along with the "bad" *Strep. pneumoniae* bug. No amount of acidophilus culture (which contains active *Lactobacillus*) can replace these *Streps* or *Staphs*.

In mice, it takes a million Salmonella bacteria to start an infection. After giving them streptomycin, it only took 10 bacteria to infect them![9] Your intestines are similarly handicapped after antibiotics, and allow even very small amounts of *Salmonella* and *Shigella* to escape and multiply!

Try to get some natural killing power back. This means improving the stomach's ability to produce acid and the liver's ability to make bile. In turn, this means getting the toxins out of the stomach and cleaning the liver. Certain toxins accumulate in the stomach when the liver and kidneys can't keep up with elimination. Arsenic is a prominent stomach toxin. Get all sources of arsenic removed. Freon is another stomach toxin. Switch to a non-Freon containing refrigerator.

The metals from dentalware: mercury, silver, copper, thallium, first are swallowed and then land in the stomach. Clean up your dentalware. Toxins you inhale such as asbestos, formaldehyde, fiberglass, also are coughed up and swallowed to accumulate in the stomach. Test for them and clean up your environment. Any stomach can recover a significant part of its function by cleaning it up. Even though you regain your tolerance toward minute bits of filth in dairy products, do not go back to unsterilized milk products.

Appendicitis

The lower abdomen on the right side has the valve that separates the small intestine (*ileum*) from the large intestine (*caecum*) called the *ileocaecal valve*. It

is a common trouble spot because large parasites can attach themselves behind it and keep themselves safe from elimination. (A parasite's biggest worry is your elimination.) It is a favorite location for pinworms in children. It is near this point where the appendix attaches and this, too, is a favorite location of pinworms. With an appendix full of pinworms and their bacteria, is it any wonder when it gets inflamed and causes pain?

Appendicitis refers to inflammation of the appendix. Often, the pain isn't felt over the appendix but over the navel (this is an example of pain being caused at one location but felt at another; it is called *referred pain*). If there are any suspicions of appendicitis, zap pinworms and all enteric parasites and bacteria immediately. Because the current does not penetrate the bowel contents very well, zap every day for two weeks and take 2 tsp. (½ tsp. for children) Black Walnut Hull Tincture Extra Strength one time. Make sure bowel movements are regular after this (see the *Bowel Program*, for hints) and hands are washed after bathroom use and before eating. Keep fingernails short for the whole family.

If appendicitis does not clear up it can lead to a burst appendix, spewing the dreadful contents into the abdomen. Kill pinworms and roundworms and enteric parasites regularly (once a week) in children. Keep pets on a regular diet of parasite-killing herbs.

Urinary Tract Pain

Urinary tract infections, including bladder, kidney, and urethral infections, are easier to clear up than to test for. Start by drinking a half gallon of water a day. Put yourself on the kidney herb recipe. This will dissolve the tiny crystals where bacteria hide and multiply.

Common urinary tract pathogens are *Gardnerella*, *Proteus*, *Trichomonas*, *Campylobacters*, *E. coli*, and *Salmonellas*. Sex will give you an instant dose of your partner's urinary tract bacteria. Make sure both of you clean up the urinary tract by zapping and doing the Kidney Cleanse.

Irritable Bowel Syndrome (IBS), Colitis, and spastic Colon

…are all conditions that combine parasite and bacterial problems plus an allergic trigger. If dairy foods trigger yours, you can guess it is not allergic at all

but simply *Salmonella* or *Shigella* infection. Boil all dairy foods; stop eating ice cream, cheese and yogurt, which you cannot boil. If eating lettuce triggers your intestinal attack, but other roughage does not, it may be a true allergen and cleaning the liver will eventually cure it. Apples, cinnamon and other “allergic” foods can be salvaged the same way. Wheat “allergy” is due to the pancreas being full of pancreatic flukes, wood alcohol, Kojic acid (a mycotoxin), and gold.

All these bowel diseases are quite easily cured by killing all parasites, bacteria, and viruses. Since reinfection is such a big problem, give your pet away until you are completely cured. Have your pet on the *Herbal Parasite Program* before bringing it back. Clean up your diet, dentalware and environment. Your abdomen will be happy once more and grateful to you for your kind attention. Remember that zapping does not penetrate into the bowel contents. It kills only the outside layer of pathogens. For this reason you should zap daily for several weeks. For this reason, too, I recommend the *Bowel Program* and Black Walnut Hull Tincture Extra Strength even though you may have gotten immediate relief from zapping alone.

Crohn's Disease

…is somewhat more serious because the sores are higher up in the digestive tract. This is because sheep liver fluke and pancreatic fluke are commonly the main parasites and these live in the pancreas and liver. They often spill over into the upper intestine. *Salmonella* and *Shigella* are always part of the picture, too, as are various amoebae and fungi. The treatment is the same, kill all parasites and remove all pollutants, especially wood alcohol in commercial beverages. Healing of the digestive tract is very quick, often in a week. Reinfection is very quick too, if the rule about cooking dairy foods is not observed. Keep up meticulous hand sanitation.

Michelle Whorton had stomach pain at the middle of her abdomen, not related to eating. She had occasional very bad diarrhea and also daily headaches. She was started on the kidney herbs for other reasons. Her diarrhea disappeared! We found she had *Ascaris* (probably in her stomach where they cause indigestion and inflammation). She zapped them with a frequency generator set to 408 KHz for three minutes at 10 volts. She was to be very careful with sanitation since they owned a number of farm dogs. Next seen after six weeks, she stated that all her previous problems were gone but she had a different pain in the mid-lower abdomen that got worse during her period and sent pain shooting down both legs.

This turned out to be uterine in origin, but not endometriosis. Her uterus was full of asbestos, arsenic, gold, silver, titanium, propyl alcohol, benzene, styrene, toluene and carbon tetrachloride. This would invite any bacteria toward it!

Mark Lippman, age 51, came in for his irritable bowel syndrome, hoping we would find *Giardia* and put an end to it quickly. Actually, he had intestinal flukes, beginning to invade the liver. He also had propyl alcohol built up in his body giving him a precancerous condition that needed immediate attention. The flukes were killed in twenty minutes, along with *Ascaris* (he had swollen eyelids). He was allergic to milk as could be expected with so much interference with digestion. He was immediately better and did not need to come back.

Billy Henry, a 9-year-old boy, had diarrhea daily and stomach aches. He also wet the bed. There was an indoor pet dog and a bird. Electronic testing showed he had two kinds of *Ascaris* and pinworms. His young body also had a buildup of benzene, mothballs and carbon tetrachloride that he was eating, drinking, and breathing. His bed-wetting stopped after killing parasites with the herbal program. His other problems recurred until he was older and could stop licking his fingers when eating.

Tom Ochs, age 36, had chronic stomach problems, alternating constipation and diarrhea, was labeled “lactose intolerant” after an elaborate test, and finally had been diagnosed with irritable bowel syndrome. Actually, he had *Ascaris*, besides other smaller parasites. He was also toxic with cesium from drinking beverages out of clear plastic bottles. This frequently causes depression and he was happy to understand his mood changes. After changing to purer food and products and killing his parasites, he did not need to come back. Five months later he was able to drink all the milk he wanted, no longer had sinus problems and lost his IBS.

Rex Callahan, age 5, had dark circles under his eyes, numerous ear infections until tonsils were removed and tubes put in, and many strep throat infections. Clinically, he was found allergic to dust mites, pollens, and animal dander. His skin got a “rash" if he drank too much fruit juice. He had frequent diarrhea. We found he had *Ascaris* parasites. They were not difficult to clear and he was soon a new person.

David Falls, age 52, had stomach pain and numerous health problems stemming, no doubt, from his diagnosed Crohn's disease. He became allergic to the sulfa drugs commonly used in this disease. We found he had sheep liver flukes and all their developmental stages in his blood and intestine. He was put on the *Herbal Parasite Program*, which he found difficult to follow. Nevertheless, in three months his bowel was nearly normal and the pain in his intestine much less.

Edward Marsili, age 7, had bouts of stomach pain. He had intestinal flukes and a build-up of benzene in his body. This would seriously lower his immunity and ability to fight off tiny parasites. He was using a product containing an herbal oil that was polluted with benzene. His parasites were quickly killed with a frequency generator and he was put on the *Herbal Parasite Program*. One month later his stomach felt much better, but he still had an occasional stomachache. Testing showed hookworm and rabbit fluke. His benzene was now gone so the tendency to “pick up everything” was gone too. Staying on a child's *Maintenance Parasite Program*would protect him.

Kim Johnson, almost two years old, had lots of ear infections. It started at eight months so the mother took her off cow's milk and wheat. This stopped her ear infections until mid-winter. She had to be back on antibiotics and a few months ago the doctor began discussing tube implants with her since she was still on antibiotics (six months). Another ear, nose and throat doctor agreed with this opinion, but was willing to wait until autumn. The baby had been passing a lot of undigested food and was unhappy. They were vegetarians. The baby nursed. Our test showed pancreatic fluke infestation; this would easily lead to bad digestion, especially of milk and gluten in wheat. Fortunately, she was nursed throughout, in spite of going to daycare. Simply killing the parasites (in both mother and baby) solved both problems and she did not need to come back. The ear infections were probably caused by bacteria and viruses brought in by the parasites.

Cynthia Prout, age 36, brought her three children because of their poor health. They all, including herself, had stomach problems, a lot of allergies, asthma, ear infections, and milk intolerance. One boy, age 8,

was intolerant of both milk and wheat and hadn't had them for years. He was infested with two kinds of *Ascaris* and pancreatic flukes. His sister, Nola, had itching legs and headaches besides; she was toxic with bismuth and antimony (from shampoo fragrance and laundry fragrance). She also showed a build up of vanadium, implying a gas leak in the home. The youngest, age 5, had frequent stomachaches and vomiting. It was a simple matter to kill *Ascaris* electronically at 408 KHz and the pancreatic fluke with all its stages (421 through 434) after which the children did fine.

Sofia Sobel had extreme ulcerative colitis although she came for her headache. She had been on Prednisone for a month with no relief. We found she had the three large flukes plus *Chilomastix*, dog whipworm, and amoebas in her intestine (but not in body organs). There were several house dogs. Her stomach and intestines were much too sensitive to accept parasite herbs, or in fact, anything—anything except slippery elm powder. This herb (1 tbs. made into a paste first with water and then drunk as a beverage three times a day) paved the way for acceptance of 2 oyster-shell calcium, 1 magnesium and 1 zinc tablet. Her blood test showed high phosphate levels since she was dissolving her bones to get calcium. She added sodium alginate (¼ tsp. to a cup of vegetable broth soup) twice a day to help her tolerate the parasite-killing herbs. Her children were given VMF (vermifuge or parasite-killing) syrup. By the 12th day of the *Parasite Program* she no longer needed colitis medicine; her bowel movements were down to twice a day, soft and formed, but still with a little blood streaking. She loved the alginate mixed with slippery elm. She was able to eat fruits and vegetables but agreed to stay off wheat and corn until her liver was cleansed. In another week she was free from all abdominal complaints except heaviness over the uterus, possibly due to two missed periods. The thought of pregnancy put her in a panic. She was instructed to induce her period (*Emmenagogue*, see *Recipes*). She was sure she wanted her period, not a pregnancy and this seemed to be her God-given right. Three weeks later she had a flare up of colitis due to *Salmonella* in food; it also gave her a urinary tract infection. This time she took Quassia herb to kill invaders in addition to the *Maintenance Parasite Program*, which she had begun to neglect. She had been very busy, had lots of energy and wasn't on medications. She treated her urinary tract infection with betaine-hydrochloride (to acidify the stomach), began using plastic utensils to reduce her nickel intake (see *Prostate Pain*)) and drank a lot of water. This experience taught her valuable lessons that she was eager to learn, benefiting her family and herself immensely.

Rebecca Goetz, age 53, had ulcerative colitis and her husband had Crohn's disease. She had been on Azulfidine™ and Flagyl™ frequently. Her parasites were only intestinal flukes and their stages, and *Endolimax*, an amoeba. It was a simple task for her to clear her problems by killing them and by sterilizing her dairy foods. Wes, her husband, had three surgeries to remove sections of bowel due to Crohn's disease. He now had a colostomy but was on Advil™ for pain in the rectal area. He could hardly sit. He had been tried on anti parasitic medicine (Cypril™ and Flagyl™) but they did no good. He had intestinal flukes and all their reproductive stages in his body, also pancreatic flukes, *Capillaria* roundworm, and *Diphyllobothrium erinacea* scolex. We interrupted his testing at that point. His kidneys were full of phosphate crystals—he ate no dairy products. He was started on half-doses of kidney herbs and only part of the *Parasite Program* in view of his colostomy and possible diarrhea. Two weeks later we continued testing, finding pinworms, *Haemonchus*, *Leishmania tropica*, *Paragonimus*, *Sarcocystis*, *Stephanuris* and *Trichuris* (whip worm.) Quassia was added and doses increased. His blood test showed a high thyroid hormone level (T4), contributory to over activity of his bowel He was started on goat milk, vitamin C (3 gm. daily) and B_{12} shots. He was given magnets to sit on for pain. He was toxic with cadmium, from his old tooth fillings. But in five weeks he could sit comfortably without pain pills. There was less blood in the stool. Dental work would bring him his next big improvement.

Benito Villamar, a middle age man, had severe side pain for several weeks. He was also gassy. He had sheep liver fluke and stages in his thymus and intestine. The thymus is under the top of the breastbone and is a very important organ of immune function. It is easily damaged by benzene. He did, indeed, have benzene accumulated there. He was given a list of benzene-polluted products to avoid and was started on the parasite-killing herbs after killing the flukes instantly with the frequency generator. Two weeks later his side was very much better, his benzene was gone and he was eager to rid himself of lower back

pain, which he also had.

Al Vickers, age 9, had stomachaches, headaches, a constantly runny nose and asthma. He was on Slo-Bid™ medicine and allergy treatment. He had a sleep problem. He also had two dogs, one rat and two hamsters. The dogs and he had high levels of *Ascaris*. He was zapped for *Ascaris* and the four common flukes (without testing). He was put on vermifuge syrup and Rascal capsules. This ended his problems and began a new chapter of better care for his health by his parents.

Tim Melton, age 16, had several colitis attacks yearly, requiring hospitalization, from third grade to the present. He also drooled constantly, needing to spit a lot. (This is due to mercury toxicity from amalgam fillings. It is better to spit out the mercury than to swallow it.) He had intestinal flukes at a high level for which he was started on the *Parasite Program*. One month later he was very much better. He had only one diarrhea session since the last visit. But he still had sharp pains under both buttocks (probably due to kidney stones). He had been an iced tea drinker and had numerous oxalate and cysteine crystals deposited. He was appalled that a common beverage could be so harmful.

Central Abdominal Pain

…can be coming from the uterus, bladder, or bowel. It is difficult to tell which is the source. The first step is to simply kill enteric (bowel) freeloaders and get into good bowel habits. Gas and bloating should be gone. If this isn't the solution to the pain there may be special bladder parasites with their bacteria. *Schistosomes* prefer to invade the bladder wall. In fact, very many parasites temporarily invade the bladder because the body is trying to excrete many of them. The whole family should be cleared of these same parasites. Kill them by zapping. Pets should not be kept indoors since they have many of these parasites, too, and they are easily transmitted to us.

Interstitial Cystitis

…is one of the most painful conditions described by clients. *Schistosomes* are the real perpetrators but after the bladder wall is weakened, other parasites and their bacteria and viruses accumulate here too. To regain your bladder's health all toxins must be cleared as well. Dental metal, environmental toxins, including radon, asbestos, formaldehyde, must be cleaned up. The diet, body products and home should be carefully searched for toxins. *Schistosomes* are easily zapped but easily picked up off toilet seats and doorknobs. Always wash hands after toileting: a single droplet reinfects you!

Uterine Pain

Endometriosis

Many a woman's dreams have been shattered by her inability to have a child. Endometriosis is often the cause. It starts with painful cramps at period times. They get worse and worse until painkillers are necessary just to get out of bed and move about the house. There are flukes in the uterus! Large intestinal flukes in a rather small organ! Did they migrate to the uterus from the intestine or did they develop there from eggs?

Sometimes sheep liver fluke is seen there. Once an avenue to the uterus is established, numerous other parasites move in the same direction: *Clonorchis*, the human liver fluke and even *Eurytrema*, the pancreatic fluke, can invade the uterus wall. Why have they taken up so abnormal a living place? Because the uterus has solvents in it! This is the green light for flukes. This disarms your organs so they are left helpless against fluke stages left there by the blood and lymph. Stop eating solvent-polluted foods. There are solvents in all cold cereals. Make cooked cereal. There are solvents in purchased drinking water. Drink from your cold kitchen faucet. There are solvents in grocery store bread, grocery baked goods and cholesterol-reduced foods. Eat none of these. Buy baked goods and bread at your local bakery. Stay away from “low cholesterol” foods. There are solvents in decaffeinated and other powdered mixes for beverages. Drink nothing except milk from the grocery store (sterilize it). Milk does not have solvent pollution. The hormones, antibiotics and udder wash can be tolerated—solvents cannot.

Beverages and powdered mixtures sold at health food stores are no exception. Use no powdered mixture intended for weight loss or weight gain, nor vitality supports, nor dietary supplements. They are all polluted. Some solvents (I often see methyl ethyl ketone and methyl butyl ketone) choose the uterus to accumulate in. This sets the stage for endometriosis and fertility problems. Where there are large parasites, smaller ones soon crowd in. All bring their own bacteria and viruses. *Gardnerella*, especially, is found in cases of endometriosis, ovarian cysts and menstrual problems. The flukes evidently travel from the uterus to other parts of your body cavity, distributing bits of the uterine lining as they go. Once this distribution has occurred, can the bleeding (regular menstrual bleeding) at these extra sites ever be stopped?

It stops immediately when the flukes are dead!

Your body knows how to clean up after dead flukes and does the job perfectly. You can be free of pain in time for your next period. Zap to kill the

four common flukes, *Gardnerella*, all other common parasites, and urinary tract bacteria (common ones include *Proteus*, *Salmonella*, *Campylobacter*, *Chlamydia*, *Trichomonas*). Avoid reinfection by avoiding solvents! It is impossible not to pick up parasites. If your uterus has solvent in it, they will find their way to it in a day. Without solvent, they will not.

The solvents will leave by themselves. Help your body get rid of them with vitamin C and B_2 (3 grams and 300 mg. respectively, daily, see *Sources*).

To heal the uterus so it no longer attracts parasites, clear up its internal pollution besides solvents. This means mainly the dental metal that has piled up and environmental toxins such as asbestos, arsenic, fiberglass, and formaldehyde. Gold and silver are especially attracted to the uterus. Don't wear gold rings or any metal jewelry touching your skin anymore, and, of course, get all metal out of your teeth. Never try to get pregnant before you have cleared up endometriosis.

The advice given by obstetricians to get pregnant to solve your pain problem is most unwise. Indeed, pregnancy changes your body's metabolism and without periods you get pain relief. But it seems much too risky to grow a baby in an infested, polluted uterus. Fear of birth defects is an intelligent fear. Be careful not to get pregnant while you are killing parasites and getting mercury removed from your teeth.

Healing starts as soon as all parasites and pollutants are gone.

Joanne Biro, age 22, had severe cramping pain with her periods, diagnosed as endometriosis. She had adult intestinal flukes and the *cercaria* stage in her uterus. She had a xylene (solvent) buildup in both her brain (cerebrum and cerebellum) and uterus. She was started on the *Herbal Parasite Program* following the kidney cleanse. Her next period was pain free. A check up showed she was free of flukes but had thallium in her immune system. *Dental Clean Up* was next on her agenda.

Denise Leyva, 22, was on birth control pills to control the growth of endometrial tissue. She had laser surgery previously. She had hexanedione and methyl butyl ketone buildup in her uterus supporting the intestinal fluke and its eggs in the uterus. There were also some sheep liver flukes and human liver fluke stages there! She was advised to stop eating cold cereals and commercial beverages and kill the parasites immediately. She had no recurrence.

Anita Pierce, age 32, had numerous surgeries for her endometriosis. She also had chronic fatigue syndrome, and several allergies. She had two beautiful poodles in her home. She could not part with them so she gave them the pet parasite herbs faithfully. She had intestinal flukes, tapeworm stages, *Ascaris* and various other flukes in the uterus. She had all her dental metal removed and home detoxified. Her body was teeming with *Nocardia* and Epstein Barre Virus (EBV). In spite of repeatedly killing the flukes and bacteria with a frequency generator and making herculean efforts she was no better off eight months later. She was unable to solve the problem of reinfection from her dogs.

Christine Solton, age 27, had extremely heavy and painful periods and didn't stop bleeding between periods. A large cyst had been seen by X-ray in the uterine wall. She also had constant bladder pain. Both problems kept her in the bathroom most of the time (90 visits/day). She had the intestinal fluke in her uterus (probable cause of cyst) and *Schistosoma haematobium* (bladder parasite) throughout her body. She was started on the *Parasite Program* and in one week her bladder pain was under control but bleeding (from the cyst in uterine wall) continued. *Schistosomes* are very contagious, probably even from toilet seats and the house dust of an infected person. She had them again three weeks later. This time she zapped them and got instant relief. Her bladder and uterus were both full of propyl alcohol, tooth metal, fluoride, cobalt, zirconium, aluminum, antimony, cadmium, and formaldehyde. She was delighted, though, to understand her problem and made the dental appointment.

Contraception

There is an excellent pamphlet available at health food stores, called Wild Yam for Birth Control Without Fear[10] that informs that 3 capsules taken two times a day provides reliable (perfect) contraception provided you give it a two month head start. Also, an *Emmenagogue* recipe.

The Silent Cervix

The cervix is a big “trouble spot” for women just as the prostate is for men. It seldom lets you know with pain, however, that bacteria or parasites or toxins are present. Sometimes a brief needle-like pain does alert you to something going on there, but it is easy to miss. The cervix is constantly secreting a little bit of mucous and this helps it stay clean but why give it mercury and copper and gold to secrete? Many a fertility problem has been solved by stopping the toxic pollution of the uterus, ovaries, and cervix. Clean up your dentalware and clean up your diet and environment.

Kill parasites and bacteria regularly, every week, with the herbal recipe or by zapping. You should have no pain with menstruation, no bloating, fatigue or headaches. A PAP smear test should always be “good”. If it isn't, hurry to the rescue of your cervix.

Menopausal Symptoms, Hot Flushes, PMS

Insomnia, irritability, PMS (pre-menstrual syndrome), depression, anxiety, nervousness, are all not to be expected at and after menopause. They may certainly be caused by hormone imbalances. It is these imbalances that are not normal.

NO menopausal symptoms are normal.

After the ovaries are done with their cycles of estrogen and progesterone production, the **adrenal glands'** hormone production was meant to “kick in” and make up any deficit.

During your fertile years, you were meant to have a peak of 100 picograms/milliliter (pg./ml) of estrogen on day 9 and day 22 of your cycle. Progesterone, on the other hand, only peaks once, on day 22, and it should reach a level 20 to 100 times as high as estrogen! After this ends, your adrenals can still keep your hormone levels regulated. Typical values are 20 pg./ml estrogen and, again, 20 to 100 times as much progesterone. Keeping these two hormones in balance is just as important as the actual amounts. **20 pg./ml estrogen is enough to prevent menopausal symptoms** including hot flushes, and to give you heart protection and bone density protection. Taking synthetic hormones usually gives you exactly such levels. But if your own adrenal glands can supply them, surely it is a better approach. (a blood test can tell you your levels; do it on day 21, 22 or 23 before menopause, after menopause the day is not critical.)

Why aren't your adrenals producing them? Because they are hampered by parasites and pollutants! Kill all the parasites, bacteria and viruses, especially *Gardnerella, Proteus, Chlamydia, Campylobacter, Neisseria, Treponema, and Salmonella.* Use the zapper.

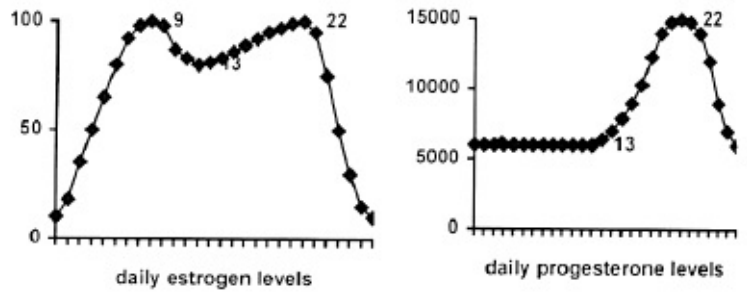

Fig. 21 Estrogen and progesterone levels (pg./ml)

Notice that these are also the favorite urinary tract bacteria! This makes good sense, because the adrenal glands sit right on the kidneys and would be geographically close to the kidney bacteria. To avoid getting them back, do a *Kidney Cleanse* to remove all crystals where they might hide.

After this, hot flushes can be suddenly gone. If not, continue with the cleanse. Meanwhile, do some permanent lifestyle improvement. Start drinking two pints of water between meals plus water and milk (sterilized) at mealtime.

Don't drink cranberry juice with its copious *hippuric acid* and its solvent pollutants. You won't need such insufficient help after cleaning up your body, dentalware, and environment. Besides giving you a better hormone supply, your newly revitalized adrenals will get you through stress in better shape and keep your blood pressure normal.

If bacteria are not kept down they will begin to invade other organs. *Gardnerella* goes to ovaries to feast on the corpus luteum after ovulation. This keeps the corpus luteum from making enough progesterone and PMS results.

Menstrual problems and PMS, in general, although they may not be pain-causers, are a sign that all is not well with the uterus and ovaries. Go on a clean up program. Kill your invaders with herbs or the zapper. Clear up your toxic accumulations from dental metal and environmental sources.

Don't be surprised by a pregnancy! This is not the time to get pregnant, though. If you wish to get pregnant, clean up your body first, being very careful to prevent pregnancy during this time. If this is not under your control do your dental work first. Since every clean up job increases your fertility, it is best to get the mercury, thallium, copper and nickel out of your body before your risk of conception is raised further by making other improvements. Many an amalgam replacement job had to be halted in the middle due to pregnancy! Couples just couldn't believe they could have a child as a result of cleaning up their bodies so they were careless in spite of my warnings! **A dentist will not take out mercury during pregnancy.**

Nicole Truett, 40ish, had PMS before her periods. She was a returning student and couldn't afford to feel emotionally upset. She also had recurrent yeast infections, *Herpes* and panic attacks. She complained that her thinking was weird, although she was an excellent student (she got her birth date wrong on our office forms!) She had high levels of mercury and we suggested dental work immediately. Two months later she was feeling much better and had all metal removed but was experiencing a slight return of symptoms, which panicked her. She still had *E. coli* and *Bacillus anthracus* at four tooth locations, giving her chronic sinus symptoms. She needed her cavitations cleaned. Four weeks later she described how she had gotten immediate emotional relief after two cavitations were done. Our solvent test showed methyl butyl ketone, benzene and carbon tetrachloride (which we found in her Mountain Valley Arkansas Spring Water). They were lowering her immunity giving recurrent herpes and yeast problems. These disappeared in a week. She was so happy to find the cause of her problems and yet so angry at the nature of the cause that she planned to write to the water company. We need more such environmental activists.

Monica Koziol was on Ibuprofen™ for menstrual cramps. She also got a severe sugar craving and minor depression and headache with her period. She was toxic with silver, copper, platinum, mercury and lead. She also had hookworms, pinworms, human liver fluke and cat liver flukes infesting her. A hormone test showed very low estrogen (57.6 pg/ml) probably due to all these interfering factors. She had all the metal from her fillings replaced and killed parasites with the herbal recipe. This gave her regular normal

periods for several months. She decided to get pregnant but couldn't. A follow-up showed she was full of parasites again. She had stopped the *Maintenance Parasite Program*. She resumed it and began kidney and *Liver Cleanses* to get longer lasting benefits.

Barbara Ashby, age 43, had suffered for 1½ years from menstrual pain. She had oxalate crystals in her kidneys and was started on the kidney cleanse. She followed this with the *Parasite Program* and dental metal replacement. Then she cleaned her liver and after three cleanses (she got over 1,000 stones the first time!) she said she felt great again.

Terri Entzminger, age 16, had a long list of health problems including painful ovaries and painful periods for which she was put on birth control pills by her doctor. She had several bacteria in her genital tract: *Neisseria gonorrhea*, *Plasmodium cyano*, *Staphylococcus aureus* (also at tooth #28 which had a plastic filling), *Streptococcus pyogenes* (also at tooth #28). A parasite test showed intestinal fluke adults in the uterus, not in the intestine or liver. There was also fluke cercaria here. She was started on the parasite herbs. Three weeks later there was no improvement. She had a rabbit, a dog and a hamster. She was to get them all onto the pet *Parasite Program*. Her diet was changed to exclude solvents. Six weeks later her periods were “great”, she did not need the pill and she was keeping the whole household on a maintenance program killing parasites. Three weeks later she had cramps again. This time it was sheep liver fluke in the uterus. She probably got them from the snails in her fish tanks. She was off the maintenance program and drinking caffeine free cola again. This would fill her with solvents that make fluke disease possible. She killed them all with a frequency generator and decided to be more vigilant over parasites as long as she was such an ardent animal lover.

Azar Moya, 57, was on Premarin™ and Provera™ for hot flushes and emotional extremes, Synthroid™ for the thyroid, Xanax™ for nerves and sleep problems, something for diarrhea and something for depression. In five months she needed none of it. She had done a *Liver Cleanse* by then and got a commode-full of stones (about 1,000), she had changed her plumbing, got rid of the water softener, killed parasites and cleansed her kidneys. She still had sinus problems and some arthritis and was planning dental metal replacement and cavitation cleaning to clear them up too.

Infertility

An ominous sign in any species, infertility is not just another disease or “problem”.

When birds' eggs don't hatch their species is doomed. So we learned from the DDT experiment humans did with birds in the 1960's. The DDT changed the thickness of their eggshells so they cracked when the mother bird sat on them. All changes are experiments whether intentional or unintentional. Nature by itself produces sweeping changes, too, such as droughts, windstorms, fires, ice ages, but usually living things had time or mobility to adapt to them. When there wasn't time, and they couldn’t run away, the species went extinct.

Are we humans an exception to this rule of adapt or perish? Nobody feels more helpless and hopeless than the infertile couple. They cannot run away, time is limited, and obviously adaptation is not occurring. More likely their lineage will perish. The couples' only wish is “Give us one child, now.” Surely, it is their

birthright, as it is any living creatures', to reproduce.

Can we relax with the assurance that our intelligence, through the arm of science, will always rescue us? Are test tube fertilizations, fertility drugs, Cesarean sections, incubators for premature babies all triumphs for science? No, they are signs of reproductive failure for the human species.

When the concern is overpopulation of this planet, reproductive failure might seem less ominous. Maybe it’s no worse than the natural way any species curbs its growth rate. Maybe only those who can survive parasitism, pollution and immune deficiency should survive in order to strengthen the species. But when reproductive intervention becomes a necessity, not an option, surely the danger signal is present as it was for the DDT'd birds that saw cracks develop in their eggs. The solution to our reproductive failure is not to find ever more artificial ways to conceive, to give birth, and to care for damaged babies. The solution is to fix the old fashioned way; to safeguard the natural way.

If you are unable to conceive or to provide viable sperms use an intelligent approach. Remove the obstacles. **The obstacles are parasites and pollutants, the same enemies of health we have seen before.**

Kill all large and small parasites with a zapper and the herbal parasite-killing program. Don't try to keep a pet parasite free, give it away. Living close to another species is a luxury you can't afford at present. The pet can live with its parasites, you can't. Remember to kill bacteria and viruses too, especially *Gardnerella*, *Neisseria*, *Treponema*, the ancient enemies of human reproduction.

The electronic way of killing parasites is safe if you use a frequency generator. the frequencies of parasites and bacteria are far away from human frequencies. The treatment with each frequency is short. There are no side effects.

Is it safe to kill parasites if you might be pregnant?

The zapper has not been tested and should not be used during pregnancy.

The herbal way of killing parasites has been used by pregnant women without bad effects, but this is not enough safeguard. I recommend waiting until the baby is born if at all possible. The treatment is long and intense. The growing baby is exposed continuously to herbs. Perhaps this is preferable to the toxins produced by parasites. You must use your own judgment. Obviously it is wiser to take a

chance on herbs than to take a chance on inheriting AIDS or “genetic” diseases.

Part two of regaining your reproductive freedom to have a child is removing pollutants. Gold, silver, copper and mercury can accumulate in the reproductive organs, wrecking the delicate hormone balance between estrogen and progesterone, or wrecking the motility of sperm. Research has not been done to search for dental metal in the uterus, ovaries and testicle of infertile couples. You can do this research yourself. Slides of ovary tissue cost less than $10.00, as do other parts of the reproductive system. Search for dental metal yourself. Remove all dental metal from your mouth, and replace it with metal-free composite. Extract teeth with root canals.

A Word Of Warning!

Be extra careful with contraception during the *Dental Clean Up*. You could get pregnant the very next day! **This is no joke**. It is a serious hazard to conceive a child while mercury is loose and rampant in your body from the removal process. It may be a higher risk than leaving it untouched. If you are pregnant no dentist will want to finish the job of mercury removal! **Don't try to get pregnant yet.**

You may have tried fertility pills, in vitro fertilization, and other methods for getting pregnant over a ten year time period, all to no avail. Then you start cleaning up your body and taking your mercury out and suddenly you are pregnant before the job is complete! It may seem unreasonable and illogical to have to be careful after ten years of no worries, but play it safe.

If you fail to observe this warning and do get pregnant too soon, you may pray for miscarriage. Otherwise, take vitamin C and thioctic acid and hope for the best. Men should add daily zinc and arginine (60 mg. and 450 mg, respectively) to their diets. Both men and women should add vitamin E (200 mg.), a prenatal multivitamin and multi-mineral tablet, eat freshly grown vegetables for folic acid, and add vitamin C (at least a gram daily, see *Sources*). **No other supplements**! Supplements polluted with heavy metals or solvents do more harm than good. If you are not sure of their purity, test one by eating it and searching for it in your immune system five minutes later. If it is there, it is harmful; eat no more.

Nausea

…of pregnancy is the scourge of expectant parents. After waiting hard and long for the desired pregnancy, the mother-to-be feels rotten, salivates and gags at the thought of food, and wants no more sex. Maybe sex is ill advised during pregnancy, no matter how reassuring the male or male-oriented obstetrician is! Maybe salivation is actually mercury excretion being attempted by the body. Maybe nausea is all about keeping toxins out of the body and away from the developing child. These are intriguing possibilities, worthy of your research expertise.

A few decades ago the treatment for nausea was a weekly B6 and B12 shot. Ask your obstetrician for this to see if it helps.

An older, herbal remedy was cinnamon tea: 2 tbs. cinnamon (bark or powder) in 2½ cups boiling water, steeped for 10 minutes. Strain and add honey to taste. Dose: ¼ cup three times a day before meals.

Nausea invites starch eating—pasta, potatoes, rice and bread. Starches can absorb. Perhaps they absorb the noxious substances causing nausea. Make sure you add vitamin C to grains. In any case you must still eat additional nutritious food to grow your baby. In spite of craving a pickles/chocolate pudding/carbonated beverage lifestyle, you must eat mainly good food. Craving can take strange turns. Search for the taste you crave in good food and in long forgotten childhood foods.

These are all the fertility cases I saw in a year's time. None were left out in order to hide failure. Assess the success rate yourself:

Domilita Renshaw and her husband had been trying for six years to get pregnant. Both had been tested and treated in assorted ways. Domilita's period was irregular, a sure sign that all is not well in the area of reproduction. I gave them the usual warning about not risking pregnancy during their deparasitizing and depolluting procedures they both would be going through. Her hormone test showed slightly high (125 pg/ml) estrogen levels for day 22 (if it really was day 22!) and higher still if it was not yet day 22! Obviously, something was irritating the ovaries into overproduction of estrogen. She had oxalate and urate crystals and was put on the kidney herb recipe. She was switched to milk (3 glasses 2% a day) as her primary beverage besides water. She was toxic with nickel (dental metal), which would invite hordes of urinary tract bacteria, dangerously close to the ovaries. She made her dental appointment. She had sheep liver flukes and was started on the *Parasite Program*. She broke out in hives from a new hair spray polluted with praseodymium, which got into her ovaries. She prepared to clean her liver for her frequent hives. Then she called to cancel her next appointment because she was pregnant (four months from first visit). Fortunately she had one visit with dentist completed. Nine months later she had a beautiful perfect baby.

Lindy Maloy and her husband had been trying for eight years to have their second child. They all had *Ascaris*, including, of course, their house dog. They wormed the dog monthly and did not want to part

with it since they did not believe it mattered. They used the pet *Parasite Program*, but five months later she had higher *Ascaris* loads than ever. She also could not rid her uterus of intestinal fluke stages in spite of killing them with a frequency generator and using the parasite herbs. She remained full of solvents, bacteria and platinum from dentalware. Her endometriosis continued. They gave up.

Rosemary Peterson, age 33, had been trying to get pregnant for fourteen years. She had seven laparoscopies for endometriosis and very hard cramps with her period. She had intestinal flukes and sheep liver flukes in her uterus. There were sheep liver flukes and human liver flukes in her liver. There were intestinal fluke redia and cercaria in her saliva. The solvents in her uterus were methyl butyl ketone, acetone, carbon tetrachloride (from drinking store bought water), styrene (from drinking out of Styrofoam cups), xylene (from carbonated beverages) and decane (from cholesterol-reduced foods). She also had a chronic yeast infection, treating it constantly with Nystatin™. She killed the flukes and yeast electronically before leaving the office and started herself on the *Parasite Program* and diet restriction. She got pregnant immediately, and did not return.

Elisabeth Tran, age 37, had tried to get pregnant for five years. She did get pregnant recently, on a special "gift" surgery program, but lost it. Her ovaries and uterus were toxic with mercury and thallium from polluted dental alloy. She also had barium and titanium in them, probably from lipstick. We did not see her again, we hope she solved these problems.

Christopher Gravely, a young man of 26 and Frederica, 22, promised faithfully not to get pregnant until their clean up was complete. He was found by his doctor to have slow moving (low motility) sperm. He was robust and healthy looking but suffered a lot from low back pain—a clue to swarms of bacteria in the lower abdomen. An electronic search of his testicles and prostate (which had been infected once) revealed iridium, platinum and yttrium. This implicated tooth metal. He was also started on kidney herbs. Eight months later he had completed all his tasks, his low back and pain with urination had stopped, and this encouraged him to continue with his fertility program. We started him on thioctic acid two a day and zinc (60 mg.) two a day, switched him to an electric razor so he wouldn't have to use any chemicals on his face, and recommended that he ventilate his garage which was attached to the house, to reduce fumes in his home.

Meanwhile, Frederica, his wife, was also checked for toxic elements. She had antimony (from mascara) in her ovaries and breasts. She had sensitive painful breasts during her periods, which were quite irregular. She also had indium and gallium, dental alloys in the ovaries and breasts. She, too, was started on the kidney herbs and instructed to get metal tooth fillings replaced. After two months they canceled their appointment. Frederica was pregnant! Not for long, though, and a wiser couple returned a few months later. Frederica finished her dental work. Both started the *Parasite Program*. Frederica's periods became regular. She was started on thioctic acid (one a day) plus zinc, (one a day), until her first missed period. Twelve months later they sent me their baby's picture: he was two months old.

Ginger Hart had been trying for three years to get pregnant. After an endometrial biopsy, a D&C,[11] and laparoscopy she was diagnosed with "inadequate corpus luteum." We found her ovaries toxic with nickel and europium from tooth fillings and strontium from toothpaste. She was delighted to understand her problem and set about correcting it.

Marjory Davis, age 28, had been on the "pill" (synthetic hormones) a long time but was off now and couldn't get pregnant. She actually got pregnant about one year ago but lost it at one month. A toxic element test showed her ovaries and uterus were full of beryllium (gasoline and coal oil), gadolinium and gallium. The metals are alloys of gold used in dentistry. She wore a lot of jewelry, just loved her chains, necklaces, rings, etc. But she agreed to go off all except two rings, which did not have these alloys. To reduce fossil fuel fumes in the house she removed all gas cans and the lawn mower from the attached garage. They parked the cars outside. She was started on kidney herbs and promised to use contraception until she was done. She was to drink three glasses of 2% milk a day and take a magnesium tablet and stop drinking other beverages. Three weeks later her husband canceled her appointment because she was too embarrassed and delighted to call herself.

Prostate Problems

If urination is not complete, so you must soon go again, especially in the night, it is suggestive of pressure on the urethra from an enlarged prostate gland. Keeping a little urine from being voided is conducive to bladder and kidney infection, too, because bacteria soon find this “free food.”

The prostate collects toxins as if it were a designated dumpsite, especially for nickel. Urinary tract bacteria quickly find “their” metal, nickel. Any supply of nickel will attract bacteria as quickly as crumbs and cheese attract mice. Urinary tract bacteria are making use of your urea as their food. To digest it, they first break the urea molecule apart into two ammonia molecules. It is the ammonia smell of the urine that gives away their presence. The urine should have no ammonia smell. Our bodies do not make ammonia. Only bacteria can do this! Their digestive enzyme is called *urease*. In order to do its job, this enzyme requires the element nickel.

Nickel is plentiful in the soil, which is undoubtedly where these bacteria belong, breaking up and utilizing the urine and droppings left there by animals. They perform an essential task in our environment, destroying animal excrement and thereby cleaning-up the soil around us. What folly it is to load ourselves up with nickel so that in one short hop from the earth they are residing in us! Bacteria are all around us doing their valuable jobs. We cannot stop associating with bacteria. We were not meant to feed them, however. If we did not supply them with nickel, as if we were just another patch of earth, they could not gain a foothold in our urinary tract and then to the prostate.

How can we rid our bodies of nickel? This is the challenge. Are we eating dirt? A small amount of dirt can't be avoided on our food. But we can stop sucking on nickel as if it were a lollipop. Our spoons, forks and knives are made of nickel! Stainless steel is 8% nickel! Does it really come off as you eat? When you stick a knife into the mayonnaise jar, it is stained in a few minutes. Try it. The mayonnaise has reacted with the metal loosening the nickel. When you smear the knife over your bread, this film comes off and you eat it. If you were to put the knife in your mouth, now, you could taste the metal. You will later wash the knife but not before you have eaten enough nickel to supply all the bacteria in your body with the daily allowance of their essential element, nickel. Nickel is not our essential mineral. Even plants keep their nickel levels very low. But due to pollution of animal feed with it, even a hen's egg now has 3 mcg/100

gm of nickel in it.[12] To produce a nickel-polluted egg, the chicken must be polluted.

Especially infants and children should never be given metal cups or cutlery. They need all their immune power to combat the barrage of new bacteria and viruses that is emerging in this age of AIDS. Nickel is part of dirt and belongs there, not in our pots and cutlery.

Another large source of nickel is metal dentalware. It is used to harden gold! If you suffer from prostate problems, remove metal from your dentalware. Nickel is used to make bridges, gold crowns, retainers, and amalgams. Exchange it all for plastic ware and composite buildups (see *Sources* for more dental information). Stop eating and cooking with metal utensils; use old-fashioned wooden or sturdy plastic cutlery instead. Always use a plastic knife for butter or mayonnaise. Never buy foil-wrapped butter.

Nickel is fat-soluble and is stored in your skin fat temporarily when a surge of it enters the body. Your skin oils may be loaded with nickel causing “allergies” in the skin. Male pattern baldness is such an allergy. The sweat tries to excrete it for you. Always wash off your scalp sweat to help with this excretion. The skin oils dissolve nickel from metal jewelry (sometimes leaving your skin with a greenish black color) and transport it into your body. Don't wear metal jewelry. Earring posts should be plastic. Metal watches and metal-rimmed glasses should be replaced with all plastic types. Metal rings should be replaced. After lowering your total body nickel levels and your prostate disease is only a memory, you might notice scalp hair returning to sparse areas. Search around the edge of the hairline for the first returnees.

Bacteria cannot live in the prostate without nickel being present. You can cure your prostate problems with the simple tactic of stopping nickel pollution of your body. Notice that you get a fresh attack after accidentally using metal cutlery in a restaurant or eating mayonnaise-style salad with a metal spoon stuck in it. It might be wise to take a **histidine** capsule (about 500 mg., one a day for three weeks, see *Sources*) when this happens. Histidine is a nickel chelator. Taking **zinc** is helpful too (60 mg. two times a day for a month). Possibly, the nickel was poisoning zinc enzymes. Read about the benefits of **flaxseed**, too, but remember to test every product for pollutants before accepting it as a supplement.

Prostate problems of all kinds clear up when bacteria are zapped, the *Kidney*

Cleanse is done, *Dental Clean Up*is done, and the *Bowel Program* is followed.

Richard Traylor, age 71, had suffered from prostate and urinary tract disease for three years. Scar tissue had to be removed occasionally from prior treatments of them. He was started on the kidney herbs and in two weeks (13 days) he had a considerable improvement in urine flow. At his follow-up visit we searched for toxins. He had radon, chromate, yttrium and strontium in his genital and urinary tract. He got rid of his water softener (such salts are polluted with chromate), toothpaste (strontium source) and opened the crawl space vents (source of radon). This cured these problems in less than two months. It also cured his stomach ulcers for which he had to take medicine. He was so pleased he decided to install a crawl space fan and pursue a *Parasite Program* and dental health just to see what extra health improvements he might get.

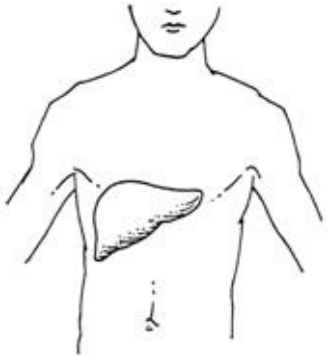
Omer Whitney, age 45, had always been a strong, healthy, hard worker. He could now barely walk, due to weakness and pains of several kinds; his prostate problems began several years ago. Our tests showed 4 kinds of kidney stones. He was started on only half a dose of the herbal recipe to give them a chance to dissolve more slowly. One month later he still had some stones although his leg cramps were already gone. At this time we found *Ascaris* (both kinds), which he killed with a frequency generator. We also found carbon tetrachloride and pentane (in decaf beverages) built up in him; also gasoline and TCE. He was considerably improved five weeks later and was quite eager to improve further. A toxic element test showed he was full of copper, antimony (from mineral ice massages), cobalt (aftershave), zirconium (deodorant), thulium (vitamin C fortified orange drink) and mercury (very high, from tooth fillings). He planned on cleaning all of it out of his body and regaining his lost strength.

Harvey Van Til, age 35, came in for his prostate and testicle swelling, which began shortly after a vasectomy. He ached over the front right side of his abdomen. He was started on the kidney herbs and in four weeks he had eliminated his oxalate crystals and felt considerably better. We next found the adult intestinal flukes and human liver flukes in his prostate gland! After killing them immediately with a frequency generator and getting instant relief of pain, he got his own device and did not need to return.

Clayton Gamino, 26, had pain during urination, which he interpreted as a leftover from a prostate infection he once had. He got all the metal out of his mouth, and did a kidney cleanse. A half year later he had no remaining pains and was able to father his first child.

Side Pain

Pain on the right side can come from problems at the ileocaecal valve or the appendix or the large intestine itself. It can also come from the liver, which is higher up but is sending its pain message to your side. Pursue it as an intestinal problem first, killing parasites and bacteria and normalizing bowel movements with the *Bowel Program*. If the pain persists, especially if it reaches up the side to the middle of the waist, it is probably due to the liver.



The liver has a large lobe on your right side with the gallbladder tucked inside. The left lobe is smaller.

Fig. 22 The liver

The liver is a large organ, mostly on the right side of the body, but with a smaller lobe on the left side. It is the chemical manufacturing plant for the body. It pulls in the food from the intestine (that you ate hours ago) and makes your body's chemicals from them. Toxic items are changed chemically into nontoxic items that the kidney is able to excrete into the bladder. Fatty things must be made water soluble for them to leave with the urine. The liver also makes bile and sends toxic items along with it to the intestine through the bile ducts. The bile enables calcium and fat to be absorbed. If the liver isn't getting much bile to the intestine, fat is left in the bowel contents and the feces will float in the toilet bowl. That is your clue to bile duct blockage.

Bile is bright green. Mixed with intestinal contents it turns the bowel movement dark brown. If the bile is <u>not</u> arriving in the intestine the bowel movement will stay light colored, even yellow or orange. This is another clue to bile duct blockage. Over a quart of bile should exit the body each day. Since bile is loaded with cholesterol this daily excretion of bile is a major method of keeping cholesterol levels low. If the bile ducts are choked with debris so only half as much (often only a cup instead of a quart!) bile is produced and excreted you can expect cholesterol levels to rise, and digestion to be bad. When food isn't promptly digested and absorbed the ever present, everready bacteria will grab it for themselves.

Taking cholesterol-lowering drugs should be reserved for cases where natural excretion cannot be regained.

E. coli and other intestinal bacteria, which do no harm in moderate numbers,

can overgrow in a few hours to give you bloating, gas and pain. Your body produces no gas. Only bacteria can produce gas. If bloating and gas accompany your side pain, you know you have a digestive problem. And that this digestive problem stems from a congested liver if the pain is directly under it or over it, or if the feces are light colored or your cholesterol levels are high. Not everybody has all the symptoms.

To clear the clogged passages of the bile ducts, you simply do the *Liver Cleanse* over and over until the problem is gone. There is one catch. If there are living parasites in the bile ducts, they will not let the bile ducts clear themselves. They are stuck fast to your ducts as a tick can be to your skin. They must be killed before they will let go. Zap them all, or you may use the *Herbal Parasite Program*, staying on a twice a week maintenance program. Only after parasites are dead (after day 20 if using the herbal program) will you get a lot of "green stuff" and be able to clear "stones" out of your bile ducts. Only one large duct at a time will clean itself. We have hundreds of larger ducts and thousands of tiny ducts feeding into the larger ones! Stay on a schedule of cleansing the liver every two weeks (unless you are ill) until your side pain is gone, your digestion is normal, and you are bouncing with energy. You may also lose some weight, but only if you are overweight.

Remember that a clogged liver does not necessarily give you pain by itself. It is more likely the bacteria in the gallbladder and bile ducts, causing inflammation there and in your intestine, that cause pain. Don't wait till pain occurs over the liver. Use whatever clues you can to diagnose your clogged condition. Or just assume it is clogged. Do the cleanse, and see if you get any stones out. It can never hurt and can help a lot.

Fig. 23 Gallstones

Bruce Hearn, 40ish, had severe side pain for several weeks and was rather gassy. He had seen a clinical doctor who found him in good health. But we found sheep liver flukes in the intestine and in the thymus! The thymus is an immunity-giving gland, so anything in the thymus is a very serious matter. He also had benzene in his thymus (inviting AIDS). He quickly switched from drinking soda to drinking milk. He went off everything in the benzene list. He killed the flukes electronically and started on the *Parasite Program*. Three weeks later the benzene was gone, his side was very much better and he could

begin a *Kidney Cleanse* or his low back pain. He hadn't cleansed his liver yet! His improvement was probably due to improving his immunity, which then controlled the bacteria.

Mid-abdomen Pain, Stomach Pain

The colon crosses over from your right side to the left side at the mid-abdomen. This is also the location for the bile duct to join your small intestine. Most mid-abdomen pain comes from either the colon or the bile duct connections. Kill parasites and bacteria by zapping or with the herbal recipe. Improve your digestion with diet clean up (off moldy food, boil dairy products). Sometimes the mid-abdomen pain stems from the stomach itself. The valves at the top and bottom of the stomach are meant to keep the food in. The valve at the top where the stomach joins the esophagus is a favorite location for bacteria.

You seldom feel them here though. This is just under your breastbone. They do their work quietly. Eventually, the tissue there is so weakened, the valve can't shut tightly and food is allowed to go back up the esophagus. This is called *reflux* and you may be told to sleep with your head elevated and to eat small meals, especially at bedtime. You may be given Reglan™, a drug to help empty the stomach faster. Digestive enzymes will help empty the stomach, too, but may harbor molds. The real solution is to kill the bacteria in this area and keep them from reinvading it. Start by killing the *Salmonellas* and *Campylobacters* (zap them).

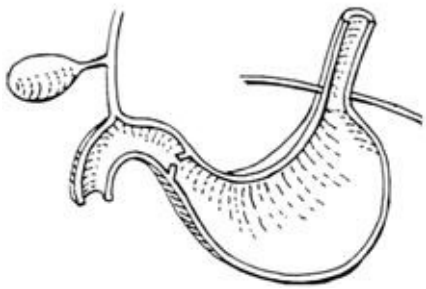


Fig. 24 Stomach, esophagus, diaphragm, gallbladder

Within a day or so, however, the area can be re-invaded. Some bacteria are coming from your teeth! Some come from the liver! Often both sources are supplying bacteria to the stomach. The stomach allows a little bile to enter at the end of each meal; this is normal. But if the bile is full of live parasite stages and bacteria they may try to colonize the stomach, too. If there is insufficient stomach acid to kill them or if there is an accumulation of toxin in the stomach,

they will get a foothold. Then they can burrow down deep to escape acid. Eventually, an ulcer can develop.

Stomach Ulcer

Often, such an ulcer is painless.

You are, therefore, not alerted to the parasites' presence until they have established themselves in good hiding places. Taking antacids, of course, works in their favor. The solution for both stomach pain and stomach ulcers is to kill parasites and bacteria, followed by dental and liver clean ups. One very common toxin that accumulates in the stomach is the pesticide **arsenic**. You inhale it right along with the flies and roaches you may be trying to kill with arsenic-laced pesticides.

Other inhaled toxins are fiberglass, asbestos, formaldehyde and Freon. Your nose and mouth mucous traps a lot of these whereupon you swallow them and they glide into the stomach. Tooth bacteria and tooth metal get into the stomach the same way. You simply swallow them.

Clean up your air, don't use any pesticides (see other methods in *Recipes*). Your dentalware may be cleaned up in a few dental visits but the *Liver Cleanses* must go on for a year or two before it is reasonably clean. You may get pain relief in a few weeks but this should not derail your intention to revitalize yourself completely with a cleaned liver and stomach.

Hiatal Hernia

When bacteria have spread to the diaphragm and weakened it, along with the upper-stomach valve, food is allowed to get pushed up right through the diaphragm. Pressure in the abdomen from overeating or sitting in an easy chair pushes it up. Walk after eating. Empty the stomach before going to bed. Don't sit in recliners. Very many of us, about 25%, have a small Hiatal hernia. It only hurts if it is inflamed. Work at clearing the inflammation first, to get pain relief. In time, the area will strengthen and the hernia itself may get smaller.

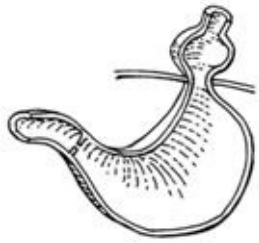

Fig. 25 Hiatal hernia

Jeffy, 3½ months, had been screaming a lot ever since birth. He was very gassy. He could not be put down without starting to cry. He was congested and had colds. He was on mother's milk exclusively so his chronic *Salmonella* infection must have come from someone who was a carrier, possibly his mother, although she had no symptoms. The mother had platinum and tellurium in her milk (*Salmonella* can be transmitted in milk but this was not checked). The solution was to clean up the mother's milk by getting the dental metal out of her mouth, and washing hands before nursing. Jeffy's father had an *Ascaris* and intestinal fluke infestation. It is quite possible the baby had these also, giving him a nasty tummy ache in addition to the gas pains. The baby's older sister had screamed and cried the first nine months, too, so the parents were told it was a "familial thing." She also had ear infections, colds and a flaky patch of skin occasionally. She, too, had *Ascaris*. They were very pleased to be able to clear up the whole family's problems by killing parasites and removing toxins.

Ruby Adair, age 14, filled a page with her symptoms. She was also chronically fatigued and had consumed enough antibiotic "to fill a room." She had shooting pains from under her feet up her legs. A quick check revealed mercury and thallium in her immune system. Instead of being dismayed, this news filled her with hope for recovery. She arranged for dental metal replacement. Then she related her stomach "story". While at a wedding, a year ago, she began vomiting with diarrhea. She thought it was the stomach "flu" but she didn't recover for six months and had to miss school. The psychologist thought it was emotional. She was still only attending school one hour a day. We found *Fasciolopsis*, the intestinal fluke, in her stomach wall as well as in her intestine. She started the *Parasite Program* and in three weeks her appetite was back, insomnia was gone, fatigue was better and a significant improvement was evident.

Respiratory Illness

Asthma

…is a very old disease described in the ancient literature. The only progress we have made to date with this disease is to give drugs to soothe the symptoms.

Asthma is associated in **all** (100%) cases with tiny *Ascaris* larvae. As soon as eggs hatch (in the stomach, immediately after swallowing filth) the microscopic larvae travel to the lungs, not the intestines. Imagine the distress of lungs full of tiny worms! One tries to cough them up, of course, but in our misguided effort to be polite we teach children to swallow anything they cough up! Some swallowing is inevitable and the young worms are back in the stomach, this time to set up their housekeeping in the intestine. Some never leave the stomach,

causing children stomach aches and, of course, a large entourage of bacteria which, in turn, have their viruses.

Most cases of *Ascaris* infestation also show *Bacteroides fragilis* bacteria, which, in turn, carry the *Coxsackie* viruses (brain viruses). Whether or not these bacteria or viruses will thrive in you depends on whether you make a good home for them, namely have low immunity in some organ. The preferred organs for *Bacteroides* are liver and brain (brain tumors always show *Bacteroides*). The preferred organs for *Coxsackie* viruses appear to be tooth abscesses and brain.

Not everybody with *Ascaris* develops asthma, even though they always go through a lung stage. Does it depend on the age of the person when the infection develops? Or how many *Ascaris* are present? Or the time of year when lung infection is present?

That innocent cough of early childhood should not be neglected, as simply "croup." At the first sign of a cough, use a frequency generator set to 408 KHz, the frequency for *Ascaris*, or use a zapper. Pay extra attention to washing hands before meals. Pay extra attention to the animals nearby. Kill their *Ascaris* with a zapper and keep it up daily or put parasite-killing herbs in their food.

Asthma sufferers become **allergic** to many air pollutants such as pollen, animal dander, and smoke. The production of histamine in the lungs and the vast interconnectedness of histamine to allergies have been well studied scientifically. Although invasion by worms is known to result in both histamine production and high eosinophil counts (over 3), and **asthma clients typically have both**, they are not routinely checked for worms clinically! They are simply given drugs to enable better breathing. More and better (though toxic) drugs have been developed.

But you can put an end to your asthma by terminating your *Ascaris* infection. Then wash your hands and fingernails with grain alcohol, and let no more filth past your lips. Wear plastic gloves for a week to break a nail biting or finger sucking habit. For children wash hands before eating anything, even between meals; keep fingernails short.

Dogs, cats, pigs and horses all get *Ascaris*. Never, never let a child clean up any vomit or mess left by an animal. This could lead to massive infection, the kind that could result not only in asthma but **seizures**. Kill the worms in animal messes before you clean them up too. Never use your dustpan or broom. Use cardboard, newspaper or anything that you can afford to throw away with the

mess. Squirt povidone iodine (available at drug stores) on the mess—even if it's outside—and cover with salt before cleaning up. Discard it in outside trash. Wash your hands with grain alcohol, paying special attention to fingernails. If you are a food preparer, you could infect the whole family if you don't wash carefully.

If there is an asthmatic in your family, the whole family should be treated for *Ascaris* with a zapper or with the herbal parasiticides. Even after everybody including the pets have been treated, pets should not be allowed in the bedroom of the asthmatic person. Asthma is more than parasitism. It is also an allergic reaction, to the pet and to other inhaled bits of matter.

Clean the air. Smoke of any kind, fragrance and chemicals of any kind, all household cleaners, polishes, and so forth should be removed. Store essentials in the garage, not the basement, since basement air rises. Clean up the whole house. Persons who must use hair spray or nail polish should do so outside in the summer and in their own rooms with the doors closed in winter. Use a chlorine filter for the water, especially at the shower. Install central air conditioning if possible, with maximum filtering (but never with chemicals added to the filter and never with a fiberglass filter) at the furnace. A room air filter (not fiberglass) is next best. Use it for an hour in the bedroom ahead of bedtime so the air currents can cease. Just moving dust around is worse than leaving it there. Never do dusting when an asthmatic is in the house. Lungs heal quickly when the air is clean and there is no reinfection. The best place to recover is outdoors away from trees and bushes or indoors with total pollution-free air conditioning (free of asbestos, formaldehyde, arsenic, fiberglass, pet dander).

As your asthma lessens, reduce your inhalers, but always keep them on hand. When you suddenly need them, try to identify your source of reinfection or allergens. Use this experience wisely. Try to understand the recurrence of your asthma. Keep notes. It may take half a year with a dozen recurrences to finally learn and conquer! It will feel great to breathe without spraying yourself and taking medicine. If it comes back a year later, figure out what is happening that's seasonal. A pine tree near the house, a flowering bush, the first mown grass? Stay away from these until you are completely healed.

There are traditional herbs for helping lungs. Grow your own **comfrey** and **garlic**. Make **mullein** tea from the dried herb (see *Sources*). Read herb books for more help. Dry some for winter use, being careful to do it right and not let it mold.

Suzanne Carlyle, 45, had asthma from infancy. She was currently on Albutesol™ spray and tablets daily. Now she was beginning to have arthritis too. She was given arginine to replace caffeine. She had two species of *Ascaris* and was allergic to cats and other animals. She was started on the *Herbal Parasite Program* after killing *Ascaris, Bacteroides* and *Coxsackie* viruses with a frequency generator. Her lungs showed kerosene, carbon tetrachloride, mineral oil, benzalkonium (from udder wash, she was also milk sensitive), and aluminum from her cookware, and aluminum silicate from her salt. She had two extra lung parasites: *Paragonimus*, a lung fluke, and *Pneumocystis*. She was immediately improved after cleaning up these sources and canceled her future appointment.

Cay Wenkert, 63, had asthma for many years for which she took Proventil™, but this gave her such bad side effects she had to stay home now and not venture out. Her lungs were full of benzalkonium (toothpaste), arsenic (ant poison under kitchen sink), zirconium (deodorant), and nickel from tooth metal. She had dog heartworm in her lungs(!), in addition to her heart where she sometimes felt pain. She had *Ascaris* and *Naegleria, mycoplasma, Endolimax* and the intestinal fluke in her lungs! She coughed up blood, after her doctor had diagnosed *bronchiestasis* recently, meaning her lungs were not capable of sweeping out the daily refuse we all breathe in. In spite of killing these and cleaning up her environment she got no improvement. She repeatedly got parasitized. She had four or five root canal teeth, which she was unwilling to have pulled. Hopefully, the tradeoff between teeth and health will soon begin to look poor.

Amy Newberry, 41, had recently begun to have asthma attacks. She had been on cortisone but now was on inhalers through the day (two puffs Ventillin™ 3x/day, plus three puffs Intel™ 3x/day plus four puffs Asthmacort™ 3x/day). She was often hospitalized for attacks. She also had stomach trouble and sinus problems (had pneumonia recently). She had *Ascaris* larvae, *Endolimax, Naegleria*, and *Acanthocephala* in her lungs! She also had arsenic and palladium (tooth metal). Going onto homeopathic medicine for stuffiness helped her avoid some hospital visits. It took several months (5 visits) to track her arsenic source to the bedroom carpets (stain resistance!). After steam cleaning it herself and doing a *Liver Cleanse* (after first killing parasites), she was amazed at her improvement. She had not been to the hospital in a month and was only using inhalers preventively. She planned to get dental work done. She got all her former health back.

Laura Brewster, 25, lived in a very old house. The slightest exertion would give her an asthma attack. She frequently got pneumonia, too. Her lungs had beryllium (coal oil) and asbestos, and two parasites, *Paragonimus* (lung fluke) and *Ascaris*. She got rid of all the old fashioned lamps and candles in the house, but could not find the source of asbestos. She got rid of the attacks but her cough and pneumonia bouts will continue until she moves from that house.

Brett Wilsey, 70, was congested most of the time, had chronic sinus problems, was getting allergy shots for dust and mold, and was on several inhalers for his asthma plus emphysema. He had asthma for eight years. He had oxalate, urate, and all three phosphate variety crystals in his kidneys. He was started on kidney herbs. His blood test showed high “total carbon dioxide” or “carbonate” showing that his air exchange was not good. His potassium was low, showing that his adrenals couldn't keep his electrolytes (sodium, potassium and chloride) regulated, in turn, giving him muscle weakness. His LDH was very high, showing that his heart muscle) was in distress, too. Fortunately, his RBC was slightly elevated, to help with oxygen delivery. (See *Anemia*). His eosinophil count was high, as is the rule for asthmatics since they all have *Ascaris* worms. Besides *Ascaris*, he had pancreatic and intestinal flukes in his lungs(!) plus *Heterakis* (a chicken roundworm), human hookworm, and *Prosthogonimus*, another fluke. He was started on the parasite herbs. Two weeks later he felt a lot better although he still had some *Ascaris*. He was toxic with barium and hafnium (which were traced to his dentures) nickel, tin, rhenium. He stopped using commercial “denture-soak.” His wife stopped using hair spray and they started leaving the car out of the garage and walked around to the front door, instead of using the attached garage. He also started drinking homemade comfrey tea. This made him feel still better.

When he removed his watch he got rid of his nickel source. Nickel has an affinity for lungs (as well as

prostate and skin). He was now down to one puff of inhaler instead of two, only four times a day instead of hourly. He could breathe deeper than before. Then the lead in his water was found and traced to a single “sweated” joint in the pipes. He was started on food grade hydrogen peroxide, working up a drop at a time; now his cough became “productive”, he was coughing up a lot.
He got the plumbing fixed and did a *Liver Cleanse* after which his fatigue lifted. He couldn't stop laughing and joking about the “emphysema” he was so worried over earlier.

Bea Karnes, 49, had asthma from childhood when she also had eczema. She was presently on several medicines plus allergy shots and antibiotics for it. She was toxic with antimony although she used no eye makeup and europium, tantalum, and gadolinium from dental metal. She also had hand swelling in the morning and was started on kidney herbs. She killed her intestinal flukes (in the intestine) and *Ascaris* in her lungs and was not seen for half a year. When we eventually saw her, she said her asthma had been “wonderful.” She was faithfully controlling parasites with the maintenance program and occasionally drinking kidney herbs.

Cynthia Prout's whole family (mentioned previously) had asthma. She was told it was inherited. The three young children and herself were on inhalers, nose sprays, cough syrups and antibiotics. Nola, age 10, also had ear infections and numerous allergies. Lewis, age 8, was a slight, nervous boy; he had been off wheat and milk for many years due to intolerance. Irwin, age 5, seldom went with the family due to his frequent stomach aches and the fact he could vomit without notice. The mother and two children who were with her (Irwin stayed home) had *Ascaris* infection and Lewis also had pancreatic flukes. Their home was toxic with vanadium, namely, a gas leak. The parasites were quickly killed and gas leak repaired. The whole family got well and canceled their next appointment. Some inherited disease!

Asthma is just one of our common respiratory problems. The causes are always a combination of *Ascaris* and other parasites with pollutants (allergies).

Bronchitis, Croup, Chronic Cough

- In **bronchitis** the bronchioles are the site of the problem.
- In **croup** it's further down.
- In cases of **chronic little hacking coughs** it may be heartworm!

Bud Portillo, 62, worked on earth moving machines. He frequently had a “bronchial virus” or “bronchial infection.” He was always coughing. He had *Ascaris* infestation and arsenic pollution in his home. He also had palladium toxicity from tooth fillings. As soon as they removed the mouse bait from their home, tore down the hallway wallpaper (arsenic source) and changed wells (the well water had arsenic in it from seepage!) and killed parasites, his cough was gone. He also finished his dental work. All this took six months.

Gene Mizell, age 4, was constantly clearing his throat. His parents wondered if it was a “nervous habit.” He had two species of *Ascaris* living inside his small body. He was started on a small dose of parasite herbs immediately, stirred into a daily dose of VMF syrup (see *Sources*). He also had PCBs, aluminum silicate, lutetium from recent painting in the house and xylene and toluene solvents. He was switched off soda pop and onto milk. We saw him five weeks later. He had gone through three treatments with vermifuge syrup. His throat clearing was gone, as well as his hacking cough and the blue circles around

his eyes. He still had PCBs, which they later cleared by switching off detergent.

Carmen Castro, 30ish, had a chronic cough without being ill. She also had some heart irregularity. She had *Dirofilaria* (dog heartworm) and *Loa loa*. There were no indoor pets. After killing the parasites with a frequency generator and starting on the parasite herbs she was still coughing a bit but her pulse was down to 80 (from 120). She still had toluene, TC Ethylene solvents and mercury, platinum and lead in her body. Then a gas leak developed in their home. She used mothballs and painted a room. After this she had to be on antibiotics for her extreme cough. This time she had *mycoplasma*, *Haemophilus* and influenza. She killed these electronically and her coughing stopped. Until she gets the dental work done she will continue to pick up new infections.

Hope Feldman, 57, had been coughing for half a year. She had seen many doctors including a reflexologist. She had *mycoplasma* and *alpha strep* at tooth #17 (lower left wisdom tooth). As soon as these were killed with a frequency generator her cough stopped. She was advised to wear turtleneck sweaters for extra warmth over her bronchi and get a cavitation cleaned at tooth #17.

Teresa White, 37, had bronchitis several times each winter and was put on antibiotic for the whole season to keep it from breaking out. Her lungs were loaded with tantalum from dental metal, cobalt from detergent and thulium from her vitamin C. She had taken herself off milk, thinking it might be a factor, and used an air cleaner but without results. As soon as she had the tooth metal replaced with plastic (in less than a month) she could go off antibiotics and also was rid of a chronic sinus condition, but still had a bronchitis bout. She had *Ascaris* larvae in her lungs and phosphate and oxalate crystals in her kidneys. Her diet was changed to include milk and fish, magnesium, lysine (500 mg one a day), vitamin B_6, and a vitamin A+D capsule. She started on the kidney cleansing herbs and then the *Parasite Program*. In another month the whole problem was gone. Wisely, she got ready to cleanse her liver.

Craig Stewart, 2, had a history of respiratory problems. He had been on Ceclor™ and Ventilin™ for a long time; he had pneumonia the previous year. He had whip worm (*Trichuris*) infesting his intestine, which was promptly killed with parasite herbs (as much as his parents could get down him was effective). He was toxic with asbestos. When the clothes dryer belt was changed to a U.S. variety (imported belts contain asbestos which flies into the air when the dryer is used), Craig's health turned around.

Doris Gumb, 26, was on Isoniazid™, Tussionex™ and Rifodin™ for tuberculosis. It started with coughing. She was down to 98 lb. in weight. Her lungs were toxic with beryllium (coal oil fuel), mercury, uranium, and tellurium. She began by clearing all toxic items from her house and basement and then bringing an air sample for testing. She also had *Ascaris* larvae in her lungs and pancreatic fluke in her pancreas. In three weeks she was coughing less and producing less with each cough. The “clean” air sample still had uranium, tellurium, mercury and beryllium. She had no metal tooth fillings, though. In the next three weeks she found a hole in the floor to the crawl space. It was letting up uranium dust and radon. The mercury was traced to the carpet in a child's bedroom. After throwing it out, her sputum cleared up and she was on the way to recovery, although we never found the source of tellurium.

Breast Pain

Although lumps and cancer in the breast produce no pain, they sometimes do give you little warning twinges. These twinges cross into the breast from the armpit or from any direction. It is gone in a second, leading one to believe it couldn't be serious. If the breast has any unusual sensations, painful or not, investigate immediately.

Test yourself for cancer. (You may use a specimen of mother's milk as a cancer test since this has mitotic stimulants in it—see Curing Cancer). If you have purchased a slide of breast tissue (mammary gland) you can search your breast for cancer. If not, but you find “mother's milk” in your white blood cells, assume it is cancer and clear it up immediately.

If you don't have cancer, search for the pollutants giving you these twinges of pain. Search for your deodorant, cosmetics, and soap in your white blood cells. Search for dental metal. The breasts are often full of nickel. Nickel is quite soluble in fat and the breast is mainly fat. Nickel is one of the top carcinogens listed by researchers. It could even explain the high incidence of breast cancer. But titanium and barium from cosmetics, as well as asbestos and fiberglass are also quickly accumulated in the breast. Clean up your dentalware and body products. Check for exposed fiberglass. Change your dryer belt. Buy a new non-CFC refrigerator. Never try to get rid of these pains with painkillers; let the pains show you whether the clean up has been complete.

Breast Sensitivity

Breast sensitivity can be quite uncomfortable to the point of not being able to wear a bra, especially near period time. It may be due to high estrogen levels; this is also conducive to breast lumps and breast cancer. The ovaries produce most of your estrogen before menopause and later by the adrenal glands. Too high estrogen levels plague the modern woman. Certain food molds, particularly **zearalenone**, causes over-estrogenization. It affects men too. I have found it in popcorn and corn chips! And brown rice. Stop eating these. Eat white rice. If you make cooked cereals be sure to add vitamin C to them before cooking (1/8 tsp. per cup), to detoxify food molds. I do not know whether taking vitamin C with your popcorn would detoxify zearalenone. Don't risk it. The excess estrogen compounds must be detoxified by the liver. Yet, the liver may be incapable of this because you ate yet another food mold! See the section on moldy food.

Over-estrogenized women are over-emotional, seemingly on a roller coaster of enthusiasm and despondence. They can develop a high-pitched voice, which almost sounds squeaky. High enough estrogen levels are important for fertility but too high levels can cause infertility. Your body is eager to set the level just right, if only you will clean up the ovaries of parasites and pollution. Don't stop your clean up until the breast feels normal again throughout your cycle and you

don't feel over-emotional, even just before your period.

Breast Lumps

Breast lumps may or may not be painful. If you feel one, don't wait to be more certain, don't wait to analyze it with tests, don't wait for a doctor's diagnosis or a mammogram. Obtain a frequency generator or zapper and zap yourself immediately. Also do the *Herbal Parasite Program* immediately.

Your body often turns the breast into a collecting station for toxic wastes that have been drawn downward from the top of your body. From your head where shampoo and hair spray and cosmetics leave their daily deposits, from your dentalware with its constant supply of heavy metals, from neck and armpits where cologne, deodorant and soap leave their toxic residues. The lymph nodes under the armpit and the region above the breast collect it all and let it slip into the breast where it is bundled up in a cyst. Perhaps the kidneys are clogged so toxins are forced to go to a designated dumpsite instead of out through the bladder. Do a *Kidney Cleanse*. Don't rest until all your breast lumps are gone. They will begin to shrink in three weeks if you are removing the correct toxins. Even radon and asbestos go to the breast, so be meticulous with your clean up.

When the platelet count (in a blood test) is very high (over 400) there is quite a tendency to form cysts or lumps since platelets make your blood clot. The platelet count goes up when parasites are present. Maybe your blood is attempting to clot them! These clots make “nests” for fluke stages, which may be why breast lumps often become cancerous. If yours is over 300, (it should be 250,000/cu mm) start patrolling parasites regularly. Stopping the use of caffeine and taking vitamin E (400 u. a day) are helpful in recovery but don't rely on these minor measures. Breast lumps definitely invite breast cancer.

Leslie Yeager, age 37, had breast soreness and “fibrocystic lumps”. She had cerium and nickel accumulated in her breasts. They cleared up in weeks after her dental metal was gone (she simply took out her retainer). Later she replaced it with a partial made of plastic.

Kari Pfeifer, age 36, had numerous cysts in both breasts and uterus. Her estrogen level was too high (187 pg/ml on day 22 of her cycle; the day of testing is important since it varies through the cycle). Her breasts were full of beryllium (coal oil from hurricane lamps) and radon. After these toxins were removed, all her breast lumps got smaller. After she did the *Kidney Cleanse* and *liver cleanse*, the lumps got softer and breasts were no longer painful. She had several root canals, which filled her breasts with numerous bacteria, mainly *Histoplasma cap* (root canals develop infection around themselves). After starting her *Dental Clean Up*and killing bacteria with a frequency generator, all her breast lumps disappeared.

Claudia Davis, age 41, had breast soreness ever since a mammogram two years earlier. She had numerous other pains and indigestion. She had intestinal flukes in her intestine and fluke eggs in her blood: a dangerous situation. They might land in the breasts and start developing there. This is how cancer begins. But she did not have cancer yet. She had a buildup of niobium from polluted painkiller drugs and thulium from her vitamin C. She had *Salmonella* and several other bacteria in her white blood cells, which accounted for digestive problems. In eight weeks she had cleaned kidneys, killed parasites and gotten rid of her heavy metals. Her breast pain was better and a lump on her eyelid had also disappeared.

Stephanie Nakamura, 68, had six surgeries to remove breast lumps, going back to youth. Her recent mammogram was O.K. Her breasts were toxic with cadmium, lead, gold, radon, uranium, gallium, silver. Our tests showed she had kidney crystals and she was started on the kidney cleanse. She was given vitamin E, (400 units daily), sodium selenite (150 mcg daily) and vitamin C (1 or more grams daily). Her triglycerides were also very high showing again that she had kidney problems. She was given magnesium (300 mg daily), vitamin B_6 (250 mg daily) and lysine (500 mg daily). She killed parasites and cleaned up everything except gallium, silver, mercury, gold, cadmium. These must have come from her gold crowns. Her dentist advised against removing these and proclaimed they had nothing to do with her developing glaucoma, arthritis and stomach ulcers. It was a tough decision for her and she made the wrong choice. Perhaps if she had been up for the next breast surgery she would have gotten those “gold” crowns replaced with composite too.

Heart Pain

Pain over the heart region is usually quite real, even though an EKG does not find any abnormality. The most common cause is *Dirofilaria*, heartworm of dogs. It often begins as a pain just above the heart but spreads itself over the whole heart region. Kill it with your zapper. Parasite herbs can also be effective. If you did kill them, the pain often intensifies for a day before it leaves. Then the pain should be completely gone.

Heartworm is very easy to pick up again. If you have had heartworm, you should no longer keep a dog for a pet. Give it away.

Another heart parasite, *Loa loa*, is also a filarial worm and may be the causative factor. Both *Dirofilaria* and *Loa loa* can be obtained as slide specimens to use for testing yourself. Heart muscle can also be obtained as a slide specimen, but a chicken heart from the grocery store or snippets of beef heart (make sure to sample all 4 chambers) will do.

Follow up on your heart, even when no pain remains. These tiny heart parasites have stages that you may not be able to purchase in slide form and therefore can't test for. These stages, if not killed, will become adults so a *Maintenance Parasite Program*, herbal or electronic, is essential. Virtually all dogs have *Dirofilaria* in spite of monthly medicine to kill it. They pick it up immediately after their last treatment for it and can give it to you again. The only way to live safely with pets is to give them parasite-killing herbs daily in the

feed.

Other heart problems such as irregular beat and mitral valve prolapse can clear up along with the pain. Or they may be due to bacteria (see Heart Disease).

Meredith Zackman, age 53, came for her diagnosed cardiomyopathy (heart disease). She owned a beautiful, old, very big dog, and of course she would never part from him. We knew she would lose her battle against heart disease. She had both *Dirofilaria* and *Loa loa*, which we killed instantly with a frequency generator. She was on Lanoxin™, Furosemide™, Captopril™ and Metoprolol™. We found she also had *Cytomegalovirus*, *Staphylococcus aureus*, *Streptococcus pneumonia* in her heart. The *Staph* bugs were also in tooth #17. She had copper in her heart (from tooth fillings) and cobalt and PCB from her detergent. There was zirconium from her deodorant and fiberglass from somewhere. Her pulse was typically in the 90's. Eight days later, after her dental work to replace metal was done her pulse was normal (low 70's), both worms were gone and she felt much better. But she still carried four bacteria, five viruses and two tapeworm stages: *Taenia solium* scolex in the spleen (she had chronic pain there) and *Taenia pisiformis* in the liver. She was started on Rascal (an herbal combination) for these. Six days later she had all of her problems back including *Loa loa*. She repeated everything, and then she had to go off her heart medications because they lowered her blood pressure and pulse too much. She started the dog on the *Parasite Program* but continued to be heavily laden with parasites and bacteria that always found their way to her heart. She purchased her own frequency generator and was quite faithful with dog treatments. She may outlive her dog and then regain her health, finally.

Bruce Walby, age 42, had chest pain for three years. We found he had *Dirofilaria* and *Loa loa* in all four chambers of his heart. When he zapped them, the pain left a day or so later.

D'Ann Fonties, age 22, had a lot of chest pain but was told by her doctor it was simply “gas bubbles”. She also had a serious digestion problem. She had *Dirofilaria*, high levels of styrene (from Styrofoam drinking cups) and benzene. This information delighted her and she planned to change her habits.

Sheila Osborn, age 27, had chest pain when she lifted objects. Her pulse was slightly elevated (81) and slightly irregular. She had *Dirofilaria*. Five weeks after starting the *Parasite Program* she was feeling much better but still had the chest pain. This time she had *Loa loa* (but not *Dirofilaria*).

Wendy Lewellen, age 28, had a chronic cough and chest pain at mid-sternum (the sternum is the bone attached to the ribs and runs up the middle of the chest). She had *Dirofilaria* in one chamber of her heart (right auricle). She had xylene and toluene solvents which came from her daily beverage, Mountain Dew.™ She was also full of asbestos from her trips to do laundry nearby (this could not be proved, but when she switched laundromats, the asbestos went away). Two months later, after killing parasites, she was free of heartworm and her cough and chest pain were almost gone. She was probably healing very slowly due to the asbestos, which was still present.

Lupita Cline, a young mother, had a chronic hacking cough and irregular heart beat. She had *Dirofilaria* in all chambers of her heart and *Loa loa* in her blood but not in her heart. She had carbon tetrachloride, propyl alcohol, hexanedione, toluene, and TC ethylene buildup from drinking Pepsi™ and Mountain Dew™. Her pulse was slightly elevated at 80. There were no pets in the house. She was started on the *Parasite Program* and two months later was rid of her heartworm but now had *Loa loa* in her heart and was still coughing a bit. She was full of platinum, mercury and palladium from tooth metal as well as vanadium from a gas leak in her home and paradichlorobenzene from using mothballs. She was on antibiotics for a “bronchial infection” and was happy to learn about a better solution.

Slow Pulse/Syncope (Passing Out)

Mason Heckler, 30s, was a mechanic by trade and could not afford to pass out on the job. Yet, it had been happening off and on for 10 years. He had acquired high blood pressure in his teens! This was soon followed by an extremely slow pulse (50 beats/min). No medicine worked (he had been tried on many) so he was on none. Then he got high blood pressure; it was 160/80 currently. He also had constant chest pain around the left nipple. He had heartworm and was started on the *Herbal Parasite Program*. He never had a dog. In five weeks his pulse was 72; the parasite was gone. I presume his syncopes were due to sudden blood pressure changes or missing a few heartbeats in a row. He began the *Kidney Cleanse* next to lower his blood pressure.

Chest Pain

When there is a tightness or just a little pain at the middle of the chest, especially under the breastbone, you may be merely having an allergic reaction. You might be feeling little spasms coming from the esophagus, and reaching up toward the throat from gallstones. You might also have HIV/AIDS disease which has a similar symptom over the sternum. So it is very important to pay attention to even a minor symptom in the chest.

Ruling out HIV disease ranks first in importance. Search for its emission at 365 KHz, or purchase a microscope slide with the dead virus on it as a test specimen (see *Sources*). Or purchase a set of slides representing all the stages of *Fasciolopsis buski*. Without this parasite you can't get the HIV virus. Purchase a slide of the thymus gland or make your own specimen of throat sweetbreads. Check yourself for benzene buildup in the thymus. (See *Using The Syncrometer®*)

If you have neither the benzene nor the parasite stages, you have no risk. Your chest distress is due to something else. Improve your air quality so that your lungs are not in distress. This includes radon, chlorine (from the bleach bottle under the sink), colognes, room fresheners as well as the usual pollutants (asbestos, arsenic, formaldehyde, fiberglass, Freon).

If you feel waves of pain reaching up to your throat, you probably have a gallstone stuck in a bile duct. Epsom salts can relax that bile duct in 20 minutes. Take a tablespoon in ¾ cup water but only on an empty stomach or you may feel quite ill. Taking a large dose of valerian herb (6 to 8 capsules) may also buy you a little time by relaxing the duct. If you do get relief, you can be sure it was a spasm of some kind. The magnesium in Epsom salts relaxes spasms. I would recommend cleaning the liver a number of times to try to dislodge the sticking gallstone. The instructions for liver cleansing advise you to kill parasites and cleanse the kidneys first. But if your throat pain is severe enough, you might just zap and go ahead with it at once.

Upper Back Pain

The main pain may be a dull ache over a shoulder blade, or between the shoulder blades or running right through you from the front to the back of the chest. These are all gallstone pains coming from the liver! Get yourself ready to clean them out. Clean the kidneys first, kill all the parasites that might be residing in the bile ducts and blocking them (flukes, pinworms and roundworms) and get onto a *Maintenance Parasite Program*. Then mark your calendar for your first *Liver Cleanse*. Even if your first cleanse gives you only a dozen bits of green “stuff” you have done well; you have accessed the bile ducts. The pains will probably be “magically” gone the next day, but they might start to return in two days. The bile ducts are having spasms again due to the remaining stones.

After you have cleaned out 1,000 or more, you will get permanent relief. Repeat every two weeks, unless ill, until the upper back pains are gone, permanently. If chest pain or upper back pain is severe, try going off your favorite high fat food (ice cream, butter, cheese). Also try taking 6 valerian capsules, 4 times a day including bedtime to relieve the spasms.

Shoulder Pain

Some shoulder pain is called *bursitis* and some is called *arthritis*. But it always derives from stuck gallstones in the bile ducts of the liver! You can prove this by taking a tablespoon of Epsom salts in ¾ cup water at 6 p.m. instead of supper and on an empty stomach (or you may feel quite ill). If some of the pain subsides then you have evidence as to its true cause, because Epsom salts relax the bile duct valves.

Get started cleaning the liver. By the time you have chronic or acute shoulder pain you have about 3,000 stones! Count them roughly, as they float in the toilet after the *Liver Cleanse* so you know how much progress you have made toward the final goal. Don't start cleaning the liver until you have killed parasites and spent three weeks cleaning the kidneys though. This improves elimination of liquid toxins so a *Liver Cleanse* is promptly cleaned up for you.

What emerges from the liver is the most contaminated mess imaginable, full of bacteria and viruses and parasite eggs and stages (all dead we hope) of every kind. It needs prompt clearing from your body. The diarrhea sees to the bowel elimination. But some toxins can only pass through the kidneys. Kidneys should

be clean and capable of doing the job. Remember it is unwise to clean the liver before all parasites are dead, especially flukes, because they produce a substance that inhibits any action of the bile ducts!

You are only one day away from freedom of shoulder motion and sleeping on your side again. Permanent improvement, though, depends on progress with your total stone count. Your bursitis can return in a few days or a few weeks. Be patient. You may only cleanse once in two weeks, and not if you are ill. After six cleanses you can be quite sure of being relatively pain free.

Between cleanses use valerian capsules to stop the spasms. It takes 6 capsules 4 times a day to be effective.

Typically only some bile ducts are spasming, and typically those ducts have a single fatty food trigger. Stop eating the high fat food you consume the most (it's probably your favorite). If that hasn't helped in two days choose a different high fat food to omit. The most common culprits are ice cream, potato chips, salad dressings, cheese, butter, cream, and milk.

Perhaps the pain is actually caused by bacteria living in the blocked bile ducts and invading the shoulder. This point has not been clarified. Using your zapper or frequency generator does no good for this pain. Only liver cleaning brings your shoulders back to their youthful mobility.

Upper Arm Pain

Excruciating pain in the upper arm soft tissues can keep your arm hanging straight down for fear of worsening it with motion.

Magnets of high strength (2x5000 gauss) taped to your arm, under your sleeve, can get you through the day. Also try valerian capsules (6 capsules four times a day). Go off all fat in the diet to let the spasm subside. Then start your *Liver Cleanse* at 6 p.m. If you used painkiller drugs during the day, the cleanse may not yield anything but it's worth a try anyway. You might be lucky and pop out the chief culprit stone. If not, you should wait several days before trying again; this time avoid painkillers the day of the cleanse. Be sure to zap parasites the day before or earlier.

Peggy Patton, age 60, had shoulder pain and painful feet in addition to aching all over. The aching was due to *Trichinella*, which both she and her husband had. It took six months on the *Parasite Program* before it stayed away. She had clay colored stools, evidence of bile duct blockage. Then two *Liver Cleanses* cured her shoulder pain, nausea and remaining pains. She started gardening again and immediately

picked up hookworms and *Trichinella* again. But she learned to sanitize her hands with grain alcohol after washing away dirt and this kept her parasites in check.

Jessica Atkinson, a middle age schoolteacher, developed a pain in the right cheek quite suddenly. She also had pain over the right mid abdomen and right side at the waist but X-rays and scans showed nothing (she had been X-rayed three times). She struggled for seven years to stay employed. She was having severe pain attacks over the liver and described her stool as almost white after these attacks. She cleaned her liver at least 30 times before she related, one day, that her joy in living had returned. Her gallstones were exceptionally large (½ x ¾ inch). Eventually the abscesses in her upper teeth were found, clearing up her cheek pain and protecting the liver from recurrent infections from these bacteria. Only then did she get permanent and complete pain relief.

Lisa Mattie, 72, had her right arm hanging limply by her side. It was so painful she bent forward to let it hang straight down. But in seven months she had done 6 *Liver Cleanses*, getting over 3,000 stones out. All pain was gone although some numbness in that arm persisted. She could also stop using Tums™, stop coughing, and no longer was bothered by her Hiatal hernia.

Elbow Pain

One variety of elbow pain is due to an inflamed tendon there; it is sometimes called “tennis elbow.” It is not due to playing tennis or any other arm use. The inflammation is caused by a liver full of stones and parasites, especially flukes that manufacture a chemical that affects tendons. Kill all flukes and cleanse the liver for quick relief. Using your elbows while they are inflamed is traumatic to them, like working with a sore thumb. Don't play tennis or do other arm exercises until they are pain free.

Parasites consume large amounts of your vitamins and minerals. Give yourself vitamin A (25,000 u daily), zinc (60 mg. daily), and B_6 (250 mg twice a day) until the pain is gone.

Wrist Pain

Tendons passing through the wrist can become inflamed from the unnatural chemicals produced by fluke parasites in the liver. Using the wrists to work further traumatizes them (injures them) making it harder for them to heal. A small hole between the tendons lets the nerve and blood vessels through into the hand. Fluke parasites also make chemicals that thicken tendons. When tendons at the wrist thicken, they can squeeze down on the nerves and blood vessels until the hand or fingers feel numb. If you have pain at the wrist or numbness in your hands, killing parasites and cleaning the liver may give you the permanent cure. Wearing a wrist bandage or support can help reduce trauma damage to the wrist while it is healing.

Numbness of hands, without wrist pain, is more often due to a brain problem with parasites and pollutants. Lead, mercury, fluke parasites are the usual culprits.

Thumb Pain and Hand Pain

…can be due to liver parasites. Get yourself ready for a *Liver Cleanse*. If the pain goes away beforehand, while you are on the kidney cleanse, it shows you had deposits in your joints. You were headed for arthritis in your hands. Read the information on arthritis to protect yourself.

Finger Pain

This is pain in a joint, often accompanied by some enlargement or knobbiness of the joint. It is not hard to recognize these as deposits of the same kind as we saw in the toes. You can test yourself to identify the variety. **Uric acid** and **phosphates** are the commonest types. Read the section on toe pain for detailed instructions. You can greatly reduce your finger joint deposits and the size of the knobs. In six weeks after starting the *Kidney Cleanse* and changing your diet, the knobs may already be shrinking. A large magnet (5000 gauss—used only as directed) may bring pain relief but only *Dental Clean Up* and environmental clean up will give you lasting improvement.

Back Of Neck Pain

The back sides of the neck seem to be highways that run between the teeth and liver. Both contribute to pain at the back of the neck. Pulling an infected tooth or cleaning a cavitation can bring complete relief, only to return the next time a tooth is extracted. Extractions should be followed by cleaning out the cavity created so an infection can't start here. Cleaning the liver can also bring immediate relief, only to find pain and stiffness to return months later. You must cleanse many times for permanent relief.

An allergic reaction to potatoes and tomatoes can express itself in neck pain too. When the liver can no longer detoxify the chemicals (solanine, etc.) in this food family they are free to roam the body with the circulation. Perhaps they prefer to attach themselves at a particular neck site and cause inflammation here. Perhaps an injury was already there, beforehand. Whiplash is often blamed for

back-neck pain and indeed chiropractic adjustments can bring total relief. Perhaps the trauma of whiplash first invited all of these contributors. Merely killing bacteria with a zapper is not long lasting. But *Dental Clean Up*plus liver cleansing is.

Front Neck Pain

Lymph nodes under the jaw strain your body fluids of the head, removing bacteria and toxins. They are sometimes called “neck glands.” If the stream of bacteria is endless such as when they are coming from a hidden tooth infection, the lymph nodes will enlarge to do a better job. They will also try to remove toxic metals, mouthwash, and toothpaste for you.

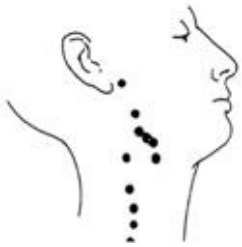

Fig. 26 Lymph node neck glands

To see what is affecting your lymph nodes, purchase a slide of lymph nodes. Since we have lymph nodes in many locations in the body, you can't single out the neck nodes for study. So you will get to see all the toxins affecting lymph nodes everywhere: PCBs in your underwear being removed by groin lymph nodes, lead in your intestinal lymph nodes from the water you are drinking, mercury in your neck lymph nodes from amalgam fillings. Eliminate all these. Don't rest as long as any of your glands are enlarged.

Roland Sanford, 23, had minor pain and a lot of stiffness along the sides of his neck. His arms had some numbness. He only had one metal tooth filling but his whole body was toxic with samarium, beryllium, indium, copper, cesium, and mercury. When it was replaced, his neck pain and numbness got better.

Audrey Doyle had severe neck pains she attributed to sitting all day and sleeping in her wheelchair. She had to take painkillers to get to sleep at night because they were so bad. She knew eating cream and butter made it worse but she had no will power, she said. After a *Liver Cleanse*, getting “thousands” of tiny stones, she was free of it...for one day! But it was enough to convince her and she was determined to be off painkillers.

Temporal Mandibular Joint TMJ) Problems

Pain at the angle of your jaw is not due to a poorly fitting joint. It fits perfectly but the muscles nearby are pulling it out of joint with their frequent spasms. There is always a hidden tooth infection present. Ask the dentist to search for hidden tooth infections and to clean your cavitations (you will need to find an alternative dentist, and read *Dental Clean Up*). Begin immediately to heal these bone lesions with vitamin D (40,000 to 50,000 units once a day for 3 weeks, followed by 2 such doses per week forever), milk-consumption for calcium, and a magnesium oxide tablet. (See bone healing).

Kill pinworms with a zapper or frequency generator in yourself and family members twice a week and keep everyone's fingernails short for extra hygiene in the family for a month to prevent reinfection. Pinworms can cause tooth grinding and contribute to TMJ dysfunction. For extra muscle relaxation, take two magnesium tablets at bedtime and valerian capsules.

Tooth Ache

Before the pain becomes acute and excruciating, kill bacteria of the mouth, including “tooth decay” and “tooth plaque” frequencies (see *Frequency List*). Make your dental appointment immediately. If zapping bacteria several times in a few hours relieves pain enough to get you through the night or past the weekend, do not delay a single day. Zapping does not reach into the middle of an abscess—it circles around, so some bacteria are left to repopulate.

Try to understand the problem. If there are teeth with root canals near the location of pain, extract them. The toxic materials of the root canal jeopardize your total body health. Removing them always helps and may let the jaw heal normally where they were extracted. Since the pain is caused by a bulging infection pressing on a jaw nerve, and because each tooth has a related organ(s) it is especially important to clear up all infections to protect these organs.

These relationships are not understood yet. Finding that teeth have the same tissue frequency as some distant organ sheds a little light on the situation. Until the meaning and function of these frequencies is understood we can only guess that they interact somehow. Bacteria have taken advantage of this common resonance and have invaded both organs.

Heart infection by *Staphylococcus aureus* is an example. It is a common heart bacterium, causing much of our heart ailments, particularly mitral valve disease and irregularity problems. They always derive from teeth, whether present or

missing! After wisdom teeth are extracted, the hole left in the jaw frequently does not heal, it picks up *Staphylococcus aureus* from the mouth and a chronic infection is started. For this reason it seems ill advised to pull wisdom teeth if it isn't necessary.

Another heart bacterium, *Nocardia*, can originate in the teeth. *Nocardia* can also invade the brain and nerves. Persons with Parkinson's disease always harbor quite a population of *Nocardia*. Zap all these bacteria before and after your dental visits. Remember that killing bacteria in itself is not a panacea. Pain and body damage will return unless you do the proper repair and clean up work.

Throat Pain

Recurring sore throats are always improved by removing dental metal and root canals, and by cleaning up hidden tooth infections. This is essential for a permanent solution. Bacteria and viruses that cause sore throats are thriving in hiding places under and around dental metal. It is quite difficult to reach the center of such places (abscesses) with electric currents. Even if you could, you would reinfect the very next time you ate non-sterile food! Zapping is not a substitute for cleaning up your dentalware.

Keep your neck warmer than would be perfectly comfortable, gargle with hot water to bring in extra circulation. Use zinc tablets (60 mg. see *Sources*) twice a day; suck on them before swallowing. After cleaning up dentalware you may never have another sore throat!

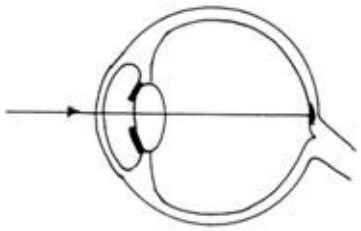
Children with recurrent sore throats usually do not have a dental problem. They invariably have an air pollution problem. Asbestos, formaldehyde, fiberglass, Freon and arsenic are the chief culprits. Clean these out of the house. Eating moldy food is especially conducive to respiratory illness. The immunity drop can last for weeks! Go off the moldy suspects to raise your family's resistance.

Eye Pain

…is caused by parasites.

The eye is a favorite location for many parasites, including *Giardia*, *amoebas, hookworm, schistosomes*, *Toxoplasma*, and innumerable others. The eye has two large bodies of watery fluid: the *aqueous humor* and *vitreous humor*, where no

blood traverses to bring in extra white blood cells when the need arises. It has its own protective devices, like tears, but some parasites, like *Toxoplasma*, have overcome all the body's defenses and regularly invade the eye if they get into the body somewhere.



Light travels through the cornea, through the aqueous liquid, the lens, and then the vast vitreous humor, finally striking the super sensitive spot on the retina, called the macula.

Fig. 27 Eye

We get *Toxplasma* from cats; the infectious stage is in cat feces. *Toxoplasma* infection could be the beginning of a lifetime of eye disease due to weakening of the eyes at an early age. *Toxoplasma* also invades the brain, frequently causing a dull ache or pressure at the back of the head. *Trichinella* is another common eye parasite, invading the eye muscles, so that a muscle is weakened and doesn't allow perfect alignment of the two eyes. Dogs and cats are the source of these.

There should never be a cat box in the house. Never let a child near a cat box.

By killing all the large parasites plus a few bacteria (*Staphylococci*, *Chlamydias*, *Neisserias*) the eye can become pain free in a few days. If pain returns, you missed something or reinfected yourself. Everyone in the family including pets needs to be treated for all the parasites. A person of low immunity should keep no indoor pets, since infecting yourself daily and then killing parasites daily is not a solution.

Herpes of the eye is not a single actor. The true host of this virus is a larger parasite, possibly a tapeworm stage. Tapeworm stages should be killed with an herbal preparation, Rascal, or with a zapper. (Not with a frequency generator. Only a zapper can kill all the segments and eggs at once, leaving nothing alive to wander about and find a new tissue to invade.)

Mary Rauch, age 60, filled a page with different pains and problems. Even her

eyes had a dull ache around and behind them, sometimes reaching to the back of the head. Her teeth hurt when she ate and she had been getting B_{12} shots once a week for 36 years for pernicious anemia. She was full of *Ascaris*, amoebas and pinworms that kept her legs twitching and jerking in bed at night, even waking her up. She was so much better after the *Kidney Cleanse* and *Parasite Program* she was eager to cleanse her liver. Before two months had passed her eye pain was gone.

Jessie Healy, middle aged and in good health otherwise, had carried the anxiety of having inherited *retinitis pigmentosa* for forty years. Now her drivers' license was in jeopardy due to fast progression of her disease. Numerous heavy metals had accumulated in her retina, including cerium from dental floss, arsenic from pesticide, tin from health food brand deodorant, PCB from skin salve, cobalt from dish detergent and indium from tooth metal. She had eight parasites in the retina including *Toxoplasma* from association with cats years ago. Removal of dental metal alone arrested the disease process. Two years later she was slightly improved and still driving her car.

Macular Degeneration

Dolores Bollapragada, 50ish, had suffered from clinical ergot poisoning in the past, which put her in a coma for several weeks. Ergot is a grain (especially rye) fungus, very toxic to the liver. Its byproducts are used in migraine medicine. She had overdosed, somehow. Perhaps her liver never recovered. It no longer detoxified solvents for her, allowing them to accumulate in her retina. There she had propyl alcohol, benzene, carbon tetrachloride, acetone, butyl nitrite, styrene, gasoline, wood alcohol, paradichlorobenzene (moth balls), pentane, methylene chloride and decane. She stopped snacking on cold cereal through the day. She had many habits and products to change. But she was determined to salvage her sight. She did.

Headache and Migraines

Headaches can take the joy out of living. They can lower your motivation level so low that you don't even want to do anything about them! People with daily headache deserve our deepest sympathy since they must carry on with life's daily duties in spite of it. Often, no medicine helps. Although there are common headaches, sinus headaches, migraines, and others, the causes of all overlap a great deal.

Tooth infection, urinary tract infection, bowel problems, and the wormlet, *Strongyloides* are the common causes.

There are also allergic connections, which include milk, eggs, citrus and salty foods. But the allergy-approach is difficult to put into practice. It is almost impossible to stay off these foods for long time periods. Eliminating bacteria and

Strongyloides leads to a permanent solution.

Possibly the parasite wormlet comes first, since even young children can suffer with migraines. *Strongyloides* is a microscopically small threadworm that horses are plagued with, but humans and our pets pick it up easily. Every migraine sufferer (100%) has high levels of this tiny worm. Perhaps it is really the special bacteria it brings with it that cause the blood vessels to seep or to spasm in the brain, causing pain. Zap it immediately.

Bacteria hidden under a tooth filling or root canal or in a space where once a tooth was pulled can be the cause. *Staphylococcus aureus* is a favorite, but various *Clostridia*, *Streps* and others are often seen, too. You don't feel pain from this small abscess because the pressure isn't building up inside it. It has found a way into your body—namely, your brain—so no pressure builds up to alert you! Find an alternative dentist with experience cleaning cavitations and finding small hidden abscesses. If you get immediate relief from dental work, only to lose ground again later, the abscess may have formed again (they are notorious for forming again). Go back to the dentist. Irrigate the dental wound site with white iodine (potassium iodide, 12 drops) or Lugol's (6 drops) to ¼ cup water using a curved-tip syringe.

Do not use iodine if you know you are allergic to it.

The colon is always a thriving mass of bacteria. It should be emptied at least twice a day to keep their levels down. Use the simple herb, *cascara Sagrada*, senna tea, or magnesium oxide tablets (2 to 3 a day) to help you eliminate frequently if your own regularity is lacking.

Gallstones in the liver and a congested liver are sources of bacteria, too. Do several *Liver Cleanses* and note the effect.

Is it the toxins made by bacteria or the inflammation from the bacteria or wormlets themselves that produces the headache? Certainly, one can eat the toxins by themselves in foods like yogurt, cheese, wine, and sour cream and develop "royal" headaches. Stay away from these **tyramine-**containing foods. Boil all your dairy foods to prevent *Salmonellas* and *Shigellas* from swimming into your beleaguered brain. Don't eat dairy foods that can't be boiled for ten seconds.

Begin by killing all *Strongyloides* and other parasites, bacteria and viruses with a zapper. Hopefully, this will only leave a few stragglers behind in

abscesses, gallstones and the colon contents. If the colon bacterium, *E. coli,* is your headache cause, start the *Bowel Program*. Search for the source of your *E coli* in food or polluted water. Stop reusing water bottles. Most people get their *Strongyloides* back in a few days from pets, other family members, and themselves! Zap every day for three weeks. Try to "clean up" family members and pets. Never let a horse or pet salivate on you. Never put your fingers in your mouth. Always sanitize your hands with grain alcohol after using the bathroom.

To summarize the steps to cure migraine headaches:

1. Kill *Strongyloides* and bacteria by zapping.
2. Do the Herbal Kidney Cleanse.
3. Clean up dentalware.
4. Do the *Bowel Program*.
5. Boil all dairy foods.
6. Do a Liver Cleanse.

This has never failed to substantially reduce migraine intensity and frequency.

Headaches are also caused by toxins in your environment; especially things you breathe in. Household gas is the most common offender. You don't smell it after you get used to it! Gas pipes are notoriously leaky. Conducting gases through pipes with joints in them, where gases could escape, must be the most ludicrous of all modern "conveniences". Would you try to conduct water through pipes with holes in them? You would soon see the water on your kitchen or bathroom floor. But gas doesn't land on the floor; it doesn't make a puddle, so you, the consumer, are left helplessly believing you don't have leaks. Every gas pipe that has a seam should have a clear plastic boot around it containing indicator compound to let it be known when gas is escaping. Other methods could be invented to make the gas utility safe. As you will see from the case histories, very many persons are living in a cloud of poisonous gas.

The telltale element is **vanadium**. When your vanadium test is positive, you have a gas leak that your body found, even though the gas company may not. Many gas companies use outmoded equipment to search for it. Four out of five gas companies miss the gas leak. Health Departments and building contractors use modern equipment that detects even the tiniest leak; call them.

If you are a headache sufferer, fixing the pipes is not good enough. Switch from fossil fuels to electric. There will be many dividends. (Remember not to use candles as part of your lifestyle, nor to be a smoker.) Your air needs to be clean: clean of perfumes and colognes, clean of potpourri and air fresheners, clean of air sprays, pesticides, formaldehyde, Freon, carpet and car odor, fireplace lighter, and of wood smoke.

Janette Donovan, age 52, had migraines every day but could not tolerate any medication for it. She walked about "like a zombie" most of the time. She frequently had vomiting with them. She was gassy, had pain in her right groin for many years and chronic bladder leakage. Our kidney stone test showed urate crystals. her urinalysis also showed urate crystals and a slight amount of blood, obviously chronic urinary tract infection. The parasite test showed *Strongyloides, Trichuris* and *Fasciolopsis buski* in the intestines. Her heavy metal test showed beryllium. This was tracked down to hurricane lamps that once held coal oil in them—it filled her house air unbeknownst to her. Thirty-five days later she had done an herbal parasite-killing program, done the kidney cleanse, cleared out the hurricane lamps and all fuel containers. Her headaches were "more like pressure" now than pain. She still had *Strongyloides*. Four months later she had some headaches still but not migraines. They were down to once a week. Three months after that she had done a *Liver Cleanse* and gotten abut 3,000 stones out! She was still getting some headaches. She tested *Positive* to *Histoplasma* and *Coxsackie virus #4* (a common brain virus) probably stemming from dentalware. She had many root canals and couldn't decide what to do. Keep her teeth and risk return of migraines; or get partial dentures. After eight months of indecisiveness she was back up to ten headaches per month, although not migraines.

Patsy Olsen, age 30, had migraines daily, frequently with vomiting. She had *Strongyloides* as well as *Ascaris*, and other bowel parasites as did her husband and two children. She couldn't tolerate any medication and had to give herself an enema daily for constipation. The whole family was put on parasite-killing herbs. A gas leak was found and fixed and the baby's diapers were changed to non-fragrant. Ten months later, the whole family still had *Strongyloides*. By one year she was experiencing a couple of good days a month although she still had *Ascaris, Coxsackie* viruses, and various tooth-related bacteria. Her two and a half year old had swollen neck glands, was toxic with bismuth from disposable diapers but did not have *Strongyloides*. The eight year old was also toxic with the lotions and fragrance of baby-stuff in the home; she was constantly congested and coughing but became free of *Strongyloides* in six months. After another ten months (the baby had been potty-trained meanwhile) the mother began to have headache-free days.

Donald Schaible, age 14, had migraines, learning disabilities and severe acne. The parasite test showed *Strongyloides*, *hookworm* and *Ascaris*. In spite of being on the *Parasite Program* two weeks and zapping, he still had *Strongyloides*.

Kenneth Jones had migraines for thirty-five years and had tried all the new medications. They worked for a while, then stopped helping, but he continued taking them anyway. He usually went to the emergency room for the really bad ones, once a week but lived with the constant daily variety. There were two house dogs. They and the whole family had *Strongyloides*. After cleaning up an asbestos problem, killing parasites for five months and clearing kidneys of urate stones, he was down to two to three mere headaches a week. Two months later, he was getting migraines again; they all had *Strongyloides* again. With renewed efforts, one month later his bad headaches were down to one a month, although his low level chronic headache persisted: they had the dogs on a strict schedule of parasite-killing herbs as well as themselves. He had not been to the emergency room for a month.

Angelina Gander, age 46, had daily headaches, not migraines. She also had persistent urinary tract infection and sinus infection. She was put on the *Herbal Parasite Program* and four weeks later was much better.

She also lost her chest pain due to heartworm and regained her milk tolerance.

Gracie Arlington had a boy age 6 who wet the bed, a girl age 8 with a behavior problem at school. She was stressed by an unfaithful spouse and thought she should go back to school for a Nursing degree so she could support the family. But she was getting two or three migraines a week in addition to colitis attacks which she feared would make her unable to study. The two cats, a dog, the children and herself all had *Strongyloides, Ascaris,* and a variety of other intestinal parasites. The humans were promptly zapped for parasites and the boy was dry that night for the first time in his life. A few nights later he was wet again. This time the animals were zapped and put on the *Pet Parasite Program*and the children's toileting was carefully supervised. When she dropped her extreme vigilance over all, they all relapsed. After a year of trying, they gave away their beloved dog, put the cat box in the porch and the mother did the cleaning herself but nothing prevented relapses. A half-year later, her six-year-old son asked if he could launder his own sheets and blankets. This request broke her heart and she planned to give away one cat. Even with only one cat, the girl's behavior and grades fluctuated extremely, the mother had a migraine a week and the boy wet. During a vacation the mother loaned the last cat, (her cat) to which she was very endeared, to a friend, to see if it made a difference. The boy never wet again, the girl made straight A's, and the mother's headaches became sinus headaches. Some intensive dental work cleared these up. She brought her Nursing diploma to our office two years after beginning. She should have had another diploma for **Intelligent Parenting.**

Earache

Earache is particularly common in children. Bacteria, mainly *Streptococcus pneumoniae,* have built up to a high level. Zap them. They were probably introduced by some larger parasite. But why did they multiply and thrive in your child's ear? There must have been food for them and protection from the immune system. Probably the Eustachian tubes are full of mucous, providing habitat. The mucous is present because some air toxin is irritating the sensitive linings. Clean up the air: not just asbestos, fiberglass, formaldehyde, Freon, and arsenic, but perfumes, fragrant school supplies, potpourri.

Being housebound, as in winter, makes the air-toxin problem worse. Use summer time to strengthen your child for the winter—spend summer outdoors. Always wash hands a lot. Stay away from moldy food. Give small doses of niacin (25 mg., niacin thins mucous so it can run away) along with vitamin C (250 mg.) at bedtime.

Putting in “tubes” is a short-term solution that is better than perpetually staying on antibiotics, but neither should be necessary.

To hasten healing, as soon as earache is suspected put room temperature olive oil in both ears, tug the earlobe to let bubbles out, and stopper them with cotton wool salvaged from vitamin bottles (other types are polluted with mercury). Put on a light hat that covers the ears.

When adults get earache, the *Strep*s are hiding under tooth fillings and in gallstones. Clean up these two sources and zap.

Drinking non-sterile milk adds *Salmonellas* and *Shigellas* to the *Strep* ear infection! Small wonder milk is thought to make people have mucous. The ears must now battle them, too. Even a few bacteria consumed in milk can start a whole colony if bowel bacteria have been disturbed by antibiotics. If your child has become “allergic“ to milk or gets mucous, remove cheese and ice cream—not milk—from the diet. Even cheese can be eaten if baked as in pizza or casseroles. Milk must be boiled. Try to reduce the child's *Salmonella* sensitivity by avoiding unnecessary antibiotics. Keep immunity high by avoiding moldy food!

Ear Noises And Ringing

This is also called *tinnitus*. A hissing or buzzing sound is heard in one or both ears. It can be continuous or pulsing off and on. It can be as loud as roaring.

Tinnitus is caused by three things acting in partnership: toxic elements, an allergy to *salicylates* (the aspirin family) and a bacterium *Streptococcus pneumoniae* (the pneumonia bug). This “bug” can be carried in the chronic state after a bout of pneumonia or what seems to be a head-cold. It is always present in earache. It is easily activated by exposure to cold wind or drafts and certain toxic substances. For this reason I recommend keeping the ears warm in winter by keeping them covered or wearing a cotton plug or ear-muffs. The *Strep* bug can also cause *Meniere's Syndrome*, congestion, loss of balance and chronic sinus problems. Often an antibiotic of the penicillin family helps immediately, and then loses its effectiveness. This shows you that bacteria are involved but cannot be truly vanquished with antibiotics.

Streptococcus pneumoniae often hides in pockets under infected teeth and in holes left where teeth have been pulled—especially wisdom teeth. These can be found by alternative dentists who clean these cavitations. *Strep* also resides in the liver; clean them out with liver flushes.

Certain foods and many medicines, especially cough medicine and lozenges contain salicylate.

To cure the tinnitus we must stop using aspirin or any high level source of salicylates. We must also stop the exposure to certain toxic elements—lead,

beryllium, zirconium, and benzalkonium. They are present in the air at gas stations and in many of our body lotions, soaps and salves. Switch to safe varieties. Niacin tablets, such as 100 mg, taken three times daily are another treatment, intended to increase the blood supply to the inner ear. Taking a thyroid tablet, by prescription, often helps too.

These methods never fail to improve tinnitus but a complete cure is seldom possible.

William Thall, 47, had a headache daily and was on pain medicine for it daily. He had tinnitus, a loud humming noise in the right ear. He had *Shigella* (producing nerve toxins) and *Borellia* (Lyme disease virus). He had *Gaffkya*, a respiratory bacterium under two wisdom teeth (right side). He also had *Campylobacter* and *Anaplasma* growing on him somewhere. He had *Strongyloides* too. He was toxic with vanadium (gas leak) and asbestos. After ten weeks he had two cavitations on the right side of his jaw cleaned, he had been on the *Parasite Program* and his tinnitus was gone, (he still had occasional headaches indicating he still had some *Strongyloides*).

Billie Scott, 26, had a history of ear problems, and lots of headaches. She was started on the kidney cleanse. Then she added the *Parasite Program* including their two dogs. She had a cyst in her left buttock, due to PCBs traced to the well water. She stopped using this well and switched off detergents for laundry and dishes. She switched off soda pop, onto milk. In 3½ months her tinnitus was gone and the cyst was shrinking.

Larry Pelegrini, 59, had tinnitus in both ears but was otherwise a strong, tall, intelligent person, who cared for sick people, whether family or not. As soon as he saw how simple it was to kill invaders with a frequency generator, he bought one. Preventing their recurrence was his big challenge since he had neither the means nor insurance to do dental work. He was toxic with aluminum, copper and PCBs. After switching to borax for all washing purposes, he got rid of aluminum and could feel his memory improve. The kidney herbs cleared him of uric acid and oxalate and he felt more supple. He had to go off his favorite beverage to get rid of pentane and methyl ethyl ketone. Twice a week he killed two dozen parasites and bacteria, that just seemed to pop up from nowhere, in order to feel better and reduce his tinnitus. But he lived alone, had to cook, garden, take care of animals and his sick friends, which gave him a lot of parasite exposure. Sometimes he would be toxic with arsenic (a new pesticide he tried out) or vanadium (gas leak) but mainly it was tooth-filling metal. If only this wonderful man could afford his dental work: what a blessing to society he could be for a long time to come.

Scalp Pain

Infection anywhere in the head can cause sensitive scalp and scalp pain. Even a common cold can cause bouts of scalp pain. Clean up your dentalware and environment.

Lumps on the scalp are often called *sebaceous cysts;* actually this is where your body has sequestered PCBs (polychlorinated biphenyls, extremely hazardous, now banned in the U.S., but often a pollutant in detergents.) Get rid of them by switching off detergents for all purposes. See *Recipes* for dishwasher liquid, dishwasher detergent, and laundry detergent replacements.

Non-Painful Diseases

Explanations for many of these “mysterious” diseases become rather obvious when you see a **common parasite, or pollutant, or both** consistently show up in case after case.

Diabetes

All diabetics have a common fluke parasite, *Eurytrema pancreaticum*, the pancreatic fluke of cattle, in their own pancreas. It seems likely that we get it from cattle, repeatedly, by eating their meat or dairy products in a raw state. It is not hard to kill with a zapper but because of its infective stages in our food supply we can immediately be reinfected.

Eurytrema will not settle and multiply in our pancreas without the presence of **wood alcohol** (methanol). Methanol pollution pervades our food supply—it is found in processed food including bottled water, artificial sweetener, soda pop, baby formula and powdered drinks of all kinds including health food varieties. I presume wood alcohol is used to wash equipment used in manufacturing. If your child has diabetes, **use nothing out of a can, package or bottle** except regular milk, and **no** processed foods.

By killing this parasite and removing wood alcohol from the diet, the need for insulin can be cut in half in three weeks (or sooner!).

Be vigilant with your blood sugar checks. The pancreas with its tiny islets that produce insulin recovers very quickly. Even if 90% of them were destroyed, requiring daily insulin shots, half of them can recover or regenerate so insulin is no longer necessary. The insulin shot itself may be polluted with wood alcohol (this is an especially cruel irony—the treatment itself is worsening the condition). Test it yourself, using the wood alcohol in automotive fluids (windshield washer) or from a paint store, as a test substance. Try different brands of insulin until you find one that is free of methanol.

Artificial sweeteners are polluted with wood alcohol! Instead of helping you cope with diabetes, they are actually promoting it! Do not use them.

Drugs that stimulate your pancreas to make more insulin may also carry solvent pollution; test them for wood alcohol and switch brands and bottles until you find a pure one. You may not need them much longer, so the extra expense now may soon reward you.

Many persons can detoxify the amount of wood alcohol that pollutes our foods. They do not have a food mold, **Kojic acid**, built up in their bodies as diabetics do. I have found Kojic acid in coffee, and potatoes with gray areas inside. Do not eat discolored potatoes or peels, even if cooked or baked. Being able to detoxify a poisonous substance like wood alcohol should not give us the justification for consuming it. All poisons are bad for us. Do not consume them.

All diabetic persons also carry a virus, *HA virus* in the pancreas. This virus grows in the skin as a wart but is spread quite widely in the body such as in the spleen or liver besides pancreas. It is not necessary to kill this virus since it disappears when the pancreatic fluke is gone. The HA virus undoubtedly belongs to the pancreatic fluke. The question can be asked: Does the fluke or its virus cause diabetes? There might even be a bacterium, so far missed in our observations, that is the real perpetrator.

There are additional aspects to diabetes that have been studied by alternative physicians. For instance, allergy to wheat and other grains containing gluten is common. Perhaps the pancreas and its islets would heal much faster if grains were out of the diet for a while. Perhaps the 50% improvement that is consistently possible just by killing parasites and stopping wood alcohol consumption could be improved further by a month of grain-free diet. Eating **fenugreek seeds** has been reported to greatly benefit (actually cure) diabetes cases. Are they a specific fluke killer, virus killer, or neither? It seems like a good idea to add this to your diet if you are a diabetic. Wood alcohol also accumulates in the eyes, and there is a connection between diabetes and eye disease. **Bilberry leaves** are an herbal treatment for both diabetes and weak eyes. Do they help by counteracting wood alcohol or detoxifying Kojic acid? Make a tea for yourself, using ¼ cup leaves to three cups water. Drink ½ cup a day. **Chromium** is another must for diabetics (200 mcg three times a day). It helps insulin enter your cells.

While recovering from diabetes, it is very important to check your blood sugar every day. Improvement is so rapid, you may suddenly be over-insulinized by your next shot. Cut down your dose to suit your actual need.

Gold is attracted to the pancreas. Heavy metals should be removed from dentalware including all gold crowns and no metal should be worn next to the skin as jewelry, including all gold items.

Blythe Jenkins was on Micronase™ (5 mg) daily for her diabetes but she still had a morning blood sugar of 183. She had pancreatic flukes and sheep liver flukes in her pancreas, vanadium (a gas leak) in her home and cadmium in her water (old pipes). After killing parasites and cleaning kidneys her morning blood sugar was down to 148. She also got rid of her hot flushes, groin and leg pain. This encouraged her so much she did the rest of her body clean up and could go off her medicine completely.

Robert Greene, age 65, had been on insulin five years already, getting two shots a day (25 u each), and even this was not controlling his blood sugar, which was 288 in the morning. He was raised to 30 units without much improvement. His legs and feet were too painful to walk without a walker to lean on. He had *Loa loa* in his pancreas. (This is another example of a parasite going to the "wrong" location, this time the pancreas instead of the heart. I believe the solvent makes this possible.) Also *mumps virus*, *HA wart virus*, *mycoplasma*, *flu virus, chicken pox virus*, *adenovirus* and *Shigella*, all making their home in his pancreas! This was possible because he had wood alcohol accumulated there, from drinking various beverages and using artificial sweetener. As soon as he stopped this practice and killed everything with a frequency generator his blood sugar fell below 100 in the morning and he had to reduce his insulin to 20 units. He was also on chromium 200 mcg (2 three times a day). Meanwhile, he cleared 2,000 stones out of his liver. He could now walk well again and decided to take a part time job. The whole process took one year.

Ralph Dixon, age 72, had been switched to 30 units of insulin, once a day, after six years on pills for his diabetes. He still had a fasting blood sugar of 242. He had the pancreatic fluke and a host of bacteria and viruses in his pancreas. He had a poodle. After killing the pathogens and cleaning his kidneys, his blood sugar dropped so he cut his insulin to 25 units (blood sugar was at 111). Soon he had to cut it to 20 units. He was also on chromium 200 mcg (2 three times a day), manganese 50 mg. (one a day), fenugreek capsules (2 a day), and bilberry leaves, each supplement by itself. He also lost his angina and fatigue with all this body cleaning. But if he went off the *Maintenance Parasite Program* he would promptly get a spike in his blood sugar, showing how easy it was for him to reinfect and how new parasites would immediately find his pancreas.

Melissa Bird, 54, had major illnesses including heart disease (2 angioplasties), numerous other surgeries and diabetes. She took 15-18 units of insulin once a day. Besides pancreatic flukes in her pancreas, she also had intestinal flukes there, plus widespread *Ascaris*! She also had warts and candidiasis. Fortunately there were no pets. Her parasites were instantly eliminated with a frequency generator and she was started on kidney herbs for her other problems. Seven weeks later she stated she had to cut down her insulin because her morning blood sugar had dropped to 90. Then she eliminated the decafs and artificial sweetener that were giving her wood alcohol, started the parasite herbs and did a *Liver Cleanse*. The day after the *Liver Cleanse* her blood sugar went up to 164 but was completely normal after that (under 100) and she did not dare take any more insulin or pills. We advised her to keep monitoring her blood sugar and be very, very vigilant and to please stop smoking.

John Angert, 65, was not on any medicine in spite of his diabetes. He was too embarrassed to tell us his blood sugar. He had a long list of other health problems, too. He was toxic with thulium (vitamin C) and palladium (from tooth fillings). He had a variety of parasites. After doing some dental work and parasite-killing his fasting blood sugar dropped to a normal 98. But his leg cramps kept returning in spite of doing a *Kidney Cleanse*. Only after changing his diet to include milk did the phosphate crystals stay away and eliminate his cramps.

Cornelius Edens, age 33, came for his diabetes, although he also had fatigue, digestion problems, and headaches. He had numerous other minor symptoms like chest pain over the heart, soreness in testicles,

etc. His diabetes was only diagnosed one year ago. He was on insulin (Humulin™ 20 long acting plus 6 regular units) in the morning. He often omitted the evening dose, which should be 14 long plus 6 regular. This brought his fasting blood sugar down to 166 in the morning.
He had pancreatic flukes in his testicles besides in his pancreas. His aflatoxin level was very high; he was told to stop eating grocery store bread, eat bakery bread only. He had silver, nickel and very high levels of gold—probably all three coming from his gold crowns—he was to have them all replaced with composite. He had fiberglass in his pancreas. Wood alcohol was present in large amounts in his pancreas as expected. He was to stop drinking all store bought beverages, whether frozen, powdered, or ready to drink. He did not test *Positive* to benzene, propyl alcohol, *Salmonellas*, *Shigellas*, or *E. coli*. But he had *Staph aureus* growing at high levels in his pancreas. The usual source for this is in teeth, so he was told to ask his dentist to search for cavitations and clean up hidden tooth infections while replacing the gold crowns. He was to find the exposed fiberglass and seal it off. He was to zap parasites every other day for 1 month. His supplements were vitamin C (1 tsp. with each meal for constipation; then 1 tsp. daily), vitamin B-50 complex (2 per day), thioctic acid (2 per day). He was to start the *Kidney Cleanse* recipe for his testicle problem, and after 6 weeks do a *Liver Cleanse*. He was to follow up with us in 3 weeks, after dental work was completed. He never returned. Four months later we received a phone call he was too embarrassed to make himself. He needed no insulin and was doing fine. Another 3 months later he was still doing well, and off insulin.

Pre-diabetic

Alyce Dold, 64, came because she was worried about her blood sugar and chest pain. Indeed, a blood test showed her fasting blood sugar to be 136, just beginning to show insufficient insulin production by her pancreas. She had pancreatic flukes and wood alcohol there, also mumps virus and HA virus. She had six more solvents accumulated due to eating raisin bran and other cold cereals each day. She was glad to be forced off this routine: she switched to 2 eggs every other day with biscuits or bread (not toast) and cooked cereal in between. Her chest pain was due to dog heartworm and *Staphylococcus aureus* bacteria that originated at teeth #16, 17, 1, and 32. The worms and *Staph* were killed with a frequency generator. She was referred to a dentist for cavitations and started on kidney herbs. Two weeks later, there was still a little residual heart pain due to *Staph*; dental work was not yet done. She was given chromium (600 mcg per day) to help her insulin regulate sugar. Her LDH (See tests) was still high from the recent heart stress, no doubt. But she had accomplished a lot and planned to get it all done.

Diabetes Of Childhood

The problem is the same for diabetes of childhood as for diabetes of later onset, but much easier to clear up, provided the whole family cooperates.

Wesley Evanco, age 6, had his onset at age 11 months. Prior to that he had chicken pox and his baby shots. He had pancreatic flukes and their reproductive stages in his pancreas as well as wood alcohol. He had no other solvents accumulated. The problem was clearly due to these two enemies of his small body. Wesley's father did not have pancreatic flukes but his mother had very high levels, along with wood alcohol. She had to clear hers up before Wesley could recover. She chose not to. She couldn't believe the connection. Our most persuasive efforts were not successful. We hope Wesley can forgive us all in due time.

Herpes

The *Herpes* family of viruses includes *Herpes Simplex Virus* (HSV) 1 and 2,

Epstein Barre Virus (EBV), shingles or Chicken Pox (*Varicella zoster*), *Cytomegalovirus* (CMV) and some newly discovered ones.

Herpes simplex virus 1 is the virus that breaks out around or inside the mouth. We call it a cold sore because it often follows a cold in childhood. As children, we may get HSV 1 once or twice each winter. When they come more often the child's immunity is low. Adults who get repeated attacks also have low immunity (this is obvious from a blood test where the white blood cell count is less than 5,000 per cu mm).

Herpes simplex virus 2 breaks out in the genital area. It is often blamed on promiscuous sex but I believe it has quite different origins.

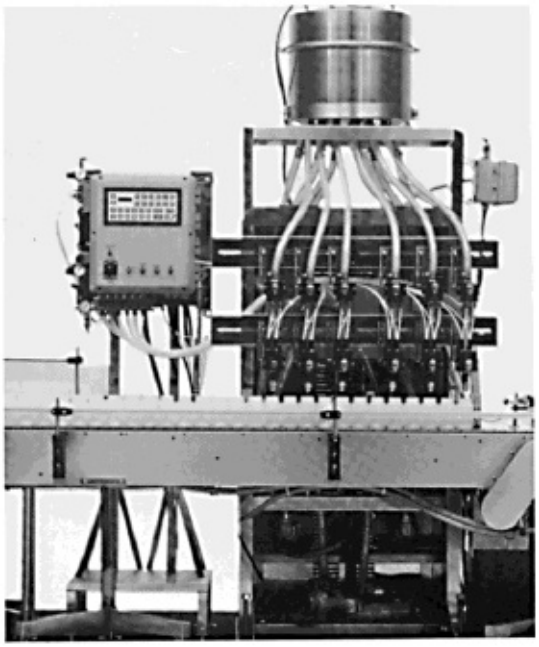
I believe the virus is introduced to our bodies by another large parasite. Perhaps it is pinworms, or *Ascaris*. Perhaps it is a tapeworm stage, picked up from dust and dirt.

I have some evidence that it is released from dog tapeworm stages when these are being killed by your immune system. It is probably the same tapeworm stage as releases the *Adenovirus* (cold virus) that would explain why children frequently get “cold sores” during or after a cold. (See Curing The Common Cold.)

Nevertheless, you would not get sick from these viral releases unless your immunity was lowered.

Herpes lives in your nerve centers (*ganglia*) and it is from here that you can be attacked after the initial infection. Evidently your immune system can destroy them as quickly as they emerge. But a meal of **aflatoxin** or other **moldy food** suddenly “gags” your white blood cells and lets a viral attack happen.

The viruses can also be “triggered” which lets them out of hibernation (latency) to multiply and travel along the nerve fiber to the skin. Triggers are things that put these nerve centers to work: sudden cold and heat, trauma from chafing and friction. Never drink water with ice cubes in it. Never eat hot soup with a metal spoon. Don't tweeze hairs.



Machinery should be rinsed with ethyl (grain) alcohol, not propyl alcohol or wood alcohol.

Fig. 28 Bottling equipment

Begin your prevention program by raising the immunity of your skin; this means removing all toxins from the skin. Use only natural lotions, softeners, cleansers on your skin made from recipes in this book. Health food brands are not superior. This will get rid of nickel, chromate, titanium, zirconium, aluminum, and benzalkonium from your skin and probably your whole body! Do laundry with borax and washing soda, only, to eliminate commercial detergent as a source, too.

As soon as you feel that warning tingle or sensation of *Herpes*, zap or use a frequency generator at 293 and 345 KHz (HSV 1) or 360 and 355 KHz (for HSV 2). Immediately take a **cayenne** capsule and 8 **lysine** tablets (500 mg each). The cayenne slows down travel of the virus along the nerve.

Attacks probably occur when the triggers act at the same time as an immune drop occurs. Immune drops happen frequently due to eating moldy food. Of course, mercury in amalgam tooth fillings keeps immunity chronically lowered. Many persons report they stopped breaking out with *Herpes 1* after replacing their amalgams. Stopping wearing tight synthetic underpants helps reduce *Herpes 2* out breaks.

When you get an outbreak, mop up a droplet of the blister fluid and prepare it

as a specimen for yourself. If you search for it in your white blood cells when your attack is over, it will not be found because it is in hiding inside your nerve cells. Zapping does not reach them inside your own cells. Nevertheless, you can totally eliminate them by repeated zapping provided you kill them at their earliest warning. Evidently, they haven't multiplied yet, so gradually their numbers go down.

Even after you have been *Herpes* free for a long time, stick to your preventive principles. Avoid the trigger foods, peanuts, and chocolate, or be ready to zap. Avoid cold wind or direct sunlight on your face. Don't eat abrasive or acid foods like popcorn, nuts, toast, crackers, candy, citrus. Although you may stop the virus in its tracks by zapping, healing the lesion takes time. Keep the skin softened with a cornstarch or sodium alginate recipe (see *Recipes*).

A lysine mush helps too: crush a lysine table with a large wooden spoon, add a pinch of vitamin C powder and a pinch of zinc oxide. Save part of this mixture for later use. Wet a small bit of it with a few drops of water to make a paste. Apply to lesions.

Bazezew Hailey, 38, started breaking out in the genital area after a period of antibiotic use. She was started on lysine (500 mg, 8 a day), cayenne caps (one with each meal). She was to fill her prescription for Zovirax™ from her doctor, though. By the time she had it filled, the next day, her lesion had stopped enlarging, and she could reduce her supplements. Her skin was full of mercury, lead, strontium, and aluminum. Her white blood cell count was low, showing low immunity. Her ratio of segmental to lymphocyte white blood cells was low, evidence for a chronic viral condition. Her bone marrow contained lead and radon. She stopped using toothpaste (strontium), salt, deodorant, and detergents (aluminum). She got the metal out of her mouth and eliminated her radon problem by opening crawl space vents. The lead source was never found, but after she moved to a new house it went away. *Herpes 2* stayed away. A year later she still hadn't opened the Zovirax™ bottle.

Fatigue

Fatigue, whether minor or extreme, is always associated with blood sugar disturbances. The more disturbance the more fatigue. We have three organs that do most of the sugar regulating: our **adrenals**, the **liver**, and the **islets in the pancreas**. In severe fatigue, that keeps you partly bedridden, all three organs are heavily parasitized. *Epstein Barre Virus* (EBV) is running amok in your body, as a rule, even when clinical culture techniques cannot find it. With your frequency generator and Syncrometer® you can find it emitting at 380 KHz. Killing the viruses is not as important as killing the larger parasites and getting your organs functioning for you again. The viruses will go away by themselves.

The liver's role in blood sugar regulation is to get it out of storage when needed. When sheep liver flukes have taken up residence they're spewing their chemicals as well as their own bacteria and viruses into your circulation; it is surprising that the liver has any sugar in reserve and can function at all. Sheep liver flukes are commonly seen in fatigue syndrome cases.

The adrenals (the outer layer called the cortex) help to regulate the blood sugar in a complex way. Some adrenal factors influence the thyroid, which is another energy-related organ. Both adrenals and thyroid have toxic buildups in fatigue cases! Their work is hampered.

The heart of sugar regulation is in your pancreas in the tiny islands of cells that secrete insulin, called the *islets of Langerhans*. Here we always find the pancreatic fluke in residence. It actually breeds there when wood alcohol accumulates in it. Wood alcohol is a common pollutant of food, even in artificial sugar, which is often recommended to replace real sugar and spare the pancreas. There is wood alcohol in store-bought drinking water, fruit juice, and powders, meant to be stirred into beverages, even if they are health food varieties. It's probably being used to clean tubes and hoses in the manufacturing plant. The only beverage you can safely buy (not safe unless you sterilize it, though) at a grocery store is milk. Make your own beverages using recipes in this book.

Your first step toward curing your fatigue syndrome is to kill the pancreatic fluke and all other living invaders of the pancreas, liver, adrenals and thyroid. Use a zapper. Drink milk or buttermilk for several days afterward to provide lactic acid for the “good” bacteria to feed and recover on.

Your second step is removing metal from your mouth, particularly gold. Gold from teeth and jewelry readily goes to the pancreas! Do everything in the *Easy Lifestyle Improvements* chapter.

Your energy can bounce back in a few weeks by attending your liver, adrenals and pancreas. Help these organs heal and grow strong again. Avoid food molds (read Moldy Food). The most powerful assistance to the liver is a cleanse. This will eliminate liver viruses such as EBV and *Cytomegalovirus* (CMV). Be patient. Do it on a schedule until you have over 2,000 stones out. Take **vitamin C** at least 3 gm/day, to help both liver and adrenals. Take **B_2 and B_6** to help adrenals and kidneys. Take glucose tolerance factor, **chromium** (two 200 mcg tablets 3x/day). See *Sources* for all of these. Take these supplements for three weeks, then cut the dose in half, and take on alternate days only, as a hedge

against possible pollution in these.

Although your energy may be normal in three weeks, you are at higher risk for fatigue than the average person. Reinfection with anything will put the new parasites right back where the old ones were. Other bacteria, solvents and toxins will head for the pancreas, liver and adrenals again because these are weakened organs. It could take two years to build your health to its previous level, but is well worth it to have youth, initiative, and a beautiful appearance again. Going back to school is a good use of your time when your initiative has returned but your physical strength is still not up to housework or a job. When your energy comes back to you, it is tempting to overwork: to clean the whole house or to get into some gardening.

It is better to be moderate today than in bed tomorrow.

Anyone who has suffered from Chronic Fatigue Syndrome (CFS) or recurrent EBV has learned that lesson well.

June Timony, age 38, was diagnosed with Chronic fatigue Syndrome), EBV and *Candida* around 1½ years ago by her family doctor. She also had a thyroid problem and a high estrogen level (165 pg/ml). She had severe depression at times. Our test showed her body was full of bismuth (fragrance) and silver (tooth fillings) especially in the ovaries. She cleansed her kidneys and killed parasites but could not make up her mind to do the expensive dental work.

Janice Brown, age 21, had EBV with chronic fatigue and depression along with a dozen more symptoms. Her skin, kidneys, breasts, brain, ovaries and pancreas were all loaded with mercury, platinum and other metals. She was full of radon and bus exhaust and the plumbing was shedding cadmium. Rather than do all this she and her husband decided to move. Before the moving date arrived she had cleansed kidneys, killed parasites and done dental work and was feeling noticeably better. Then they moved. She immediately was very fatigued again and worried that the move had been in vain. This time she had a liver full of *Salmonella* and a return of phosphate crystals in her kidneys. But it was easy to clear up and it was a very useful lesson to her to avoid unsterilized dairy products. She was much more careful after this.

Dee Safian, age 36, came especially for her low energy. She had EBV once. It left her extremely nervous. We advised going off caffeine but not substituting for it by drinking decafs. Her tissues were full of arsenic from pesticide; her urinalysis showed kidney crystals and her eosinophil count was high 5.5% (parasites). She had sheep liver flukes and stages in her pancreas due to a buildup of wood alcohol there. In four months after killing parasites and doing a *Kidney Cleanse* she was much improved.

Josefina Linzer, age 32, came for her fatigue and depression. Her tissues were full of arsenic, PCBs, chromate (eye makeup), mercury, yttrium, radon and terbium. She needed tooth metal replacement but could not schedule it immediately. She had *Ascaris* and pancreatic flukes in her pancreas and reacted to sugar in her diet quite strongly, so avoided it. She also had *Strongyloides* and *Trichinella*. She killed all these with a frequency generator and started on the kidney herbs. Her wood alcohol buildup was coming from carbonated beverages. She went off. In 6 weeks she had done everything except the mercury removal and was feeling much better.

Brigette Dawn, age 21, had Chronic Fatigue Syndrome with EBV, along with other problems. She cleaned her home and cleansed kidneys, killed parasites, and did two *Liver Cleanses*. Still the fatigue would return two days later. Meanwhile, though, her infertility problem got solved (she got pregnant) and this encouraged her to continue the battle against fatigue after the baby was born.

Hector Garcia, age 14, was getting gamma globulin injections every three weeks for his chronic fatigue syndrome. He had pancreatic flukes in his pancreas, sheep and human liver flukes in his liver and intestinal fluke in his intestine. He had a buildup of benzene, propanol, and carbon tetrachloride, as well as aflatoxin from his granola breakfasts. He also had *Candida* and measles in his white blood cells. He killed parasites with a frequency generator and went off the solvent polluted items in the propyl alcohol and benzene lists. He immediately (in 20 days) felt much better.

Dana Levi, age 16, had chronic fatigue syndrome and dizziness; he was not in school. He had pancreatic fluke in his pancreas, sheep, human and intestinal flukes in his liver! Both benzene and propyl alcohol were present in his immune system. As soon as the parasites were killed (with a frequency generator) and he changed a lot of his products, he felt better but soon lost his improvement. At the next visit, our tests showed a buildup of vanadium (from burning candles in his bedroom). When he stopped this, he was better again for a while only to relapse again. His propyl alcohol level was up as was aflatoxin. But getting a taste of normal energy gave him the determination to get himself well! He embarked on a *Liver Cleanse* program and still more careful food selection.

Dennis Dillard, age 16, was beginning to do poorly at school due to fatigue. He had to stop athletics although his regular doctor pronounced him well. He was also getting chronic sinus infections. His lungs and trachea had accumulated seven heavy metals: vanadium, palladium, cerium, barium, tin, europium, beryllium. His fasting blood sugar was low (73 mg/DL) and LDH very low (90 u/L; it should have been 160). The body makes LDH in response to lactic acid levels. When the muscles aren't making much lactic acid from their normal metabolism, LDH levels will fall too. Was he developing a muscle disease? The gas leak was fixed (vanadium), the garage was sealed off from the house to eliminate barium and beryllium but the other toxic elements came from his dental retainer. As soon as his retainer came out, and they stopped using flea powder on their dog, his energy became normal and sinuses cleared up. A year later he still had not been ill.

Evelina Rojas, age 12, was having extreme fatigue with mood problems and sudden fevers. She killed *Ascaris* and sheep liver flukes with the *Parasite Program* but promptly got them back due to a benzene buildup I believe due to using products containing an herbal oil. Her high levels of *Streptococcus pneumoniae* (cause of fevers), *Staphylococcus aureus* and *Nocardia* could not be eliminated until her three baby teeth (with root canals) were pulled. After that, she was well.

Elaine Perkins, 48, came specifically for her low energy and nervousness. She was toxic with arsenic, a substance that replaces energy with nervous excitement and exhaustion. She also had a backlog of antimony (using baby oil), aluminum, rhenium (hair spray), benzalkonium (toothpaste) and radon. In four months, she had the arsenic and three other toxins eliminated and already had more energy.

Neil Youngblood, 53, was so fatigued, he had to brace himself even while sitting. A blood thyroxin level (T_4) of 1.0 instead of the normal 7.5 mcg/DL explained his fatigue. He had a mouthful of assorted dental metals which were accumulating in the thyroid, inviting viruses, particularly CMV, into it. He had to be on four grains of thyroid to feel near normal. After he had all his tooth metal removed, he only needed one grain to feel O.K. This encouraged him to clean up more of his body.

Scott Pennington, 50ish, was on thyroid medicine for his hyperthyroidism. He had been on iodine-radium earlier. He had the miracidia of the intestinal fluke, sheep liver fluke, and pancreatic fluke in his thyroid! Adult human liver flukes were also there! His thyroid was toxic with iridium, nickel, tellurium and mercury (metal tooth fillings) and decane, TC Ethylene and pentane solvents. He had been drinking a great deal of regular tea, which let oxalate crystals deposit in his kidney and slow down the excretion of

toxins. The parasites were killed with a frequency generator, he changed his diet to get rid of solvents. In two weeks he was feeling better, had more energy and better sleep. This encouraged him to do the dental work.

Skin Problems

Sebaceous Cysts

Your body, in its wisdom, keeps toxins together and out of harm's way by making a cyst out of it. All the *sebaceous cysts* I have seen are filled with *polychlorinated biphenyls* (PCBs).

Get rid of PCB sources in order to clear PCBs from your body. This can take 6 to 12 months. Change all detergents (for dishes, laundry, and body use) to borax and/or washing soda.

Commercial detergents are wonderful cleaners.....but are unquestionably toxic.

Whether you have cysts or not, it is always a good idea to use borax and washing soda instead.

If you have a particularly visible cyst, try to poultice it to the surface. Washing away some of it would be a great help to your body. Read herb books on poultices or just take whatever wild leaves you can gather; make a mush out of them with a blender, mix with honey or homemade skin softener to make it spread like peanut butter and cover the cyst with it night and day, covered with a piece of plastic. The wetness has drawing power. The plant juices have other benefits. If you can’t poultice and must rely on kidney excretion, be sure to take kidney herbs at the same time.

Skin Rash

Rashes can be caused by many things. To find the cause, follow a logical pattern. It may be due to:

- HIV
- Yeast and Fungus

- Allergy
- Childhood Diseases (rubella, etc.)

HIV is the most alarming possibility. Eliminate it first by testing for it. It's often too early for a clinical test to be *Positive* for HIV, so use the Syncrometer®. I often see the rash disappear within days of eliminating the virus.

Probably the most common cause of rash is **yeast**. *Candida* has a resonant frequency of 384-388 KHz. If you test *Positive* for it, stop all commercial soap and detergent for all possible uses. Zapping *Candida* may drive it away for a few days. The fungus is hosted by another parasite but finds your skin quite satisfactory for a home, at least while your skin immunity is low. It may be low from wearing metal jewelry, having metal tooth fillings, aluminum (from lotions and soaps), cobalt (from shaving supplies), and zirconium (from deodorant.). When all these are removed, the skin will dry up quickly in open air or under a heat lamp.

In babies' skin, immunity is low from diaper chemicals (mercury and thallium), wipes, and soap and detergent chemicals. Tight fitting, mercury treated diapers are a modern atrocity. Always line them with a tissue and keep them loose fitting.

The skin that has rash or fungus should be dried with paper towels, unfragranced and uncolored, in order not to contaminate the cloth towels, and thereby transport the tiny infectious spores to other skin locations. You may use skin healers.

Only the skin healers given in *Recipes* are safe to use. Keep them refrigerated when not in daily use. Commercial lotions, including health varieties, all contain toxic ingredients.

Snug-fitting diapers are a modern atrocity, forcing mercury and thallium into the baby’s sponge-like skin.

Fig. 29 Tight diapers

Many adult rashes are due to **allergies**. Allergy to nickel is common, the reaction is easiest to see under rings or watches. The metal is pulled into the body for elimination. Since nickel is used by so many bacteria, especially urinary tract bacteria, it doesn't get eliminated, it gets taken up by bacteria. It also piles up in kidneys, adrenals, bladder and prostate where bacteria thrive on it. Strangely, it also accumulates in the male scalp (and in women’s scalps who have male pattern baldness).

Allergy to strawberries, perfume, deodorant or chlorinated water, however different they are, can all be expressed the same way, in a rash. The liver has refused (been unable) to detoxify the chemicals in these items and allows them to circulate in the body. Not for long, though, since great damage could be done to brain and other tissues. Mercifully, the skin grabs these chemicals into itself. Ultimately, it must still be removed. The allergic reaction and your immune system come to your skin's rescue, although bringing you discomfort.

Why didn't the liver detoxify the chemicals given to it? The answer is based on a simple experiment. Try cleaning your liver several times or until 1,000 bits of refuse have been washed out of the bile ducts. This relieves the back pressure on that part of the liver, and allows it to do its work again. The physiological details are not understood. Fortunately, the results are instantaneous. The day before the *Liver Cleanse* you would never eat a strawberry or peanut for fear of a reaction. A few days after the cleanse, your body “knows” which food it might tolerate and as you try a bit, you notice no reaction, no rash this simple experiment suggests that the liver couldn't detoxify these foods because of the refuse in its ducts.

Each *Liver Cleanse* “cures” a different set of allergies suggesting that the liver is compartmentalized—different parts having different duties. It follows that by getting all the stones out all your allergies will disappear. Experience shows this to be true, although it can take two years to carry out such a program.

Meanwhile, avoiding the offensive food or product is very important. It is quite destructive to bathe the brain in strawberry chemicals or your toes in maple syrup chemicals. Stay off allergy-producing foods and products even if you can tolerate a little or can be “desensitized” to them with shots or homeopathic methods. Use these methods for relief, not license to continue using items that

tax your body.

Certain **childhood diseases** produce a rash and this can be diagnosed by testing for the suspected disease with a slide or culture of it. Then use a zapper to kill both the bug and any larger parasites that may have brought it in.

Hives

Sometimes your body will break out in hives instead of a rash. Again, gallstones in the liver and gallbladder are responsible. Do the *Liver Cleanse*.

Acne

The more severe cases of acne cover parts of the body as well as face and can pit the face so badly there is hardly any clear skin left.

In ten days you can reverse this, so most of the skin is beautifully clear. There are bacteria involved and skin oils of youth feed these bacteria. Acne has been extensively studied by scientists. Perhaps the true culprit was too big to be seen with a microscope or too small (antigen) to be recognized or just too unimaginable. I inevitably find *Trichinella*, one of the four common roundworms that infect humans.

Test yourself to *Trichinella* with the slide called “larvae in tissue.” Search for it in your skin. It is generally believed to reside in muscles, especially the diaphragm, but in acne cases it is in the skin.

If you only have a frequency generator, set it at 404.5 KHz and at neighboring numbers, extending 5 KHz on each side, to be sure to include all eggs and other molt stages. Or zap.

Psoriasis, Eczema

Psoriasis and eczema are both caused by *Ascaris*. Their molting chemicals are quite allergenic; perhaps it is these that are affecting the skin. Since pets pick these worms up daily, there is chronic reinfection in families with pets. Keep zapping.

Bernadette McNutt, 34, had acne on her back, chest and face. She had been treated since teen age with ultraviolet light, Retin A, and antibiotics. She already had a history of shingles and fungus, two more skin conditions. Her skin was toxic with strontium and her kidneys had cadmium, silver and beryllium deposits inhibiting excretion. She had only one parasite, extremely high levels of *Trichinella*. Her children were also infected as was the cat. In spite of using parasite herbs for months she got no

improvement until the baby was out of diapers. Then she cleared up.

Royce Hamilton, 17, had acne so dense on his face there was no good spot the size of a dime anywhere. He had it about one year. His urinalysis showed “amorphous” crystals (stones of all kinds) and a trace of protein. He had *Trichinella* worms throughout his organs. He was very fatigued. He was started on kidney herbs so there would be good excretion after killing the *Trichinella*. His thyroid and kidneys were full of zirconium and titanium from all the lotions he used for his skin. He didn't need deodorant. Evidently even his armpit bacteria had been affected. It took four months to clear his *Trichinella* although there were no young children or pets in the house. His face was beginning to heal, but three months later he had a recurrence, although his parent was not a carrier. After this, he cleared it up again and his face looked as beautiful as a child's.

Evan Knight, 36, had psoriasis at elbows and knees from age 9 but now it was spreading to his fingers and scalp. He occasionally had bronchitis and puffy eyelids, indicative of *Ascaris* but at the time of his visit he had *Trichinella*, fluke stages and *Echinostomum* in his skin. He was started on the *Parasite Program* and in three weeks it was clearing instead of advancing. He switched to milk for his beverage to raise his immunity and removed the arsenic, formaldehyde and thulium (from his vitamin C) by doing the necessary clean ups.

Gerry Chastain, 41, had a red nose, erupted along the sides. He had been on sulfa drugs and Emycin.™ He had *Leishmania tropica*. He killed it in the office with a frequency generator and got immediate improvement but four weeks later it was back. He had four solvents built up in his body: benzene, TCE, TC Ethylene and hexanedione. This situation would make recovery impossible since he was no doubt reinfecting himself. He also had titanium, platinum and silver accumulated in his tissues and needed to replace his dentalware before expecting a permanent cure.

Floyd Oldham, 50s, was getting pimples on his nose. His whole face was red and flushed looking. His bowels were loose and he had some urinary urgency. He harbored two kinds of *Leishmania* (*braziliensis* and *tropica*). He killed the *Leishmanias* with a frequency generator and started himself on the kidney herb program. Five weeks later the pimples were gone but general redness had reappeared. The *Leishmanias* were still gone but this time he was toxic with cobalt.

Cobalt is known to promote skin cancers and also heart disease. This was discovered decades ago when an outbreak of heart disease occurred in England. It was traced to a pub (where they all partook) where cobalt was added to the beer to make the foam rise higher! In fact, the foam will just stay in place like a hairdo, if you add cobalt. It was made an illegal additive. Gradually, it has crept back into consumer's products: first toilet cake (blue), then window washer (blue), then dishwasher detergent, and now even mouthwash. If you see a blue colored product, **stay away from it.** It accumulates in the heart and skin. People with skin cancers often have cobalt build up.

Floyd stopped using all these products and cleared up again.

Grethe Driscoll, middle aged, wore tons of make up, so skillfully applied that scars from a face-lift could never be detected. When she had minor breakouts, which usually occurred while away on a trip, it seemed like a catastrophe. She tried everything available but could not get to her parasite herbs until she was back home several weeks later. After one week on them (5 day high dose plus maintenance) her complexion was perfect again.

Crofton Thornton, 15, had an embarrassing case of acne. He had *Ascaris*, hookworm and *Strongyloides* (he also had migraines) all reacting in the skin. He stopped drinking commercial beverages that gave him solvents. He killed parasites electronically and with herbs and got a considerable improvement. But he still had *Strongyloides* one month later. Nevertheless, he had seen the connection and he knew it was just a matter of persistence to a clear complexion. Note, he should have had *Trichinella*—did I miss testing for it?

Warts

Could we get warts from playing with toads in childhood? We don't play with toads anymore. Yet we get warts. We don't know how we get them. But after learning how to get rid of them, you will probably know how you got them. Not all warts are the same. In fact, they might all be different: each one is made up of 5 or 6 different viruses, not just one as we had believed.

Peel a tiny fragment off one of your warts. Prepare it for testing by placing it in a small bottle. Add a few tsp. filtered water and a ¼ tsp. grain alcohol. Label it with the location you got it from: like “left middle finger knuckle. “ First, search your body for other locations of this wart (organs that test *Positive* to your sample). You can easily find them in your skin, of course. But also search electronically in your liver, spleen, muscles, stomach, heart, pancreas. **Notice how often they are present in the pancreas**. The pancreas seems to be a wart-virus heaven. Are they in the islets or the rest of the pancreas?

Without a zapper, you will need to find the frequency of each virus to completely destroy it. Attach your frequency generator and search between 400 and 290 KHz. When you find its resonant frequency, kill it by treating yourself for three minutes at 10 volts from a frequency generator. Will your warts fall off?

In a few days one or two of your warts will begin to shred. After a week you may lose one or two completely, and find that several more have become smaller. The remainder is unchanged. Continue to identify and kill them. Notice that they are not necessarily gone from the pancreas or other organs at the same time as they are gone from the skin. Perhaps warts are not the benign entities we have believed them to be. They may, in fact, ride into the body on some common bacteria, like *Salmonella*, or common parasite like pinworms or tapeworm stages.

Zapping doesn't reach all the viruses in a wart either. It takes repeated zapping to start the shredding and gradual killing of warts.

Guy Laird, age 11, had warts on his lips besides fingers. His job was feeding the three outdoor dogs. He was full of *Ascaris*. He had *Taenia pisiformis* and *Taenia solium*bladder cysts in his liver. These were shedding viruses into Guy. He was started on Rascal for six weeks (this was before the zapper was invented). Maybe his benzene buildup was responsible for letting so many parasites (and their viruses) survive and multiply in his body. He stopped using toothpaste, killed *Ascaris* (408 KHz) and some flukes (434 to 421 KHz) and improved his diet. All except one wart came off (without bleeding). He was given different chores, too, to reduce his contact with animals and their parasites.

Georgianna Mills, a middle age music teacher, broke out with warts all over her hands, at least 30 in total. A few months later she was diagnosed with bone cancer; she always wondered if there was a connection. She cleared up her cancer and killed her viruses and bacteria with a frequency generator. Nearly all her warts disappeared. But her indoor pet brought new parasites daily, especially *Moniezia* tapeworm stages. With each *Moniezia* infection (about once a month) she got new warts. She was never able to clear them completely.

I concluded that each wart is actually composed of 3 to 6 viruses and these viruses are distributed throughout our bodies! How satisfying to be able to rid our bodies of them, once and for all even in internal organs. There is a catch. Small remnants of some warts do not disappear in spite of killing most of them. More accurately, they disappear and then reappear in our internal organs. Could this suggest to us their true origin? Could it be a tapeworm stage?

Tapeworm Stages

Our bodies harbor numerous stages of tapeworms. But not the tapeworm itself, which may belong to a dog, cow, or pigeon. Tapeworms lead complicated lives, much like insects with their caterpillars, larvae, larval molts, pupae and eventual adults. Tapeworms shed eggs with the bowel movement of the animal host. The eggs blow in the dust and reside in the earth. A vegetarian animal nibbling vegetation near this filth, or licking dirt and dust off its coat, swallows the eggs. Humans, too, eat plenty of filth by licking their fingers. As children we all eat dirt simply by eating with unwashed hands.

The Jewish society discovered the great importance of washing hands before eating, thousands of years ago. But many of us choose to ignore truths that seem old fashioned. In our own relatively short life times we cannot see the whole picture as well as the prophets and seers of ancient cultures could. We eat plenty of dirt and along with it, the eggs of tapeworms. Dog and cat tapeworms are most prevalent, but sheep, cow, pig, and seagull tapeworms are also common.

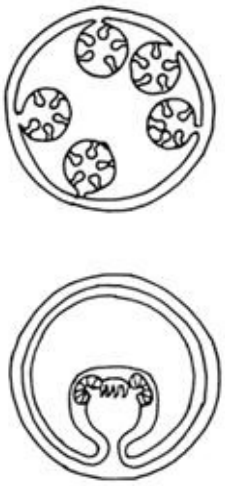


Fig. 30 Some cysticercus varieties have multiple heads.

There is hardly a predator species in existence that doesn't have its own characteristic tapeworm. Whatever animal species you live near, or once lived near, you probably swallowed some of its filth and some tape eggs. The **eggs** hatch in your stomach and the tiny **larvae** burrow into a neighboring organ without any consideration that this is your stomach wall or spleen or muscle. The larva's plan is not to grow into a long worm—that can wait. The larva must simply survive until you can be conveniently eaten! A wolf or a tiger will surely come along! In bygone days it did.

The larva is about ¼ inch long, surrounded by a “sac of waters,” like a tiny water balloon. Looking very closely at this sac, called a **cysticercus**, we see a head (scolex), complete with hooks and suckers, turned inside out, inside a bladder.

As the tiger's teeth bite down on the cysticercus, the pressure pops it out. The head is now right side out with hooks and suckers ready for action. Now it grows in the tiger!

It quickly hooks into a loop of intestinal wall so it can't be swept away and begins its growth into a regular long **adult** tapeworm. The tiger is the true or **primary host**. We were merely the secondary or **intermediate host**. Why does the adult tapeworm prefer the tiger instead of us? Only Mother Nature knows. But the best way to get to a carnivore is through its prey.

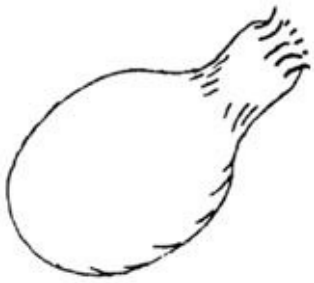

Fig. 31 Emerged cysticercus

You can find these larval cysts in your organs using slides of the *cysticercus* stage of various common tapeworms. Search in your muscles, liver, stomach, pancreas, spleen, intestine and even brain. **You will not find even little bits of them in your white blood cells.** My explanation for this curious finding is that the tapeworm leaves no debris to be cleaned up by your white blood cells. Evidently your body builds a cyst wall around the larva to tightly encase it and prevent toxins and debris from entering your body. Thus your white blood cells are not alerted in any way. Of course, the larva is much too big to be devoured by tiny white blood cells anyway. Yet, it seems that if a pack of white blood cells had attacked the larva just as soon as it hatched from the egg they would have been able to devour it. Perhaps it enlarges too rapidly. Perhaps our white blood cells are preoccupied. In any case, we begin to load up on tapeworm stages from infancy and by the time we are middle aged we have dozens tucked away in our organs.

Some do die in the course of time. Perhaps their true secondary host is a rabbit or a mouse instead of a human. The short life span of these other hosts might mean that the life span of the *cysticercus* is also quite short, not 40 years! When they die, the white blood cells do clean them up and we can see them in our white blood cells at this time. It can take several weeks for the *cysticercus* to be completely gone by this natural method. During this time, we become ill! Numerous bacteria and viruses spring up, as if from nowhere, in our organs.

Don't be surprised if you are testing yourself during illness to find a tapeworm or two in your white blood cells! It is well worth searching for at such a time. Help your body dispatch the tapeworm stages all together with your zapper. A frequency generator is bound to miss some. Some cysticercus varieties consist of many heads, and each head has even more heads inside it! These might have different resonant frequencies. Only killing them together has the desired effect. Remember bacteria and viruses are released by killing tapeworms, so always

follow with a second zapping in 20 minutes, and a third zapping 20 minutes after that. Only then can your tapeworm-related illness disappear.

If you do nothing, your body will be kept busy killing bacteria and viruses as the tape cysticercus wears down and eventually dies. You may not wish to identify all of them (but at least search for *Adenovirus*, the common cold) and just note where you are being attacked: your nose, throat, ears, lungs, bronchi. Internal organs are attacked too. It seldom takes more than three weeks, though, for your body to clean up a tape stage even without any help from a zapper. The attendant illness will be gone by then, too.

Watching these events in your body gives you insight into the very powerful forces at work, called immunity or body defense. The body “knows” a great deal more than we have surmised. There is yet so much to discover.

What initiated the death or dying process of the tapeworm stage in the first place? Has your body been trying all along and finally succeeded? Has the *cysticercus* reached the end of its life span naturally? Have its (the tapeworm's) own viruses and bacteria gotten the upper hand and killed it? Did it accidentally absorb something that killed it?

By taking a herbal combination, Rascal, you can soon find a tapeworm stage in your white blood cells where you could not find it earlier. It is now dead or dying. This proves the effectiveness of Rascal, even though it is slow.

Since we all eat dirt and inhale dust that is laden with dog feces or other animal excrement, we all harbor tapeworm stages, although none may be present in our white blood cells. **Are they harming us?** Perhaps they are living out their lives as quietly as they can in our organs, the way mice or ants try to live in our dwellings. Yet, when tapeworm stages are being killed, either spontaneously by your body or with a zapping device, we see an assortment of bacteria and viruses spread through the body, including the common cold.

Getting rid of the tapeworm stages in your organs seems a very worthwhile goal. Since each of us has been associated with dozens of animal species in our past, we probably have dozens of varieties of tapeworm stages in us. I cannot identify more than a handful due to lack of prepared slides. You can find them without identifying first, though, by listening to their emission frequencies. Their emissions are often extremely weak, possibly due to being encased in a cyst. Search between 510 KHz and 410 KHz. You may wish to “track” them for a while before killing them. You may wish to search for identical frequencies in

your pet's saliva. Or you may wish to dispatch them as rapidly as possible. Use the zapper, not a frequency generator. Remember to “mop up” after your tapeworm killing by zapping again to kill bacteria and viruses that have been released from the tapeworm.

You may be disappointed not to feel any different after ridding yourself of numerous tapeworms and their pathogens. Evidently, the tapeworm stage itself doesn't make you sick; it is simply there like a wart is there, without making you sick. Its viruses can make you sick. Depending on which virus it is, it can make you very sick or not sick at all. Different viruses invade different organs. And some of these turn into warts!

The Flu

Influenza is a virus that can cause “the flu.” Does it belong to us as humans or to a larger parasite we are hosting? It is easily transmitted from person to person and in less than a year can spread across the planet. Some flu examples are Influenza A, B, C and Swine flu.

However, much that is called “flu” is actually caused by a bacterium, either *Salmonella* or *Shigella*. If someone in your family is “catching” a flu, test their saliva for the presence of dairy products, implicating the *Salmonellas* and *Shigellas*. Also test for influenza A, B, and C. Children's “flus”, especially when there is a fever, are usually due to *Salmonellas*. Even after zapping it can take an hour for the symptoms and fever to go away.

Go straight to the refrigerator and throw away all dairy products. Throw away all milk, cheesecakes, buttermilk, cream, butter, yogurt and cottage cheese, deli food and leftovers. You may wish to identify the food source of your family's bacteria first, and save the uncontaminated food. Use the sick person as a subject, searching for foods that appear in her white blood cells (or search their saliva sample for the food offender). If the flu is “going around” your neighborhood, you might wish to tell some of your neighbors which foods you found were contaminated. They may have purchased the same food! Obviously, when a contaminated shipment of dairy products arrives in your grocery stores, quite a few people will be consuming it, setting the stage for a “bad flu” that “goes around”.

Why can some people eat contaminated food without getting sick? Maybe their *Salmonellas* don't multiply rapidly. Maybe their stomach acid is strong

enough to kill most of them. Maybe their bowel movements are frequent enough to expel them quickly. Maybe they haven't been on frequent treatments with anti-strep antibiotics. The answer is not known yet. After a serious bout with *Salmonellas* or *Shigellas* the body does not completely clear itself of them. They stay in hiding somewhere. When a new batch of bacteria arrives, even though very sparse, as in 1 tbs. of milk, the two subtypes can hybridize and produce a much more vigorous offspring. This is called *virulence*. You are made much sicker by more virulent subtypes of bacteria. You may have diarrhea, vomiting, illness. Especially if you believe you have “lactose intolerance,” pay attention to *Salmonella* and *Shigella*.

If your flu is due to an influenza virus, kill it with your zapper. Some family members may prefer to take a homeopathic flu “remedy” such as Oscillococcinum™ or Flusolution™. Others may take herbs. These probably act by prying the viruses out of your cells' gateways and channels so the white blood cells can easily devour them.

But flu due to *Salmonella* is not easily zapped away. Remember, the zapper current does not penetrate the bowel contents, which is exactly where *Salmonella* lives! Besides zapping to clear them from your tissues, you must eliminate them from the bowel by using the *Bowel Program*.

Lugol’s iodine solution (see Recipes) can quite quickly get rid of Salmonella throughout the body. Use 6 drops (small drops from an eyedropper) in ½ glass of water four times a day. If no more *Salmonella* is consumed, it will be vanquished in a day or two.

If your flu brings you a fever, use Lugol’s.

Fever

Fevers are there to help your body fight the invaders...up to a point. Don’t use a fever medication unless the body temperature goes over 102°F, and then only enough to bring the fever down a bit.

Most fevers, especially **“fevers of unknown origin”** are due to *Salmonellas* and *Shigellas*. Your body may be young and strong enough to kill them but not strong enough to kill an everlasting supply of them coming from dairy foods you eat on a daily basis. Stop eating salads at restaurants immediately. Stop eating food made by others' hands unless it is sterilized. Stop eating dairy foods until

you have cooked them. Stop eating those that can't be cooked.

Sam Ellis, age 7, had two episodes of severe abdominal pain with fever lasting two weeks. He got hyperactive with milk products, had a frequent cough and stuffy nose. (Here the picture is quite clear. The milk products were bringing him *Salmonellas, Shigellas* and other bacteria which grew in his intestine to produce pain. But why only Sam and not his brothers?) Sam had a buildup of benzene from using bathroom soap containing a special herbal oil. Sam also had hookworms, intestinal fluke, and rabbit fluke, probably due to his lowered immunity from the benzene. Then his mother boiled Sam's milk, removed the polluted soap (she planned to use it herself!) and killed his parasites with the parasite herbs. His fever went away and stayed away. He said he enjoyed all this because now he "could play after school" without a stomach ache and he wasn't being sent to the nurse's office because of a fever. Notice the bacteria causing the temperature went away by themselves, probably due to the return of his normally strong immune system.

Jalene McCormick, 46, had been passing lots of kidney stones (hundreds) for years and had a temperature most of the time for which she was on antibiotics. It took her six months on our kidney herb recipe to dissolve and pass so many they no longer showed up on X-ray, and to stop making them. Then her fever left, not to return.

Kristen Jane Johnson, a young mother, had recurrent fevers and fatigue but, besides EBV, her doctors found no cause. We found HIV virus and a lot of bacteria and parasites. The fever-causing bacterium was *Salmonella*. To stop her *Salmonella* attacks she had to raise her immunity besides boiling all dairy products. Moldy foods (pasta) and lunch meats (benzopyrenes) were the source of liver toxicity. Each new *Salmonella* attack immediately invaded the liver so a vicious cycle was set up. When she stayed meticulously on the *Parasite Program*, meticulously off unsterilized dairy products, and meticulously off benzene-polluted items, she cured herself of fevers and night sweats and the HIV infection. Perhaps in two years the liver will have recovered enough to kill *Salmonella* that enter it, but she is not taking any chances till then.

Although Kristen was eating food polluted with both *Salmonellas* and *Shigellas* she only "picked up" *Salmonella*, never *Shigella*! Why is that? In contrast, people with multiple sclerosis "pick up" *Shigellas*, not *Salmonellas.*

Multiple Sclerosis & Amyotrophic Lateral Sclerosis

Multiple sclerosis (MS) is a disease of the brain and spinal cord. It is called *lateral sclerosis* if the disease is mainly in the spinal cord.

It is caused by fluke parasites reaching the brain or spinal cord and attempting to multiply there. Any of the four common flukes may be responsible. Kill them immediately with your zapper or a frequency generator (434 KHz to 421 KHz). They cannot return unless you reinfect yourself. Stop eating meats, except fish and seafood. All meats are a source of fluke parasite stages unless canned or very well cooked. Pets and family members are undoubtedly carriers of the same flukes, although they do not show the same symptoms. Give away your house

pets. Don't kiss your loved ones on the mouth. Make sure your sex partner has also been freed of fluke parasites.

The most important question you must be able to answer is why did these parasites enter your brain and spinal cord? When the brain contains solvents, it allows flukes to multiply there. The solvents, **xylene** and **toluene** are common brain solvents always seen in MS cases. Evidently these solvents accumulate first in the motor and sensory regions of the brain, inviting the parasites to these locations.

Xylene and toluene are industrial solvents used in paint and thinners. It is also a pollutant of certain carbonated beverages (I found it in 7-Up™, ginger ale and others that I tested). Stop drinking them.

All MS cases I have seen also harbor *Shigella* bacteria in the brain and spinal cord. These come from dairy products. They are manure bacteria. Be absolutely meticulous about sterilizing dairy products. Even one tsp. unsterilized milk added to scrambled eggs could reinfect you. Not even heavy whipping cream or butter is safe without boiling. Kill bacteria every day with a zapper. *Shigellas* produce chemicals that are toxic to the brain and spinal cord. Eliminating *Shigellas* brings immediate improvement.

All large parasites like flukes have their own entourage of bacteria and viruses. Perhaps it is these that initiate the brain's reaction, which is inflammation and scar tissue formation in the outer covering of brain cells and nerve fibers. Perhaps it is the fluke stages themselves. your brain is trying desperately to heal these lesions, only to be assailed by a fresh batch of solvent and *Shigellas* and another generation of parasites and pathogens.

The other pollutant associated with MS is **mercury** from dental metal. The mercury that is constantly released in the mouth does not all get excreted by the kidneys or eliminated by the bowels. Some of it travels up to the brain and gets into the spinal cord as well. You will be able to eliminate and excrete more mercury by doing a kidney and *Liver Cleanse*. The mercury may itself be polluted with **thallium**, which is even more toxic. For this reason mercury removal should be done extra thoroughly to be sure no thallium has been left behind.

If you are concerned about MS-like symptoms, purchase slides of the brain regions, cerebrum, and cerebellum. Or purchase pork brains at the grocery store and snip out a portion of the sensory lobe and cerebellum. Prepare these as test

substances (sterilize your hands afterward). Test your daily foods and body products for their presence in these brain areas. Also test for parasites, bacteria (especially *Nocardia* and *Shigella*) and other pollutants such as arsenic and pesticides. If the disease (tremor and lack of sensation) has not progressed too far, you can cure it. In all cases you can stop it from progressing further by cleaning up dentalware, the environment and diet.

Brandi Rainey, age 34, of Amish religious culture, was diagnosed with MS four months earlier after an MRI confirmed it although she had symptoms for many years. She was told she had inherited a gene for it and that Amish folk are particularly susceptible to MS for reasons of inbreeding. She had a constant pain running down the side of her neck, and headache. Her legs were getting too heavy to get up stairs. Our tests showed her brain was full of scandium (tooth metal alloy) and fluoride (toothpaste). Her vision was getting worse; her eyes were full of wood alcohol. She lost no time in getting dentures: there were no teeth that could be saved. She had several bacteria growing in her jaw bone: *Strep G* (sore throat bacteria), *Staphylococcus aureus* (this was raising her pulse to over 100), *Clostridium tetani* (causes great stiffness), and *Shigella* (produces nerve toxins). She killed these with a frequency generator. Five weeks later the pain and stiffness in her neck were gone, her pulse was down to 100, her periods were free of pain and her hands seemed to shake less. She was put on the *Parasite Program* plus thioctic acid (2 a day) and histidine (500 mg, one a day to keep nickel levels down) and advised to cook and eat with non metal. Four weeks later her pulse was down to 80, her legs were much better. She zapped four remaining bacteria. Two months later the numbness and tremor had left; her legs still felt tired and her hands sometimes shook but she was quite reassured that MS would not claim her life. Nor had a gene betrayed her. A half-year later she was walking and working normally, doing *Liver Cleanses* and keeping up her vigilance against parasites and pollutants.

Kendra Welch, 56, was diagnosed with MS a year ago, by MRI. She went to a chelating doctor and this cleared up her temporary ischemic attacks (T.I.A's) which were occurring daily. But she had lost her balance, eyesight was getting worse, her feet and hands stung. Her sister also had MS but nobody else in the family did which baffled her doctor. Her brain tissue was full of barium, europium, gadolinium, and platinum. These are dental alloys, although barium could come from bus exhaust (she wore no lipstick). She was advised to have all metal removed from her mouth immediately. Two days afterward she came into the office without any neurological symptoms. She stated she was afraid to stop her new health program, though, and this was good policy.

Lynne Ceretto, age 15, was diagnosed with an “MS-like syndrome“ by MRI. She had intestinal flukes and stages, human liver flukes and *Trichinella* in the brain. She had no tooth fillings. But there was benzene in her thymus keeping her immunity low. She also had propane and asbestos in her brain from leaky pipes and a worn washing machine belt. She, too, was told she had a “bad” gene. She was barely able to walk with help. It took several months to track down the source of benzene—the drinking water. Sometimes it was polluted; sometimes it was not! When the pump was oiled, some of it dripped onto the cement platform. Rain washed it to the center and down the pipe in the well. They eagerly removed the platform, found the oil on the water surface, cleaned everything up carefully, until no benzene could be found which put her on the road to recovery. A year later she had recovered further.

Norma Luellen, a young mother, had tingling, numbness and weakness on the entire left side of her body. She was in process of clinical tests for MS. Her body was full of pentane, possibly from her workplace since 12 other persons working there also had MS (such a situation should make our government eager to jump at investigations)! She had intestinal flukes and their stages, not in the intestine or liver or thymus, but in her brain! We found her home air toxic with bismuth too, probably from cosmetics. In spite of staying on the *Parasite Program* she got reinfected with sheep liver fluke, probably from eating hamburgers. She was not able to stop her carbonated beverage habit and frequently showed xylene,

acetone, methylene chloride in addition to pentane in her white blood cells.

Shannon Synder, age 44, had been getting more numb over her whole body for several years and was presently considered by her doctor to have MS. Her muscles twitched all night, making sleep impossible, and her hands shook. She had intestinal flukes in the brain (cerebrum and cerebellum) but none in the intestine ! The brain also had wood alcohol from drinking Diet Coke.™ She also had bismuth (cosmetics), palladium, copper, samarium, and tellurium (tooth alloys) in her brain. She began to improve enough to be off Prednisone by her 10th day of the *Parasite Program*.

Erica Blake, age 41, was diagnosed with MS two years earlier although her symptoms went back 13 years. She was on Prednisone™ but her balance was getting so bad she had to be in a wheelchair. Chelation treatments kept her from deteriorating further. Her brain was full of gasoline; she used to work at a gas station and now was getting it from the attached garage. Her hands and feet were completely numb. She had 5 root canals extracted and a few days later was able to stand. She could now walk with a cane. She had human liver flukes, sheep liver fluke and *Trichinellas* and dog tapeworm stages in her cerebellum (motor control center). After killing parasites and starting to take thioctic acid (4 a day) and cleaning up her environment she improved enough to drive a car again, walk without a cane in her home. She regained enough feeling in her hands and legs to do her housework, too.

Kurt Nielsen, age 43, was told he had peripheral neuropathy. His feet were so numb he had to look at the clutch to drive. Also both hands were numb. He was full of kerosene and benzene possibly from fuel oil that he pumped for a living. There were fluke stages in his brain and a dozen bacteria and viruses. He also had mercury and thallium in his immune system which came from tooth fillings. However, he had all his metal fillings replaced two years earlier! He thought there was no mercury left in his mouth! Actually, he had little bits (called tattoos) left somewhere. And they were giving him the classical symptoms: numbness of hands and feet and gradual destruction of his nervous system. His peripheral neuropathy was due to thallium poisoning. The dentist couldn't find tattoos, and he was left in his predicament. (This was before I found mercury and thallium sources in many personal products.)

Duncan Wood, a middle age father of 5 young children, could still slowly shuffle along when he arrived. He could not raise his arms to eat. He had uncontrolled inappropriate laughter every minute. He was diagnosed with MS two years earlier and told he had a "bad" gene. The fact that one child was beginning to show similar symptoms strengthened their belief in the gene theory. Ten days later his inappropriate laughter stopped; he could get his right hand to his face, he walked twice as fast and had very little tremor remaining. Strong chelating treatments obtained at a Mexican clinic had drawn much of the mercury and thallium out of his brain. He killed the flukes and *Shigella* bacteria electronically and stopped consuming unboiled milk. The brain solvents, xylene and toluene were removed quickly, too, as well as asbestos. His fast improvement showed them how important it was to remove the source of these pollutants in his home.

Two days later he regressed considerably which made him feel quite depressed, since his chelating treatments had not stopped. Was there still an unknown factor? It was a return of *Shigella* bacteria! He had inadvertently eaten a non-sterile dairy food: milk added to soup when it was already done cooking! This was a valuable lesson. Nothing else had returned. He was away from the asbestos and xylene from the workshop at home. He zapped the bacteria again and applied greater vigilance to eating only sterilized dairy foods. He recouped his losses in one day.

Then they scheduled their dental work, which had already been done once two years ago! He had leftover mercury and thallium. Now, selecting a dentist with experience in finding tattoos and cleaning cavitations made much more sense to him than it had before. He also planned to do a kidney and *Liver Cleanse* after returning home. And to stay out of the workshop until the asbestos-containing belt had been replaced and the furniture painting had been moved to a different building.

Shigella also causes irritability and depression, a frequent problem for MS cases.

High Blood Pressure

High blood pressure is one of the easiest problems to correct without resorting to drugs.

The most important change to make is to stop using caffeine as in coffee, tea, or carbonated beverages. Don't use decaffeinated coffee or tea either because of the solvent pollution in them. Switch to hot milk or hot water if a hot beverage is desired, or any of the beverages given in the recipe section. If being without caffeine leaves you fatigued, take an arginine tablet in the morning (500 mg).

Blood pressure is mainly controlled by the adrenal glands which sit like little caps on top of the kidneys. Whatever is affecting the kidneys is probably affecting the adrenals, too, since they're so close to each other. You must find out what it is.

You could do your search in the kidneys since kidney tissue is available in grocery stores. Adrenal tissue is available on microscope slides. What will you find? Probably **cadmium**.

Search for the cadmium source in your drinking water! Cadmium comes from the metal pipes. In fact, you could scrape a galvanized pipe to get a cadmium test substance. Conducting or storing drinking water in containers of metal is as foolish a practice as eating food off the floor. Water picks up everything it touches simply because it is wet! You may not see what it picked up any more than you can see if it has picked up sugar or salt. The cadmium and other metal is dissolved in the water. The older the pipes the softer, more corroded they are, and the more metal is picked up as the water rushes by. If you find cadmium in your hot or cold water, you will never be able to filter it out. Nor should you switch to bottled water. The amount of cadmium in your clothing from doing laundry with this water is already too much for your adrenals and kidneys.

Change your galvanized pipes to PVC plastic. If you believe you already have plastic pipes or all copper (which leads to leukemia, schizophrenia and fertility problems) you will need to search every inch of plumbing for a very short piece of galvanized pipe left in the system! A piece as short as a 2 inch T or Y can be causing all the trouble.

The toxicity of cadmium, in fact, the high blood pressure connection, has been known a long time. After finding the cadmium start on the kidney cleanse. You

might miss the cadmium problem if you don't attend to it first. Also remove all metal from your mouth.

All (100%) cases of high blood pressure I have seen could be easily cured by eliminating cadmium and other pollutants, followed by cleansing the kidneys.

To test whether you still need your blood pressure medicine, wait until your pressure is down to 140/90 or better. Then cut the dose in half. Check it again next day. If it has climbed back up you are not ready; go back to ¾ or a full dose of medicine. Try again a few days later. If your blood pressure stays down, cut your medicine in half again (you are now down to ¼ the regular dose) and see if your blood pressure stays improved.

When you are down to 130/80 go off completely. But stay on the kidney herb recipe. At 120/80 try yourself on a few shakes of sea salt. The amount of salt eaten, once the pressure is down, has little influence. In fact increasing salt intake improves energy without raising blood pressure. Take no more than one teaspoon a day (2,000 mg sodium), total, including cooking. Better yet, make a salt that is a mixture of sodium and potassium chlorides (see *Sources*). Mix it for yourself in a 1 to 1 ratio or whatever your taste can accept. The sodium portion could be sterilized sea salt (test and make sure it has no aluminum silicate in it first).

Mold toxins have specific kidney effects! Especially **T-2 toxin**, found mostly in dried peas, beans and lentils. Rinse these thoroughly first, throw away shriveled ones, and add vitamin C to the cooking water. All cases of serious kidney disease show a build up of T-2 toxin. Be extra careful to avoid moldy food (read *Moldy Food*).

Bala Cuzmin, age 72, had high blood pressure for ten years but the upper (systolic) pressure remained high in spite of various medicines that were tried. She had three kinds of kidney stones and only one functional kidney. She stopped using caffeine, switching to arginine tablets to get over the let-down. Her diet was changed to reduce phosphate and add calcium, and she took magnesium and Vitamin B_6 to assist the kidneys. She was very anemic and her mean cell volume (MCV) was high due to *Ascaris* infestation. She killed parasites, cleansed kidneys but saw no drop in blood pressure which stayed at 150 to 170 systolic. Her adrenal glands were choked with copper and platinum. She had all the metal in her mouth replaced and promptly saw a blood pressure drop to 145-150. Three months later it was at 128 to 133 on half her medicine. She had not been tested for T-2 toxin yet, nor changed her copper water pipes.

Sabrina Patton, 66, had a long list of health problems, including high blood pressure for six years. She was on Corgard™ and diazide drugs which kept it down to 140-160/74-80. She had phosphate crystals in her kidneys and was started on kidney herbs and a diet change to include milk and exclude soda pop. She had high levels of mercury and copper in her immune system. She was feeling so much better after the *Kidney Cleanse* that she decided to remove her last fillings and replace her bridge, too, since it was shedding ruthenium. On her way home from the dentist, her ears stopped ringing and soon her blood

pressure was down to 126/68. She was still on half a dose of drugs because she was too afraid to go off entirely. But when her pressure stayed down she found the courage to go off completely. This gave her the energy she wanted to play basketball with the grandchildren again.

Rolf Ehrhart, 61, had 80% blockage of heart arteries and high blood pressure for which he was on a Hydropres™ patch, Tenormin™, and Logol™ (diuretic). He had phosphate and uric acid crystals in his kidneys. He was started on kidney herbs followed by the parasite herbs. His *Ascaris* and flukes were zapped. He stopped using store-bought beverages. Then he could cut back on his medicines, measuring his blood pressure daily to guide him. After seven weeks it was down to 140/85, so he decided to do without medicine, a bit early. He was also getting chelation therapy and was now able to walk 2-4 miles a day. His next chore, which he approached gladly, was removal of all metal from his mouth.

Len Gerald, 45, was on Vasotec™ for high blood pressure. He was constantly sleepy; his blood test showed a low thyroid level in spite of being on Euthyroid.™ He was started on kidney herbs followed by parasite herbs. In two weeks, barely into his program, his blood pressure dropped. He had to go off his blood pressure medicine. It stayed at 126/80. He still had some *Ascaris* and other health problems but was highly motivated to clean them up, too.

Glaucoma

In glaucoma the pressure in the eyeball gets too high, putting pressure on fragile retina cells that do your seeing. The first question to ask is: “Is my blood pressure too high?” There is a link between high blood pressure and elevated eyeball pressure.

Your blood pressure should be 120/80. Your doctor may say 140/85 is “not high.” He or she is kindly refraining from giving you drugs until this level of pressure is reached. It is your tip-off, though, that something is not right and you should correct it now, when it is easy, and before other damage is done. Read the section on high blood pressure to learn how to reduce it by going off caffeine, checking for cadmium poisoning from your water pipes, and cleansing the kidneys. Even though your doctor has explained how the tiny tube draining your eyeball is too narrow, you should ask: was it not too narrow <u>before</u> high blood pressure struck? Simply getting your blood pressure to normal is sufficient help for beginning glaucoma.

Antonia Guerrero, age 51, had glaucoma for five years and was deteriorating rapidly. She cleansed her kidneys, killed parasites and changed her diet to the anti-arthritic one since she also suffered from arthritis in her hands for ten years with painful enlarged knuckles. She didn't get relief from taking aspirin. She got rid of her asbestos toxins by bringing her own hair blower with her to the hairdresser. After seven months she had pain relief for her arthritis (without aspirin) and her glaucoma was pronounced stable by her ophthalmologist.

Tooth Decay

The strongest part of our body structure is our bones. The strongest bones are our teeth. How can they decay? We must look at the **enamel**, **dentine** and **root** of the tooth as well as the bone they rest in for some answers.

Scientists have already searched very hard and long for answers. But their work is hampered by commercial interests that try to shape the results. Since commerce determines which research can be done (that is, paid for) sacred territory can be ignored. For example, the effects of sugar-eating, gum-chewing, tooth brushing, fluoridation, tooth filling materials and diet can be ignored if it interferes with product sales. Trivial studies such as comparing shapes of toothbrushes, studying the chemical composition of plaque, and studies of bacterial structure and genes are done instead. Studies “at the molecular level” do not threaten existing industries.

Important research has lapsed since the 40's and 50's. Perspective on tooth health was sound and clear in the mind of Dr. Weston Price in the 1930's. His scientific studies stand as a beacon even today because truths, once found, do not change. He traveled the world over in search of good teeth. Anywhere and anytime he found them, he described the people who had them. This is excellent science. It lets you draw the conclusions. He described what he saw in a book, titled Nutrition and Physical Degeneration.[13] They came to these conclusions from the following observable facts:

1. Skulls of primitive peoples who lived along coastlines, such as Peruvians, Scandinavians and various islanders, and whose staple foods included fish daily, showed perfect teeth; not a single cavity in a lifetime. They had strong bones that didn't break even once in a lifetime of 45 years. Skeletal structure was fully developed, meaning the jaw bone was not undershot or cheek bones squeezed together, forcing the teeth to grow into a smaller than ideal space. Consequently, there was room for the wisdom teeth, and no need to crowd the remainder. They saw no crooked teeth or unerupted wisdom teeth. The authors estimated a daily consumption of **4 to 5 grams of calcium** in their fish containing diet.

Our daily consumption of less than 1 gram calcium daily is small by comparison. Our wisdom teeth erupt poorly, our other teeth are often crooked. But today bad teeth go shamefully unheeded because we don't need to chew our food, we can lap it (ice cream) or suck it, or gum it (applesauce).

2. These primitive peoples got all the calcium, magnesium, phosphate, boron and other bone builders they needed simply from eating (fish) bones. Mexican

peoples got 4 to 6 grams of calcium a day from **stone-grinding** of corn for their staple, tortillas, instead of from fish.

Where do we get our calcium? Milk is our only supply. One quart supplies one gram. There is little excuse for a carnivorous society like ours to regularly throw away the bones of its food animals in view of our dire shortage. It leaves us dependent on milk alone. Milk has so many disadvantages. It is impossible to milk a cow by machine and not get a few manure bacteria, *Salmonellas* and *Shigellas*, into the milk. These bacteria are not completely killed by pasteurization the way more susceptible bacteria are. It takes boiling temperature to kill all of them. Why isn't milk sterilized? Water was sterilized for human consumption in distant decades. Chlorination of water is not ideal but it did sterilize the water. Milk could be sterilized by boiling or flash-heating.

Milk has other disadvantages: dozens of antibiotics, both by feed and by shot, bovine growth hormone, chemicals added in milk processing, the bad effects of homogenization, and allergy to milk. Yet, in a choice between milk drinking and bone loss, one must choose the milk. This would not be necessary if bones were properly salvaged—ground to powder and added back to the meat where it belongs—to offset the acidifying effect of the phosphate in meat. One gram of calcium is not much bone (½ tsp.) but it requires a whole quart of milk. Bone powder added back to ground meat, soups, stews could greatly improve our tooth decay problem, bone density problem, and skeletal growth problems.

Softened teeth set the stage for decay; bacteria do the dirty work.

Zapping bacteria does not kill them all. The zapper current does not reach into abscesses under metal filled teeth or around root canals. *Staphylococcus aureus*, which we are constantly stuffing in our mouths as we lick our fingers, finds an immediate hiding place in a crevice where it can't be zapped. Many other bacteria hide here, too: those that cause ear ache, sore throats, bronchitis, stiff knees, joint disease. You can try zapping all the *Clostridia*, *Streps* and tooth decay or plaque bacteria. But the only way to successfully eliminate them is to pry them out of hiding and wash them away. This is a job for the dentist (see *Dental Clean Up*).

Strep. mutans is considered to be <u>the</u> bacterium that causes tooth cavities. I have found it in milk, evidently another pasteurization escapee. All the more reason to sterilize dairy products.

Frannie LaSalle, 52, was getting compression fractures in her spine, but the weak bone condition was evident in her mouth (many teeth were loose—they could be jiggled!). Her gums were red and inflamed. A low thyroid condition (she needed 2½ grains a day of thyroid—in one day the normal body goes through 5 grains of thyroid products) contributed to this. Her blood phosphate level was high (4.7 mg/DL—should be below 4.0) and her alkaline phosphatase was 205, also high, showing she was dissolving her bones (including tooth sockets) at a rapid pace. Her whole system was too acid, as could be seen in elevated CO_2 levels (28, when 23-30 is normal).

Only the major minerals, sodium, potassium, calcium and magnesium can have an impact on this major disturbance. The dentist said she had to have all her teeth pulled and replaced with dentures. Her kidneys showed all three types of calcium phosphate crystals. She drank no milk. She had only three weeks before her oral surgery appointment. She was started on ½ cup 2% milk, 6 times a day plus 50,000 units of vitamin D (a prescription dose) to make sure she absorbed all the calcium. She also took magnesium oxide (300 mg. once a day) and vitamin B_6 500 mg (one a day).

She was started on the *Kidney Cleanse* to help activate the vitamin D and to help the adrenal glands make *estrogen.* Her estrogen level (5.2 pg/ml) was too low to get the calcium deposited back into her bones. She was also given licorice herb for their estrogen-like action to help with this and vitamin C, 1 gram (1,000 mg) 2 to 3 a day.

Her mouth care was to be as follows: potassium iodide (white iodine, made up by dissolving 88 gm potassium iodide in one liter/quart water). Purchase a new very soft toothbrush. Use no toothpaste or store bought floss. Use 2 lb. or 4 lb. (the 4 lb. is coarser) fish line (rinse first). Brush twice a day; floss only once at bedtime before brushing. Use 6 drops of food grade hydrogen peroxide for daytime brushing. Use 6 drops of potassium iodide for nighttime brushing. Use no mouthwash, chewing gum, candy. In three weeks her teeth could not be jiggled. Her dentist was astonished (but was not interested in how she achieved this). In six weeks her mouth looked normal and she could chew some foods. Her vitamin D was tapered as follows: Take 6 a week for the first week (miss one day). Take 5 a week for the second week (miss two days). Take 4 a week for the third week. Then 2 a week indefinitely. She never lost a tooth.

Muscle Diseases

There are a variety of muscle wasting diseases, thought to be genetic in their cause. Yet, what could be more easily inherited than a parasite? Persons living together share food, living habits, refrigerators, and parasites. Their shared genes indeed give them similar susceptibilities but if we take muscle parasites away, muscle diseases “magically” disappear.

Of course, there is no magic involved. It is actually hard work. Hard work to rid the whole family of parasites that are shared and possibly were present even at birth. Parasites that normally don't go to the muscles. For example liver flukes and intestinal flukes. They belong in the liver and intestine! Yet, in muscle disease they show up and reproduce themselves in the muscles. The reason for this becomes clearer when you see that certain solvents have accumulated there. Heavy metals, bacteria, and viruses have accumulated there, too. The host's muscles, instead of kidney and bowel, have taken on the duties of toxic dumping grounds. Could it be that the regular routes of elimination were overwhelmed? Or did the muscles, traumatized by these unusual parasites, invite the toxins? A

tantalizing question.

But in seven minutes you can methodically kill everything and anything that is alive in your muscles and shouldn't be there. Zap until you are free of all parasite invaders. Your muscles will feel lighter afterward.

Muscular Dystrophy

In muscular dystrophy the solvents, **xylene** and **toluene** are seen to accumulate in muscles. These also accumulate in brain and nervous tissue! (See Alzheimer's and multiple sclerosis). Could it be that these solvents are actually present in the nerves of the muscles?

Fortunately these solvents will leave your body, by themselves, in five days after you stop consuming them! Stop drinking all store bought beverages, including water and powders that you mix, and including health food varieties. Water claims and health food powder claims sound as convincing and strong as a twelve inch plank to walk on. But if the plank leads out over the side of a ship, would you walk it?

Throw all your possible sources of solvents out. Flavored foods are the chief offenders (cold cereals, sweets and candy too). But of course, you should check in your basement or attached garage for cleaning solvents. Places where painting is done or automobiles are worked on should be off limits to you.

If you've been wondering whether you have muscular dystrophy, which I consider to be a fluke disease, search your muscles electronically. Use prepared slides of flukes along with a sample of hamburger meat to represent your muscles. If flukes have already taken up residence in them, you should diagnose yourself as “Positive”. If not, but other parasites and toxins are present, you have pre-muscular dystrophy.

Also, the likelihood of finding thallium is quite high, judging by the case histories.

Mel Rickling, age 18, had been seeing a specialist for bouts of muscular weakness for several years, but no diagnosis was given. His condition was not yet severe enough although it was difficult for him to raise an empty glass or get upstairs. It began at puberty, not too long after his first mercury tooth filling. He had asthma in childhood. The flukes attacking his muscles were liver fluke, intestinal fluke, and pancreatic fluke. Other parasites in his muscles were *Leishmanias,* several dog tapeworm cysts, and pinworm.

He also had assorted bacteria in his muscles. The solvents propyl alcohol, benzene, toluene, and xylene were accumulated there too. Ortho-phospho-tyrosine (cancer test) was already positive. His doctors had

not searched for cancer in their biopsies. His drinking water contained lead and since he had lived in one house since birth he was probably drinking lead every day of his life. He also had high levels of mercury and some thallium accumulated in his muscles; these came from the tooth fillings in his mouth and could explain why his problems began after his first filling was put in.

His flukes and other large parasites were killed immediately with a frequency generator. He was started on the *Herbal Parasite Program* to prevent reinfection. His diet and body products were changed to exclude solvent pollution. He could have no commercially prepared beverages except milk, which needed to be boiled to kill bacteria. In twelve days his daily stomach pains were gone, so he was able to eat more and gain some much needed weight. The rash on his face was gone, the pain at his right side was gone, his muscle twitches were gone, his joints no longer ached and his mood was much better. The whole family was put on the *Parasite Program* and Mel was scheduled for dental clean up. The plumbing repairs removed lead from the water and he was soon able to walk upstairs, in fact run upstairs.

A young man, seeing himself regain normalcy, wants nothing more than to "lead a normal life" which includes reckless behavior. But after several warnings from his muscles he stuck to his restrictions and gained the weight he wanted in order to participate in athletics.

Myasthenia Gravis

…is probably a fluke disease. Some chemical, possibly coming from the fluke, may affect the acetylcholine receptors, thereby causing an allergic reaction so they become inefficient. This is most noticeable in the eyelids. They droop from lack of strength to lift them.

The thymus is often involved, too. The thymus is extremely sensitive to benzene and with so much benzene pollution in our products and foods (pollution from gasoline is negligible by comparison), you will probably find benzene accumulated there. Search the thymus and the muscles for parasites, bacteria and tooth metal as well as toxins in the foods eaten daily. Kill invaders twice a week with a zapper or stay on an *Herbal Parasite Program* until all danger of recurrence is past (one to two years).

Clean up dentalware, diet and environment. Keep no indoor pets since any new parasite, however tiny, will surely find the niche left behind by the flukes and give you a new myasthenia gravis-like disease. The whole family must be parasite-free to protect the member with myasthenia gravis. But it is a task easily accomplished and desirable in its own right, so discuss your plan immediately with family members. Don't delay. The flukes don't waste a single minute. They go right on feeding and breeding.

Carmen Opsal, age 37, was told by her specialist she had her myasthenia from birth since she didn't have the strength to nurse. She had pancreatic fluke stages throughout her body. Her plan was to start on the parasite-killing program, clean her kidneys, remove toxic elements, kill bacteria and clean her liver. Long before she accomplished this, in one month, she was feeling better and had return of her strength on some days. She still had the solvent, methylene chloride, from drinking "pure" orange juice and praseodymium from eating foil-packaged foods, also thulium from her brand of vitamin C. She was full

of auto exhaust and nickel from dental metal. There was hafnium from nail polish and hair spray and zirconium from deodorant. She planned to get rid of it all, and never need to return.

Universal Allergies

If minor allergies are due to a disabled liver, then extreme allergies must be due to an extremely disabled liver. This is the case for persons suffering from “universal” allergies, namely “everything”, like the lacquer on floors, plastic chairs, the neighbor’s flowers, and the grocery store.

They have more than merely clogged bile ducts. They have the sheep liver fluke living in the bile ducts! A tip-off to this situation is allergy to wool and wool fat (lanolin). A few flukes might not be noticed but a liver full of flukes that spill over into the intestine can give the worst case of allergy imaginable.

Sometimes the body manages to kill them with its own resources (maybe you ate something even too toxic for them!) They come through the bowel in a torrent. In the water of the toilet bowel they explode, spewing their infectious eggs all over in little black threads. Because these look like hairs, you may believe you passed “things with black hairy legs.“ These are actually burst flukes with black strings of highly infectious eggs. Why some people are literally taken over by these flukes is unclear. Amongst sheep, only certain sheep will be severely affected, being called “liver-rot.” The disease in animals has been extensively studied.

Kill flukes with a frequency generator (434-421 KHz) or zapper. Come to the aid of the liver by avoiding food molds, removing dental metals, stopping chronic *Salmonella* infection and finally cleaning the kidneys and liver.

Black threads in toilet are indicative of fluke remains.

Fig. 32 Sheep liver flukes.

Environmental Illness

is another name for “universal” allergies. When more than a few flukes are present in the liver, they keep the liver from doing its major job: detoxifying all the food and chemicals that are taken into your body.

Different parts of the liver have different detoxifying jobs. One part detoxifies plastics and solvents; another part detoxifies perfumes and another newsprint ink, and so on. Foods have natural chemicals that need detoxification. By changing our food constantly we avoid overburdening any one of our detoxifying mechanisms. This is probably the basis for wanting different food at each meal and different meals each day. We somehow “know” when we're ready for the same food again.

Less extreme forms of allergy can be due to other flukes in the liver, such as human liver fluke (*Clonorchis*), or just plain clogging with numerous cholesterol crystals.

Anything that is lodged in the bile ducts obstructs the flow of bile. This causes back pressure in that part of the liver so it produces less bile.

The bile duct system is a gigantic tree with lots of interconnecting branches. Remember how “stringy” liver can be when you buy it in the grocery store. These strings are bile ducts. When one is obstructed, others take over its job. But

when a whole section of the liver gets obstructed and it can't detoxify a whole set of chemicals you dare not get those chemicals into you again.

What if you do? These chemicals go coursing all over your body! They are taken up by various organs. The brain has special protection, called the *blood brain barrier*. But this can get broken by parasites that burrow. Now chemicals can roam through the brain. Some attach themselves and cause an “allergic reaction”. Beryllium, from “coal oil,” kerosene and gasoline attaches itself to the brain easily. Then other things attach themselves to the beryllium!

The extreme form of allergies simply requires killing the sheep liver fluke and other flukes inhabiting the liver. They tend to overflow the liver and inhabit the intestine , too. In this case, you might actually see some in the bowel movement after killing them. They won't let go of you as long as they are alive.

They have two attachments to hold onto you, yet, they are not difficult to kill, even with herbs. Use the herbal parasite recipe, zapper, or a frequency generator.

Sheep liver flukes might actually be breeding, that is, multiplying in the liver of the hyperallergic person. This is not normal. Sheep liver flukes “should” only spend their adulthood in our bodies. When the baby stages are also found in our bodies, (instead of in minnows or snails) there is undoubtedly a specific solvent involved. Environmentally ill persons have quite a few solvents accumulated in their organ tissues. Which one enables the sheep liver fluke to go through <u>all</u> of its development in the human is not known yet.

Obviously, the extremely allergic person, should remove all solvents from their diet and environment. Begin with eliminating propyl alcohol and benzene. The <u>same</u> products have other solvents too. It is processing of foods that puts solvents into them. Go completely natural. Dairy products are free of solvents, except for some cheeses. Remember to boil them to get rid of bacteria. Salt, olive oil, butter, and honey are free of solvents. With electronic technology, you can find solvent free products. Otherwise, if it didn't grow or you didn't make it from scratch, you must assume it has solvents! Cook from scratch, make your own pasta, bread, fruit juices, beverages.

Often, <u>but not always</u>, persons with sheep liver fluke, have a specific allergy to lanolin, a sheep product. Since lanolin is widely used in other products, this becomes a very broad range allergy. Such persons “can get no fat” at mealtimes or wear no wool without a considerable reaction. The allergy to lanolin does not disappear the day the flukes are all dead. But cleaning the liver with several

Liver Cleanses after killing parasites will start the recovery process.

Which comes first, the flukes or the solvents? That can't be answered. But what happens next is easily seen. The more flukes, the less able the liver is to detoxify solvents. The more solvents the better able the fluke is to multiply. A vicious cycle is set up that accelerates the illness.

Perhaps neither of these came first. Perhaps something else poisoned the liver so both solvents and flukes are given a home in your liver! Such a powerful liver poison would be a food mold: *aflatoxin, cytochalasin B, sterigmatocystin, zearalenone, ochratoxin, sorghum mold, griseofulvin, citrinin, T-2 toxin, Kojic acid, ergot* and others. Avoid food molds—see Mold Free Diet. The diet must be quite limited at first, to allow the liver time to "regain" its detoxifying capability.

Of course, it is assumed that environmentally ill persons have had their dental metal replaced by metal free composite. This includes gold. Gold accumulates in the pancreas, another organ of digestion. This may mean choosing partial dentures. Read the section on healing the jaw and Bone Strengthening to ensure this move brings you success.

The liver is a versatile organ. It can regenerate itself but it won't if food molds block regeneration. Given half a chance it will become like new. After killing parasites do the *Liver Cleanse*. If it has been a month or more since you killed parasites, then go on a high dose parasite herb treatment the week before, or zap. Don't use the herbs the day of the cleanse. With one major allergy gone after each cleanse and by timing *Liver Cleanses* two weeks apart, it takes only six months to have a reasonably normal life again. You can endure indoor air again, sit on plastic chairs, read newspapers, and wear cotton clothing and leather shoes without reacting. You must still be patient and careful as you take back the world for you to live in.

Delores Flores, 53, was brought by her husband to the driveway in front of the office. There she put on her mask and advanced to the outdoor bench. She did not dare to come in. Without doing any testing her condition was obvious. She must start killing liver parasites. But it seemed too simple to be believable. And she knew she'd be allergic to the parasite-killing herbs (this was before the zapper). She decided to do nothing.

Patricia Humphry arrived wearing an industrial painters' mask. It smelled rubbery. Her winter boots smelled moldy. And a faint scent of mothballs came from somewhere. Even her car had an engine problem, spewing exhaust fumes into the driveway. I suggested she begin with some basic reading material on allergies. She did not return either.

Arlene Kelly, 50ish, could eat no fat—not the tiniest snippet. But at Thanksgiving she allowed herself a little gravy. The consequences were swollen eyelids, swollen face, swollen throat: quite a dangerous

situation. After killing *Ascaris* and the flukes, and cleansing the liver (all in time for Christmas) she dared a little pie—and got along quite well!

Alcoholism

When the portion of liver that detoxifies ethyl alcohol (the drinking kind) is hampered you are at risk for alcoholism. The other contributors to alcoholism are **beryllium** and **ergot**. Perhaps there are even more contributors.

Beryllium is plentiful in coal products such as “coal oil”, and in gasoline to which kerosene or coal oil has been added. Fuel for “hurricane lamps” is a common offender, filling the air with beryllium. Liver blockage can force beryllium to circulate through the body; if it happens to attach itself to the addiction center of the brain, you're in a heap of trouble. Beryllium is very reactive. Any other allergen coursing by can react with it. If this happens to be alcohol—the drinking kind—you will be alcoholic unbeknownst to you.

When the liver is quite disabled, there may still be alcohol coursing through your body the day after you drank even a little bit! It is bound to find the beryllium stuck to the addiction center. Together, they turn the brain into a uncontrolled machine. Neurotransmitters are released that shouldn't be; others not released that should be. Mood is affected in a typically “alcoholic” way. Depression may be lifted—or caused!

Alcoholic persons should remove all fossil fuels from their environment, and never choose a career that exposes them to paint, cleaners, or automotive products. They should do *Liver Cleanses* until 2,000 stones or more are out.

Of course, they should never touch a drop of alcohol: not even the Black Walnut Hull Tincture in the *Herbal Parasite Program*. The aqueous recipe should be made for them. Since alcohol is produced anyway, in the body, the liver should never be poisoned by molds, especially ergot: the very mold that is so abundant in alcoholic beverages! Alcohol and ergot interact to make each more toxic.

To help the brain recover its neurotransmitter status, take glutamine (500 mg.), a B-50 complex, and niacinamide (500 mg—to help detoxify ergot), with each meal.

To prevent alcoholism, protect your liver from food molds, especially ergot. Add vitamin C to nuts, pasta cereals, grains and even alcoholic beverages! Avoid

fossil fuel pollution of your home by switching to all electric utilities.

Alcohol Addiction

There are many definitions of addiction. My definition is based on the special brain toxins, *beryllium* and *ergot*.

The brain has a region called the addiction center. If this center is stimulated it produces pleasure-chemicals. It is carefully controlled so that not too much pleasure or happiness can be experienced.

When a toxic substance, beryllium, is inhaled it circulates with the blood to the brain and may land at the addiction center. The more beryllium is inhaled the bigger the chance that it will occupy the addiction center. The brain cells in the addiction center have receptor sites for *glutamate* (the same glutamic acid that comes from the protein in our food). Normally, glutamate activates the addiction center. But when beryllium has "stolen" these seats, the glutamate is powerless to activate the joy and happiness center. The result is a low level chronic depression. The more beryllium there is to clog the receptors the worse the depression. Giving glutamic acid does not help but giving **glutamine** does! Addicted or depressed persons should take glutamine, no less than 3 grams (3000 mg) a day. It comes in 500 mg. tablets. It is completely harmless.

When we drink alcohol or put it on the skin (as in mouthwash, tinctures, medicine) or produce it by fermentation in the intestines (*Candida* produces alcohol) a substance, *salsol*, is formed. Salsol reacts with beryllium. If the beryllium is in the pleasure center it reacts with it there. This reaction has the effect of activating the cells! Now a large amount of pleasure-chemical can be released. The amount is larger than normal because so many clogged cells are activated together. This explains the alcohol "high". In all the alcohol-addicted persons I studied, salsol was present, along with beryllium, on the receptor sites normally activated by glutamate (or NMDA or kainate). As we removed the beryllium we saw that the salsol also disappeared.

The solution to alcoholism is to avoid ergot contaminated food and avoid beryllium inhalation. We also remove the brain beryllium using **thioctic acid**. Stopping the use of alcohol may save a life or career but does not correct the problem. Even after 30 years of abstinence, I still see the beryllium present in the addiction center and the salsol, derived no doubt from endogenous sources, still attached to the beryllium. This is why the addiction is never gone even after

years of abstinence.

If any member of the family is, or was, addicted to alcohol the house should be searched for beryllium sources. Hurricane lamps or antique lamps are the most common sources. Remove them permanently. Washing does not clean them. Remove all solvents, cleaners, lighters. Switch to a butane lighter. The air should be tested for beryllium. The garage door to the house should be permanently closed. and the car and lawnmower kept out of it. Addicted persons should not be painters! Nor walk into a dry-cleaning business. Soon you will see a more cheerful disposition in the addicted person and this will be rewarding for the whole family.

Miguel Alcorn's wife cleaned up the environment for Miguel, whose alcoholism was 30 years long. Even lighter fluid was removed. The garage was sealed off from the house. She added vitamin C to his meals so he didn't have to “take anything”. She was very careful about moldy grains. He lost his preoccupation with drinking after killing parasites. She believes he is not sneaking any. Our hats are off to her.

Seizures

are always caused by tiny *Ascaris* larvae in the brain.

I suppose they find their way to the seizure center by accident. It is not normal for them to be in the brain, they typically travel between the stomach and lungs. *Ascaris* eggs are present everywhere in animal filth. Dogs, cats, horses and pigs all get *Ascaris*. Their excrement dries and flies about in the dust, but mostly it resides in the soil. Children playing in the dirt cannot help but pick up *Ascaris* eggs. The eggs hatch in the stomach and the tiny larvae, microscopic in size, travel first to the lungs. Here they go through a *molt*. This causes some coughing.

Whenever a child coughs for part of the day do not assume it is harmless. Use a frequency generator set to 408 KHz, or use a zapper. Children should be treated for *Ascaris* anyway, whether coughing or not, once a week. The tiny larvae are in the cough up. Children should not be taught to politely swallow this. They could be swallowing their own future seizures, asthma, or eczema. Teach children to use tissues for all spit up. The lungs are doing what they can to rid the body of these invaders. Your intelligence must cooperate with your lungs.

Ascaris do not come sweet and clean in themselves. They bring their own bacteria and viruses. One of these bacteria is *Bacteroides fragilis. Bacteroides* needs a host like *Ascaris* so it can be oxygen-free. Such a requirement is termed

obligatory anaerobic meaning “must have absence of air.”

Being transported to the brain inside *Ascaris* larvae is probably the means by which *Bacteroides* gets into the brain. Brain abscesses and brain tumors usually have *Bacteroides fragilis* growing there. Brain tumors will not shrink unless all the parasites, bacteria and viruses are dead. *Bacteroides*, in turn, are big enough to house thousands of viruses. Two common viruses seen with *Ascaris* are *Coxsackie* B_1 and *Coxsackie* B_4. Perhaps it is the toxins of the *Ascaris* larvae or *Bacteroides* or *Coxsackies* that induces the seizures. Maybe it is something else about the infestation that induces them. But by killing *Ascaris*, *Bacteroides* and *Coxsackies* (zapper or frequency generator at 408, 325, 364, 362.5 KHz) you have eliminated the first essential link in the chain of developments that causes seizures.

The brain does not quietly tolerate these invaders. It fights back with its immune system. But the wormlets are already too big to be eaten by white blood cells. The brain fights back by producing **inflammation**.

Inflammations are intended to attract calcium so a wall can be built around the intruders. Inflammations are negatively charged regions so the positively charged calcium can find its way to the inflamed site. But lead and mercury are also positively charged! Perhaps this is how these **toxic metals** are attracted to the brain. All metals are positively charged. Perhaps this is their fateful poisonous attraction to living things. Perhaps they do not poison when no inflammations are present! In seizure cases we see many tooth metals in the brain. These must be removed so the inflamed site can heal.

Other toxic substances have also found their way to the inflammation at the seizure center: **vanadium** from leaking household gas; **PVC** from new carpets; **titanium** from face powder; **zirconium** from deodorant; **asbestos** from the clothes dryer belt or hair blower; **lead** from tainted drinking water. Do a good clean up of your environment.

Solvents accumulate here, too. Especially **toluene** and **xylene**. These are found in paint (persons with seizures should never be around fresh paint) but are also found in trace amounts in carbonated beverages. A person with seizures should drink no commercial beverages: see the Recipe section for homemade carbonated and other beverages. There are several other specific brain irritants that accumulate at the seizure center.

The food fungus, **ergot**, is always seen in seizure cases. Perhaps it can act

alone to produce seizures. After all, seizures are an ancient malady, existing long before chemicals and solvents were manufactured.

MSG, which is *monosodium glutamate* should never be used in food. It was already banned in infant food in Europe a decade ago. Why are we still allowing it? Are our children not as precious? Healthy adults may tolerate it better than young children. But what about sick adults? Specifically, adults with a brain illness? Glutamic acid is a natural constituent of protein in our foods. And the sodium glutamate it must form in the body does no harm. But MSG is not biologically produced. It is lab-made. Lab-made amino acids are not the same as biologically made. Perhaps it is these "isomers", perhaps it is the simple overdose of a natural thing that is brain-toxic. Whatever the mechanism, MSG should not be consumed by anyone, let alone a seizure sufferer. Fortunately, you can ask at restaurants, where (not whether) MSG is used so you can avoid these foods.

BHT and **BHA**, standing for *bishydroxytoluene* and *bishydroxyanisole* are food preservatives and also seizure triggers. They are often put on the boxes of cereals, rather than the cereals themselves, so the cereals can be pronounced preservative-free. Imagine how much the box must be drenched with to prevent oxygen leakage into the interior?

A more insidious seizure trigger is a perfectly natural substance, **malvin**. Malvin is the natural dye found in grapes, strawberries, plums and blueberries. Stop eating strawberry and grape jam or juice. Chickens and the eggs they lay, have lots of malvin too, stop eating chicken and eggs.

Here are foods relatively free of malvin: artichokes, asparagus, almonds, barley, beans of all kinds, green beans, broccoli, Brussels sprouts, cantaloupe, celery, nectarines, citrus, dates, mango, pears, kiwi, pineapple, Granny Smith apples.[14]

To Summarize

To stop your seizures on a dime, and not have another one:

1. Avoid malvin in food. Eat nothing colored red or blue, chicken, eggs, MSG, BHA & BHT. Boil all dairy products or don't eat them.
2. Avoid ergot in food. Eat no whole grain products; take niacinamide 500 mg

three times a day to help the liver detoxify tiny bits in other foods.

3. Kill *Ascaris*, *Bacteroides* and *Coxsackie* virus and stay on a maintenance program of killing them. Avoid reinfection. It would be wise to have only outdoor pets.

4. Replace dental metal with metal-free plastic (See *Dental Clean Up*).

5. Clean up the home environment and body products of toxic substances.

6. Keep your fingers sanitary: spray them with 10% grain alcohol or vodka after bathroom use.

You can often tell by how you feel whether you are near to having a seizure. But some people get no warning. Don't take chances. Keep your drugs with you, even though you no longer need to take them. Drugs like Tegretol™ and Phenobarbital™ are not harmless. Once you can tell that you're better, try reducing your drug dosage slightly. See how you manage. If you have a breakthrough seizure you could fall and break a bone. Don't take chances. Even a year after your last seizure you should carry your medicine with you and have some in your house. This is because it is so easy to pick up *Ascaris* again. The highway to the brain—its seizure center—is still open. They will travel it again. It might only take two days from the time of accidental swallowing of animal filth, to having little larvae in the brain. Use a frequency generator every day at first, or zap daily to guard against this. Notice that killing parasites the first time may actually start a seizure coming. Simply stop zapping if you feel one coming. Do shortened zapping until you can tolerate a regular treatment. Have someone with you while zapping.

Say good-bye to seizures forever. But don't forget your susceptibility. I believe you should be extra careful for two years. If you have a recurrence, repeat the whole procedure. This time it should be curable in a single day.

Doug's mother was distraught when she brought him, age 8 months. Her doctor only seemed sympathetic with her purpose to keep the baby's temperature down the next time he catches a cold. But her doctor had referred her to the county social worker. She had been completely honest with her doctor, because she was that kind of trusting person. Since her baby had only experienced one seizure (which was during a fever), she didn't see why her beautiful first born child should be on medicine “the rest of his life”. She wanted her baby to be perfect. But the social worker had called her, talked about “the law” and being an unfit mother. She was all apart. The baby was supposed to be on Phenobarbital™ twice a day. Our tests showed Doug had *Ascaris* plus lead toxicity. He was also getting homemade strawberry and grape juice. She promised to put the three cats outdoors, keep the baby off the floor, keep Doug's fingernails short and always wash his hands before eating. The parasites were easily killed. The lead was sporadically present in the water. She planned to move, and until then would filter all the drinking water so her breast

milk would be free of it too. His diet was changed to eliminate eggs, chicken and the red and blue fruits. We recommended leaving the state in order to be able to peacefully raise her child. We promised to treat her child free of charge if another seizure should occur. Two years passed and we heard she was doing fine with her child.

Clara Scruggs, 50ish, was losing control over her seizures and had to be hospitalized while a new medicine was tried. It changed her personality (again!) which upset her husband, too. She was started on the *Herbal Parasite Program* but could only increase by one drop of Black Walnut Hull Tincture a week, instead of daily, since each new increase would give her a seizure. In half a year she was fairly free of seizures in spite of being off drugs. After each seizure, a checkup showed she had picked up *Ascaris* again sometimes with additional parasites. She could not bear to put her cat outside; Boots had been a friend in need many times. When she finally got Boots onto a regular *Parasite Program* she improved enough to go to church and church events again. When Boots finally "wanted out" she didn't mind. She decided to do a *Liver Cleanse* —this, too, gave her two seizures the next day but paid big dividends in other ways. She eventually improved to an incidence of one small seizure ("spacey" time or incoherent speech) in two weeks.

Chun Yee, age 28, has been on Dilantin™ from age 15. Now he was up to five pills a day and it didn't control his seizures. Any activity would trigger it. He was put on a low malvin diet and started on the kidney cleanse. His blood test showed he was anemic with a high MCV (104 cu microns), suggesting the *Ascaris* worms were using up all his vitamin B_{12}, too. In six weeks he was down to one or two seizures per week, although he had not yet started the *Parasite Program*. He had beryllium built up in him, probably from a kerosene heater. When the pets and family were all treated for parasites he had no more breakthrough seizures and could cut his medicine in half which gave him much more energy. He was no longer in danger of losing his job.

Shiresse Nobel, age 7, was having minimal seizures but the mother did not want to start her on medicine. Shiresse had high levels of mercury in her body, although she had no tooth fillings. The whole family cleared their Ascaris infestation and in three weeks the seizures were gone but aggressive behavior remained. There was mercury in the air of some rooms but it was not in the paint. The bathroom was the worst. When everything in the bathroom was removed, the air cleared and so did Shiresse's behavior problem.

Drew Seaton, age 8, had his first seizure lasting nearly a minute. The parents were very fastidious and extremely conscientious about diet and habits. They were distraught. They all had *Ascaris*. A baby was still being diapered. Drew had arsenic (pesticide under kitchen sink), formaldehyde (some remodeling) and PVC (a new carpet) accumulated in his body. The carpets had to be steam cleaned to get rid of the arsenic. He was started on parasite herbs at once, since he was on medication that would shield him from having another seizure while killing *Ascaris*. Two weeks later everybody, except the mother, was free of *Ascaris*. In another two weeks they were all free and had cleaned up house toxins. They dared to stop his medicine. This let Drew's former happy personality come back to everyone's delight. Two years later there was still no recurrence.

Cosmo Maser, 30ish, was in a hospital across the country. He was having continuous seizures, although he had been there a week. It seemed impossible to transport him but, against doctor's orders, they got him into a station wagon. He had nothing to eat or drink that had any malvin in it (he ate four very well done hamburgers, plain, with lettuce on his trip) and his seizures stopped immediately. They felt a bit sheepish upon arrival 20 hours later since he could sit up, could tell his own story and no longer looked ill. He was without medication, too. They had left in a hurry. They immediately removed all the metal from his mouth; this cleared his mercury problem. He was started on parasite medicine and weathered the small seizures each increase gave him. He could return home in five days with his new diet and thioctic acid daily as a supplement. He occasionally had a seizure (2 a month) until they moved away from the busy street below their apartment. About a year later he could hold a job and go off Social

Security support.

Weight Problems

Overweight is not the same problem as *obesity*. In fact, I do not have the answer to either problem, only a part of the answer.

In **obese** women, the ovaries, pancreas and thyroid are all involved. Perhaps the adrenals, the brain satiety center, and the liver are also involved. Maybe it's as simple as gold accumulation in all these places. Perhaps it is bacteria in all these places. When you weigh close to 300 pounds obviously some organ isn't working right. Try several things, but not a starvation diet.

The cause is not eating too much. Try removing all gold: gold teeth, gold jewelry and gold rings. Replace them with non metal varieties. After removing the gold, pull the remaining gold out of your tissues with thioctic acid (2 or 3 a day for several months). Make sure kidneys are able to excrete the gold instead of making crystals by doing a kidney cleanse. Gold accumulates in the pancreas, the brain (possibly in a control center here) and the ovaries (causes some infertility here). Also try clearing the body of all bacteria and parasites by regularly using a zapper. Use the *Bowel Program* to evict the last of the *Shigellas*. Be very careful to avoid nonsterile dairy products. Try cleansing your liver by doing *Liver Cleanses*. Get 3,000 stones out.

Make sure you are getting enough nutritious food; make carrot and vegetable juice; use no commercial beverages. Avoid moldy food—don't take risks. If all these measures bring your weight down to the level of mere overweight give yourself good grades.

Overweight is a low energy condition. Your food is being turned into fat instead of energy. The decision not to make energy is being made in the liver mainly, but perhaps other organs as well.

Try cleaning the liver until no more stones come out: get at least 2,000 stones. Notice that as the liver gets cleaner you get more and more energy right after each cleanse. Some cleanses have a dramatic effect. Others do not. This suggests that a certain part of the liver is the responsible part. Soon after the cleanse—within a week—the same old lassitude sets in. But during these few days notice how your body feels. It feels light. Your abdomen feels tight, like it's a part of you again. You're mind isn't on food throughout the day. It's very easy to lose weight; in fact you may lose five pounds in these few days without dieting or

exercising. Definitely, your long-lost weight regulation is back in force. But then it vanishes. Fortunately, a bit of the weight loss stays with you, and by repeating cleanses (only once in 2 weeks, though) you can shed the pounds you want and gain energy in a permanent way. It is probably the way nature intended.

Try increasing your bowel movements. Notice how cats and dogs seem to derive energy from emptying their bowels. A cat walks to its litter box; after emptying its bowels and carefully covering it up, it jumps from the box and runs away. It now has its playful mood. A body chemical, *acetylcholine*, plays a role in emptying the bowels. Acetylcholine is a necessary operator for many of our muscles. Is there a disturbance in our acetylcholine metabolism in overweight conditions?

Coax your body to release more acetylcholine, at least in the intestines, by using a herbal laxative like cascara sagrada. Other varieties are useful, too, but don't use a drug laxative: it burdens the liver more. Try to have three bowel movements a day.

Shigella bacteria can cause dreadful constipation. Immediately, the body feels sluggish, abdomen feels disconnected or hanging out. A nameless hunger sets in. Keep a close watch on dairy foods to make sure they are sterile. Zap when in doubt and do the *Bowel Program*.

Exercise helps as long as you keep at it. Strict dieting works as long as you keep doing it. But there's the problem. When you stop, you lose ground. It doesn't solve the problem of an inefficient body metabolism.

Raising thyroid levels helps but this can be dangerous. Raising thyroid levels naturally, by removing toxins is a very effective method—provided it was low to begin with. Overweight people often have a low body temperature, showing that the thyroid is involved: it is under producing. **But giving the body extra thyroid doesn't solve the thyroid's problem. It only temporarily solves the rest of the body's problem.** The thyroid will have viruses and heavy metals in it. The metal in your mouth drains downward to the stomach passing very close to the thyroid. Perhaps its iodine uptake is inhibited. The chlorine in water and bromine in bread may inhibit iodine uptake by the thyroid, too. After all, they are all halogens. Stop eating bleached bread and filter out the chlorine in your water. If this raises your body temperature you could expect better weight control.

The traditional herb, *Fucus*, was used to treat thyroid problems (and

overweight) in days when herbs ruled medicine. Herbalists made a point of discouraging use of plain iodine. Fucus, they said, was much more effective. See *Recipes*.

If all these measures don't work for you, at least you have improved your health trying.

There are some advantages of being overweight. Overweight people seem to weather illness better. They laugh more. But one look in the mirror or at the scales ruins it. Put away the long mirror and scales. Don't ruin your whole life over it. Make a reasonable effort and then let go. Enjoy your stay on this planet.

Underweight can be just as difficult as overweight to correct. Once the stomach has been trained to say “full” or “full enough,” even after a few mouthfuls, it is difficult to heal. *Salmonellas* in the stomach wall are often seen. *Giardia* and other common parasites, that don't belong in the stomach, are seen here in cases of underweight.

The stomach is invaded by bacteria and parasites when its immunity is low. The common culprit is tooth metal draining down continuously into the stomach. Remove every bit of mouth metal. Don't cook or eat with metal. Stimulate your appetite with B-vitamins. And, again, the liver plays a role. If it is toxic with mold, it may say “eat no more” and the body obeys.

I found all calorie boosters to be polluted with wood alcohol. Make your own.

Fig. 33 Calorie boosters

A stage of cancer illness is weight loss. This is called *cachexia*. The victim believes he or she is eating enough. They may not even have a poor appetite. Yet weight drops steadily. This metabolic problem has been studied scientifically. A chemical, **hydrazine sulfate** (prescription only), can reverse it to some degree.

Use 65 mg three times a day for 30 days. Perhaps a lesson taken from cachexia metabolism could be applied to obesity. For the cachexia sufferer, life would end sooner if high calorie supplements were not used. But don't use canned “calorie boosters”. They are polluted—often with the very solvent that makes the condition worse. Instead, make an eggnog: ½ cup boiled milk, ¼ cup boiled whipping cream, a raw egg (exterior carefully washed), 1 tsp. olive oil, a banana, honey, cinnamon, cloves, nutmeg to taste. Mix all in a blender. Drink 1 cup a day. Vary it daily to keep it interesting.

If all this fails, give yourself credit for achieving health improvement and shift your focus to a different project. Underweight is not all bad either.

Sleep Problems

All big animals sleep, but some sleep by day instead of night. When humans do this, that is, work the night shift, they don't feel as well. Humans need about seven hours of sleep out of the twenty-four. Younger ones sleep more; newborns sleep much more. When we are deprived of sleep we are grouchy, think less clearly next day and have less energy. In spite of lots of research at “sleep labs” sleep problems are not understood, except for sleep *apnea*. Breathing should be even. When breaths are missed it is called apnea. It is especially disturbing when a baby shows apnea.

Sleep Apnea

Since breathing is regulated by acid levels in the blood and this is influenced by air quality, air toxins should be searched for first. **Cigarette smoke** is an air toxin. **Vanadium** from a gas leak is a very serious air toxin and can go unnoticed. Do your own checking since gas companies give wrong answers four out of five times. Ask a home construction company to check for gas leaks or the Health Department. **PVC** from new carpeting may be polluting the air. **Arsenic** from “treated” carpets and drapes and furniture also pollutes. **Asbestos** from clothes and hair dryers may be the toxin responsible. Perhaps even **fiberglass**, **formaldehyde**, or **Freon**.

Adults with sleep apnea show swollen throat tissues: not necessarily pain. This makes the air passage smaller; long gasps of air are taken to try to make up for the missed oxygen and the carbon dioxide build up.

Swelling of the throat is a common allergic reaction. The possibility of allergy

should get second consideration after air quality. Drug reactions, even in a nursing baby, where only the mother is using a medicine could be the problem. Allergy to food chemicals has been suggested, as well as a simple lack of vitamin C (implicating mold and medicine which consume vitamin C in the detoxification process).

A third possibility is infection. Many bacteria and viruses can cause throat swelling. Redness of the throat is a telltale sign. It doesn't necessarily hurt. Kill all invaders with a zapper and try to understand the basis of low immunity in the throat.

Keeping metal in the mouth constantly, is a cause of low throat immunity since it must drain past the throat.

If you snore, you can deduce that your throat is swollen, even if you don't have sleep apnea. Pursue all three possible causes (air toxin, allergy, infection).

Overweight and obesity have been emphasized as causes. This may apply to some cases but certainly not to babies.

Whatever you do, don't do nothing. Keep removing bad things until you find the cause of irregular breathing.

Chester Fannon, 50ish, was quite overweight and wore a mask at night with an air blower to assist his breathing. He had been referred to a sleep center for sleep apnea. He had extreme dryness of his throat at night and some hearing loss in one ear. He was toxic with arsenic (roach killer), bismuth (cologne), tin (toothpaste), and thallium (polluted dentalware). He was infested with both species of *Ascaris* and had a hacking cough. He had four solvents accumulated in his tissues. He was growing nine pathogens: *Mycoplasma, Haemophilus inf., Streptococcus pneu, A-strep, Nocardia, Staphylococcus aureus, Bacillus cereus* and Flu virus, over half of them in his throat. These were killed with a frequency generator and a general clean up was done. After two teeth were pulled he no longer needed his mask, he no longer had apnea.

Peter Day, middle age, was set for throat surgery in a few days. He had a couple of scary nights when he thought he was dying and couldn't risk many more nights with his obstructed airways. He was overweight. His throat was red and swollen, although he felt nothing. He never even had colds. His diet was completely changed, to things he rarely ate (bananas, milk, soup, oatmeal) and off things he ate daily (hamburgers, fries, tea, pancakes with genuine maple syrup). In two days, his throat was quite clear, the tissues having become unswollen. Maybe it was the molds in the maple syrup, maybe it was the oxalic acid in the tea, or something else he could not detoxify in these foods. He was certainly happy not to live the rest of his life with an artificial voice box.

Insomnia

Another sleep disturbance is waking in the night and not being able to go back to sleep for hours. Or not being able to get to sleep.

I believe these problems are caused by a high ammonia level in the brain. This belief is based on two observations. **Ornithine**, an ammonia reducer, induces a wonderful sleep in sleep-deprived persons. It is also observed that after killing parasites, which produce ammonia, sleep is much improved. Our metabolism does not produce ammonia. We produce urea which is excreted by the kidneys along with water and then called urine. When we are parasitized, our metabolism is burdened with ammonia, though, made by the parasites. We have to turn it into urea in the liver and kidneys so we can excrete for them. But this can't be done in the brain! The brain lacks an essential enzyme, *ornithine carbamyl-transferase*, for this bit of biochemistry. The brain was never meant to be parasitized or infected and has no defense. Most of our parasites come from animals we associate with. We weren't meant to live with horses, cows, sheep, pigs, monkeys, guinea pigs, cats, dogs and chickens nor to come in contact with dozens more at a zoo. We do so at our own peril.

It is known that ammonia is a strong brain irritant. In fact, a person can be awakened from a coma by being made to smell ammonia "smelling salts." Ornithine reacts with ammonia, mopping it up like a sponge. **Arginine**, another amino acid, also reacts with ammonia, but does not put you to sleep. So there is more to insomnia than mere inability to reduce ammonia levels. Arginine results in alertness and therefore should be used in the morning, when needed. Ornithine, given at bedtime, may take ½ hour to do its magic. Both are perfectly safe, since they are natural to your body, and a food constituent.

Start by taking two ornithine capsules (each 500 mg.) on the first night. Take four the next night. Take six the night after and choose the dose you like best. Sometimes it takes five days to "catch up" on everything that needs to be done for the brain and get you sleeping. Meanwhile, of course, you are planning to kill your parasites and be done with insomnia in the most effective way of all.

Another sleep aid is herbal. A couple of herbs, **valerian** and **skullcap**, are known for such action. The mechanisms are not understood and this makes for non-uniform action. Some persons sleep well with them, others do not. Simply try them to find out. We are all so different in our metabolism details, we respond differently to herbs. But it is a blessing that the mechanism is not understood. Herbs, a tradition that precedes civilization, need to be forever off limits for intervention by government agencies.

Tryptophane, another amino acid, is about twice as powerful as ornithine, but was taken off the market a few years ago. Some persons taking it daily were seen

to become quite ill and some deaths ensued. Since tryptophane had been used in prior years without noticing toxicity, something unusual should have been suspected. My tests showed extreme pollution of tryptophane capsules. They contained PCBs, mercury, ruthenium, strontium, praseodymium, aluminum, and benzalkonium. I can only speculate that a mixing vat broke, dumping its precious load onto the floor—but it was salvaged. Or that the mixing vat wasn't cleaned thoroughly from it's last use.

Persons with illness due to taking tryptophane developed an extremely high eosinophil count in their blood test—an index of parasitism, too. Parasitism, that would have led to insomnia in the first place! Were these unfortunate victims seeing the cause or the result of their tryptophane use? This tragic event should have led to a discovery of the heavy pollution, a revelation of the industrial manufacturing process, and a safeguarding against any repetition. It has not been done (certainly not publicly).

Foreign countries' manufacturing processes do not come under U.S. scrutiny or jurisdiction, although some imported products must pass tests. There are no safeguards against repetition of the tryptophane experience. It behooves us to demand safe supplements and medicines. It is not the list of ingredients that informs. Lot analysis, after bottling, would give us the necessary safeguard. The presence of filth contamination and toxins cannot be completely avoided but the consumer can make informed choices if he or she knows it is there. Disclosure, of course, is the bane of the manufacturing business. Interest rate disclosure was the bane of the money lending business. Such important matters can't be left to “self-regulation” policies. The consumers must simply demand to know what they are consuming.

Ruby Adair, 14, ached all over, had ringing in her ears, sinus problems and chronic fatigue. She couldn't get to sleep, ever; and had been half a year out of school already. She had intestinal flukes in her stomach. In three weeks she had eliminated them with parasite herbs and she could go to sleep naturally.

Yeast Infections

The most common yeast in humans is *Candida albicans*. *Candida* has always been around. It flies in the air, searching for a place to land and reproduce. It can invade a variety of human tissues like the mouth (called thrush), skin (including some kinds of diaper rash), vagina, and the digestive tract. We all have some yeast in our digestive tract, but when it gets out of hand, it's called *candidiasis*.

Yeast is a **fungus**. It needs dampness to survive and sugar to grow.

Our immune system, white blood cells, is capable of eradicating yeast provided it isn't growing too fast. And provided the white blood cells aren't immobilized or preoccupied with something else.

Diaper Rash

A baby's rash is an example of the white blood cells being preoccupied. When chemicals are used in the diaper, the white blood cells go after the chemicals and let the yeast grow. Drying the baby's skin helps since the yeast must have dampness. This should be done with air, sunlight and a heat lamp, not with more chemicals! Certainly not with cortisone containing salves that further reduce the immune competence of white blood cells.

Use a heat lamp for five minutes at a time, several times a day. Switch to cloth diapers; do not bleach them with chlorine bleach, the residual chlorine trapped in the cloth is a chronic irritant, setting the stage for another rash and future chlorine-allergy. Cloth diapers should be sterilized, not bleached. Use the hottest water your laundry system is capable of producing. Add ½ cup borax for the washing process. If you have homemade Lugol's iodine (made by your pharmacist or by yourself, see *Recipes*), add a tsp. to the wash or rinse. Vinegar is a yeast inhibitor, add it to the rinse. Dry the diapers at the hottest setting. Dry to kill. Kill all the yeast spores in the diapers.

To strengthen the baby's skin against future infection, do not put chemicals on the skin. Do not use any soap, fragrance, bath oil, ointment or lotion. Do not use cotton balls or baby wipes. Do not give a daily bath. Wash bottoms gently, with borax followed by a vitamin C rinse. Vitamin C is acid and is our natural healing agent but it will sting on a broken skin surface. Use it as dilute as necessary to be tolerated. Zinc oxide is another natural healer because it competes away the iron that fungus and bacteria need for their reproduction. Never use commercially available zinc compounds though, simply purchase your own zinc oxide powder, mix it with cornstarch and keep in a large old salt shaker, dust it wherever there is moisture or fungus growth.

Treat Yeast or Fungus the Same

Other fungus growths, like *Tinea* (crotch itch), ringworm (not a worm at all), athlete's foot, along with *Candida*, can be similarly eradicated:

1. Deprive the fungus of moisture.
2. Deprive the invaders of iron.
3. Deprive the fungus of sugar.
4. Strengthen the skin's immune power.
5. Strengthen the skin's healing ability.

It may be impossible to deprive the fungus of moisture, for example if your feet sweat and you must wear socks. Take your socks off as soon as you are at home, treat your feet with a heat lamp. Use zinc oxide or cornstarch to powder and dry the skin. Boil your socks when laundering. Dry them to tinder-heat (too hot to touch). Launder with borax only (soaps and detergents contain aluminum which pollutes the skin). Rinse skin with vitamin C water. It takes all these measures used simultaneously to clear up athlete's foot fungus. And great persistence. They may have developed a foothold underneath the toe nail where a steady supply of moisture, iron and sugar is available to them. Nevertheless, your white blood cells will eventually gobble them up if you let them.

In thrush (yeast infection of the mouth) you must again outwit its growth by doing everything possible at one time. Eat no sugar, drink no fruit juice, stay off antibiotic. Avoid trauma like eating abrasive foods (crusts, popcorn, nuts, lozenges) or sucking on things. Floss teeth only once a day (using monofilament fish line), followed immediately by brushing with white iodine (or Lugol's, but this may temporarily stain). Hydrogen peroxide is not strong enough. Remember to sterilize your toothbrush with grain alcohol or iodine. You may also rinse your mouth with Lugol's (6 drops to ¼ cup of water). Or apply 6 drops directly to the tongue and rub it in lightly with your lips.

Do not use Lugol's iodine if you have been told you are allergic to iodine.

Kill *Candida* daily with a frequency generator or zapper. Since reinfection is constant, you must continue to do all the treatments given to permanently cure yourself of fungus disease.

Since *Candida* grows right into your living cells (which you are not attacking!) you cannot kill it all at once. Only surface fungus can be accessed by either Lugol's or electrical "zapping". But as the top layer is killed, exposing the next layer, you will make progress. It will take a month of daily treatment to

clear it.

Clearing up fungus at one location but not another will not bring you a permanent cure, either. Damp locations like under the breasts, under the belly fold, groin and crotch need to be kept dry with cornstarch daily. Keep it up long after it seems to be cured.

Fluke Disease

Flukes, or flatworms, have a complex life cycle with many stages. Although sheep, cattle, pigs and humans can be “natural” hosts to the **adult** stage, the other stages are meant to develop outdoors and in secondary hosts. When fluke stages other than the adult are able to develop in us, I call it *fluke disease*

Or, when an adult that “normally belongs” to another species is able to develop in us, I also call that fluke disease Or even with adult flukes in their “normal” host, when they move from the organ that they “normally” colonize to other organs in the body I call this fluke disease, too.

Four fluke varieties engaged in this extra territorial pursuit are the intestinal fluke, sheep liver fluke, pancreatic fluke, and human liver fluke.

As you can see from their names, scientists have studied them well, and know exactly which animals are the “normal” hosts, and which organ in that animal is the adult fluke's “normal” home. Fluke disease is when any of these is “wrong.”

Flukes don't have eyes to see with or legs to walk with, so how can they find and travel to the organ they want in the middle of your body? Scientists do not know for sure. However it's concluded from many scientific studies that the liver fluke, *Fasciola*, for example, has no trouble seeking out and colonizing the liver.

Here are some examples of what can happen when flukes go “wrong:”

- Adult flukes (any of the four mentioned) in the uterine wall causes cramping and bleeding when it is not menstrual period time. If an adult crosses the wall to the inside and then manages to get out through the fallopian tubes to the abdominal cavity it takes some endometrium with it—causing **endometriosis**.
- If adults develop in the kidneys, it can cause **lupus** or **Hodgkin's disease**.

- If adults complete their cycle in the brain, **Alzheimer's** disease and **multiple sclerosis** result.
- If the intestinal fluke (*Fasciolopsis buski*) becomes adult in the liver it causes **cancers** of many (hundreds) kinds.
- If the pancreatic fluke completes its cycle in the pancreas it leads to **diabetes**. This is not an example of flukes straying into the wrong organs, but of having its stages reproducing where they never could before.
- If flukes develop in the thymus, immunity is lowered. If it happens to be the intestinal fluke, **HIV** (Human Immunodeficiency Virus) is released there. In turn, HIV invades other tissues, like penis and vagina.
- These four flukes can also invade the muscles, causing **dystrophies**.

As dissimilar as we always thought these diseases to be, it's obvious to me that they are but one disease—fluke disease

Considering the size of these flukes (adults are easily visible), it is not surprising that they can quickly lay waste a human's organs. Yet a human is big and makes a valiant effort to kill the stages, block access to tissues and otherwise battle them.

But only the human's intelligence can be counted on to defeat them. The intelligent approach is to discover what enables these mighty monsters to do their reproducing in our bodies instead of the pond with its snail/minnow secondary hosts.

Flukes and Solvents

The explanation I have found for two of these flukes is the presence of solvents in our bodies. The presence of *isopropyl alcohol* is associated in 100% of cancer cases (over 500 cases) with reproduction of the intestinal fluke stages in a variety of organs causing cancers in these organs.

The presence of *benzene* is associated in 100% of HIV cases (over 100 cases) with reproduction of intestinal fluke stages in the thymus.

The presence of *wood alcohol* is associated in 100% of diabetes cases (over

50 cases) with reproduction of pancreatic fluke stages in the pancreas.

The presence of *xylene* and *toluene* is associated in 100% of Alzheimer cases (over 10 cases) with the reproduction of intestinal fluke stages in the brain.

Much more work needs to be done to examine the relationship between fluke reproduction, the solvent and the chosen organ. But it seems probable that the solvent allows it all to happen. And our intelligence, to save us, must find a solution.

Stopping use of these solvents seems to me to be the most urgent advice. Finding which foods and products are polluted with them is the first step. It is imperative that you test everything you use or eat for solvent pollution. The Syncrometer® makes that an easy task. Ideally, we should all pool our results, adding to the body of knowledge I have begun.

In my observations, when the big sources of solvents are stopped, the body's levels go back to zero. In other words, the minute amounts that we inhale here and there do not accumulate to the point of serious damage. We have to eat, drink or absorb them on a daily basis to injure us! So where can they come from?

The sources of benzene and propyl alcohol that I found are given in special lists. The sources of wood alcohol are not as well known, but include commercial beverages, cold cereals, artificial sweetener, vitamins, and drugs. Other solvents are even less studied. But a pattern is emerging: foods and products that require sterilization of bottles and machinery to fill these bottles are polluted with propyl alcohol or wood alcohol. Foods and products containing flavorings or oils are polluted with benzene. Let the buyer (you) be wary! Test your own products if possible. If not, do not purchase them.

There are many other flukes and many other diseases. Are there other fluke/solvent/disease trios? Has fluke disease been going on for a long time or is it a recent phenomenon? Certainly cancer is 100 years old, so is the use of propyl alcohol**.** Diabetes is quite old as an illness, too, and so is its associated solvent, wood alcohol. But HIV, AIDS and Alzheimer's are recent diseases. Should we conclude that benzene, xylene and toluene were used much less in the past?

Fluke diseases could be eradicated with some simple actions: monitoring of solvents in foods, feeds and products. Hopefully, this will begin. It is in the interest of the consumer to have her or his own independent way of monitoring

too. Chemical ways can be devised, besides the electronic way presented in this book. Imagine a small test strip like a flat toothpick which turns color when in contact with propyl alcohol. Keep a pack in your pocket and never be unknowingly dosed again...all in tomorrow’s world.

Flukes Not Alone

There are other families of parasites. The roundworms and tapeworms are gaining ground too. Are they associated with solvents? Or with yet undiscovered factors? Are they changing their life cycles to take advantage of our lowered immunity? These are important questions. But you are armed with excellent technology. The answers will be found.

And along with answers there will surely develop a new industry. An industry that not only proclaims purity for its products but provides the proof to your satisfaction.

Burning And Numbness

Burning sensations in the skin let you know that nerves are involved. Mercury is the most common offender. Mercury may have started the trek of a host of other toxins as well into your nervous system: pesticide, automotive chemicals, household chemicals, fragrance and even food chemicals. Some people can get a burning sensation after a car trip, some when exposed to perfume, some when walking down the soap aisle in a grocery store. When the affected nerves don't go to skin but instead go to an organ like toes, you might feel a toe cramp or finger cramp instead. Remove your mercury sources.

Burning skin is an ancient malady—maybe even the basis of concepts like “hell.” St. Anthony's fire was caused by *ergot* (food fungus) ingestion. Molds don't necessarily come singly. Maybe other mold toxins can go to your nerves, too (see Moldy Food). Maybe the mold toxins interfere with **pantothenic acid** used by your body, because giving pantothenate (500 mg three times a day) can sometimes relieve the condition and, of course, this is good for your body.

Monosodium glutamate (MSG) can cause burning, especially of the face and lips. Sometimes swelling occurs too. MSG is used as a flavor enhancer. It was found decades ago to be a brain toxin and was taken out of baby food. But what about adults? Especially those who already have a brain problem. Throw it all out of your kitchen. Ask at restaurants which foods have it.

Numbnesshas a similar cause. Numbness of fingers or feet has become quite common since thallium and mercury toxicity has spread so widely.

If you have burning and numbness, can multiple sclerosis (MS) be far away? Remove all the metal in your dentalware immediately, replacing with composite (see *Dental Clean Up*). Hopefully, your immune system is still strong enough to clear the bacteria growing around the metal and in pockets in the jaw. Check and clean cavitations. Start your jaw healing with the milk, magnesium, vitamin D diet. Use thioctic acid to help clear your tissues of remaining metal (3 to 6 a day).

The most common nervous system bacterium is *Shigella*. Its beginning can already be seen in cases of burning and numbness. It is deeply entrenched in cases of MS. Three kinds of *Shigella* are readily obtainable on slides: *Shigella dysenteriae, Shigella flexneri, Shigella sonnei*. *Shigella flex* causes depression and irritability. All can cause gas and bloating. Zapping doesn't kill all of them because they inhabit the bowel. You must empty your bowels frequently, two or three times a day. And do the *Bowel Program* until all symptoms are gone. Be very careful not to put contaminated dairy food in your mouth again. Boil all milk products. They must be at boiling point for 10 seconds. This includes cheese, cottage cheese, buttermilk and regular milk. Eat only homemade yogurt or homemade buttermilk. Butter and whipping cream need this treatment, too. Never use raw dairy products.

Nana Hughes, 48, had numbness of the whole right arm, hand and right side of her head; it was particularly bad in the last four months. She was toxic with PCBs, titanium and dysprosium (paint). She was on thyroid, Xantac™ (for stomach) and chlorazipate medicines. We also found dog heartworm (she had chest pain over the heart). She started on the *Parasite Program*, stopped using nail polish, and stopped all detergents for dishes or laundry. In three weeks her numbness was greatly reduced. She still had titanium buildup from dental metal (a partial bridge). Seeing she was on the right track, she stopped use of MSG in her food, switched from concocted beverages to milk and cut down on her smoking. She brought her arm pretty near to normal.

Marla Santana, 45, had numbness in both arms; they would tingle and “go to sleep” a lot. It was spreading to one leg. Her muscles were toxic with thallium. It was in some very old pesticide, still effective and still in use in the house. It was also in the well water, probably, from pesticide seepage. She went off all commercial body products, did a *Kidney Cleanse* and killed parasites. She had difficulty getting rid of *Prosthogonimus* but in two months she had everything cleaned up. Her legs, arms, sleep problem, urinary tract problems were all gone and she could focus on her last problem, digestion.

Candy Donaldson, 44, had numbness from her shoulder to the wrist of one arm, it started a year ago. She was toxic with iridium, lithium and vanadium from a gas leak. She was advised to stop caffeine use and switch to milk (her calcium level was low: 9.0 mg/DL) and a magnesium tablet (300 mg daily). Her triglycerides were high, implying a kidney problem. She had urate and phosphate crystals in her kidney. She decreased the phosphate in her diet (meat, nuts, grains, soda pop) and started the kidney cleanse. When the gas leak was fixed, both her lithium and vanadium toxicity disappeared. In six weeks she had

also killed parasites and her periods became regular for the first time. An ovarian cyst had disappeared, too, as checked by ultrasound. Soon her PMS was gone, including hot flushes. After four months she had done three *Liver Cleanses* and suddenly her numbness improved. After a few more there was no numbness at all.

If cleaning cavitations brings you immediate improvement you know that these bacteria were part of the problem. Have them checked again if problems return; dental bacteria are notorious for returning. If kidney cleansing makes it worse for a day and then better, you know kidney bacteria are partly responsible. If *Liver Cleanses* make matters worse for a day and then better, you know bacteria are entrenched in the liver. Continue cleansing until none of these sources exist any longer. Kill all bacteria at least once a week electronically. Burning and numbness can be cured, not just arrested. In other words, your nerves can be cleaned up and healed.

Depression

All persons I have seen with clinical depression had small roundworms in the brain. Is it any wonder the brain can't make enough neurotransmitters or gets them out of balance? The usual worms are hookworms (*Ancylostoma*), *Ascaris* of cats and dogs, *Trichinellas* and *Strongyloides*.

Although it is commonly believed that hookworms penetrate the skin when walking barefoot on earth, this appears to be a negligible route. The important routes are eating animal filth and inhaling filthy dust. Our pets pick these worms up daily. We get them and give them in constant exchange with our pets and family members. Diapering babies is an especially hazardous, though necessary, business. Letting little children clean up after their own bowel movements is even more hazardous. Hands should be sanitized with grain alcohol after dealing with bowel contents, whether your own, your child's, or an animal's. If you clean up a messy diaper and then your hands well with soap, then go to make the chopped salad for dinner, you're sure to give each family member a dose of whatever the baby has. It was hiding under the fingernails. Animals clean up the easy way: they simply lick the youngster's bottom. But, we humans are not strong enough to take on a dose of bottom with each meal. **We must sanitize our hands.**

Cleaning bathrooms is also dangerous. Wear gloves. If nobody suffers from depression, you can use bleach (stored in the garage) to disinfect the stool, otherwise use alcohol (50% grain alcohol). Keep doorknobs and faucet handles wiped with alcohol, too.

If you suffer from depression use your zapper to immediately kill these four roundworm species: *Ancylostoma*, *Ascaris*, *Trichinella* and *Strongyloides*.

Other family members should be cleared of these four worms on the same day or as close to it as possible. Reinfection always occurs. In the depressed person, the microscopic parasites travel immediately to the brain. In others, they may simply reside in the intestine or lungs or liver, or other organs. Pathways (routes) to the brain have become established for the depressed person. These must heal before there is any tolerance to reinfection.

Solvents and other toxins, also in the brain, slow down or prevent healing. For this reason the depressed person should do the *Four Clean Ups*.

The bacteria of the *Shigella* family are always seen in depression cases. Kill all *Shigellas* and avoid reinfection by boiling dairy products and not eating those that can't be boiled. Go on the *Bowel Program*. Do not eat deli food or hand prepared salads at salad bars. Finally, do the *Liver Cleanse*, repeating every two weeks. Depression, even of long standing, can lift within days after the brain finally has its territory to itself. Look in the mirror and smile at yourself for your success in vanquishing your invaders. Never again, let these creepy crawlers into the happiness-center of your brain.

Manic Depression

This variety of depression is associated with *Strongyloides*, as the main parasite in the brain. Plus **chlorine** as an allergen! *Strongyloides* is the same worm that causes migraines and other severe types of recurrent headache. It probably depends on where these tiny worms have set up their “housekeeping” which symptoms you get: manic depression or migraines. Maybe chlorine is the deciding factor.

These tiny wormlets can pass the placenta into the unborn fetus. Is it any wonder that these brain disturbances seem to be inherited? Of course, there is ample opportunity to simply eat them off hands, other people's hands, and off floors during childhood. The amazing truth is that some family members do not get infected with it or at least do not get brain symptoms! It is very difficult to eradicate *Strongyloides* in a whole family and thereby let the depressed person get well. It is, in fact, impossible if there is a pet or other animal connection. Getting rid of the chlorine allergy is also very challenging. Step one is to zap all parasites.

I usually see an accumulation of **bromine** as well. Since bromine, fluorine and chlorine are all *halogens*, maybe getting too much of any one could saturate the liver's ability to detoxify chlorine. Stop eating brominated (bleached) bread. Stop taking drugs containing bromides. That is the easy part. You must also stop even washing your face in chlorinated water (use a pure carbon filter system). You inhale it as you wash. Never drink it or use it for any purpose. Of course, there should be no bleach container in the house, even when tightly closed; nor should bleached clothing be worn.

Do the *Four Clean Ups*. Sometimes the cloud lifts and the mind clears on the way home from the dentist. Recovery can be very rapid—less than a week. And recurrence just as rapid when a tiny bit of chlorine is inhaled or drunk. But your careful vigilance pays off. In half a year you can expect no recurrence.

Humans, it seems, must lick fingers with the same compulsion that cows lick their noses and cats lick their rears. The single, most significant advance in human hygiene would most assuredly be stopping the hand to mouth habit. We must <u>always</u> eat with utensils. And never leave a bathroom without washing. These are difficult changes but the new age of parasitism makes it necessary. Together with the new pollutants, solvents, and heavy metals, parasites will overtake us unless we change.

Don't go off lithium and other medicines until your doctor agrees you are ready, about a half year. After this, make sure you still keep it handy. Although you may be free of manic depression in a day, reinfecting yourself weeks later will attack your brain like a hurricane; it has not yet healed, the routes are open. Be patient; healing will happen.

Lena Constantine, age 39, had a history of migraine, TMJ, heavy clotting with periods and numerous pains but it shouldn't have made her try suicide 1½ years ago. She was put on Prozac™ afterward. she was parasitized by intestinal flukes (in the intestine), dog whipworm, *Strongyloides* and human liver flukes. She was started on a *Parasite Program* and *Kidney Cleanse*. This made her feel so good she took herself off Prozac™ and landed in the hospital for reasons she couldn't remember. After 42 days spent there she got out, wiser than before. She set to work again, leaving no detail undone, because she could remember how good it felt to be free of depression (not drugged out of it). Three months later she still had *Strongyloides* (she had a cat) but she did her first *Liver Cleanse* anyway. She got over 500 stones out. Her depression was gone. She substituted 4 ornithine and 2 ginseng capsules daily (more if tension was not relieved) for Prozac and cured her problem.

Mona Zabala, 33, was extremely depressed over her job. She was full of mercury, arsenic, PCBs, chromate from eye liner, wood alcohol from drinking colas and she had *Ascaris*, pancreatic flukes, *Trichinellas* and *Strongyloides*. She thought she was a hopeless case. But in less than three months, when only half her clean up chores were done, she was already saying *Positive* things about her job.

Acey O'Hara, a young graduate student, was very careful to avoid junk food, caffeine, fragrance, and body

products because he had learned the hard way that he didn't tolerate them. When “crying” depression hit him he was not only surprised but angry that his good health habits “hadn't paid off.” He was buying his drinking water; it came in clear plastic containers. He had cesium in his tissues and brain. When he switched back to plain tap water (filtered in small quantities) the depression lifted in a week and he was no longer crying over anything.

Leisa Underwood, 46, was clinically depressed and in therapy. She believed it was due to going through menopause. She had a heavy burden of *Strongyloides* but no other worms. Only one of her two dogs had *Strongyloides* (saliva test) and the cat was free of them also. She was full of cesium (from drinking refrigerator water) and vanadium (from a gas leak). In two months she had accomplished the impossible: all pets and herself were free of *Strongyloides*, they had repaired three gas leaks and her depression was just a memory.

Roland Greeley was diagnosed as manic depressive a few years ago and was put on Ativan™ and Prozac.™ This controlled him but did not relieve depression. He had a prominent tremor. He had *Ascaris* and sheep liver fluke stages in the brain. Also *Trichinella*, *Strongyloides* and human liver fluke stages. Styrene (from Styrofoam cups), methyl ethyl ketone (beverage) and carbon tetrachloride were in his brain also, probably setting the stage for parasite reproduction. He had high levels of mercury and silver but highest of all—throughout his body—was chlorine (from bleach and tap water). In four weeks he had all the metal removed from his mouth. He stated that this “unchained” him. He could already tell on his way home from the dentist that something special had happened. His depression was simply gone “the way you lift a blanket off a bed”. He resolved to clean up his whole body and recover from his illness using logical methods, like ours. Staying away from regular chlorinated water was a fine challenge to his resolve but with whole house filtering now available he may have done it.

Darren Knox, age 48, had been on Thorazine™ for 36 years but was recently changed to Desyral, Valium and lithium. He had *Ascaris* and hookworm and two dozen more assorted parasites including fluke stages. His brain was also hosting *Bacteroides* and *Nocardia*. All parasites were killed in half an hour by frequency generator at his first visit whereupon he immediately announced himself free of depression; better than the last eight years. He had many metals in his brain, also chlorine. In four weeks his tremor was way down, after dechlorinating his tap water. His depression never came back after dental work was done.

Schizophrenia

Much more mold toxin was seen in schizophrenic families than in other kinds of illness. They usually had four or more kinds of mold toxins at the same time, meaning that one toxin was not detoxified before the next was already eaten. It may reflect on the liver as much as the food selected. The initial injury, though, to the liver may have occurred in early childhood.

Schizophrenia does not require mercury or other dental metal pollution for its expression. This pattern is logical when it is seen that young children can have schizophrenia. Schizophrenia is an ancient illness, being described in some very old literature, before dentistry existed. But parasites existed. And moldy food existed. And copper existed!

Ergot is always seen in sick persons. Other mycotoxins are also present,

including *sterigmatocystin*, *cytochalasin B*, and *aflatoxin*. As the mycotoxin panorama changes, brain symptoms can change from compulsive hand washing to paranoia or from hearing voices to meanness in disposition.

It is my belief that the current increase in violent crime in U.S. society can be attributed to the especially high levels of mold consumption in foods and beverages, with the resultant effect that behavior erupts into violence with almost no provocation, merely some frustration. It would not be difficult or expensive to experiment with a mold-free diet in our prisons.

A bacterium, *Mycobacterium phlei*, may also be a cause because I have seen a high correlation between it and schizophrenia cases. What its specific effects are, I don't yet know. This bacterium may be hiding under teeth. It is also seen in dogs.

Shigella bacteria from nonsterile dairy foods are part of the problem, too. They produce brain and nerve toxins resulting in irritability, depression, anger. In fact, anger can be so intense, it erupts in violence.

Lead and copper are commonly seen in schizophrenia sufferers. The usual source for these is the household water (household plumbing may have lead solder joints). Change plumbing to PVC, then take thioctic acid (100 mg, twice a day).

Parasites always found in schizophrenia are hookworms (4 *Ancylostoma* varieties) in the brain.

Instructions:

1. Stop eating all grain products, nut products and syrups immediately.
2. Sterilize all dairy products.
3. Search for lead and copper in the water.
4. Stop drinking commercial beverages, including bottled water.
5. Zap the parasites in the whole family for three days, followed by repetitions twice a week.
6. Eliminate *Shigellas* with the Bowel Program.

7. Give away pets. Schizophrenia is too serious to risk reinfection.

8. Do the *Dental Clean Up.*

The need to zap repeatedly arises from reinfection. Nothing needs to be killed twice. But reinfection from self, family members, pets and food happens every hour. One cannot rely on zapping to stay well. Do a thorough diagnostic search of all foods eaten at the last meal, the water drunk, the air breathed. Only when all these are clean, will the brain heal.

When can you eat grains again? When you are well. Find a cereal or pasta that has no mold. Test it for the mold frequencies (77, 88, 100, 126, 131, 177, 188, 232, 242, 277, 281, 288, 295 KHz). Search especially for ergot (295). Remember, ergot makes *lysergic acid diethylamide* (LSD), not a good thing for a schizophrenic brain. Honeys, too, have ergot. Ergot takes longer (up to 20 minutes) to detoxify with added vitamin C. (Read the section on Moldy Food). If you become ill again after starting grains, go off again. Take 500 mg. niacinamide 3 times a day to speed up ergot detoxification by the liver. Avoidance is much easier.

Healing of the brain is very rapid; in less than one week feelings and behavior are more normal. Perhaps there are herbs that hasten healing; considering how old the illness is, there must surely be several useful herbs. But considering that herbs, too, can be moldy, be very careful to search for molds electronically before using any herbs. Blue vervain, sage, and ginseng are herbs worth trying.

A question may have popped into your mind as well as mine. If the whole family is eating moldy food, why aren't they all schizophrenic? In fact, family members usually do suffer from some symptoms that are similar to the victim. But every person's collection of parasites and pollutants is unique. Certainly, the whole family should obey the moldy food rules, in order to function better.

Autism

Childhood brain disorders suggest an inherited genetic defect. Yet numerous parasites and pollutants are able to pass into the unborn child through the placenta. Even some bacteria and viruses can.

Lead accumulation is always seen in children with autism. Was it acquired before birth?

Mercury can be transmitted from mother to child, too. If mercury fillings were not removed before pregnancy, have them replaced as soon after delivery as possible (never during pregnancy since the removal itself causes a surge of heavy metal to enter the body).

The common tiny worms such as *Ascaris*, hookworm, *Strongyloides* and *Trichinellas* easily enter the brain. They are present in dirt. Dirt enters buildings via shoes. Shoes carry animal filth. Don't let children put their own shoes on until they have learned to avoid touching the soles. Don't let your child crawl on the floor of a public building, even though it looks glossy. Don't set shoes on furniture or table! A preferred habit is to leave shoes at the door.

Once wormlets have found a pathway to the child's brain it is difficult to reroute them. They must all be killed repeatedly since there is daily reinfection from putting hands in mouths. All family members should kill these parasites weekly to protect the child with autism. When lead and parasites are gone consistently for several weeks the pathway to the brain heals and reinfection no longer sends them to the brain and your child can resume a normal life.

I have not treated enough cases to point to a particular parasite or pollutant. For this reason you must do a total clean up: body, environment, dental, diet (especially solvents and molds).

Leon Dickson, age 10, appeared normal at birth but he crawled and walked late. At age 3½ he began having seizures and was also diagnosed with autism. (Seizures are caused by *Ascaris* larvae, they probably began the routing to the brain). He was started on Phenobarbital™ by his clinical doctor; switched to Dilantin™; then two other drugs were tried. Now he was on Tegretol™ plus Depacote.™ The mother used no anti nausea medicine during pregnancy, no caffeine, no alcohol or nicotine, not even a single aspirin. In spite of his medicines he seemed to have headaches, continued to have seizures which disturbed his sleep and he wasn't trying to talk. He vomited a lot. He would take no pills or drops (no herbs even mixed with honey) and our frequency generator method was not discovered at that time. He couldn't kill his parasites and *Shigellas*. His brain was full of thallium (not mercury!) besides the roundworm larvae. He must have gotten this from Q-tipsTM or cotton balls or some other mercury-sterilized product. Leon's favorite food was grilled chicken which he ate nearly every day, as well as two eggs a day.

His diet was changed to exclude chicken, eggs, bacon, chips, preservatives and colors in foods, grape jelly and strawberry jam. One month later he had not improved, nor had they been able to kill his parasites with the herbal recipe. The diet change was extremely difficult; he was screaming for his favorite junk food and the whole family was upset over his restrictions. But we encouraged the mother to stick to her purpose, get a different baby-sitter who would obey her, and to try to get some parasite herbs and thioctic acid (100 mg. daily, stirred into honey, to take out lead) down him. The first week the new baby-sitter succeeded in getting him to take thioctic acid. He had only one seizure that week. This encouraged the mother to enforce the *Parasite Program* and the diet rules. He became attentive in one month and tried to voice sounds.

The problem with eggs is that they are contaminated with *Salmonellas.* I find, however that it is the outside of the eggshell and the carton that is contaminated. The safe way to handle eggs is to remove them and return the carton to the refrigerator, then wash the eggs and your hands before cracking them. Eggs also contain malvin, a known seizure trigger.

Kirk Peeples, age 5, did not have any words yet but he would point to something and voice M-M-M to mean he wanted it (usually food). He was in a special school and "doing well." He had the brain toxin MSG, and antioxidants BHT and BHA accumulated in him. In other words, his liver was not able to detoxify these common food chemicals. At that time, I had not found the mold toxins yet; I would now surmise that they were responsible for the liver's disability. Besides going off these food additives he was "desensitized" to them with homeopathic drops by an alternative allergist. The result was immediate. In one week he tried several new sounds and managed his first word: "box." After killing parasites with the herbal program over a four week time period he could speak 19 words. The parents were bewildered with joy. They cleaned the toxins out of their home so thoroughly, there was no place to sit and nothing familiar to eat. But their son could say things and the parents loved each new sound as if it came from a newborn baby. In two months he was saying two-syllable words and putting phrases together. He needed us no more (he was on homeopathic thyroid drops, too).

Geoff Berkely was diagnosed autistic. He went about his business of examining everything in the office without a word. He was infested with both species of *Ascaris* (there was a pet dog) and was started on the *Herbal Parasite Program*: just a little less than the adult doses. (Children's' syrups are not as effective.) He was toxic with mercury, too. He had 2 or 3 "baby" root canals. These were to be pulled out. He was also taken off food color, MSG, chicken and eggs. The parents accomplished all this very quickly and called to say their child had become normal but they didn't want us to spread the good news to the "autism" club they attended for fear of criticism for doing unorthodox things. Only in the USA could such thinking occur!

Digestion Problems

Burping, bloating, and being gassy are signs that your digestion isn't perfect. What has gone wrong? Burps are gases escaping upward. Bloating is due to bubbles of gas causing pressure. Your body does not make gas! Gas can only be made by bacteria. The immediate conclusion is that bacteria are growing in your digestive tract (stomach and intestines) that should not be allowed to do so. They are likely to be the common enteric (digestive tract) bacteria: *Salmonellas*, *Shigellas*, *E. coli*, *Bacteroides fragilis*.

You may wish to identify them before killing them with the zapper. Or you can sweep through the whole bacterial and viral range killing all with a frequency generator. The good effects can be felt in an hour, although the last gases may take days to get rid of. *Salmonella* and *Bacteroides fragilis* are two bacteria that can eat bile, and can do without oxygen, so they are commonly seen in the liver. *Bacteroides* probably escaped from its roundworm host, *Ascaris*. *Salmonella* probably came with nonsterile dairy food.

If you have an intestinal problem involving digestion or pain, start immediately to boil all dairy foods. Stop eating those that can't be boiled: cheese sandwiches, yogurt, ice cream. It must be boiled for 10 seconds. The bacteria are in the liver because your liver attempted to strain them out of your blood and lymph in order to kill them with bile. Instead, they turned around and “ate” the bile, turning it brown as evidence. Now, every time the liver lets down bile into the intestine (and stomach), a population of these bacteria goes with it. The intestine becomes a seething mass of bacteria, bubbling away as they produce CO_2, SO_2, H_2S, CO (carbon dioxide, sulfur dioxide, hydrogen sulfide, carbon monoxide). Some of these gases are quite toxic.

Help your liver expel its bacterial overload with *Liver Cleanses* until all the bile is a beautiful bright green. This is evident as dark brown bowel movements. Without the green color of bile added to your intestine, the bowel movement remains light colored, such as tan, yellow or orange! By stopping eating polluted food, killing bacteria and cleansing the liver, digestion becomes normal again.

Of course, there must be enough acid in the stomach and digestive enzymes produced to make good digestion possible. Otherwise, leftover food goes to feed the waiting bacteria.

Persons with a chronic digestion problem may also find they harbor lead, cadmium, or mercury in the intestine! This is very good in a sense. Your body has kept these toxins in the intestine, preventing it from getting into your vital organs. The bad news is that their presence in the intestine could start an intestinal disease. toxins in the intestine would inhibit your immune system (here the white blood cells are in clumps called *Peyer's patches*), from gobbling up the “bad” enteric bacteria. Maybe the “good” bacteria found your intestine too toxic to live there. Clean up your dentalware. Search for lead and cadmium in your drinking water. After improving your lifestyle, continue to do *Liver Cleanses*. Keep your goals high: a flat tummy that feels energetic, no burps or gas.

Stomach ache and **hiatal hernia** are also digestive problems but are dealt with under pain. (See also lower abdominal pains, and appendicitis).

Alan Barth had his two young sons with him. One of them had a very sensitive stomach, a poor appetite, wanting nothing but sweets or chips to eat. The 16 year old had aches and pains that were keeping him out of sports. The father had a tonsil problem; they swelled if he drank milk. One problem was obvious. Their milk was tainted with *Salmonellas* and *Shigellas*, setting up throat problems for the father, stomach problems for one child and a pain syndrome for the other child. Boiling all milk, not bringing raw chicken into the house (*Salmonella* source) and stopping eating yogurt and cheese was the solution. There were traces of lead in their tap water and the house air had vanadium in it, announcing a gas leak.

They were all heavily parasitized. When these problems were cleaned up, the whole family's health improved.

Kae Nakajima, middle age, had a history of ulcers and stomach problems. She took a lot of Zantac™ and Tagamet™. She was drinking coffee, tea and colas. She had *Ascaris* and cadmium in her stomach. Five months later she had cleaned up everything except dentalware and was feeling very good. She didn't need any medicines. She still had arthritis and sinus problems but felt so encouraged she had the dental work scheduled.

Sven Lippencott, age 4, had been tube fed for several years due to weak stomach action. He was quite underweight for his age. He had a population of intestinal fluke in his stomach along with arsenic (pesticide). The rest of the family also had intestinal flukes. After killing parasites and washing the upholstered furniture, Sven's appetite went up so he ate more by mouth and grew immediately. But he soon picked up *Ascaris* and cat liver fluke (there was an indoor cat). Then the whole family got intestinal flukes again. They all, including Sven, drank carbonated beverages *ad libitum* (whenever they wished). With both parents working it would not be possible to discipline the habit. Sven had wood alcohol, methyl butyl ketone, hexanedione, methylene chloride and toluene buildup making his recovery hopeless.

Alzheimer's

What was once a rare disease has become a household word because it now affects so many. Two new pollutants of the brain, inviting an old parasite to a location it would not normally be, is the explanation. The new pollutants are solvents that seek the brain.

Xylene and **toluene** are pollutants of popular beverages, decaffeinated powders and carbonated drinks. At first, the body can detoxify these but with a steady stream of solvent arriving, detoxification slows down and parasites begin to build up in the brain. Common fluke parasites which we eat in undercooked meat and perhaps get from our pets, can now reach the brain and multiply there.

Other toxins are also present, such as aluminum, mercury, Freon, thallium, cadmium. Aluminum buildup is seen in all Alzheimer's sufferers (100%). This is undoubtedly part of the true cause. Did it come before or after the parasites?

Whatever the answer, your job is clear. Remove every bit of aluminum from the food and environment. Throw out the pots, the aluminum foil, the cookie sheets, the tea ball. Throw out the kitchen salt, the pickles, the baking powder. Buy things made with baking soda (not baking powder), use a plastic salt shaker, buy salt without added aluminum. Stop using commercial soaps and lotions. Make the soap recipes in this book. Finally, tape over all aluminum handles in the bathroom and elsewhere (e.g. the walker) with masking tape. Then find a chelating doctor to help remove aluminum from the brain. Also use thioctic acid (100 mg; take 2 three times a day).

Kill the four common flukes with the first frequency generator or zapper you can get your hands on. Prevent reinfection from meats and pets. Stop all commercial beverages, including water. The processing has left xylene and toluene in them. They are not put in intentionally. For the same reason, health food beverages are similarly polluted. Only milk is safely bought from the store. You must still sterilize it, however. Make your own fruit juices. Select beverages from the list of recipes given. Drink water from your cold water tap, filtering it with a small pure carbon filter as in a filter pitcher (see *Sources*).

As much as xylene and toluene are brain-seeking solvents, *Shigella* is a brain-seeking bacterium. The symptoms it causes are not always the same since they depend on the location of infection. Sometimes they cause tremor, sometimes loss of balance, sometimes speech problems. But they are very serious problems. Kill *Shigellas* every day at bedtime with your zapper. Start the *Bowel Program*. When improvement is lasting you know you have stopped reinfecting from your own bowel or from polluted dairy products.

Remove dental metal and use thioctic acid as a help to clear tissues of metal. Use vitamin C (3 grams) and B_2 (300 mg) to assist the liver with detoxification. Use B complex (2 a day) to assist the liver generally. Avoid food molds; ergot especially has strong mental effects (see Moldy Food).

Start a *Kidney Cleanse* as soon as you can. Follow this with a *Liver Cleanse*. Clean up environment and diet. Your beloved family member or friend with Alzheimer's can regain her or his mental function to a considerable degree. **Most important is stopping the mental deterioration** before it is not reversible.

Lisa Anne Reed, 60ish, was tentatively diagnosed with Alzheimer's 10 years ago. She needed complete care at present but was able to walk (could disappear quickly) and eat. She could occasionally say her name. Her brain had intestinal flukes and their eggs and was toxic with aluminum (cooking pots) and aluminum silicate (salt). One week later she still had the parasites because nobody could skillfully give her the *Parasite Program*. She was also toxic with benzene so reinfection was occurring. In addition she was toxic with bromine (from brominated bread?), chlorine (chlorinated water?) lithium, bismuth, vanadium, and tungsten, all known to have strong brain effects. She was also toxic with moth balls and iridium. She harbored *Naegleria*, another brain parasite. In another week there still were no changes due to inability to administer the treatment.

Isabelita Ufford, 77, was in a wheelchair, brought by her two daughters who took turns caring for her. She was on Clanopin™ medicine, did not try to speak and needed total care, including feeding. She had been ill about seven years. She had intestinal flukes and their stages in her brain (the cerebrum) as well as intestine. She also had isopropanol solvent, aluminum, chromate and high levels of arsenic in her body. She was given the parasite herbs plus instruction to get rid of solvents and metals but the plans could not be carried out. The parasites could not be killed without considerably more help than was available. She was a dear, sweet person. The daughters were highly motivated but were overwhelmed with the size of the task.

Beth Hamm, 60ish, arrived led by her ever-vigilant, ever-caring husband. She was started by medical doctors on EDTA chelation to remove aluminum from her brain. My tests showed aluminum, toluene, sheep liver flukes, asbestos and *Shigella* bacteria. The parasites and bacteria were zapped immediately and her husband began the difficult task of excluding non-sterile dairy products from the diet provided. In four days she was able to walk by herself, knowing where she was going. She could finish a short sentence and comply with directions to sit down and get up. Then she had a set back—she had acquired *Salmonellas* in the brain from a bit of dairy food that had slipped by his attention. She was given Lugol's and she improved further. In ten days she was a new person; an interview of twenty minutes length did not reveal Alzheimer symptoms. Will she be able to hold on to her gains? Only if the aluminum and asbestos are removed from her home environment, his vigilance with dairy food keeps up, and she stays on a *Maintenance Parasite Program*. But her husband appeared intent on her recovery. She is a person again.

Ruben Camberos was brought by his wife and a friend for Alzheimer's. The first day he arrived, the intestinal flukes in his brain were found and killed. He was started on EDTA chelation. They were warned about non sterile dairy foods. His *Shigella* was zapped. Four days later he spoke his first meaningful sentence: it was three words long. He could pay attention to the appointment proceedings. Two days after that he was reading a newspaper. This was utterly shocking to his wife. In another three days, he could hold a conversation consisting of very short sentences. Larger ones became hopelessly garbled. He was started on ornithine (4) and valerian capsules (6) at bedtime: this produced a beautiful nights sleep (especially for his caretakers!) and his days were less agitated. There were still setbacks later but his wife was determined to get him well.

Dementias, Memory Loss

Memory loss is progressive with age but not due to aging. There are plenty of nonagenarians and centenarians with clear minds and good memories to prove that age is not the deciding factor in the dementias. Why do some people deteriorate much sooner? Could you prevent personal deterioration of mental abilities? You probably can. You will know it by noticing memory improvement. Telephone numbers that left you with no recall, unless you wrote them down, number by number, now form groups as you hear them, and you can jot them down the way you always did! This is a good sign of memory improvement. Your writing can improve. The jagged, crooked, misaligned words can be smoothly written again! You can remember things that happened earlier in the day and talk about it later, at mealtime. You can finish your thoughts in conversation.

Mental deterioration of the elderly is not as complicated as is generally believed. Although circulation and blood pressure play a role, **the effect of toxins is much greater**. The action of toxins is greater in age than in youth. The same polluted water and food causes disorientation in the elderly when it only gives a young person a stomach ache.

The liver's detoxification capability may be the real issue. Indeed, the liver may age, in accordance with the calendar date. Perhaps the liver is the only truly aging organ. It may even determine your life span. The answer, then, is to stop giving it toxic substances and shortening your life span.

As the liver is less able to detoxify them, common toxins are allowed to roam the body with the circulation, doing harm to all the organs. The brain feels disoriented or dizzy; there is memory loss. At first, the liver can “catch up” its work and finally clear the toxin for excretion. But, eventually, it can't catch up or keep up. The body, notably the brain, is bathed in toxic chemicals that interfere with its functioning. Now, the elderly person must use a cane for stability, must walk very carefully not to fall, must write everything down to remember it, calls people by their wrong names, can't “find” the right words to speak with, can't finish sentences, must write on a calendar to keep the days straight, starts talking to themselves to help think of things, develops tremors and unsteady gait, acquires a passive personality, loses weight, gets stooped, stops reading the newspaper.

All these signs of aging (dementias) can be reversed by simply removing the common toxins with which we are already familiar.

Of primary significance are food molds. These cause brain hemorrhages. Clean up diet, mouth, body, environment, very meticulously.

Of course, an elderly person cannot bring these changes to herself or himself. If you have a loved one with symptoms of aging, and this person is willing to cooperate with you, you can honestly promise them numerous improvements. Spend a good deal of your effort on persuasion since living longer or being healthier may not seem worth giving up a coffee and doughnut breakfast. On the other hand, they might respond to the goal of needing fewer pills, getting into their own apartment again or becoming freed from a walker.

Walter Heffern, 64, had been to various neurologists but could not find any help. He appeared to have the same kind of mental deterioration as his mother, but at a much earlier age. He couldn't understand an ordinary conversation; he constantly spoke about winning money, walked hesitantly and had to be left undisturbed to accomplish anything—even eating and dressing. He needed a lot of care. We found he had *Ascaris* larvae in the brain—in the cerebrum, where you think. He also had *Acanthocephala*, *Dipetalonema* (a chicken roundworm), amoeba (*Entamoeba histolytica*) and *Fischoedrius* in the thinking part of his brain. He had been in the poultry business all his life: his mother probably shared this exposure, as well as other lifestyle habits that gave them solvents and pollutants besides parasites. He had constant ringing in his ears, this could affect hearing an ordinary conversation. He had a water softener that would have supplied a daily dose of aluminum to the brain, too. There always were dogs in

the house. Perhaps the marvel is that he was no worse off, a tribute to human strength in general.

Pushing Back Age

This chapter is a tribute to Jimmy, Nazy, Michele, Suzanne, Marlena and all the others who achieved excellence with daily care-taking of Mary Austin, deceased at 97.

It's true that we have to die sometime. But why die before our life span is up? If many people can live to 100 years, then surely this is the human life span, not three score and ten. Some scientists think the true human life span is closer to 140 years! And that we all lead shortened lives. The shortening is due to failure of some organ in us. Other organs are dependent on the failing organ and begin to fail also. When the brain fails, death occurs, sometimes in five minutes.

If we knew which organ is failing, we could come to its assistance and prevent the collapse of the whole body. Often it is easy to see which organ is failing. But whether this is the true beginning of the body's problems we cannot know. Before death there may have been appetite loss. Before the appetite loss there may have been a broken hip. Before the broken hip, dizziness. Before the dizziness a blood pressure or blood sugar problem. Before these, an episode of “flu” or a dental “repair.” Sometimes we know what started it all. But often we don't. Just make a guess and begin somewhere.

Diet

If your aging friend or relative is in a home for the elderly, you may be able to persuade him or her to choose a diet that is wiser than the average diet people eat there. This can help a lot. Just stopping drinking the coffee, decaf, iced tea and carbonated beverages that are served, and switching to the recipes in this book could get them off some of their medicines.

The beverages to encourage are sterilized milk and hot water—delicious with whipping cream, honey and cinnamon. This gets them away from solvents, oxalic acid and caffeine.

Old age is not a time when you “no longer need milk.” Calcium losses increase in old age. Milk has the organic form of calcium, chelated with lactic acid, and it has the cream to promote absorption. For this reason, milk should

never be reduced in fat content (not less than 2%). The cream is necessary to improve calcium absorption.

In old age it is downright dangerous to be taking many calcium tablets. The stomach does not have the acid necessary to dissolve them. They pass into the intestine, disturbing its function and acid levels. With tablets, too, one must be careful with dosages, while food is self limiting. No elderly person would be able to drink more than one cup of milk at a time. This contains 250 mg. of calcium.

Milk, however, requires stomach acid to curdle it as the first step in digestion. If there is not sufficient acid, it will pass undigested into the intestine, causing new problems. We must listen to the elderly when they say milk gives them gas or other troubles.

Having the milk warm to hot helps in getting digestion started in the stomach. Milk served hot with cinnamon accomplishes two purposes: it will stimulate acid secretion and the cinnamon is an insulin aid. Milk served hot with honey adds the nutritive value of honey, displacing the need for other unnatural sweets. The meal should always include something sour to curdle the milk. It does not have to be added to the milk; it can simply be included with the meal somewhere.

Lemon juice or vinegar can be put in certain foods but the most reliable way to get it into the diet is to put 1 tablespoon into the water glass along with a teaspoon of honey. This gives the water a “sweet and sour” flavor, enough to make it interesting throughout the meal. The fresh lemon juice or white distilled vinegar and a honey dispenser that is easy to use should always be on the table. Bring these two items to your loved one at the “home” if it cannot be provided regularly and reliably. Pop in at mealtime to check up on it. Powdered vitamin C (¼ tsp.) is another useful acid if the first two are not effective enough.

The lemon and honey habit, alone, can add years (healthier years) to an elderly person. The extra acid taken with lunch and supper (the stomach has its own best supply of acid in the morning, for breakfast) improves overall digestion and helps dissolve the calcium, magnesium, iron, zinc, manganese, and other minerals in the food so they can be absorbed.

The habit of using vinegar and honey in water as a beverage was made famous by Dr. Jarvis in his book *Folk Medicine*, circa 1960. He recommended apple cider vinegar for its extra potassium. In those days, vinegar was made of good apples. Now, all the regular vinegars have mold in them. The toxin, *patulin*, in

moldy apples has been carefully studied by scientists. It taints the vinegar as well as apple juice and concentrate made from them. I have not tested patulin to see if it can be detoxified by vitamin C. We must use only white distilled vinegar, even though it lacks potassium, aroma and popularity. Using a variety of honeys can make up for the need to vary the flavor. Get orange blossom, linden blossom, buckwheat, wildflower, and sage honey, besides clover blossom.

But honey is not perfect food. It usually has *ergot* mold, a very serious toxin. To detoxify the ergot, you simply add vitamin C to the honey as soon as it arrives from the supermarket. This gives it plenty of time to react with the ergot before you eat it. Bring your "fixed" honeys to the home.

If your elderly loved one has not tolerated milk in years, start with the vinegar and honey beverage, or lemon and honey, and be patient until that is accepted. Then add only ¼ cup milk to the day's diet, (in the morning, on homemade cereal). Go up very gradually and only when digestion allows it. Of course, the milk must be sterile.

If it is not sterile, the final warming will only increase the bacterial count. You must be sure of its sterility. Boil the milk yourself. Near-boiling is not hot enough. It must be heated until it bubbles up and almost goes over the container for ten seconds. Use a non-metal pot that holds one to two quarts. You may throw away the skin. Then cool and refrigerate. Supply it to the home, too.

Milk that is marketed in paper containers that need no refrigeration has been sterilized; it is safe.

Once the body, even an aged body, finds a nutritious food that does not cause troubles of its own, it asks for more. Your loved one will accept it and drink it without forceful coaxing, if there is no problem with it. As long as your loved one tries to avoid drinking it, your challenge is to find the problem and solve it. It is not a matter of taste or habit. It is a matter of digestibility and lack of toxicity. When your loved one is drinking three cups of milk (or buttermilk or whey) a day and three cups of water, there will be no room (nor request) for the usual coffee and tea and other bad beverages.

We all must die of something. But it needn't be a stroke, or heart failure, or cancer. Choose what seems to be the most pressing problem to work on. Common problems that plague the aged are brain problems, incontinence, bad digestion, diabetes, tremor, weakness, feeling cold, sensitivity to noise, losing the sense of taste and smell, hearing loss, insomnia, kidney and heart failure.

Increase Oxygen

Brain problems include memory loss, communication deficit, dementia (calling things by inappropriate names and saying inappropriate things). The brain is simply not getting enough oxygen and food to work right. It is like having a pocket calculator with rundown batteries: it will give you wrong answers (without telling you they are wrong). Not enough oxygen to the brain is the main cause of memory loss, inability to find the right words, getting words mixed up and not being able to speak in sentences. You can prove this by providing oxygen from a tank; modern equipment is very easy to use and inexpensive. If your loved one responds well to a few hours of oxygen, you have proof of the problem.

How can you increase oxygen in the brain?

1. Open the blood vessels wider.
2. Increase pressure of blood running through the blood vessels.
3. Raise the oxygen level in the air that is breathed. Less carbon dioxide, tobacco smoke and auto exhaust. All these, including a gas leak from the pipes in the house, compete with oxygen.
4. Increase the oxygen delivery system to the brain by raising hemoglobin levels. Cure anemia and low iron levels.
5. Raise oxygen saturation of blood by keeping body acidity down.
6. Correct a slow and irregular heart beat.

Niacin

Open blood vessels wider by giving **niacin**. Give it early in the morning, upon rising, as soon as the feet are set on the floor. Keep it at the bedside, use small capsules or tablets and combine this chore with water drinking. The water should not be cold and should have nothing added to make it a beverage. (Drinking water within minutes of sitting upright may also move the bowels soon.) A 250 mg. time-release niacin tablet (see *Sources*) is a good choice. The elderly have little side effects. Even the niacin-flush, which reddens the face and neck is welcomed since it gives a sensation of warmth.

The flush is intensified by giving hot liquids or acids (even vitamin C) to drink. The flush is reduced by giving cold liquids. The opening of blood vessels by niacin only lasts a few hours. If you see it has a good effect on your loved one, give several a day. Do not use a prescription variety, since they are polluted with heavy metals; use only the brand in *Sources*, or a brand that you have tested pure. You can freely experiment with niacin to find the best dosage and variety; it is not toxic in this amount; but the size of the tablet should not turn it into an unpleasant chore. Reduce it if it seems too large to swallow. Don't cut tablets in half, the rough edges can scratch the throat.

Add vitamin C (1/8 tsp.) upon opening and wait 10 minutes for it to act.

Fig. 34 Alcoholic beverages contain ergot and aflatoxin.

Hawthorn berry is an herb that opens blood vessels, particularly to the heart. Carefully watch the effect on blood pressure when using it.

Food mold, particularly ergot, has the opposite effect of niacin. Brain blood vessels are made narrower, cutting down the oxygen supply. Ergot is a common contaminant of grains: don't provide rye or pumpernickel breads or crackers. Don't provide wine or other alcoholic beverages; they are too contaminated with ergot and aflatoxin. Narrowing the blood vessels in the brain can lead to stroke. If you notice an attack of dementia coming, try a niacin tablet (100 mg, not timed release) immediately.

TIA’s, Strokes and Purpura

Sometimes, the elderly person is aware of the onset of a brain attack; they may see stars or peculiar shapes or lose vision temporarily. These are called *temporary ischemic attacks* (TIA's). Immediately give a 100 mg tablet of niacin, 1 gram vitamin C, and a B-complex in this order of importance.

TIA’s are caused by spasming in the brain blood vessels. If this causes them to spring a tiny leak somewhere, a part of the brain will not get its usual oxygen and nourishment. A stroke results.

The spasming was probably caused by sorghum molds. Cooking during the manufacturing of sorghum syrup kills the mold but its toxic byproducts (mycotoxins) are still present. Other syrups may have sorghum added, polluting them. Brown sugar is also polluted with sorghum molds, but fortunately you can detoxify this mold with vitamin C as usual. Mix well ¼ tsp. powdered vitamin C with each new (1 lb.) box of brown sugar.

Purple patches, like bruises, on the hands or arms of an elderly person are called *purpura*, and is also caused by sorghum molds. It weakens blood vessels so they break easily.

When an elderly person has purpura or TIA’s and the mold source isn’t obvious, you must track it down. Test in a saliva sample for all the sweeteners used recently (at least an hour ago). At the very least, keep notes on all the sweeteners being used. Look for a common one at the next attack. Never let the trigger food be eaten again.

Blood Pressure

Increase blood pressure if it is habitually too low. Blood pressures below 110 may prevent strokes but ruin the quality of life. Low blood pressures are often due to toxins from foods. But severe salt deprivation in the diet can also cause this. If the adrenal glands are not conserving salt properly, too much sodium is allowed to leave the body with the urine, resulting in low sodium levels in the blood and a blood pressure drop. Adrenal performance is improved by taking the kidney herb recipe.

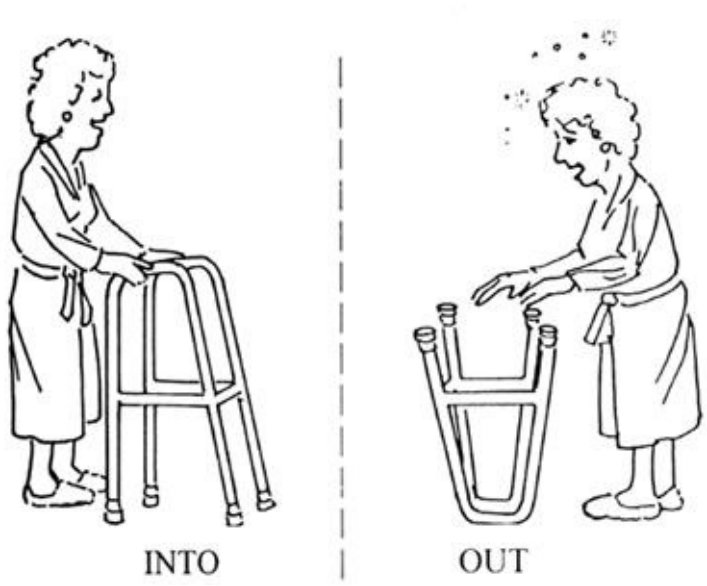
The kidney herbs, at half dose level (½ cup a day instead of a whole cup) can be given daily for three weeks and then on alternate days indefinitely. Be very careful to keep the herbal tea sterile by reheating. Elderly people seem to sense the improvement given by kidney herbs. Try other kidney herbs from time to time: **shave grass, cedar berries, juniper berries, butcher’s broom, corn silk silk**. None interfere with drugs. Remember, they also have a diuretic effect. Be prepared to use extra paper padding in underwear to help catch the extra urine output. The first few nights may be disturbed by extra urination. Interpret this positively.

After the blood pressure comes up to 115 (systolic) mental performance will be greatly improved. Don't try to bring it up to 120 since this raises the stroke potential without giving you much improvement in performance. Use an electronic device to measure blood pressure, one with a finger cuff, not an arm cuff which can itself induce broken blood vessels. Purchase a device that needs no adjustments of any kind and has automatic cuff tension control (see mail order catalogs if your pharmacy does not have one).

Air Pollution

Improve the quality of the air by lowering the pollution level. Check into carbon dioxide, carbon monoxide, fumes from a gas stove pilot light, auto exhaust from an attached garage or nearby highway, arsenic from household pesticide, PVC from new plastic curtains or carpeting, formaldehyde from wearing new clothing before washing it, asbestos from hair dryers, Freon from a refrigerator, fiberglass, and chlorine from running tap water. Some of these displace oxygen, some are simply toxic to the body and lungs. Clean up the air according to the general principles of environmental clean up (see *Four Clean Ups*).

For the elderly pay special attention to **chlorine** in the air. Shower water puts a lot of chlorine into the bathroom air which then distributes itself through the rest of the house. Notice whether your elderly person goes into the bathroom in fair shape mentally but comes out confused, unreasonable. Not every day's chlorine exposure will have the same effect. Trust your judgment. Attach a carbon filter to the shower head (see *Sources*). Purchase a variety that has very simple-to-replace cartridges. Figure out how long it should last and write the date for replacement on the outside of it for your own convenience.



When into and out of the bathroom is a different performance suspect chlorine. Put a filter on your faucets.

Fig. 35 Chlorinated water can cause mental symptoms.

Washing hands and face in chlorinated water can give off enough chlorine to trigger a manic episode in a manic-depressive person. Certainly, it is enough to cause mental effects in an elderly person. Of course, the chlorine bleach bottle should not be kept under the sink. It should be kept in a closed plastic bag in the garage. It should not be used while the elderly person is in the house and never for his or her laundry. Use chlorine-free bleach.

Don't pollute the air with fresh flowers, potpourris, or room fresheners. These can induce a dizzy spell.

Room air conditioners may have a fiberglass filter! This fills the house with tiny particles of glass to be breathed by everybody. The body makes tumors out of them in order to stop them from cutting through your tissue. Replace the filter with a foam sheet. This sheet is 1/8 inch thick and washable. I have not found these types of foam filters to emit formaldehyde.

Room air filters are not the answer to polluted air. Removing the pollution source is. Air filters may remove some of the toxic elements but by blowing the air (and dust) around vigorously the remaining toxins are made much more vicious in their effect. The noise of a filter motor and fumes it may put out itself adds misery to the simple job of breathing. Using a non-fiberglass filter at the furnace is a better idea.

Make sure all fragrances are removed from the air, even though family members “like” them. They don't belong in air. The lungs treat them like toxins to be coughed up or removed by the kidneys and immune system. This includes colognes, scented tissues, soap and shampoo and shaving supplies. If you can walk into the bathroom blindfolded and know you're in the bathroom, it's not clean enough. Everything in the bathroom pollutes the air of the whole house. People who must use fragrance should apply it outdoors to keep the indoor air less polluted.

Anemia

Oxygen gets to the brain on a carrier system of tiny rafts called *red blood cells*. They were meant to be an exact shape and size to fit the most oxygen molecules onto them.

Each red blood cell is shaped like a doughnut without the hole. This fits a lot more oxygen, O_2, than round balls would. Yet, if there isn't enough vitamin B_{12}, the dimple isn't put into them to make them doughnut shaped. This reduces the body's oxygen supply and the disorder is called *“pernicious” anemia*. The changed shape of the red blood cells is reflected in a bigger volume called *mean cell volume* (MCV).The correct volume for red blood cells is about 90 cubic microns. Many elderly persons have a MCV over 100!

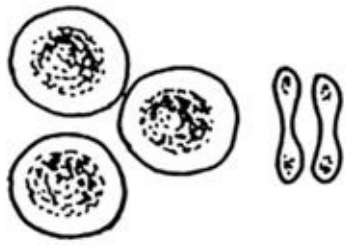


Fig. 36 Red blood cells, top and side view.

I have seen pernicious anemia to be associated with *Ascaris* infestation. Kill *Ascaris* on a frequency generator (408 KHz) or zap. The source of *Ascaris* is usually a pet, owned in the past. Once infected, the tiny worms do not leave your body on their own. The infestation may date back to childhood. What a relief for the bone marrow whose job it is to make red blood cells to have enough vitamin B_{12} again! What does *Ascaris* do with your B_{12}? B_{12} is a beautiful rose colored vitamin. Some worms are actually pink from absorbing your B_{12}! Giving B_{12} shots is the current clinical treatment for B_{12} deficiency. Killing *Ascaris* twice a week

by zapping and taking B_{12} lozenges (see *Sources*) is a better solution. (If your loved one is getting shots, make sure that no isopropyl alcohol is used on the skin beforehand. Provide vodka yourself in a small pocket flask or 70% grain alcohol for this purpose. Unfortunately, the shot itself may contain traces of this harmful solvent—take a sample home for testing.)

Other kinds of "anemia" can deprive your elderly person of oxygen. A low red blood cell count (under 4.4 million/mm^3) is the "garden" variety. Sometimes iron levels are low and can explain the low red blood cell count. Sometimes they are not.

Most regular anemia's, including low iron levels, are associated with *hookworm* infestations.

Kill all *Ancylostomas* along with *Ascaris* twice a week. It is not wise to take iron pills, even if they do raise hemoglobin levels, except in life-threatening situations. Remove the tiny creatures that cause microscopic bleeding instead. Iron in the form of pills is too easily snatched up by bacteria who also need it, making them more virulent to the body. Use grain alcohol rinse in the bathroom to kill *Ascaris* and hookworm eggs under fingernails. Don't have pets in the house or keep them on daily parasite-killing herbs.

It takes nutritious food to build the blood back up to its normal hemoglobin level. Eggs and meats (all very well cooked) are the richest sources of iron and other minerals used in blood building. B_6 and other vitamins are also involved and can be given as a B-complex (see *Sources*). Do not use black strap molasses as an iron source, or any molasses, since it contains toxic molds. (The molds could be detoxified with vitamin C the same way as honey. However, I have not tested enough molasses for solvents and you cannot risk these.) In the past, when the nutrient properties of molasses were discovered, the molasses manufacturing was a small, carefully conducted business. Now it has molds which cause platelet destruction, (purpuric spots) internal bleeding, and immune failure.

Acid Levels

Oxygen must first jump onto its raft, the hemoglobin, in the lungs. Later, in the brain, oxygen must jump off again to enter the brain cells. A difference in acid levels makes this possible. Acid levels operate the latching system that decides whether oxygen will be attached to hemoglobin or let go! Acidity

unlatches oxygen. There should be no acidity in the lungs so oxygen can attach here. Sometimes, the entire body is too acid! Diabetics, asthmatics, arthritics, especially, suffer from total body acidity.

Acid was meant to be removed from the blood and loaded into the stomach at mealtime for digestion. When this isn't happening, it was meant to be shipped out of the body with the urine. But the kidneys may be doing a poor job because they are clogged with tiny crystals and because not enough water is drunk, so the body's acid levels rise. You can test total body acidity by measuring the pH of the morning urine. It should not be under (more acid than) 5.5. If the body acid level is too high, help the kidneys excrete it by adding more water to the diet and more minerals to neutralize the acid. The main minerals for this purpose are calcium and magnesium.

Increase Minerals

Adding water to the diet could be the most difficult of tasks if your elderly loved one “doesn't like it.” Calcium should be in the form of milk, magnesium as a tablet. When tablets cannot be swallowed; use magnesium oxide powder (see *Sources*). Use 1/8 tsp. added to cooked cereal, soup, stew, pudding. Magnesium, being a mineral, does not get destroyed as vitamins may. You can add it anywhere in the diet where it won't be tasted. Notice how calming it is to have extra magnesium in this gradual way. And how much better the sleep is at night.

Fig. 37 Water pitcher with filter

When water “doesn't taste good,” there is probably a valid reason. The body may be trying to reject chlorine or other toxins in it. In this case, filter it with a

small all-carbon unit that is changed right on schedule. A plastic pitcher (not clear plastic or flexible plastic) with a carbon pack fitted into the top is best. Sterilize it once a week by putting a cup of water and one tbs. of grain alcohol in it and turning it upside down so the filter can soak for 15 minutes. Flush out the alcohol with two pitchers of water. Make sure the temperature suits the person. Temperature can mean everything to the never-thirsty person. Don't allow ice cubes, however, nor beverage making, with the essential water. Adding lemon or vinegar (white distilled) and 1 tsp. honey is probably the best way to stimulate both thirst and appetite.

When blood is properly oxygenated it takes on a bright red color, unoxygenated blood is more purple. A chelation doctor can easily see the state of oxygenation.

Chelation

Chelation is a powerful way to quickly improve oxygenation of blood. The most important rule to observe, though, is to take the treatment slowly. Especially if *ethylene diamine tetra acetate* (EDTA) is being used to remove heavy metals, it is important to take the treatment over a two hour time period. Mini doses may be given in a shorter time. Generally, you are in charge of the flow rate. Discuss it with the nurse. Weekly chelations can correct many problems of the elderly that no other treatment could.

Because of hostility from insurance companies who do not wish to add another cost to their ledger and doctors indoctrinated with misinformation, bad publicity is given to this wonderful, life-prolonging mode of treatment. Clinical doctors who have no time to really investigate the statistics of chelation treatments and for whom this is purely competition may feel antagonistic to these treatments. Your loved one should not be the one who must suffer from medical politics. Go to see for yourself what chelation is all about. The receptionist should be glad to show you around. The secret is to talk to the patients themselves. They are usually sitting around a room, eating their lunch and reading as their IV's drip. The pulse, blood pressure and blood chemistry is also carefully monitored. Sit down with them to find out their stories. Get a realistic picture of benefits and costs.

Pulse

The pulse reflects the heartbeat. A **slow pulse** can give weird brain symptoms

besides great fatigue. The cause is usually a drug that is being taken to correct a **fast pulse**! Check with the nurse. Read the insert included with packaging for all drugs used. The drugs responsible are usually “beta blockers”, used for the purpose of smoothing out the heart beat, that is, making it regular. Often the drug can be changed.

Less than 60 beats per minute will lead to trouble. For a young person it is a good sign to be as low as 60, provided no drug is involved. But for the elderly it does not reflect a strong athletic heart beat.

The heart is made of four separate “chambers” or compartments each pulsing in turn. They are like four horses pulling a wagon. Unless they pull evenly, the wagon feels jerky, and irregular. The wagon will wear out sooner with jerky pulling. To smooth them out you simply slow them down. Apparently they sense each other better and can pull evenly now.

A heart that is beating 100 times per minute, not unusual for a weak old heart, can be so irregular that it misses every fourth beat. That creates a terrible deficiency of oxygen. Imagine your four cylinder car or lawnmower missing one out of four engine strokes! Beta-blockers have some quite undesirable side effects but heart regularity has a higher priority. So drugs are the immediate choice. Later, when heart health is improved, the heart will beat regularly without drug use. In the meantime, watch over the pulse. when the pulse drops below 60 the new danger is slowness. Take the pulse daily when a new drug has been added, or when you are working on heart health, without getting your loved one anxious about it.

Heart Health

To improve heart health, the first steps of course would be to go off caffeine and to kill parasites and bacteria. This alone could drop the pulse from 120 to 80 in a few days. Obviously, the need for a drug is gone. Cut the drug dosage in half immediately. Don't wait for a doctor’s appointment to O.K. it. If you waited another day the pulse could be below 60.

Many common bacteria, especially *Staphylococcus aureus*, choose the heart as their favorite location. Their nesting place, though, will be under a missing tooth in the jaw (cavitation). Heartworm and *Loa loa* are two very common heart parasites. You can have all these killed in a day, without side effects and your heart is once more free to beat regularly. Don't take a chance on over-

medicating. As soon as the beat is regular and under 100 per minute, reduce your heart drugs. Stop them when you are regular and under 80. Fatigue will leave and the brain will work better.

Raising potassium levels slows the pulse. Try to do this with diet by eating more potassium rich food and by conserving on potassium losses. The adrenals are in control of losses. Give them a thorough cleaning. The adrenals are situated right on top of the kidneys where all toxic things are being excreted. Being this near to the urinary tract will result in shared toxins. Urinary tract bacteria, small kidney stones, moldy foods and metal from dentalware are the chief offenders. Switch to composite tooth fillings. Use non-metal jewelry. Cook and eat with non-metal ware. Don't handle metal unconsciously throughout the day. Aluminum objects that must be touched should be wrapped in masking tape: this includes walker, shower door, bathroom supports.

Doorknobs, taped walker handles, and cane handles should be wiped daily with a grain alcohol solution.

Treat the adrenal glands to 5 supplements

1. **Vitamin C:** shake some into all foods that can absorb a bit of the sour taste, even cooked cereal and vinegar water.
2. **Pantothenic acid:** 500 mg., one daily.
3. **B_6:** 250-500 mg. daily.
4. **Folic acid:** 800 mcg. daily.
5. **B_2:** 150 mg. daily. These are minimum dosages.

If no capsules or tablets can be swallowed put a three day supply in a heavy plastic bag. Pound with a hammer; then roll finer with a big glass jar. Use about 1/3 of the mix each day. If you are trying to do all this in a nursing home, feed it to your loved one while visiting. Put the powder mix in a plastic (not Styrofoam) cup, add honey and stir until you get a paste. Feed the paste directly by spoon. Often the elderly prefer it this way in order not to bother with pill taking at meal time. Remind them it will turn the urine yellow.

When the brain problems are corrected for an elderly person, be sure to relate

the improvement to him or her. Improvements should not be dismissed lightly. Keep notes. This encourages the elderly, letting them know their existence and quality of life is important to you. Improvements are not merely steps to yet further improvements. Enjoy each bit of progress; it is often too subtle for your loved one to notice even when it is glaringly obvious to you. Before and after a chelation treatment can show a dramatic change in mood, energy, appetite and communication ability, yet get no comment from your loved one. Point it out explicitly so your loved one can look forward to it, too.

Aging is no fun. The elderly long for a brisk gait, laughter, and a picnic at a park again. They dwell on dying, though, because they know it isn't far away and wonder what to do about it. They dare not talk about it because it is too painful a subject for the loved ones. And the immediate problems are too pressing to allow much contemplation of future problems. Talk about aging in its *Positive* aspects. Let your loved one express feelings about it.

Incontinence

plagues most elderly persons. It begins to plague women much earlier—after childbirth, for instance. Surgically shortening the bands that hold the bladder in position (called bladder “lifting”) can give temporary relief, but the surgeon may be the first to tell you that it is a temporary fix. Still, it is so shocking not to be able to run a few steps or sneeze or cough without wetting the underwear, that anything seems better than doing nothing. Surgeons will tell you that the bands have been “overstretched.”

The real reason why nothing, not even surgery, is permanent is that the support bands are <u>weak</u>. Bacterial invasion causes most of this weakness. Low potassium levels (due to excess potassium losses by the adrenals) causes more weakness. When you kill bacteria (and *Schistosomes* and *Ascaris* and other parasites that bring in bacteria) and blood potassium levels go up, the problem is solved. Overnight you may throw those pads away. Even though you needed three pads to be “safe” you will not need <u>any</u>. Whether you have killed bacteria permanently determines whether you have permanently cured the condition. Make sure all dairy foods are absolutely sterile. Ask that the milk be boiled for ten seconds and other foods that can't be sterilized are not on the menu, like sour cream. Sour cream has too much *tyramine* to be safe. Tyramine is a bacterial by product that is quite toxic; it is rather high in aged cheese, also. With the food bacteria, *Salmonellas* and *Shigella*, out of the way and parasites being killed

regularly, you can focus attention on the adrenals which control potassium levels.

Be careful not to rave about the foods that your loved one cannot eat.

Eating more potassium in food is a good nutrition project. Bananas are the top choice. Fresh fruit salad and baked potatoes and soup also provides a lot. Mixing potassium salt with regular salt, half and half, for the shaker is another easy trick, even if you only use it in cooking where the taste cannot be detected. Potassium by prescription is often used by clinicians to conserve body potassium during diuretic use. This need not be stopped (if the pills are not polluted) although taking potassium pills is less useful than salting it in because the adrenals will let any big dose escape anyway. A sign of too much potassium is a slow pulse.

It may be necessary to wear some kind of incontinence underwear. Try to avoid them at night, though, so the skin can breathe freely. Bring a commode near the bed for the night, rather than diapering your loved one (but don't call them diapers; say “underwear”). Absorbent pants of all kinds are heavily chemicalized. This is absorbed by the skin and adds to the toxin level. Less will be absorbed if you powder the skin with cornstarch first. Use them minimally and line them with tissue or paper towel. Chair and bed pads, too, are chemicalized. Don't sit on them with bare skin. To facilitate getting to the commode quickly in the night, dress the elderly in a short night shirt, no pajamas or long gown. Bed socks on the feet help with warmth.

Wash the body parts daily, around the urinary and rectal outlet, using borax water. Follow with 5% grain alcohol. Put washcloth in laundry after a single use. Nothing, not even brain improvement, impresses and encourages an elderly person as much as seeing the incontinence lessen. This bit of progress will put him or her solidly on your side. When they believe in you, it makes your task more rewarding. Remember to enjoy and celebrate your achievements together; don't make a grim business out of it.

Bad Digestion

with its excessive gas and burping is another plague of the elderly. They would rather not go to church nor visit a friend than embarrass themselves in that way.

Chewing

It all begins with the stomach although chewing food well is essential for really good digestion. Dentures should fit perfectly so the mouth does not develop sores. Using denture cream is not a good substitute for correct fit and is toxic. Denture plastic is often toxic, even containing mercury in its composition! Toxins in plastic can seep! Such toxins lower the immunity of the mouth and throat and stomach since it all flows down into the stomach. Low immunity in the mouth permits throat infections to be chronic. If your elderly loved one has a red-looking mouth or throat, instead of pink, an infection is going on in spite of no coughs and no complaints.

It will do no good to keep zapping bacteria when reinfection is so easy. First kill the bacteria in the dentures by soaking in 70% grain alcohol. Then test the dentures for toxins. Soak the dentures in water for several hours. Rinse and soak again in fresh water. Repeat a third time to insure that any toxin found came from the dentures, not the saliva. Save this water for testing. Search for heavy metals in the denture water. If you find any, you know the dentures are toxic! Get new ones, made of uncolored methacrylate (see *Dental Clean Up*,).

The denture-soak should kill bacteria each night. Plastic has tiny pores where bacteria can hide. Use 70% grain alcohol, which you make yourself or plain vodka which is about 50% alcohol. Since alcohol evaporates and is expensive, use a wide mouth jar with close fitting non-metal lid for all this. Fish them out with your toothbrush so it gets sterilized too. It only takes minutes to kill everything. Commercial denture cleaners are much more toxic than grain alcohol; don’t use them.

Use food grade hydrogen peroxide or salt water to brush teeth in your mouth, **never toothpaste**. Toothpaste has toxic metals (tin, fluoride, strontium) besides benzene pollution. See the section on brushing teeth for details and sources. If you are responsible for this daily chore, use homemade floss (2 pound to 4 pound nylon fish line) first; then brush. If your loved one is seated they may be able to handle the brush by themselves, giving them pride in the achievement.

If an elderly person refuses or can't wear dentures, provide food that is soft and without chunks since this decides whether the stomach can digest it. The stomach is the weak point of the digestive process for the elderly because nearly all don't produce enough acid to get the job done.

Stomach Acid

The body produces hydrochloric acid (HCL) which gets pushed into the stomach from the blood! The enzyme, *carbonic anhydrase*, a zinc enzyme, is involved. Not many ways are known to stimulate this whole process. Drinking water before meals stimulates it in unknown ways but is hard to do for the elderly. Next best is to provide acid.

Because strong HCL would dissolve teeth it is not available as a solution to aid digestion. Ask a pharmacist to make a 1% HCL solution and use 10 drops of it in a beverage at mealtime once a day. HCL as a tablet (“Betaine HCL”) is available but doesn’t have enough HCL in it.

Using a lemon or vinegar and honey beverage helps with digestion although this provides citric or acetic acid, not hydrochloric. These acids are completely metabolized so they don't add to the body acid level. But the fact that it is not hydrochloric means that it can't kill bacteria and parasites in the stomach like regular hydrochloric acid could. The stomach becomes a haven for *Salmonellas* and other bacteria and this is **the biggest digestive plague of the elderly.** *Salmonellas* dig deep into the stomach wall, safe from antibiotics and stomach acid and aren't washed away with the food. When they take over the region near the top of the stomach, it weakens the esophageal sphincter and food keeps coming back up a bit—a most uncomfortable development, especially after supper or when lying down.

When the Salmonellas spread out further to invade the diaphragm around the sphincter, the diaphragm weakens, and lets a bit of the stomach up through the hole.

This causes *hiatal hernia* distress. Don't settle your loved one in an easy chair after supper. This presses the stomach upward and the food up, too. Leave them sitting at the table a while, then walk a bit, to get the food down lower. The food will sink lower if some of it can leave the stomach at the lower pyloric end. But if *Salmonellas* are entrenched here, too, the lower end does not have enough action to push the food through the valve. Drugs like Reglan™ are given to speed this up.

What helps most is getting digestion completed. This sets up the natural cues for emptying. digestive enzyme tablets have been in popular use to help digestion. But they may not be safe since they have not been sterilized. Always try the vinegar and honey method first. Coughing during eating is a sign that the

diaphragm is irritated (by a hiatal hernia). If drinking water starts the coughing, omit it at the beginning of meals. Work in sips during the meal.

Salmonella and Shigella

Some *Salmonella* infections can bring dizziness to your elderly person. Dizziness is another plague of the elderly, keeping them from going shopping, getting to church and even from getting around their own homes. Drugs such as Antivert™ are given but only take the edge off the problem. Feeling dizzy can make your loved one home bound and stuck to a walker for every move.

Salmonellas, along with *Shigellas*, produce very toxic substances that cause dizziness. There are three common *Salmonella* varieties: *Salmonella enteriditis*, *Salmonella paratyphi*, and *Salmonella typhimurium* (386, 380, 354 KHz). Kill *Salmonellas* daily for a month by taking Lugol's iodine (6 drops in a half cup water, after meals and bedtime, see *Recipes*). Unfortunately, this will not kill *Shigellas*; follow the *Bowel Program* to get them.

During this time set up a system of sterilizing all dairy products (see Milk) since this is the source of reinfection. Set up a system of rinsing fingers (and fingernails) in 10% grain alcohol in the bathroom. Deli food and restaurant salads carry *Salmonellas* and *Shigellas*, too. Kill them, routinely, after eating such food due to necessity. A warm stomach full of food at a neutral pH is just the right culture condition for these bacteria. It's like putting yeast into a bowl of warm water, flour and sugar. In half an hour it is overflowing with growth.

Once *Salmonella* is entrenched in an organ it is difficult to eliminate. Only an electric zapper can kill them all (in an organ, not the bowel). If your body has the right conditions (like a low acid stomach) to let them grow you dare not swallow another one! *Shigellas* arrive with dairy foods, too, but prefer the lower intestine as their headquarters. Indigestion that starts right after eating is probably due to *Salmonellas*. If your indigestion comes in the night, this suggests *Shigellas*, since they've had time to reach their favorite place further down.

Campylobacter and *E. coli*, other digestive bacteria, are sometimes the culprits. The *Bowel Program* is effective against these also. Besides getting digestive improvement you get mental improvement, less depression, less dizziness, less irritability after clearing these up. Remember that eating bacteria and killing them later will not solve the problem. Stopping eating them will.

Other Clues

Digestion problems that remain after eliminating bacteria can be diagnosed in a rational way. Ask these questions:

- Is the stool orangish-yellow, or very pale, instead of greenish brown? If so, bile isn't getting delivered to the small intestine from the liver.
- Is there abdominal pain? It may be due to *Ascaris,* flukes, or other parasites.
- Is there constipation? This will let wastes accumulate, all the longer for bacteria to thrive on them.
- Is there bloating? This is due to gas made by bacteria.
- Does the stool float? If so, it must be lighter than water and contain fat or a great deal of undigested material.

Liver Bile

Bile is necessary for digestion. Absorption of fat and calcium depends on bile mixing with the food. When fat isn't absorbed, it stays in the intestine. Fat is lighter than water; it makes the stool float. Feces should not float. When the stool floats you can assume that calcium isn't being absorbed either, leaving the blood in a deficit which will be taken from the bones.

If the stool floats or is orangish in color prepare your elderly person for a *Liver Cleanse* to clear a bile duct of obstruction. They get quite fond of these cleanses and will ask to have one. *Liver Cleanses* are completely safe, even for persons in their 80's. One of the stones pictured came from a woman age 97. The general rules apply to the extremely elderly: kill all parasites first by zapper if possible, otherwise by herbal parasite-killing. Do a *Kidney Cleanse* first, using half a dose instead of the regular dose, for three to six weeks. Attend your loved one in person for the *Liver Cleanse,* have a commode at bedside, protect bedding from accident: use paper underwear if necessary. Share the joy of getting gallstones out painlessly with your loved one; let them see and count them if they wish before you flush them (use a flashlight).

Be extra careful with the skin cleansing. Hot water soothes and heals. Use starch skin soother to dispense onto the wet paper towel, besides borax solution and alcohol. Don't use ordinary soap. The starch skin softener gives the

smoothness of soap, and prevents the pain of friction. An elderly person may have no diarrhea at all with the Epsom salts! Evidently the body absorbs all the magnesium so eagerly, none is left in the intestine to absorb water and create diarrhea. It is especially important though to rehydrate your elderly person after a diarrhea. This time they do not balk at water consumption. The *Liver Cleanse*, it seems, gives them new thirst as well as new appetite. But it doesn't last long. As the stones from the far corners of the liver move forward, they compact into larger stones and plug the ducts again. Their previous symptoms return. Try to give a cleanse once a month until the dark color of the stool returns and it no longer floats.

The benefits of a *Liver Cleanse* will last longer if **valerian herb** is taken the day after the cleanse and from then forward. It may be preventing spasm of the bile ducts. Use 2 oz. of the herb (cut) in 3 cups water. Simmer for 5-10 minutes, let settle or strain. Add honey to sweeten. Give a few tbs. every 4 hours (or 6 capsules) for several days followed by a daily dose at bedtime.

Constipation

If constipation is a problem, use an herbal product rather than a drug until you have removed the cause. **Cascara Sagrada** (half dosage) or **prunes** work for many people. Adding **roughage** to the diet is a good solution but often doesn't work. If you try bran, you should add vitamin C and boil it, first, because it is very moldy. But even eating tree branches for supper won't move a bowel that has the wrong bacteria in it.

Bacteria are part of the cause; and part of the result! Constipation increases the bacteria level which causes further constipation! You may solve the constipation problem immediately by zapping. Even though this kills some “good” with some “bad” bacteria, no harm is done. The stool is recolonized in one to two days.

Poop Your Troubles Away

Two bowel movements a day are the minimum necessary for good health. The first one should be in the morning. The morning cup of water, drunk at the bedside has the magical ability to move the bowels. Cold water may fail. But the water effect only works in the early morning. Waiting until after breakfast may not work. Notice the energy lift your loved one gets from this most primitive body cleanse. Take advantage of this to exercise them. Go immediately for the

morning walk. This might be the only time of day they can enjoy their walk.

Walking and **liver cleansing** are the most health-promoting activities you can do for your loved one.

Make walking as essential as eating. Walking is not merely walking about the house or shopping. Walking should be done outdoors. Walking is a brisk exercise, done as speedily as possible and lasting at least ½ hour. Only if the weather doesn't allow outdoor walking can an indoor walk be substituted. Don't let your elderly person choose whether they will walk that day. To overcome resistance, find a cheerful neighborhood person willing to do this task for pay. The need to respond to a new stranger energizes the elderly more than your persuasion can.

Sugar Regulation

Diabetes is a common development in the elderly. If your loved one is already on a pill for beginning diabetes, take this as your challenge never to let it get worse. It is not a chronic metabolic deterioration. It is a destruction of the pancreas (specifically the islets) by the pancreatic fluke which is attracted to the pancreas by wood alcohol. Zap flukes and eliminate wood alcohol as described in the section on diabetes.

Use no artificial sweetener and no beverages besides milk, water and the recipes given in this book. This is one regimen your loved one will not resent. They are well motivated to prevent the need for giving themselves daily shots of insulin. Use this motivation to acquire the taste for new foods and beverages.

Elderly Person’s 7-Day Diabetic Diet

Daily supplements: 4 chromium (200 mcg. each), 1 or 2 B-50 complex, vitamin C (1,000 mg. or ¼ tsp.). Take with food.

Breakfast

Choose any one; they need not be in order.

1. Two eggs, (replace carton and wash hands and eggs before cracking),

wheat-free, corn-free bread, not toasted (special breads can be found in the freezer section of natural food stores), with butter and 1 tbs. orange blossom honey. 1 peeled pear, raw, with whipping cream. One cup hot milk with cinnamon.

2. Old fashioned oats, with 1/4 tsp. cinnamon and 1/8 tsp. vitamin C, stirred in just before serving. Mix whipping cream with sterilized milk to make a “half n half” for the cereal. 1 tbs. honey. 1 banana. One half cup milk, one half glass water with honey and vinegar.

3. Fried potatoes with 2 eggs (use only butter, olive oil or lard), 1 cup hot or cold milk. A quartered orange (wash the orange before quartering).

4. Cream of rice, with homemade “half n half” or whipping cream, cinnamon and vitamin C stirred in. 1 cup milk, 1 banana.

5. Cottage cheese, cooked in covered skillet to sterilize. Add chives or peeled fruit (not canned). Wheat-free, corn-free bread, or rice bread with 1 tbs. honey. 1 nectarine or piece of melon. 1 cup hot milk. Water with vinegar and honey.

6. Pancakes or waffles with butter and eggs (no sweetening). Fruit (peeled), hot milk, water.

7. Fruit cup, large bowl of peeled, chopped mixed fruit with whipping cream and 1 tbs. honey and rice bread or other wheat-free, corn-free bread with unsalted butter. 1 cup hot milk with cinnamon.

Remember, all honey must be pretreated with vitamin C. All fruit is peeled and free of blemishes and soft spots. All milk, cream, butter must be sterilized for 10 seconds at full boiling point. Butter must not be “raw”. Get wheat-free, corn-free bread at a natural foods store.

Lunch

It is better to have most of the day's calories in the middle of the day than at the end. Arrange for dinner at noon if possible.

Dinner

Choose any one.

1. Green beans with potatoes, meat dish, cabbage apple salad, water with lemon juice and honey, 1 cup hot milk. Water.

Fresh green beans, especially fava beans contain a substance that is described in old herbal literature to be especially beneficial to diabetics. Don't overcook them—it might harm this substance.

For the same reason, don't use canned green beans. If “fresh” isn't possible, choose “frozen” but rinse the chemicals off before cooking. Potatoes (not overcooked), peeled to make sure there are no blemishes (contain mold and pesticide) can be cooked with the beans. Cook with onions and oregano for flavoring. Add fresh chopped parsley to the sauce or butter for both green beans and potatoes. Fresh parsley has special herbal goodness (high magnesium, high potassium, diuretic.)

The meat dish should be overdone. “Fast food” is plopped from the freezer into the boiling grease which browns the outside nicely but can easily leave the inside undercooked. Meat must never be “rare.” There should be no redness near bones! Canned meat is safe from parasites but may have smoke flavoring added (contains benzopyrene) or nitrates. Avoid these chemicals. Avoid MSG too.

Whenever a meat dish is not accepted, substitute sardines. let them choose from a display of six kinds. Purchase the flip-top cans to avoid eating metal grindings from the can opening process.

Cabbage for salad should be chopped fine enough to be digestible. Add finely chopped apples (peeled) and a few apple seeds and whipping cream for the dressing.

Sweet things are reserved for dessert. Since a diabetic's tissues are not absorbing sugar, they crave it more and more. As the diabetes improves they crave it less. For dessert, serve 1 tbs. of honey to satisfy this craving without endangering their blood sugar regulation. It can be used in the hot milk or in other ways. Undercooking the vegetables also helps slow down the sugar release. Never serve mashed potatoes for this reason.

The drinking water should always have a little vitamin C, lemon juice or vinegar added, and 1 tsp. honey if desired.

2. Asparagus, potato, raw salad, fowl dish, fruit, water with vinegar and honey, 1 cup hot milk.

The asparagus can be fresh or canned. Bake the potato: not in aluminum foil, not baked until fluffy. Don't let the skin be eaten. Use genuine butter, only, or a homemade sour cream dressing (see *Recipes*). Fresh chopped chives may be added but no regular sour cream since this is very high in *tyramine*, a brain toxin.

The raw salad should be chopped small enough to be edible by dentures. Use homemade salad dressing with a preference for oil and vinegar styles.

The fowl dish should be very well done, never “fast food”.

For dessert, fresh fruit chunks dipped in a homemade honey sauce (honey, water and cinnamon). Less sweets are consumed if you dip the fruit rather than pour the sauce over. Limit the total to 1 tbs. honey. Don't serve grapes or strawberries due to the intense mold problem.

3. Soup, sandwich, fruit, hot milk, water.

Soup should be homemade from scratch. Add bones and 1 tbs. vinegar (white distilled) or a tomato to the kettle to ensure some calcium leaches out of the bones. A fish chowder serves this purpose very well, too.

The sandwich has lettuce, real butter, and whatever else tastes good (no cheese, bacon bits or condiments). The bread is wheat-free, corn-free, stored in freezer. Homemade salad dressing can be added.

The fruit may be chopped with whipping cream, cinnamon and honey sauce (not more than 1 tbs. honey).

The water may be plain if there was vinegar in the soup.

4. Fish, green beans, potatoes, other greens, fruit, hot milk, water.

Fried or baked fish is served with lemon or lime. Green beans are served with a cheese sauce so a lot will be eaten. (Cheese sauce: add milk, olive oil to a block of cheese. Melt and cook at least 10 seconds.) Serve au gratin potatoes or scalloped potatoes or any kind of potatoes that will be enjoyed. The extra greens can be beet greens, collards, mustard greens or spinach served with a favorite dressing to make sure it’s eaten. (No croutons or bacon bits, though.)

Never serve dessert if the plate has not been cleared. Your loved one isn't hungry enough. If appetite is very poor, sweets will only worsen the problem. Try to change the menu to stimulate the appetite. Acid foods stimulate; spices

and B-vitamins (especially B_1) stimulate; hot foods stimulate. Much appetite is controlled by the liver and brain. Toxins at either location (especially food-derived toxins) tell the body to stop eating. Suspect food molds first, bacteria and chemical additives next.

5. Asparagus, meat dish, white rice (brown rice contains mold), coleslaw, milk, water, ice cream.

A hot meat dish (no pasta, no wheat flour, no regular gravy) can be fried, cooked or baked, but not grilled. Asparagus is fresh, frozen or canned. Rinse if frozen. Fix it differently than last time. Season rice with parsley and minimal salt and pure herbs like thyme; no MSG or mixed seasoning, make butter sauce. Dessert is homemade ice cream (see *Recipes*).

6. Fish or seafood hot dish. Green peas or peas and onions. Peeled sweet potato with butter (not canned). May switch sweet potato with rice on asparagus day. Sliced tomatoes or cucumber or other raw vegetables with or without dressing. Milk, 1 tbs. honey (can be used on sweet potato).

7. Chili or stew with unlimited rice-bread and butter. If chili produces gas, stay away from it. Serve no canned varieties. Grated carrot salad with stewed raisins added and heavy cream. Milk, water as usual. Blueberry pie, sweet potato pie, custard pie.

If more bread is requested, provide a wheat-free, corn-free variety; but limit bread eating to “after main dish” eating. If not enough milk is drunk: make custard pudding or rice pudding so the daily amount (3 cups) is consumed.

Supper

1. Tuna with salad dressing or tuna salad (no pasta). Non-wheat raisin bread (from natural foods store) and butter. Milk, water.
2. Custard, cooked greens, baked potato. Rice-bread and butter. Herb tea with milk added (single herb only, not mixed herbs).
3. Vegetable soup, homemade, from scratch. Leftover meat sandwich with rice-bread (no deli or cold cuts or luncheon meat). Milk, water.
4. Baked squash with butter, rice pudding with cinnamon, raisins, and honey. Canned salmon or sardines with wheat free, corn free bread. Milk, water.

5. Chili or stew leftovers with wheat free, corn free bread. Custard pudding sweetened with honey, and nutmeg/cinnamon mix. Milk, water.
6. Sardines and rice bread or other wheat free, corn free bread. Homemade tomato juice with celery, strained. Milk, plain water. Pie a la mode (homemade pumpkin or squash pie and homemade ice cream).
7. Potato salad. Leftover meat dish and beans, stewed tomatoes, squash. Baked apple with cinnamon, cream and honey. Milk, water.

Many diabetics lose 50 points (mg/DL) of blood sugar in a few days on this diet. This is why: there is less bread than a diabetic would prefer. There is very little cheese (it must always be boiled in a sauce to sterilize). There is no fruit or vegetable juice except homemade, and not much of that because it crowds out milk and water. If your elderly loved one can't eat all this, make sure there are no snacks consumed between meals that are forbidden.

There is no pasta anywhere. Pasta is mold-ridden. Even after cooking, it may be toxic. There is no wheat or corn bread. The menu is heavy on green beans and asparagus and cinnamon. If by chance, your elderly person hates these and starves themselves to get your sympathy, add a lot more potatoes and rice (never brown) to raise calories.

There is no sweetening other than honey (5 kinds). There are no syrups or sugars. Honey is self limiting—the taste for it is all gone after 1 tbs. Not so for other sugars. The heavy use of cream and butter is offset by no deep fat fried food and little cheese.

Keep in mind that this diet may reduce the need for insulin almost immediately. You may have to cut it in half! But how would you know this? The morning blood sugar test is essential to keep track of changing circumstances. Don't neglect it. Be careful not to use rubbing alcohol when making the finger stick (use vodka or grain alcohol). Your elderly person will feel it is all worthwhile (doing without coffee or pie) if one less insulin shot is needed or if they can go back on tablets instead of insulin. Or even just the knowledge they are staying well controlled and will never have to take insulin shots. Remember to give yourself the credit for a fine accomplishment when your loved one's diabetes improves.

Diabetic Supplements

Several supplements are especially good for diabetics:

- Fenugreek seeds, 3 capsules with each meal.
- Fresh vegetable juice made of raw green beans and carrots (½ cup total).
- Bilberry leaves. Maybe they have something in them that helps detoxify wood alcohol, since bilberry leaves are good for eyes, too. Get in capsules or make a tea.

Diabetic Eating Out

Since the rules are always somewhat relaxed when “eating out” a diabetic loved one will badger you to go out with them. If rules are sure to be broken, calculate it into the rest of the day so you can compensate for it.

Extra Diet Tips For The Elderly

Food should taste good.

Eating is a fundamental pleasure of living. In old age there is no other pleasure that can equal enjoyment of food. It is a time when we long for the foods of our own childhood, too. Ethnic foods often had to be given up when children were raised (switched to hot dogs and pizza) but with this diversion gone, a return to family food would be most welcome and most healthful. Ethnic foods were made from scratch. And they certainly were made at home where cleanliness and “persnicketiness” are at their finest! A speck in the batter gets noticed. Not so in a commercial mixing vat. Pots and pans are sanitized with hot water, not chemicals.

Good advice is to return to old fashioned home cooking: with its flour and butter, lard and cream, homemade pasta, olive oil and soup, coarse cereal grains and plain fruit. Gone are the fruit juices, flour mixes, crackers and sweets that fill grocery shelves. What about convenience? Old fashioned cooking took most of the day. It does take 3 or 4 hours to make a soup from scratch. But you then get 3 days off! Each day you reboil it, it is sterile again. Or freeze half of it (take the potatoes out first). It does take a whole morning to make pasta or some ethnic dish. Freeze it in plastic sealed containers so the delicate flavor isn't spoiled. Baking homemade bread is automated now. Do at least this much to get away from the mold-ridden grocery store loaves. Make your own ice cream and

nut butters. They last many days and free your schedule.

Time is the great inhibitor but if you have the means or the help, the best advice, nutritionally, is a return to old-fashioned cooking and recipes. Use your new insights to improve them where you can. Don't use your mother's aluminum ware; use her enamel ware or the new glass and ceramic ware. Don't use her copper-bottomed tea kettle or gold-rimmed cups or “silver”. Use her wooden spoons, glass glasses, and plain dishes, her wooden and straw bowls and enamel pots and pans.

Salt

Should you avoid salt? No. But a good salt rule is to either cook with it or have it on the table, but not both. Use aluminum-free sea salt, and make sure the salt is sterilized by heating five minutes at 400°F in a glass pie plate to kill mold. (Sea gulls fly over the salt flats where sea salt is gathered. Their droppings provide a medium for mold.)

The best salt is a mixture of 1 part of your aluminum-free, sterilized sea salt and 1 part potassium chloride (another kind of salt, see *Sources*). Potassium ousts sodium (salt) from your body, so you can use twice as much of this kind of salt! Also, the extra potassium helps lift fatigue and has other benefits.

Always use a non-metal salt shaker with a closable lid to keep out moisture. Don’t put rice in your salt because it invites mold.

Since you, the cook, know where the salt is, (mostly in soups and stews), don't serve as much of these when there is heart and kidney illness or high blood pressure. Don't put salt in cereal, cooking vegetables, or other dishes. Just leave it out! Use herbs instead. **Tip:** Encapsulated herbs stay fresher and are more potent. Fenugreek and thyme are the most beneficial of the common cooking herbs. Just open a capsule and season.

Fig. 38 Sea salt flats are often roosting places for sea gulls.

Tremor

Tremor is a symptom, not a natural part of aging. The nerves controlling the hands and arms are poisoned. The nerves originate in the brain where the poison has accumulated. What is the poison? Did it happen long ago? No! It could have happened as long as two weeks ago but not longer!

Tremor is the result of ongoing poisoning! It is important to find the poison as soon as you can since the rest of the body will soon be affected, too. Search your memory for the new things that happened in the last two weeks. It is a herculean task but only gets harder each day, so keep notes as you ask: Is there new carpeting? Is there a new furnace? Is there a different water supply? Is there a new hair dresser? Did somebody bring a vase of fresh flowers? Is there a new laundry person? Was the place sprayed for insects? Is there a new medicine (drug) or supplement? Was remodeling done? Is there a new food?

The list is endless and the situation looks hopeless because so many new things can happen in two weeks.

Rather than asking individual questions like these, let's ask only **five general questions** and have the assurance that one of them will catch the culprit.

1. Is it in the **air**? This will catch insecticide, flowers, carpets all together.

2. Is it in the **water**?

3. Is it in the **medicines** or **supplements**?

4. Is it in the **clothing**?

5. Is it in the **food** or on the dishes?

To answer each question, test the item using your Syncrometer® searching technique. Make a test substance. Then search a saliva sample for it.

To test the air, take a dust sample off the kitchen counter or table (this gives you fresh dust). Pick up the dust with a few wipes by a small, two-inch square of damp paper towel. Place in a zippered baggy.

To test the water, make samples by putting about a tsp. of hot, cold, or filtered water into a zippered baggy with a bit of paper towel in it. Try to get the first morning water before it has run.

To test the medicines and supplements put one of each in zippered baggies.

To test clothing (laundry) use a bit of it, (such as a sock) rolled up tightly.

Testing food is the biggest job. If there are leftovers in the refrigerator or freezer, this helps. You can combine all the leftovers in a single baggy. Frozen things don't need to be thawed for testing. Still, the chance of missing a food culprit is quite high. Be sure to test everything eaten in a two week time period: unusual things like popcorn, candy, crackers, cookies, health foods and special powders. A consolation is that you will find a number of bad foods that are not necessarily the tremor causes but which cause other health problems.

Tremor Remedies

1. Let us imagine that the air (dust) sample proves toxic (resonates with the saliva sample). What is it in the air that is toxic? These are the biggest suspects:

- CFCs (from leaking refrigerant, check refrigerator and air conditioner by removing them from the house and retesting the dust after three days, or simply buy a non-CFC variety)
- vanadium (from leaking house gas from a fuel line—repair)

- arsenic from pesticide (switch to boric acid)
- solvent from a lamp or can of lighter fuel (take them out of the house)
- chlorine from water (use carbon filters; remove bleach bottles)
- asbestos (clothes dryer belt)
- paint thinner, carpet cleaner (remove from house)
- fiberglass from bare insulation somewhere (fix holes in ceiling or wall)
- formaldehyde (new foam bedding, new fabric or clothing)

2. Suppose the water proves toxic (appears in your white blood cells); search for lead, copper, and cadmium. Although municipal water tests occasionally detect small amounts of propyl alcohol, benzene, or wood alcohol, I have never detected them—you need not search for them.

3. If the medicines are toxic just change brands. Your pharmacist can help you find a replacement brand. Find which ones are toxic and stop using them. (Don't use up any of the polluted pills or supplements.) They do more harm than good.

4. If the clothing or dishes are toxic (appear in the saliva), suspect

- cobalt
- PCB
- aluminum

Stop all detergent use. Use borax, or washing soda, or use paper plates and plastic cups (not Styrofoam).

5. If the food is toxic, suspect

- food molds
- aluminum
- bacteria

Don't eat that food any more.

6. Any bacterium or toxin that invades certain brain centers can cause tremor. The most common culprits are *Shigella*, mercury, thallium and arsenic. Try to identify these for your sake as well as your loved one.

The *Salmonellas* and *Shigellas* will have come from some food. Be sure all dairy foods, including butter and whipping cream, are sterilized. Parasites come from meats. Be sure no undercooked or fast food meats are eaten. Kill all bacteria, viruses and parasites with a zapper. Sterilize fingernails with grain alcohol to prevent reinfection. Use Lugol's (see *Recipes*) and the *Bowel Program* to clear them up.

Bacteria, coming from teeth and jaw (bone infections, called *cavitations*) may not seem as recent as two weeks. Indeed, they may have been there for ten years. But something recent may have aggravated them, so they now can enter more easily into the blood and brain. You may never find out what caused this. It is wisest to check this possibility with a dentist before doing weeks of other testing. See a dentist who can find and clean cavitations. Do dental repair according to the principles described in the dental section.

Going after a tremor problem in this logical way <u>always</u> finds the cause of tremor.

…whether its a simple short attack or a situation of long standing tremor with head shaking and drooling. If your situation is extra difficult, <u>you will at least improve it</u> and stop its progression. **This includes Parkinson's cases.**

In cases of Parkinson's disease I often find the bacterium *Clostridium tetani*, well known for causing stiffness. It hides under tooth fillings, too.

Remember, there is a consolation for doing all this work. When you find the culprit, you not only will be stopping the tremor, you will be improving a lot of other conditions along the way. Conditions like hesitant speech, shuffling walk, getting up stiffly and slowly from a chair. These are <u>extra dividends</u> for your loved one. And you have learned which things to avoid for <u>yourself</u> too.

One more thing, <u>don't take no</u> for an answer.

If the problem is a drug, don't accept "No, it can't be changed." Everything

can be changed. Go to higher levels of authority. Doctors are very understanding and sympathetic with your intent. If the problem is leaking house gas, don't accept “We can't find a leak, “implying there is none. Go to a building contractor or the Health Department. Their equipment is better. If you get nowhere, change to electric utilities. If the problem is auto exhaust, don't accept “But we have to use the kitchen door to the garage, because it's cold outside.” Conveniences vs. tremor is no contest. Everyone benefits by excluding auto fumes from the house. Lock the door and cover it with plastic. By the time you have identified the culprits (probably 20 hours of work) surely you have won the right to make changes.

Often others are not impressed. Even when the tremor lessens and the elderly person plainly states they feel better, family members may disregard your recommendations. **Get tough!** It's your loved one. You have something at stake too. Be sympathetic with negative responses. But very firm. Make their choices clear:

- Either the inside door to the garage gets sealed off or the cars and lawn mower get parked outside and anything containing gasoline or solvents gets put in a detached shed.
- Either the girls use their hair dryers in their bedrooms with the door closed or you'll get them all new ones that don't contain asbestos.
- Either the clothes dryer gets a new belt or it is taped securely shut and the laundry is dried on the line or taken to a Laundromat.
- Either the plumbing gets changed (to plastic) or each faucet in the house gets a filter. (If your plumbing is corroding, not even filters are a good idea —you would have to change them every week!)

Weakness

…should not be taken for granted in the elderly. Especially if they themselves complain about it. It isn't normal for them. Sometimes they will describe “spells” of weakness. This is an important clue. Check the pulse immediately. Count for 30 beats at least. Are there missing beats? There should not be! Missing two beats in a row certainly can produce a weak or “sinking” spell. The brain and body need every pulse of blood sent out right on time.

Check into caffeine use first. Take it all away. Caffeine speeds up the heart; then the overworked heart has to “take time out” for itself by missing a beat. Don't switch to decafs because this introduces solvents and new problems. If no other natural beverages appeal, serve hot water with cream and cinnamon. After stopping caffeine use ask: Is the pulse too slow or too fast? The pulse should be between 60 and 80 beats per minute.

If it is lower than 60, a medicine may be at fault. Ask the clinical doctor about it immediately. A slow pulse could certainly bring about weakness. A young athlete may have a slow pulse legitimately, due to having a very strong efficient heart, but your elderly person does not fit this category. The cause must be found.

If the pulse is quite high, over 100 perhaps, this will wear the heart out much sooner than necessary. Ask why it is beating so fast? A probable answer is that it is so weak that it has to beat faster to keep up with its job of circulating the blood. What is making the heart so weak?

Heart Disease

When the heart is enlarged, the valves don't quite close where they should, making the work harder for it and weakening it. It may be called “congestive heart failure". Why is it enlarged? Possibly because it is so weak! Yes, it becomes a vicious cycle, getting worse and worse. But you can break into this cycle and get it all reversed again. The real culprit is parasite invaders and toxic pollutants.

The most common parasite heart invaders are *Dirofilaria*, heartworm “of dogs” and *Loa loa*, another small filaria worm. At one stage these worms are so tiny that they can slide through the smallest blood vessels. They are very contagious. Even persons who don't live with a house dog can pick up heartworm. *Loa loa* is thought to be a tropical parasite but it is alive and thriving in the USA! The source of *Loa loa* seems to be tapeworm stages; this is not a certainty.

Both heartworm and *Loa loa* are very easy to kill with a zapper and both are very easy to pick up again. Treat your elderly person twice a week if there is any heart problem. It makes no difference that the house dog is getting monthly preventive treatments for heartworm. They pick it up daily and have thirty days to develop it and give it to others between treatments. Killing the dog's parasites

twice a week with a zapper would be very helpful to you. These heart parasites may not cause any pains, yet disturb the rhythm or the pulse of the heart and cause it to enlarge.

Staphylococcus aureus is a bacterium hiding out in far away places like pockets left under teeth when they were extracted or along root canals. Make sure extractions heal and don't leave permanent cavitations where bacteria can live. Ask a dentist familiar with cavitations to do a mouth search. Once the mouth source is cleaned up, the bacteria do not come back to the heart (after one last zapping). If they do, go back to the dentist!

Killing these three invaders (heartworm, *Loa loa*, *Staphylococcus aureus*) should cure an irregular heart beat immediately (within a day).

If the elderly person is on a heart-slowing drug, check the pulse twice a day after zapping to make sure it doesn't drop too low. They may need to be <u>off</u> their heart medicine. Nobody will notice the relief of going off this medicine as much as you. The sunshine breaks out! Your loved one can smile again at little things! Even interest in sex returns so watch out! Life is normalized when drugs, especially beta blockers are gone. (Other heart medicines, such as Digitoxin™, don't have this depressive effect. They are used to make the heart beat stronger, not to affect the <u>rate</u> of beating.)

The pulse should be around 70 beats per minute and <u>perfectly</u> regular.

If it isn't, there is still something wrong. Get rid of toxic body products and house pollutants. Test your air for gas leaks frequently. Gas heat, gas stoves and gas water heaters are notoriously leaky. Weather changes, namely temperature changes make pipes expand or shrink—leaving cracks! The gas is toxic and a small amount can't be smelled. What a predicament! Delivering poisonous house gas to our homes in pipes that are not fail-safe is an archaic practice. Especially when the blood test shows a high “total CO_2” level, near the upper limit, search for an air pollutant like house gas or auto fumes. And read the sections in this book on pulse and brain problems very closely for more things to check.

With the heart regular again, it will be much stronger, too, since it doesn't have to work against itself. This strength is necessary to push the blood into the farthest “corners” of the body, especially the hands and feet, and warm them up! If your loved one constantly has cold hands or feet, try to improve circulation.

Dissolve phosphate crystals with the kidney herb recipe. Give niacin. Give cayenne capsules (one with each meal). Blood thinning drugs to improve circulation are dangerous—use only if the doctor insists. Monitor blood clotting time if your loved one is on a thinner.

Heart/Kidney Relationship

A strong heart is necessary, too, to push the blood through the kidneys. Often a kidney problem is linked to the heart disorder. Kidneys are made of tubes that get finer and finer. It takes pressure, namely strength, to push the blood through them so wastes and extra water can be let down the kidney tube. Think of the kidneys as a colander full of tiny holes of various sizes that let certain things through them but not bigger things. These holes are constantly being adjusted by the adrenals which sit right on top of the kidneys and "supervise".

If the elderly person is not producing four cups of urine in a day (24 hours), it is not enough. The body cannot get enough cleansing action from less than four cups. More liquid must be consumed. If most of the urine is passed in the night this reflects on unhealthy kidneys. Use the kidney herb recipe—but only half a dose (so it will take six weeks instead of three to see good effects). As the tiny "colander" holes open up there is freer flow and many more trips to the bathroom result. The urine loses its awful odor (no ammonia, acetone and bacteria!) and gets a clear look that shows no sediment. Now that water and wastes (urea and uric acid and other acids) can leave the body quickly through more holes, it takes less pressure from the heart to get blood pushed through the kidneys. This brings relief to the heart because its work is easier. The heart and kidneys work <u>together</u>. Like horse and wagon the heart provides the power and the kidneys follow.

This is why heart medicine and diuretics are commonly given together. *Diuresis* (urine flow) helps the heart and a stronger heart helps the kidneys. Similarly, they fail together. In the old days this was called *dropsy*. Urine that should have left the body is backed up in the tissues. Sometimes it shows up in pockets that hang like giant oranges from the skin.

Even (especially) when the strongest diuretics (Maxzide™, Lasix™) fail to work, even when coupled with strong heart medicine (Digitoxin™), the kidney herb recipe can bail you out of the emergency.

The secret is in the varied actions of different herbs. This makes them work together. Be very careful to keep the herb tea sterile by reheating every fourth day. Freeze unused larger amounts. If too much is drunk at once, especially on the first day, a stomach ache can develop and a pressure felt in the bladder that is most uncomfortable. Go extra slow on the first few days, even though you find it quite tasty, so there is no discomfort (only lots of bathroom visits).

Diuretics

As soon as urine is flowing better, blood pressure may drop. Keep track of this twice a day with a modern electronic finger device (not an arm cuff that itself can break blood vessels). Cut down on drug diuretics gradually, using only ¾ dose the first day, then ½ dose, then ¼ dose. The amount of urine produced or the weight of the person can be used to assess how effective your method is. **Your goal is to not need any drug diuretics.** Again, mood will improve dramatically when diuretic drugs are removed for your loved one. The sense of humor comes back: be prepared for some new jokes and new laughter. Give yourself good grades for this accomplishment.

Don't throw out the drug diuretics. After being off them for a while, they become more potent again. So if an emergency (sudden edema) should arise they could again be useful.

With a parasite and pollution-free heart and a low-resistance, freely flowing kidney, some reserve strength will soon be built up. Weak spells are gone and forgotten. Your loved one is walking better, needing less sleep, and a “golden age” finally arrives. It is free of pain, free of medicine, free of shots and doctor visits, free of dementia, free of the dreadful weakness that demands so much help. They are free to enjoy family and friends again. Seeing themselves gain strength and be able to do more for themselves gives the elderly a sense of pride.

Give them the credit for improving their health. When they balk at having to take herbs or vegetable juice, remind them of the days they were on a handful of pills and still had heart failure, pain and kidney disease.

Feeling Comfortable

If all this improvement doesn't warm up their feet or hands (feel them yourself) put extra socks on. Warming up their feet might have the effect of warming up hands, too. But if it doesn't, raise the room temperature.

Being forced to feel cold is an undeserved misery of the aged.

Others must accommodate to the elderly's need for body warmth. The thermometer does not tell all. Comfort is paramount for each of us. Younger persons can undress for comfort. The elderly can't make changes for themselves. Usually, by the time they are complaining of cold, they have suffered a long time, feeling too guilty to request a temperature hike. Ask your loved one. They will appreciate it. A shawl, a lap-blanket, woolen sweater, long underwear and fleecy thermal outerwear help a lot. But if your hand still senses cold feet, the thermostat must still go higher. Cold body temperature is an invitation for fungus and viruses to multiply. Viruses escape into the body daily. Don't give them the advantage.

But unless all these things are tried, don't raise the temperature. It is much healthier to be warmly dressed and breathe cool air than to be lightly dressed in an 80°F room. The heart, especially, benefits by the cooler air temperature.

For this reason, it is important to have air conditioning during the hot season. Keep your elderly person warmly dressed, away from air conditioner or fan drafts, but keep it cool. As cool as their body temperature and comfort will allow. Don't seat an elderly person under a fan in restaurants. The blowing air not only chills them, but also brings filth in dust that blows in the air currents. Bacteria and viruses are soon to follow.

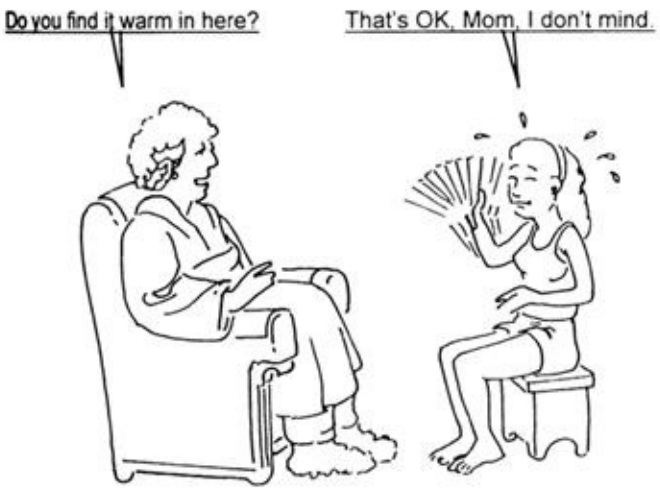

Fig. 39 Too hot and too cold.

Being comfortable, knowing you are there to care for them, brings out the best in your elderly person. They might get well enough to long for a genuine

relationship again. And put you to the test. The test of listening. This can be very rewarding if they are still able to communicate and distill their life experience into wisdom for you. If you can listen and be interested in their distillations or their ramblings their longing for relationship will be fulfilled. There's just one catch, if the new found interest in communication can't be expressed. If they haven't communicated much for a long time, it would be easy for you to miss a simple fact. They can't hear!

Hearing Loss

The hearing deficit in an elderly person is always much greater than they or you realize. Try to understand these communications:

What your (caregiver) says	**What an elderly person hears**	**What they think**	**What they respond**
“Look at the sunshine, isn't it a nice day?”	“Look at something, isn't it a nice bay?”	What a stupid sentence. But she wants an answer. So here goes,	“Mmm Hmm” (Meaning, “yes.”)
“We'll have such a nice walk.”	“Have a...rock.”	Rock what? I'm not in a rocking chair. I better not say anything.	"No thanks."
“What kind of soup should I make?”	“What kind of hoop should I make?”	I haven't used a hoop for embroidery for a long time. Why is she digging that up. I better say I don't know.	“I don't know.”

Don't let this ruin your relationship. It takes the fun out of their life as much as yours. **Get hearing aids**.

Don't ask your loved one if they need a hearing aid. The answer may be “I'm not deaf.” You can go about it more persuasively. Every time you talk, come quite near to the person's ear and speak loudly. They can see that you must come near. If they are fighting against the whole business, they will say things like, “You don't have to shout. I can hear you.” (It's what you're saying that's wrong!)

Arrange for a hearing test. It is free. That will appeal. The results of a hearing

test, as it is told by a salesperson, is much more persuasive than you can be. Let the salesperson use his or her special talents to sell your loved one on hearing aids. But you make the choice on quality. Both you and your elderly person deserve the best tone quality that is made. Plus a regular cleaning service. Most companies do offer this but don't tell the customer because of the dreadful amount of time it would take if everybody took advantage of it. You take advantage of it. Clogged hearing aids are the most troublesome feature of any of them—and never mentioned! Make it a rule to buy your batteries at the same hearing aid office where they are cleaned free of charge. This repays them and serves the elderly best. Hearing loss is too subtle to leave to chance; have the hearing aids cleaned each time you buy fresh batteries (about three months). Take your loved one to a nurse for ear cleaning every six months after hearing aids are begun. Wax and debris accumulate behind the aid because the channel is stopped up.

With hearing aids that hear, and kidneys that flush and a heart that beats strongly, your elderly person may choose to attend concerts again, go to church or gatherings—and leave you out of the picture. Give yourself good grades for this achievement. Get them incontinence pants, get regular taxi service. **Do whatever it takes to get your loved one out into the world again!**

If the excitement of a night out keeps him or her from sleeping use **ornithine** and **valerian** capsules. They are good for the health anyway. Hot milk and a piece of cake (homemade, never chocolate) may do as much.

But if insomnia is the rule, not the exception, you need to go after it as a special problem.

Insomnia

…is always associated with high levels of parasites and bacteria. This leads me to believe it is their waste products, namely ammonia that really causes insomnia. Read the section on Insomnia under Sleep Problems for more on this.

A sound sleep refreshes as nothing else can. Your elderly person will have more energy throughout the day and a better mood if sleep was good.

Of course you must guard against daytime napping if nights are sleepless. Sleep at night is more important than sleep by day. They are not equal. Try to turn your loved one's cycle back to night-time sleeping if it has become turned

around by bad kidney function (frequent urination at night) or too much daytime napping. Sleep can be disturbed by taking vitamins at bedtime too. Sleep is enhanced by taking magnesium. Limit bedtime supplements to magnesium, ornithine, valerian (6 capsules) taken with hot milk.

Healthful Habits

If your loved one had his or her way, they would drive the car forever, wear the same cosmetics forever, smoke or chew tobacco forever and eat their favorite dessert forever.

But if you are the caretaker, you know that some things must stop. You also know that gentle persuasion is useless; it merely erodes your relationship. Here are a few tips.

1. Ask your loved one to ask their doctor (clinical doctor or trusted medical advisor) the following question: “Would it be better for my lungs to stop smoking?” Be present so the question does not turn into “Will smoking a few cigarettes once in a while kill me?” Hearing it from the doctor is what's needed.

2. Don't ever purchase something you believe is detrimental to your elderly person. Whether it's coffee, cigarettes, beer or lipstick, say “That is something I can't buy for you; it's against my principles.” Don't be surprised if you cave in a few times to some super ruse they use on you. But the next time, have your answer ready.

3. Let your family and other caretakers know you are no longer supplying these items (the car keys, the wine bottle, the codeine-containing pain pills). Try to get cooperation. Discussing it with your loved one may do more harm than good. If they start the discussion, you end it. This is not a task for the timid! After it's done, you'll wonder what was so difficult.

Don't buy a wheelchair if your loved one can still walk with your help. Stay with a cane as long as possible. Then the walker. Stay with a walker as long as possible. Then your personal help. Once a wheelchair has been accepted, the last bit of exercise, walking, is lost. Fight against it. Hide it in a far away closet.

Aging is necessary… but chronic illness and pain are not.

If you have managed to free your loved one from having to take pills or from certain disabilities that would soon require pills, you can give yourself great credit. Perhaps you, too, will find the needed natural help when you are aged and have lost your authority and your way mentally. Our lives are all foreshortened, much like the life of a domestic steer's. Does a captive animal learn from seeing its companion disappear? It does nothing to escape its fate. Should we accept our fate with the same docility? None of us can remember how things were in pre-civilized times. We are eager to believe the present is the best time that has ever been. The steer, too, has its feed provided, its water provided, its shelter for the night provided, seemingly the best time it ever had. Perhaps the price we pay for civilization, like the steer's price, is simply too high. There must be other ways. As a society, we should search for our lost longevity.

Not Old Yet

For persons merely over 40 and not ill a most important rule is: **don't overdo**.

It's easy to injure tendons and muscles by pulling or stretching them too far. Don't try, with almighty determination to open a jar. Leave it for stronger hands. Don't try to stretch a gigantic stretch to reach something on a high shelf. Wait for someone taller to come along and reach it down for you. Don't do exercises that have left you with strains in the past. Do different exercises. Don't do new exercises, with a determined approach; start moderately; stay moderate. If you start a new job that uses a foot, leg, hand or wrist a lot, more than it was used before, even though it's in ordinary use, it can feel injured. These stresses and strains invite bacteria toward themselves. Bacteria from the liver or your own intestines find these strained tissues immediately and intensify the pain. Kill the bacteria with a zapper, cleanse the liver, and start the *Bowel Program* if this has already happened to you.

Don't kneel on the floor to do some cleaning job. Don't sit on the floor at a gathering. Don't let your grandchildren take “rides” on you. Don't bend over as far as you can to pick something up. Let your family know you are aiming to reach 100 years in healthy condition.

Super Longevity

We should be able to live to 140 years of age. Middle age might begin at 65, old age at 90. What is the clue to long life? Surely it is keeping all your cells healthy so they can coordinate the constant tasks of nourishing themselves, removing their wastes, plus whatever job that cell was meant to do.

Since your cells divide and therefore start again at age zero, even though you are 90, why do you age at all? Only the nervous system does not divide. Is it the nerve that ages then, and decides death for each of us?

It would never do to live forever. It would clutter the planet. Are evolutionary forces at work preventing this? But we have never cluttered the planet yet. So how could evolutionary forces have “learned” to establish death to prevent overpopulation? Living to age 140 is not living forever. Wisdom comes with age. Wisdom would serve our society well. Perhaps wisdom is needed more than ever for humans to survive. Part of the human tragedy is war. Wisdom gathered from a knowledge of history, might help end wars! But history can't be gathered and understood in less than 100 years. If centenarians can't think well or express themselves, their perspectives are lost. Longevity seems a very useful trait if only it were accompanied by health!

Dying

Although it can't be avoided it can be helped. Dying alone is the most barbaric of all society's practices.

It is still like death in the forest amongst chimpanzees. Unable to feed, to run, to call for help brings pain, fear, loneliness and finally, death. When your loved one is in the mood to talk about dying, listen. Especially if it is about their own imminent death. This doesn't obligate you to carry out any of their wishes. When death approaches the important thing is simply to be there. They may not have requested this, out of a sense of guilt or masochism, or plain dementia. But it is the most primitive of needs, the same as having a loved one nearby during childbirth. It is just a presence that counts. How can you be there if you have a job or are attending a family's needs? It is a time of great frustration for you. All your hard work and successes are culminating in one grand failure!

The good news is that it need not be you who attends your loved one every minute of the last week. Pay for someone to sit—someone who is recognized. But arrange for immediate privacy when you return. No matter how much your loved one admonishes you to go about your business, you will know when you

share the final minute that your presence helped. The loneliness of the last coma, the last silence is unspeakable. Give yourself the reward of knowing you shared the pain, fear and silent cry for help.

Curing Cancer

Cancer is no longer the deadly disease it once was. In fact, you can clear it up in less time than it takes to get a doctor's appointment for a check up. If you notice a lump or think you might have cancer, don't rush to see a doctor first. Rush to clear it up, yourself, first. By the time your doctor's appointment arrives, you can be sure of a *Negative* test.

Another Fluke Disease

Cancer is so easily cured because it is a parasite-caused disease. Kill the parasite and you have stopped the cancer. This does not mean you have also stopped being ill. If the cancer damaged your ovaries or prostate, you still must heal these organs. The Ca-125 or PSA test will not drop to normal unless you begin to heal them. These markers reflect the condition of the organ, not its malignant nature. Remember that killing a mosquito does not remove the lump it caused. That will take its course. It will heal beautifully if you let it. But if you scratch it mercilessly, it will take longer. Removing toxins from the affected organs lets them heal.

Fortunately for us, **cancer is not like a fire, unstoppable once it has started.** It takes only 7 minutes to zap all the parasite adults and their stages that cause your cells to multiply.

The responsible parasite is *Fasciolopsis buski,* the **human intestinal fluke**, a flatworm. It is a human parasite although it can also parasitize other species. It normally lives quietly in the intestine. (The goal for all larger parasites is to live quietly. After all, your demise is their demise.) They were meant to pass their thousands of eggs with your bowel movement, outside, to some pond where snails live. But when the eggs hatch before they leave your body and are allowed to continue their development inside you, the setting is right for cancer to develop.

If the fluke eggs and other stages go through their development in your breast it can become breast cancer. If it is in the prostate it can become prostate cancer. And so on. Each different kind of cancer means the developmental stages of the intestinal fluke are present there. Only one more thing is needed to bring about

an avalanche of reproduction, so that hundreds of little larvae turn into hundreds more in a short time: a growth factor. It makes them multiply and your cells are similarly affected. This growth factor, *ortho-phospho-tyrosine* (and possibly, also, *epidermal growth factor* and *insulin-dependent growth factor*) really begins your cancer.

Teamed With A Solvent

The good news is that this growth factor, which is essential for cancer to develop, cannot be made, without the presence of an abnormal solvent, **propyl alcohol** (or more exactly, isopropyl alcohol).

Without taking in propyl alcohol you could never get cancer. It takes two things, together, to give you cancer: propyl alcohol and the human intestinal fluke parasite.

Since it takes a frequency generator (3 minutes at each of 434, 432, 427, 425, 423, 421 KHz) or zapper mere minutes to kill the fluke and its stages you will be stopping the production of growth factors immediately.

Zap yourself every day for three, 7-minute periods, until after you are completely well.

After killing the flukes, those growth factors already formed will disappear in one hour. Your malignancy is stopped. It cannot return unless you infect yourself with the parasite again!

Getting rid of propyl alcohol is also a simple task. Once you have stopped using it, the last remnants leave your body within three days.

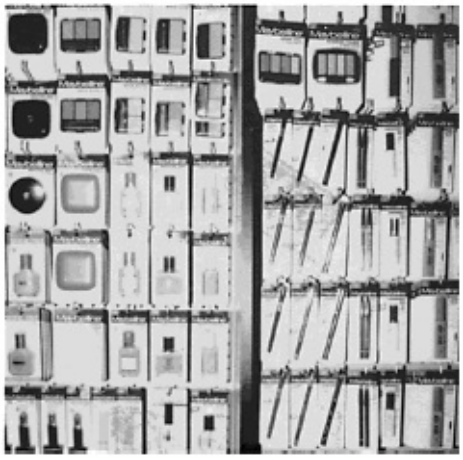
We must marvel at the body's wisdom and capabilities for restoring health. You are not permanently damaged by this large and hungry parasite. Given half a chance your body will throw the rascals out and restore order in you tissues.

Read the list of foods and products that are polluted with propyl alcohol. It is not, of course, usually on the label. If it is used as an ingredient, it is on the label, easy for you to avoid. It is the pollutants not appearing on the label that pose sinister hazards.

All the store bought shampoo I tested had propyl alcohol. Health brands were no exception.

Fig. 40 Products with propyl alcohol.

Bottled water is polluted with antiseptics from the bottling procedure. This is a main source of propyl alcohol.



Cosmetics are laced with propyl alcohol. Use the recipes in this book to make your own.

Propyl Alcohol Polluted Products

THROW THESE OUT

…even if propyl alcohol is not listed on the label!

- **shampoo**, even health brands
- **hair spray** and **mousse**
- **cold cereals**, even “natural” granolas
- **cosmetics** (make your own)
- **bottled water,** distilled water, or spring water
- **rubbing alcohol**
- **white sugar** (brown is OK if detoxified)
- all **shaving supplies** including aftershave

- **mouthwash**
- **carbonated beverages**
- **decaffeinated coffee**, Postum™, herb tea blends (single herb teas are OK)
- store-bought **fruit juice**, including health food brands
- **vitamins, minerals and supplements** (unless you test them)

Tear out this page, put it on your refrigerator, and make a copy to stick on your medicine cabinet. Remember propyl alcohol is also called propanol, isopropanol, isopropyl alcohol and rubbing alcohol. You won't drop dead from getting propyl alcohol, but your cancer will flare up with each small addition.

Avoid the entire list, meticulously. Even using one of these, **like your favorite shampoo or bottled water**, will result in failure. Your body will continue to make *human chorionic gonadotropin* (hCG) and the pathology will remain "indeterminate"—not cancerous but not well, either. If you have learned the new bioelectronic technology described in this book, you can test all your foods and products for isopropyl alcohol.

When you find a beverage that is free of propyl alcohol, it may have other pollutants. Xylene and toluene invite parasites to the brain. Wood alcohol invites them to eyes and pancreas. The diseases caused by these are not as frightening, perhaps, as cancer, but entirely avoidable. For this reason, I suggest in this book that you go back (actually "forward") to self made products, unprocessed food and a limited number of tested supplements.

Getting Well After Cancer

The ravages of cancer must be healed once the malignancy has been stopped. This is where *carcinogens* play a role. The lung lesions will not heal unless cigarette smoking, Freon, asbestos, and fiberglass exposure is stopped. Carcinogens were thought to be the cause of cancer. Actually, they drew the cancer to the organ. Nickel draws cancer to the prostate. Barium found in lipstick draws cancer to the breast. And so on.

The following toxins can be present in any organ! I consider these to be our most serious threat. Starting with the worst, they are:

Freon (same as **CFCs** or refrigerant). I have not found a single person to be entirely free of it, including persons without cancer or disease. But in cancer sufferers it is always concentrated in the cancerous organ, and facilitates the accumulation of other toxins. This makes your refrigerator, if it leaks even microscopically, the top cancer hazard in the country!

Copper from water pipes. All cancer sufferers have an accumulation in the cancerous tissue. This makes plumbing the second greatest hazard.

Fiberglass or **asbestos** is present in about 25% of the cancer victims I see.

Mercury as in tooth fillings.

Lead from solder joints in copper plumbing. All colon cancer sufferers test positive.

Formaldehyde as in foam bedding and new clothing.

Nickel usually from dental metal. Most prostate cancer sufferers test positive.

At first, tumors are benign—what a relief to find your tumor was benign. Its true nature is still unknown, but it contains Freon, other toxins, and later propyl alcohol! Since tumors are often large, many centimeters in diameter, and toxins do not occupy much space, there is much unidentified substance. These tumors can multiply and enlarge, as in fibrocystic breast disease, all without being malignant. But what a convenient place for baby stages of the fluke to hide out and multiply, safe from your immune system. After being colonized by fluke stages, the tumors become malignant. Eventually they also become infected when metastasis sets in.

All malignancies have the same two fundamental causes: intestinal flukes and propyl alcohol. Whether you have a rhabdomyosarcoma or a mesothelioma or melanoma, you can cure it quickly, never to return.

Herbal Parasite-Killing Program

Flatworms, roundworms, protozoa, even bacteria and viruses are remarkably

easy to kill using a combination of zapping and this herbal program. Thus it is not just for cancer, but a general treatment that can benefit almost every illness

1. Black Walnut Hull Tincture Extra Strength (see *Recipes*):

Day 1: (this is the day you begin; start the same day you receive it) Take one drop. Put it in ½ cup of water. Sip it on an empty stomach such as before a meal.

Day 2: Take 2 drops in ½ cup water same as above.

Day 3: Take 3 drops in ½ cup water same as above.

Day 4: Take 4 drops in ½ cup water same as above.

Day 5: Take 5 drops in ½ cup water same as above.

Day 6: Take 2 tsp., all together in ¼ cup water. Sip it, don't gulp it. Get it down within 15 minutes. (If you are over 150 pounds, take 2½ tsp. Do not take more than 3 tsp. because no additional value has been observed.)

This dose kills any remaining stages throughout the body, including the bowel contents, a location unreachable by electric current. The alcohol in the tincture can make you slightly woozy for several minutes. Simply stay seated until you are comfortable again. You may put the tincture in lukewarm water to help evaporate some of the alcohol, but do not use hot water because that may damage its parasiticide power. Then take niacinamide 500 mg to counteract the toxicity of the alcohol. You could also feel a slight nausea for a few minutes. Walk in the fresh air or simply rest until it passes. You may add more water or honey or a spice to make it more palatable.

For a year: take 2 tsp. Black Walnut Hull Tincture Extra Strength every week or until your illness is but a hazy memory. This is to kill any parasite stages you pick up from your family, friends, or pets.

You may be wondering why you should wait for five days before taking the 2 tsp. dose. It is for your convenience only. You may have a sensitive stomach or be worried about toxicity or side effects. By the sixth day you will have convinced yourself there is no toxicity or side effects.

Family members and friends should take 2 tsp. every other week to avoid

reinfecting you. They may be harboring a few parasite stages in their intestinal tract without having symptoms. But when these stages are transmitted to a cancer patient, they immediately seek out the cancerous organ again.

Going faster. In fact, if you are convinced after the first drop of the restorative powers of Black Walnut Hull Tincture Extra Strength, take the 2 tsp. dose on the very first day.

Going slower. On the other hand, if you cringe at the thought of taking an herb or you are anxious about it's safety, continue the drops, increasing at your own pace, until you are ready to brave the decisive 2 tsp. dose.

2. Wormwood capsules (should contain 200-300 mg of wormwood, see *Sources*):

Day 1: Take 1 capsule before supper (with water).

Day 2: Take 1 capsule before supper.

Day 3: Take 2 capsules before supper.

Day 4: Take 2 capsules before supper.

Continue increasing in this way to day 14, whereupon you are up to seven capsules. You take the capsules all in a single dose (you may take a few at a time until they are all gone). Then you do 2 more days of 7 capsules each. After this, you take 7 capsules once a week forever, as it states in the *Maintenance Parasite Program*. Try not to get interrupted before the 6th day, so you know the adult intestinal flukes are dead. After this, you may proceed more slowly if you wish. Many persons with sensitive stomachs prefer to stay longer on each dose instead of increasing according to this schedule. You may choose the pace after the sixth day.

Cloves: Fill size 00 capsules with fresh ground cloves; if this size is not available, use size 0 or 000. In a pinch, buy gelatin capsules and empty them or empty other vitamin capsules. You may be able to purchase fresh ground cloves that are already encapsulated; they should be about 500 mg. Grocery store ground cloves do not work! Either grind them yourself or see Sources.

Day 1: Take one capsule 3 times a day before meals.

Day 2: Take two capsules 3 times a day.

Days 3, 4, 5, 6, 7, 8, 9, 10: Take three capsules 3 times a day.

After day 10: Take 3 capsules all together once a week forever, as in the Maintenance Parasite Program.

Take **ornithine** at bedtime for insomnia. Even if you do not suffer from insomnia now, you may when you kill parasites.

Parasite Program Handy Chart

Strike out the doses as you take them.

	Black Walnut Hull Tincture Extra Strength Dose	**Wormwood Capsule Dose (200-300 mg)**	**Clove Capsule Dose (Size 0 or 00)**
Day	drops 1 time per day, like before a meal	capsules 1 time per day, on empty stomach (before meal)	capsules 3 times per day, like at mealtime
1	1	1	1, 1, 1
2	2	1	2, 2, 2
3	3	2	3, 3, 3
4	4	2	3, 3, 3
5	5	3	3, 3, 3
6	2 tsp.	3	3, 3, 3
7	Now once a week	4	3, 3, 3
8		4	3, 3, 3
9		5	3, 3, 3
10		5	3, 3, 3
11		6	3
12		6	Now once a week
13	2 tsp.	7	
14		7	
15		7	
16		7	
17		Now once a week	

At this point you do not need to keep a strict schedule, but instead may choose any day of the week to take all the *Parasite Program* ingredients.

Continue on the *Maintenance Parasite Program*, indefinitely, to prevent future reinfection.

Maintenance Parasite Program

YOU ARE ALWAYS PICKING UP PARASITES! PARASITES ARE EVERYWHERE AROUND YOU! YOU GET THEM FROM OTHER PEOPLE, YOUR FAMILY, YOURSELF, YOUR HOME, YOUR PETS, UNDERCOOKED MEAT, AND UNDERCOOKED DAIRY PRODUCTS.

I believe the main source of the intestinal fluke is undercooked meat. After we are infected with it this way, we can give it to each other through blood, saliva, semen, and breast milk, which means kissing on the mouth, sex, nursing, and childbearing.

Family members nearly always have the same parasites. If one person develops cancer or HIV, the others probably have the intestinal fluke also. These diseases are caused by the same parasite. They should give themselves the same de-parasitizing program.

Do this once a week. You may take these at different times in the day or together:

1. **Black Walnut Hull Tincture Extra Strength**: 2 tsp. on an empty stomach, like before a meal.
2. **Wormwood capsules**: 7 capsules (with 200-300 mg wormwood each) at once on an empty stomach.
3. **Cloves**: 3 capsules (about 500 mg. each, or fill size 00 capsules yourself) at once on an empty stomach.
4. Take ornithine as needed.

	Black Walnut Hull Tincture Extra Strength Dose	**Wormwood Capsule Dose (200-300 mg)**	**Clove Capsule Dose (Size 0 or 00)**
Day	1 time per day, on empty stomach	capsules 1 time per day, on empty stomach	capsules 1 time per day, on empty stomach
1	2 tsp.	7	3
2			
3			
4			
5			
6			
7			
8	2 tsp.	7	3
9			
10			
11			
12			
13			
14			
15	2 tsp.	7	3
and so on…			

The only after-effects you may feel are due to bacteria and viruses escaping from dead parasites! Be sure to zap after taking your *Maintenance Parasite Program*. After-effects also let you know that you did indeed kill something. Try to discover how you might have picked up parasites and avoid them next time.

Pet Parasite Program

Pets have many of the same parasites that we get, including *Ascaris* (common roundworm), hookworm, *Trichinella*, *Strongyloides*, heartworm and a variety of tapeworms. Every pet living in your home should be deparasitized (cleared of

parasites) and maintained on a *Parasite Program*. Monthly trips to your vet are not sufficient.

You may not need to get rid of your pet to keep yourself free of parasites. But if you are quite ill it is best to board it with a friend until you are better.

Your pet is part of your family and should be kept as sweet and clean and healthy as yourself. This is not difficult to achieve. Here is the recipe:

1. Parsley water: cook a big bunch of fresh parsley in a quart of water for 3 minutes. Throw away the parsley. After cooling, you may freeze most of it in several 1 cup containers. This is a month's supply. Put 1 tsp. parsley water on the pet's food. You don't have to watch it go down. Whatever amount is eaten is satisfactory.

All dosages are based on a 10 pound (5 kilo) cat or dog. Double them for a 20 pound pet, and so forth.

Pets are so full of parasites, you must be quite careful not to deparasitize too quickly. The purpose of the parsley water is to keep the kidneys flowing well so dead parasite refuse is eliminated promptly. They get quite fond of their parsley water. Perhaps they can sense the benefit it brings them. Do this for a week before starting the Black Walnut Hull Tincture.

2. Black Walnut Hull Tincture (regular strength): 1 drop on the food. Don't force them to eat it. Count carefully. Treat cats only twice a week. Treat dogs daily, for instance a 30 pound dog would get 3 drops per day (but work up to it, increasing one drop per day). Do not use Extra Strength.

If your pet vomits or has diarrhea, you may expect to see worms. This is extremely infectious and hazardous. Never let a child clean up a pet mess. Begin by pouring salt and iodine[15] on the mess and letting it stand for 5 minutes before cleaning it up. Clean up outdoor messes the same way. Finally, clean your hands with diluted grain alcohol (dilute 1 part alcohol with 4 parts water) or vodka. Be careful to keep all alcohol out of sight of children; don't rely on discipline for this. Be careful not to buy isopropyl rubbing alcohol for this purpose.

Start the wormwood a week later.

3. Wormwood capsules: (200-300 mg wormwood per capsule) open a capsule and put the smallest pinch possible on their dry food. Do this for a week before starting the cloves.

4. Cloves: put the smallest pinch possible on their dry food.

Keep all of this up as a routine so that you need not fear your pets. Also, notice how peppy and happy they become.

Go slowly so the pet can learn to eat all of it. To repeat:

- Week 1: parsley water.
- Week 2: parsley water and Black walnut.
- Week 3: parsley water, Black walnut, and wormwood.
- Week 4: parsley water, Black walnut, wormwood, and cloves.

	Parsley Water	**Black Walnut Hull Tincture Dose**	**Wormwood Capsule Dose**	**Clove Capsule Dose (Size 0 or 00)**
Week	teaspoons on food	drops on food, cats twice per week, dogs daily	open capsule, put smallest pinch on food	open capsule, put smallest pinch on food
1	1 or more, based on size			
2	1 or more	1		
3	1 or more	1 or more, based on size	1	
4	1 or more	1 or more	1	1
5 and onward	1 or more	1 or more	1	1

Parasites Gone, Toxins Next

Healing is automatic when you clean up your body tissues. Killing parasites and bacterial and viral invaders is fundamental. Removing toxins which invite them into your organs is even more fundamental.

How do you know which toxins are responsible for your cancer? Unless you use a Syncrometer® to test, you can not know. So learn to use a Syncrometer®, it will save your life.

The only other alternative is to move to a safer environment. Go on vacation. Stay in hotels less than ten years old (so the plumbing hasn't started to corrode) but not in new construction (give the carpets time to outgas). Do not have a Freon containing refrigerator in your room. Do not use the hair drier they supply. Do not let them spray your room with anything. Launder the sheets and towels yourself at a Laundromat with borax and/or washing soda. Don't hesitate to drink the municipal water. Get busy with your *Dental Clean Up*.

When you get better on vacation, let that be your inspiration to move from your home. All of the toxins come from a civilized lifestyle. Resolve to leave it behind. Select a warm climate where you can spend your time outdoors in the shade most of the day. Have no refrigerator, air conditioner, clothes dryer, hair dryer, new clothing, detergent. Check that the plumbing is relatively new and that no pesticide is being used. Make the Easy Lifestyle Improvements. Throw away non-essential health supplements (unless tested) and drugs. The risk is greater than the benefit.

Watch For Bacteria

In the later stages of cancer the tumors are more and more infected with the common bacteria *Salmonella, Shigella*, and *Staphylococcus aureus*. Killing parasites prepares a feast for these ubiquitous bacteria. Now, more than ever, must you stay off dairy products (except for boiled milk), do the *Bowel Program*, take Lugol's. Remove *Staphs* by doing the *Dental Clean Up*. Don't delay.

Help Your Family, Too

If you had cancer, your whole family should be freed of intestinal fluke parasites to protect you! They may not be getting cancer (yet!) but your closeness puts you at risk. Kissing on the mouth could reinfect you. Request that

family members zap themselves and take at least one 2 tsp. dose of Black Walnut Hull Tincture Extra Strength while living with you.

Pets, too, can be a source of cancer fluke stages (in their drool). They get propyl alcohol from their feed. Use unflavored, uncolored feed for them to minimize pollution from processing. Add 1 tbs. vitamin C powder to the top of a 5 lb. bag; it will stick to the pellets as they pour out. Zap your pet along with yourself by holding them and touching a bare spot such as nose or paw.

Never eat rare meats or fast food chicken. Parasite stages survive heat up to the boiling point. If you have taken a risk, zap yourself as soon as you get home to minimize the damage.

Cancer could be completely eliminated in the entire country if laws required testing for solvents in animal feeds and human food and products. Presently it is allowed in the United States Code of Federal Regulations (CFR)!

Another reason for propyl alcohol pollution (and other pollutants) in our food are the chemicals used by manufacturers to sterilize their food handling equipment.

21 CFR 178.1010 (4-1-94 Edition) Sanitizing solutions.

Sanitizing solutions may be safely used on food-processing equipment and utensils, and on other food-contact articles as specified in this section, within the following prescribed conditions:

(a) Such sanitizing solutions are used, followed by adequate draining, before contact with food. **[Note rinsing or drying is not required!]**

(b) The solutions consist of one of the following, to which may be added components general recognized as safe and components which are permitted by prior sanction or approval.

[Now comes (1) through (43) permissible sterilizing solutions, including several with isopropyl alcohol, like:]

(25) An aqueous solution containing elemental iodine (CAS Reg. No. 7553-56-2), potassium iodide (CAS Reg. No. 7681-11-0), and isopropanol (CAS Reg. No. 67-63-0). In addition to use on food processing equipment and utensils, this solution may be used on beverage containers, including milk containers and equipment and on food-contact surfaces in public eating places.

[Then in paragraph (c)(19) the exact concentration of the iodine is specified. Nowhere is the concentration of the isopropanol specified. It can be as strong as desired.]

Fig. 41 U.S. regulations on sterilizing solutions.

Even if there were regulations governing removal of sanitizing solutions, the overwhelming truth is missed: that **nothing can ever be completely removed after it has been added**. Or perhaps the lawmakers didn’t miss this fact. Perhaps they believed that small amounts—too small to measure with an ultraviolet spectrophotometer—could surely do no harm.

Meanwhile, protect yourself by avoiding propyl alcohol. And by observing 2 extra rules:

1. Never eat moldy foods.

2. Always take vitamin C.

Aflatoxin

A common mold found on bread, nuts and fruit and in beer, apple cider vinegar and syrups, produces *aflatoxin*. This is what prevents you from detoxifying tiny bits of propyl alcohol that get into your body!

Buy bakery bread or bake your own. Roast nuts after washing in vitamin C water to destroy aflatoxin and then store in refrigerator. Keep moldy fruit out of the refrigerator where the spores can spread. Use only white distilled vinegar. Use honeys instead of syrups and even add vitamin C to them.

Vitamin C helps your body detoxify all the mold toxins I have tested, including aflatoxin.

Keep powdered vitamin C in a salt shaker. It belongs on the table with salt and pepper, and at the stove. Put it in everything possible, from cereal to soup to rice (1/8 tsp. is enough). Besides this take 1/8 tsp. powdered vitamin C with each meal (500 mg).

Keep both salt and vitamin C powders in closable plastic shakers.

Fig. 42 Plastic shaker

Developing cancer is a chain of events. This explains why it is a disease of aging. For ten years or more you poisoned your body with Freon, fiberglass, asbestos, mercury, lead, copper, etc. You continually ate moldy food (chips, nuts, etc.), which was toxic to the liver. But the liver regenerated the pieces that died. Eventually a mold toxin prevents the liver from regenerating. Your

aflatoxined liver then lets propyl alcohol build up after using it. You use more and more propyl alcohol. Somewhere, over the years, you pick up the intestinal fluke in a hamburger or from a pet or person. The stage is set and cancer is inevitable. But pull out any one of the links in this chain and cancer is impossible. **Pull them all out for a return to good health.**

So cure yourself, prevent reinfection, heal the damage and go through life without this sword hanging over you. **Over 100 consecutive case histories of cured cancer victims** are the subject of another book[16] along with more detailed instructions and suggestions.

Curing HIV/AIDS

HIV and AIDS disease are very similar to cancer. That is why cancer is so often seen with HIV/AIDS. It is caused by the same parasite but the solvent is **benzene** instead of propyl alcohol.

HIV stands for Human Immunodeficiency Virus
AIDS stands for Acquired Immune Deficiency Syndrome

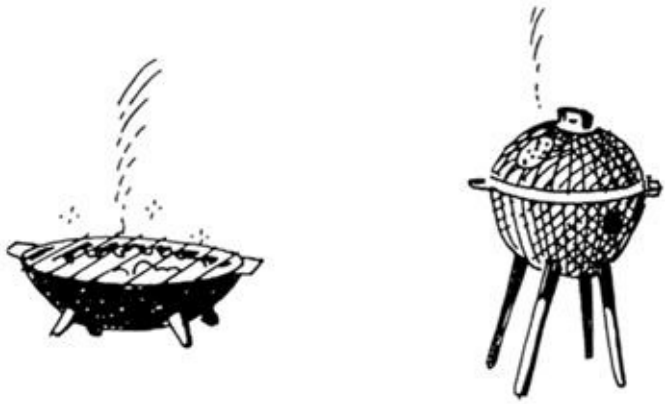
Many researchers believe HIV causes AIDS. I observe them both caused by parasites and solvents!

When the body can no longer detoxify benzene it soon may not be able to detoxify propyl alcohol. Food mold, at the base of the propyl alcohol problem, is also at the base of the benzene problem. Zearalenone, a mycotoxin I find in popcorn, corn chips, and brown rice specifically inhibits detoxification of benzene. None of us should be eating these foods untested.

Several common mold toxins inhibit the immune system, too, specifically those white blood cells that are supposed to eat and destroy viruses. Consequently, the HIV virus cannot be checked once it is introduced in the body.

Benzene goes to the bone marrow where T-cells are made, and to the thymus where T-cells are programmed, two big blows to the immune system.

Benzene, a most unthinkable pollutant, is widespread in extremely small amounts. But when **benzopyrenes** are added, the total is entirely too much for the liver and it begins to accumulate in your thymus.



Hot dogs and “smoke flavored” foods have benzopyrenes.

Fig. 43 Grilled food has benzopyrenes

Benzopyrenes are made right in your food by direct flame-heat. Grilled food, smoked food, hot dogs and lunchmeats with “smoke flavor” all have benzopyrenes—even toast has it. Food fried in a skillet does not (even if you burn it black!). As the thymus deteriorates from its benzene burden so does your immunity.

Without benzene in your body you can't get AIDS. Without the intestinal fluke in your body you can't get HIV.

After killing the parasite and its stages the HIV virus will be gone in 2 hours, almost as quickly as the cancer marker, ortho-phospho-tyrosine. It is not necessary to zap the virus itself at 365 KHz.

But the AIDS is not gone. This depends on removing benzene from your body and keeping it out of your body. Keeping it out on alternate days or 5 days of the week will not suffice. It must be out consistently. Only then can your thymus and bone marrow recover.

As your thymus recovers your immunity returns. Immunity to all the diseases that lurk at very low level in our bodies. They are already in us. We have accumulated them in a lifetime. Mumps, measles, chicken pox tuberculosis, CMV, *Staphylococcus aureus*, *E. coli*, are all there. Until now they have been controlled—kept down—by an ever vigilant immune system. If this system fails, you are an easy target for any and all of these invaders.

Method Of Treatment

As soon as you find you are HIV positive, don't panic. It was inevitable. It is also inevitable for many others with unexplainable risk factors. If you have a source of infection with the intestinal fluke and at the same time a source of benzene, HIV and AIDS are a logical result. You must stop the source of both.

Purchase or make a zapper or use somebody's frequency generator (434 KHz to 421 KHz giving 3 minutes to each KHz). Kill your flukes immediately. Take vitamin B_2 immediately to help detoxify benzene (three 100 mg. tablets 3 times a day, 9 altogether). Zap daily until you feel completely well: no night sweats, no coughing, no symptoms of any kind.

Remember parasites are all around us. We pick them up daily. And your weakened immune system lets everything gain a foothold in your body. Avoiding benzene will restore your immunity. Use the benzene pollution list to guide you.

Benzene Polluted Products

THROW THESE OUT

Your health is worth more than the fortune you spent on them!

- **Flavored food, yogurt, jello, candies, throat lozenges, store-bought cookies, cakes**
- **Cooking oil and shortening (use only olive oil, butter and lard)**
- **Bottled water, whether distilled, spring,**
- **Vaseline products (Noxzema, Vick's, Lip Therapy), chap stick, hand cleaners**
- **Vitamins and other health supplements, unless tested.**
- **Rice cakes, even the**

mineral, or name brand. Bottled fruit juice.

- **Cold cereal, including granola and health brands**
- **Toothpaste, including health brands**
- **Chewing gum**
- **Ice cream and frozen yogurt**
- **Pills and capsules. At least a third of all I test are polluted. This includes herbal extracts and prescription drugs. Test yours and switch brands until you find a safe one.**

plain ones

- **Personal lubricant, including lubricated condoms**
- **Baking soda and cornstarch (see *Sources*)**
- **Soaps, hand creams, skin creams, moisturizers**
- **Flavored pet food, both for cats and dogs**
- **Bird food made into cakes**

Fig. 44 Mexican made candy with no benzene.

It is impossible for me to have tested every batch of every food and product,

but so many test *Positive* you simply can not risk any of the foods and products on the list.

Fig. 45 Pollutants are in unlikely places.

Learn to use the Syncrometer® to do your own testing. While you are learning, observe the rules perfectly. There is no halfway measure with benzene. Take an attitude of over-compliance, not "getting away" with as much as possible. Over-compliance can bring back radiant health, strength you never knew you had, a beautiful normal body again! You will be able to resume your plans for education, professional life, and personal relationships, free of the sword hanging over you. You will not be infectious to anybody. Let over-compliance enthuse you.

There are 2 extra rules that help eliminate benzene buildup:

1. Never eat moldy or grilled foods including popcorn, corn chips, grocery store breads, pasta, nuts, alcoholic beverages, toast, or brown rice (white is OK).

2. Always take Vitamin B_2 (three 100 mg tablets three times a day) and vitamin C (1/8 tsp. with each meal).

Every brand of popcorn and corn chips I tested had zearalenone contamination.

Fig. 46 Popcorn and corn chips

Plan For The Future

After you are well again, you may wish to indulge in some philosophy. How did an obscure virus—a snail virus!—become a human virus? This is not so bizarre. After all, rabies virus comes to us from animals, and many encephalitis viruses come from mosquitoes. How did HIV spread so rapidly? How did a pollutant as dangerous as benzene get to be in our very food? What must be done to protect ourselves and loved ones from future disasters? Would getting away from fossil fuel be a big answer? Would getting away from preoccupation with chemistry be a big answer? Would more disclosure of industrial practices be an answer? Should the government agencies responsible for food and product safety be depoliticized? Should public inspection of food manufacturing be a right? Should disclosure of foreign origins of food ingredients be mandatory? Would communicating with other cancer and AIDS survivors be useful? The computer age would make communication possible. Communication leads to answers. Answers might lead to new policies. Policies supported at the grass roots level can bring about change.

Over 50 case histories of cured HIV victims are the subject of another book[17] along with more detailed instructions and suggestions.

Curing The Common Cold

Sometimes you can zap *Adenovirus*, the common cold virus, at 393 KHz for three minutes with a frequency generator and be rid of your cold, magically, in five minutes. But magic and luck are not really responsible for this. And most of the time the cold will reappear a few hours later.

Homeopathy, too, can immediately banish your cold symptoms. The reason is not mysterious either. But, this time, the cold reappears later in a different location. Choose the right homeopathic remedy for that, and you can chase it away again.

Tapeworm Stage or Mites

The fascinating story of how we really “catch” a cold kept me spellbound for a year. I was hot on the heels of *Adenovirus* wherever it might be in my body. Sometimes I saw it; sometimes I didn't. Sometimes I had cold symptoms; sometimes I didn't. Sometimes I could zap it; sometimes it did no good.

It is now apparent to me that *Adenovirus* isn't our (a human) virus at all! It belongs to other parasites; parasites as varied as tapeworm stages and mites. Perhaps it belongs to many other parasites, as well. My evidence comes from a tapeworm stage, cysticercus of *Diphyllobothrium erinacea*, the mites *Sarcoptes* and *Dermatophagoides*, and our own colon bacteria, *E. coli*.

The tapeworm stage flies in the dust as eggs, you can trap these by setting out a pint jar with a little water in it. In three days' time you are likely to find its frequency near 487 KHz in your jar. You are also likely to find it on your kitchen sponge, since you wipe up dust each day. To test it, place it in a plastic bag, wet it thoroughly and search from 510 KHz downward, one KHz at a time. The various tapeworm stages emit between 510 and 440 KHz.

If you have a household pet, you will always be able to find a tapeworm stage in your sponge or in a dust sample you collect from the table or kitchen counter in the morning. Gather dust with a damp bit of paper towel; put it in a plastic bag. Then wash your hands or you may accidentally eat some.

This, of course, happens to every household member. Eating the dust off the

tables, inhaling the dust, and eating off surfaces wiped by the kitchen sponge happens to everyone. And everyone “catches” colds. If you search for *Adenovirus*, though, in your dust sample, it isn't there!

Similarly, you can search for the mites in your house dust. Search near the frequencies given for them. There is a good chance you will have one that is not given, because the list is so incomplete. Name it after yourself. Compare notes with others; maybe it is common, maybe it's a rare one. Again, you will not find *Adenovirus* beeping its characteristic frequency out of your mite specimen. Why not? Possibly, it is too faint; it must multiply and create a loud chorus before you can hear it. But multiply it will, if given a chance, in you. You must, of course, first eat or inhale the dust.

Then the tape eggs hatch into the *cysticercus* stage, which promptly gets to the liver. Sometimes it gets to other organs, like the muscles, the spleen, the pancreas. Presumably the liver screened it out of the blood originally.

Soon you will zap them, wherever they are. If you are using a slide specimen of *cysticercus* you can locate it in your body. If you are only listening to its beeps, you can't. If you can do both, you may be able to see which organ allows the virus to replicate after it emerges. Maybe only the respiratory organs do; maybe they start to replicate in the organ where they emerge, such as the liver and then get to the respiratory tract. This is a fascinating avenue I have not yet explored.

Mites are inhaled or swallowed or both, just as tapeworm eggs are. They are on your kitchen sponge, and in any food or dishes that stand uncovered anywhere in the home. Never drink water from a glass that has “stood out” all day. After finding one, you will notice it beeping in you for several days. Then the beep disappears; presumably the mite is dead.

The tapeworm stage beeps may disappear in a few days, too, presumably dead. Except in cases of disease. Muscles that are diseased will take in the newcomer and allow it to survive adding to the parasites and pollutants already there! Evidently the immune power of such diseased locations is way down.

On the day that the mite stops beeping, the day it dies, *Adenovirus* appears!

Not many *Adenovirus* at first. You will need to search several times during the

day to find it in your white blood cells. (And you have no symptoms, yet, either!) Is it a coincidence that *Adenovirus* appeared directly after a tapeworm stage or mite died?

You can find out by waiting until a time when you have a tapeworm stage or mite and no *Adenovirus*. Then kill your tapeworm stage or mite by zapping for 7 minutes. Within minutes after that, the beeping of the tapeworm stage or mite is gone and *Adenovirus* can be heard, loud and clear at 393 KHz! And minutes later you may feel a stuffy nose, a slight congestion developing, a certain head feeling that is different. You are “catching” a cold!

Will you really get this cold? Will it become a full-blown cold of the usual kind? After seeing this happen dozens of times after killing a mite or tapeworm stage I concluded that *Adenovirus* really belongs to them; the virus is scuttling its dying host like people jumping off a sinking ship into the ocean. Our bodies are the oceans for them. They too, immediately swim and search for a hospitable island. Our respiratory tract is such an island; perhaps other organs, too.

Yes, this “baby cold” will develop into a full-blown cold if, but only if, you have a mold in you!

Molds and Colds

This is part two of the cold story. You may have *Adenoviruses* quietly slipping into your blood stream and tissues from a tapeworm stage or mite you inhaled, or *E. coli* bacteria that strayed into your tissues, and which is being slowly killed by your immune system. Your immune system can keep up with them quite easily provided you don't have a mold in you at the same time. The significance of the mold is that it lowers your immunity, specifically and generally.

Mold eluded, is health improved.

This has already been studied extensively for a number of food molds. There are a variety of ways that mold toxins lower immunity. Some simply kill white blood cells. Others seem to “bind and gag” them so they just can't go about eating viruses.

So with mold toxins present, *Adenovirus*, fleeing the dead tapeworm stage, mite, or *E. coli* is not gobbled up. It has time to get to its favorite organ and enter

the cells there. It may get in your lungs if they're full of arsenic or formaldehyde, in your throat if it's full of mercury from your fillings, in your spinal cord if it's full of thallium. Sometimes you feel the viral attack, sometimes you don't.

When *E. coli* is the source of your *Adenovirus*, a question pops up. Why don't you have a perpetual cold, since these bacteria are always in your colon...and should be! As long as *E. coli* stays dutifully in your colon, no *Adenovirus* is seen. But as soon as any cross the colon wall to invade your body, your white blood cells pounce on them. After this, *Adenovirus* appears and again you are catching a cold. They may go to your internal organs where you don't feel them.

Made from white, unbleached flour and not wrapped in plastic.

Fig. 47 This Mexican bread had no molds.

One place you do feel an attack is in your respiratory tract: lungs, bronchi, sinuses, nose, Eustachian tubes, inner ear, eyes or head. And the size of the attack depends on whether you recently ate moldy food.

Human food (in general, in the U.S.) is very, very moldy. We do not taste it because manufacturers have been using more and more flavorings in food. This covers up small amounts of mold or "off" flavor. Measures to reduce mold are not effective enough.

Bread is a good example. Calcium propionate is added to bread-stuff to inhibit

molding. That's fine. But then the bread is encased in plastic to hold in moisture and keep it “fresh”. The moisture acts to incubate mold spores and overwhelms the inhibitor. Vinegar is used instead of calcium propionate in some breads but, again, the plastic ruins its effectiveness.

Another good mold inhibitor is lime water. This is used in making tortillas. None of the old fashioned tortillas (made with just corn, water, lime) that I tested had any mold, even without propionate added! Other tortillas made of flour and calcium propionate frequently had molds.

Bread is such a staple we must correct its mold problem immediately. The two likely sources for the mold spores are: in the flour to begin with, or just flying about the bakery and landing on the newly baked loaves. Bread flour in the grocery store is quite free of mold spores, so maybe it is the bakery that needs to change. Perhaps it is not possible to bake 24 hours a day in the same building, year after year, without bits of flour and moisture accumulating in the millions of tiny cracks and crevices that all buildings have and germinating mold. Yet bread from small neighborhood bakeries does not have mold!

Only buy fresh bread not wrapped in plastic.

As soon as you feel a cold coming, ask yourself: what did you eat recently that might have been moldy? Cold cereal, hot cereal, bread, crackers, cookies, rice, other grains, fresh fruit, store bought fruit juice, nuts, syrups, pasta, honey? This takes up a large part of any person's diet, even in a single meal. The answer is yes, no doubt you ate moldy food recently.

So you can’t catch a cold directly from some sneezing companion, or *E. coli*, or tapeworm stages, or mites. You have to eat moldy food first. This lowers your immunity, allowing any *Adenovirus* to invade your weakest tissues. If that happens to be your respiratory system, you get classic symptoms. (Those same “cold” symptoms can be caused by bacteria, for which I have preliminary evidence of arriving in a similar fashion.)

As fascinating as this whole story is, the bottom line is: how can you stop a cold, in record time?

The Cure

Remember, zapping does not kill your cells. So anything hiding in them will

not be harmed by the electric current either. Viruses live inside your cells while they reproduce. You can only kill the outsiders: those stuck in your cell gateways. The rest will be killed by your own cells in time. Not much time. Five or six hours at most. Your cells do it with mucous secretion, inflammation and other unknown ways. So zapping is an imperfect solution.

Using a frequency generator to electrocute *Adenovirus* (393 KHz for three minutes) is not effective either because you are not killing the mites and tapeworm stages at the same time, and the *Adenoviruses* are coming from them.

The best advice to stop a cold is to:

1. **Eat sterile food for 24 hours.** Follow the Mold Free Diet on. Do not eat one questionable item.

2. **Take vitamin C** (10 grams or 2 tsp.), a **B50 complex** (2 tablets), and niacinamide (3, 500 mg tablets) to help detoxify the mycotoxins already in you. See *Sources*. It will still take five or six hours for your white blood cells to recover their ability to capture viruses, for the "gag" to wear off.

3. **Zap** for 7 minutes, killing all viruses, tapeworm stages and mites together. **Wait** twenty minutes to let viruses and bacteria in the dead larger parasites emerge. **Zap** a second time for 7 minutes to kill those viruses and bacteria. **Wait** twenty minutes to let any viruses infecting the killed bacteria emerge. **Zap** a third time for 7 minutes to kill the last viruses.

4. Now you need only wait for your tissues to decongest and stop making mucous, etc.

5. Immediately start the *Bowel Program* in case yours is an *E. coli* cold. You can't, and wouldn't want to, kill all the bacteria in your bowel. Zapping kills the escapees, though, to give a bit of relief, and the *Bowel Program* stops the invasive *E. coli*.

6. Do additional zapping as time permits until the *Bowel Program* has stemmed the invasion.

In five or six hours your cold could be gone.

Of all these measures, stopping mold consumption is the most important. If you eat peanut butter now, your cold will return with a vengeance. If you eat

cheese it will add *Salmonella* to your illness and you may develop a fever. Your own immune system is the most powerful cold killer, so stop handicapping it.

Test yourself for the presence of molds to see if you are accomplishing your goal. The various molds I have tested had these emitting frequencies: 77, 88, 100, 126, 133, 177, 181, 188, 232, 242, 277, 288, 295 KHz.

In about five hours, some relief will be felt. The time it takes depends on how much mold you ate. But if you stop immediately and eat only perfectly safe food, your illness will be over in the shortest time. Shorter than merely zapping.

Mold Free Diet

Stick to this for 24 hours, even if you feel better much sooner.

Before starting to cook sterilize your kitchen sponge (microwave it for three minutes), and wash hands.

Breakfast

- 1 or 2 eggs any style. The egg carton and egg exterior have *Salmonella* on them, so remove the eggs, replace the carton, wash the exterior of the eggs and then your hands again before cracking them. You don't want a *Salmonella* infection added to your cold.
- Hash brown potatoes
- Pancakes or waffles with artificial maple syrup made with brown sugar and vitamin C.
- 1 cup herb tea with vitamin C, cinnamon, or other spice.
- Water with a tsp. of vinegar and honey.

Lunch

- Soup without noodles, without rice or any grain product.

- Homemade biscuits or bakery bread with butter.
- Homemade pudding or custard, all ingredients well cooked.

Supper

- Well cooked fish or seafood (canned O.K., like sardines, salmon and tuna).
- Fresh green vegetables, in perfect condition.
- Cooked vegetables with olive oil and salt (pure, see *Sources*).
- Canned beans, any variety.
- Baked or boiled potato (don't eat skin) with olive oil and salt as described on.
- Hot water with whipping cream and cinnamon.
- A perfectly unblemished banana.
- Water with lemon.

You can “mix and match” these safe foods. If you get a hefty dose of mold at the outset of your cold, the toxicity lasts quite a long time. Repeat the diet the next day and the next until you are well. In animal experiments reported by scientists, toxicity from mold usually lasted three weeks. Sometimes the real damage was only seen after three weeks! Keep up your vigilance. When you decide to take some risks, make sure vitamin C has been added to the new food and mixed with it thoroughly.

Goods baked in a panaderia never tested Positive to molds.

Prevention

What is the best way to prevent a cold? Stop eating moldy food. We were never meant to eat rotting, spoiling food. We were meant to be repelled by the bad odor, the bad appearance, the bad taste. Our parents were supposed to teach us in childhood to distinguish between good and bad food. This system no longer works. By mixing spoiled food with good food, by adding flavors and changing the food consistency, parents can't distinguish substandard foods, nor teach their children to.

We rely on government agency assurances, like beef grades, expiration dates, approved food colors and additives. And when they fail? We land in a debacle such as the present one, where large segments of society are ill with uncontrollable behavior (called crime), suffer from hormone imbalances and sexual disturbances, are sidelined by chronic fatigue and new illness. But the greatest social disaster is lowered immunity—AIDS.

We cannot individually control the destiny of our species. But we can get ourselves out of the path of the falling human tide. We can dissent. We can say **NO** to rotten moldy food.

What about exposure to a cold? Won't you catch one if you're in a roomful of coughing, sneezing people? Or you shake hands with a coughing, sneezing person? Or you drink from the same glass as a person with a cold? Or your child

plays with the same toys as sick children?

Yes, you will catch the virus, but you won't get sick. If you are tracking *Adenovirus* using the electronic techniques in this book, you will see that it infects you immediately after eating coughed-on food. It stays in you about twenty minutes. Then it disappears, evidently eaten up by your white blood cells, **provided there is no mold toxin in you**. But if you do have a mold toxin in you, the virus spreads, multiplies and gives you a cold! I have only followed *Adenovirus* behavior. There are numerous other “cold bugs” left for you to track. Each illness in your family could provide you with a specimen to research.

This throws light on self infection, too. When we cough into our hands and then eat with them, we self-infect. But it only makes us sicker if we harbor molds.

Curing Symptoms

Cold symptoms alone can be cured much faster than the cold. Taking drugs proves that. Most of the drugs on the market can cure some symptoms in less than one hour. But not without a price, such as a harmful side effect.

Homeopathy can cure cold symptoms too, without side effects. There are three or four favorite homeopathic remedies for colds and eight or nine less common ones. To use them you read the symptoms listed and take the remedy with the closest match.

Homeopathic Remedy	For These Symptoms
Aconitum	early cold with fever, headache, hoarse cough
Allium	clear runny nose with burning of lips or eyes
Arsenicum	sneezing cold, frontal headache, tickling cough
Belladonna	high fever cold with flushed face, throbbing head
Kali bi	thick post nasal drip, colored discharge, sinus headache
Spongia	croupy cough

Fig. 49 Starter set of homeopathic remedies.

There are lots more remedies with fascinating symptoms to try to match with your own. Books suggest that you start with a 6X or a 12X remedy, but success is more certain with 30X. Use three remedies simultaneously. If you get total relief at some point, stop. If the cold has moved or won’t budge, try another set of three after an hour. Don’t take them within 15 minutes of food or anything else. Homeopathy makes very interesting reading.

Homeopaths say they stimulate the immune system specifically. My results show they do much more. They go right to the gateways of your cells and evict the tiny parasite, bacteria or virus stuck to the latch and trying to get in. Your immune system would be able to gobble them all up if they weren't gagged by the food mold you ate.

Different homeopathic remedies go to different tissues, so you can only clear one tissue at a time. If you plan on trying this for yourself, order the set of cold remedies listed above (see *Sources*). The homeopathic method would be a beautiful cold cure if it weren't for the mold intrusion.

Herbs, too, can cure symptoms rather quickly. **Elderberry tea** mixed with **peppermint** is cited in herbal textbooks and it could probably do a lot if it weren't for the mold immuno-suppression. If you plan on trying these start with a set of **thyme**, **fenugreek**, **sage** (for throat). Since both herbs and homeopathic remedies work on the principle of ejection, they could eject each other. Maybe the last one to arrive takes over. This is an exciting field for you to explore.

Ultimately, the length of time your own white blood cells are bound and gagged decides how soon you are really cured of your cold. Remember taking vitamin C (10 grams or more) helps detoxify the molds. If you find a recipe that works for everybody in less than five hours, be sure to let everybody know.

True Origins Of Viruses

Your body can eliminate any virus in a short time, such as hours or days. It can even keep up with a steady stream that is coming from tapeworm stages!

Let us apply these new insights to several diseases we are familiar with. Let us speculate what could really be happening.

Epstein Barre Virus (EBV) is a mysterious disease because in spite of building up antibodies, it attacks repeatedly. I only see EBV if the person also has *Eurytrema* (pancreatic fluke) in the pancreas. When the fluke is gone, I no longer find EBV in the white blood cells. This suggests that the virus comes from the fluke. As each fluke dies and is finally removed, the body's white blood cells can catch up with the viruses and you begin to feel better again, which can be as quick as one day. But reinfection with an EBV-carrying *Eurytrema* (plus a wood alcohol containing beverage to allow the fluke to go to the pancreas) can spark the next recurrence.

Shingles is a recurrence of chicken pox. I always find *Ascaris* in persons with shingles! Unfortunately, killing the *Ascaris* does not cure shingles. *Herpes Zoster* (the shingles/chicken pox virus) is known to hide in nerve cells. Perhaps *Ascaris* facilitates it's release, or simply suppresses the immune system in a way that allows it to suddenly multiply.

Polio was once a scourge. At that time, we can theorize that a new large parasite was making its appearance. Was a new animal association taking place in the early 1900's? Life was indeed becoming more urban with horse manure on all streets. Owning a dog for a house pet was becoming an acceptable lifestyle. Could the tapeworms of these animals give us a tapeworm stage that hosts polio virus? Many polio sufferers also had migraines. These are caused by *Strongyloides*, a horse threadworm. Does *Strongyloides* host polio virus?

The **HIV** virus infects us during the time the intestinal fluke, *Fasciolopsis buski*, is being hosted. Persons test *Negative* to HIV shortly after the fluke and its stages are eliminated.

Coxsackie viruses give us some of our encephalitis's. I never see *Coxsackie* viruses without the bacteria, *Bacteroides fragilis*, and I never see *Bacteroides fragilis* without *Ascaris* (a roundworm.) I conclude that one lives inside the other!

We may be deriving viruses from all the roundworms, flukes, tapeworms and bacteria that infect us! It would be a fascinating study, simply to examine each of these parasites singly, searching for their viruses with an electron microscope. They could also be searched for using immunological methods.

Fortunately, your health improvement does not need to wait on such studies. Your electronic technique can detect them in your body long before you are made ill by them. You don't need to know their hosts in order to stop hosting them yourself.

It is a time of great change for this planet as pollution spreads from pole to pole. The growth of industrial activity, mining, chemical manufacturing, the food “industry”, and personal habits like smoking have spread new chemicals to every corner of the globe. The element *polonium*, which is radioactive and in tobacco smoke, is harmful to human lungs, but <u>may not be harmful</u> to a small lung parasite, like *Pneumocystis carinii*.

Benzene, which is a solvent and extremely harmful to humans, may not be

harmful to fluke parasites living within us. Propyl alcohol facilitates the intestinal fluke but is toxic to us.

Parasites are doing abnormal things. Is this because of pollution?

The tables are gradually being turned against us in favor of our parasites and pathogens. Such large changes are called evolutionary. Is the human species doomed, or will some of us “adapt”. Will some of us survive to pass on our “better” genes to a new population of cancer-resistant, AIDS-resistant, Alzheimer's-resistant, etc.-resistant humans? How many of us will die trying?

The common cold should not be so common!

Body Wisdom and Why Bad Food Tastes Good

Don't let yourself eat junk food just because your body craves something in it. Try to figure out what it is your body craves. Could it be fat? Could it be salt? Could it be starch?

Salt

If it's salt, you might also love popcorn and other salty food. This implicates the adrenal glands. Maybe they're letting too much salt (sodium chloride) leave the body through the kidneys. Maybe they're letting too much potassium chloride through, too. A diuretic pill could certainly have a similar effect.

Help the adrenal glands do their job of regulating sodium and potassium chloride by cleaning them up. Let salt-hunger be your signal to do a *Kidney Cleanse*. This will clean adrenals too. Even a slight drop in sodium and potassium chloride in the blood (body fluids) can make you too fatigued to tie your own shoelaces.

Remember, when your body craves potato chips, it craves something in the potato chips. If you let yourself eat highly salted food while you're giving the adrenals a clean up, at least add potassium chloride to your diet. Make yourself a mixture of equal parts of sodium chloride and potassium chloride. Part of salt hunger is actually potassium hunger. Let your body (your taste) decide on the amount of potassium chloride to add. Maybe one part potassium chloride to two or three parts sodium chloride is a better mixture for you. After mixing, store it in the original containers (re-label them) to prevent caking. If you put it in an ordinary salt shaker, it will cake soon. Use a shaker with a lid that closes.

Fats

Maybe you like French fries because of the fat. If you deprive yourself of the “good” normal greases that come from plant or animal sources, which would ordinarily make up 25% of your calories, of course you'll crave grease. But what a bad trade it is. Now you are getting lab-made (hydrogenated) grease with a

non-biological structure, and loaded with the carcinogen nickel.

So if you're body tells you that you need grease, go back to olive oil, butter, cheese (baked only), lard, avocados, nuts and nut butters (homemade only) and seeds. Humankind has been eating these natural fats long before cholesterol was vilified. The key to cholesterol control is not fat avoidance, but a *Liver Cleanse*!

Starch

If switching to natural greases doesn't satisfy your “fat-tooth”, maybe its the potato in the French fries that your body craves. Plain, pure starch. Do you also love bread and pasta (more pure starch though very inferior to potatoes)? Pure starch is very easy to digest and has a large adsorptive capability for toxins. In fact, if any family member should accidentally eat something poisonous, drinking cornstarch will quickly mop it up and keep it stuck so it can't enter your tissues. (This doesn't work for all poisons.) By craving pure starches, your body could be telling you about a need to improve your digestion (liver disorders) or to eat and breathe less toxic things.

Maybe a stomach-full of baby *Ascaris* is telling you to eat only food that doesn't need a lot of acid: “just potatoes, bread and pasta, please, and skip the sauce.” *Ascaris* inhibits acid production by the stomach. This can result in an aversion to meat.

It doesn't take much acid to digest pure starch and get it on its way out of the stomach. And out of the stomach means relief: relief of the pressure on the diaphragm and liver, heartburn, that too-full feeling, and other digestive disturbances.

Sugar

Your body runs on sugar. If you are short on sugar it will turn fat into sugar. If you are short on both, it will turn your muscles into sugar. However eating more sugar doesn't cure the craving. You have to find out why you are so short, in spite of eating it.

The first thing to try is 1 mg chromium (five 200 mcg tablets, see *Sources*) per day. If you still crave sugar after a week the problem is something else. Perhaps you have pancreatic flukes upsetting your sugar regulation. Kill them and go off commercial beverages that may contain wood alcohol. Sugar regulation is very

complex, but these two approaches help most of the time.

Dislikes

Respect your body's opinion when it says, “No, I don't want to eat that.” Our education about nutritive value of food may be sound but there are other facts to consider. We should take a lesson from nursing babies: when they refuse to nurse, there is something unpalatable in the mother's milk. Usually the mother has eaten onions or members of the cabbage family. The baby tries it once, and learns to reject it immediately. The baby's liver, in its wisdom, does not want the baby to eat what it can't properly digest. The mother may feel: “Now, this breast milk is good for you and drink it you must, or you shall go hungry.” Unfortunately, this works for 2-year-olds and up. They are forced to eat carrots, peas, and other vegetables; vegetables that taste terrible, (modern agriculture has ruined the flavor). they alone taste the bitterness of PIT, a cyanide-related chemical, and very difficult for the liver to metabolize. broccoli and onions may burn the tongue with its sulfur-containing acids. Green beans, onions, garlic, eggplant, all have unique chemicals in them. If you or your child are not ready to eat them, avoid them carefully, so you don't get a surprise dose of the toxic chemical.

The more mold a child eats, inadvertently, in peanut butter, bread, potato chips, syrups, the less capable the liver is of detoxifying foods. This will certainly increase the “pickiness” of a child's appetite. If your child has too many foods on her or his personal “off list”, let this signal you to improve liver function. Stop the barrage of chemicals that comes with cold cereals, canned soup, grocery bread, instant cheese dishes, artificially flavored gelatin, canned whipped cream, fancy yogurts and cookies or chips. Move to a simpler diet, cooked cereal with honey, cinnamon and whipping cream (only 4 ingredients), milk (boiled), bakery bread, canned tuna or salmon, plain cooked or fried potatoes with butter, and slices of raw vegetables and fruit without any sauces, except honey or homemade tomato sauce, to dip into.

It is frustrating to cook “a fine meal” for the family and find everybody likes it except Ms. Picky. The good news is that she can usually think of something she would rather eat. If it's nutritious, be thankful. If it's not, say No.

Adults should hide their junk food, including everything off limits to children. Don't “hide” your junk food in the refrigerator and lower level cupboards! Treat yourself as well as your child. If a food tastes bad, don’t eat it. If you crave it,

try to understand the message.

Outwit The Cravings

Here are some examples. Suppose you crave these items:

- **Pickles**. They supply vinegar and are often loved by persons with little acid in their stomachs or a lot of yeast (vinegar is a yeast inhibitor). Start drinking water with lemon juice or vinegar and honey.
- **Bacon**. The fat soothes the stomach and slows down digestion. Switch to butter and cream, with meals.
- **Sugar coated cereals.** Loved by persons with disturbed sugar regulation. Kill parasites; avoid wood alcohol, use chromium tablets and a lot of cinnamon.
- **Crunchy munchies**. Your jaw and teeth want some work to do. Try salads, an apple, raw sunflower seeds (beware of moldy seeds, nuts and dried fruit).
- **Ice cream.** Ice-cold food stimulates the thyroid; loved by low thyroid persons. Clean up the thyroid by doing dental work and *Liver Cleanses*.
- **Caffeine**-laced beverages. Stimulate many body tissues, raise blood pressure. Loved by low energy people. Do a general body and environment clean up. (There are people who say coffee puts them to sleep. Insomnia has better solutions than caffeine, though.)
- **Candy.** The more you eat the more you crave because chromium is being used up as you eat it and yet it is necessary to utilize more sugar. Give yourself chromium (GTF) tablets totaling 1 mg. (1,000 mcg.) a day and watch your sugar-craving shrink.
- **Pretzels.** You want salt plus crunch.
- **Potato chips.** You want salt, grease, starch and crunch. No wonder they are so popular!

If your body still has its wisdom, or most of it, why can't it detect the mold in peanuts, crackers and bread for us? There is a very sound reason. Our food

manufacturers have gone to great lengths to fool our native senses. Salt and sugar, roasting and flavoring, do most of it.

Your body is accustomed, natively, to interpret sugar, salt, and flavors as “good, good, and good.” Of course, the mold is “bad, bad, and bad.” But when you mix them, what is your body to read? The “goods” always win; manufacturers don't stop until they do. More flavorings are added. The result is that you can be eating rotten moldy food without knowing it.

Food that is predominantly concocted can't be interpreted by your body wisdom. You must use your second-best ally, your intelligence.

How would you interpret these situations, taken from real life?

- An elderly person can't stand butter, wants and enjoys margarine.
- A child prefers canned spaghetti for the real thing.
- A child wants to eat only sweets; everything else must be coaxed down.
- A young man needs “his” beer to enjoy a cookout.
- A young man with serious mental illness drinks half a gallon of Mellow Yellow™ a day.
- A child wants ketchup on everything.
- A pregnant woman puts herself on a pickled pigs feet and white bread diet.

Back To Normal

Body wisdom was not meant to substitute for parental teaching. They must both be there. But when there is conflict, trust your wisdom. Will you ever get your primitive body wisdom back and enjoy vegetables, fruit, simple styles of cooking and baking them? Yes, to a considerable extent. You'll hold your nose at all seeds and nuts and most flour (they smell so rancid). You'll back away from cookies and cakes, especially icing (they taste like you imagine shortening tastes). You'll retreat from deep fat fried foods: the dripping grease will just undo the appetite. You'll say “No thanks” to canned food and metal cutlery (you can taste the metal now). You'd have to force yourself to eat grocery bread (it's so doughy and sour smelling). Wheat germ smells terrible (rancidity). Even vitamin

tablets may smell awful.

Has life been ruined, now that plain potatoes and butter taste good? Your body wisdom has returned. You are the true gourmet. It is as different as corn on the cob is from the canned variety. Perhaps you are “spoiled” now by eating un-rotten food. Accept the charge with humor and dignity—as long as you're not expected to eat any more spoiled, moldy food.

Toxic Food

Grilled food develops *benzopyrenes* in it that are very toxic.

In an age of lowered immunity, it makes little sense to deliberately poison the food with benzopyrenes. Especially for children, who will be faced with new viruses and parasites in their lifetimes. Will they be able to overcome them or succumb at middle age? Only the strength of their immune system decides this.

Benzopyrenes must be detoxified using the liver's valuable benzene-detoxification system. With so many benzene-polluted items, there is hardly enough detoxification capability to get it all taken care of. NAD enzymes (the N stands for niacin) come into play too. These are essential for alcohol detoxification. If you have consumed alcohol, like a can of beer, NAD enzymes must be shared between the alcohol in the beer and the benzene in the beer. It takes longer to detoxify both the benzene and alcohol. The time delay is a time of lowered immunity and facilitates a growth spurt for parasites and pathogens.

Foods that are raised to very high temperatures, made possible with a microwave oven, produce benzopyrenes. Ordinary bread-toasters can do this too! Old-fashioned toasters had a layer of metal separating the bread from the wires. Toasting bread in a frying pan or a stovetop surface protects it too. But your stove grill, whether electric or flame, will produce benzopyrenes in your food unless there is a separating wall between them.

It does not matter what kind of fuel is used, the benzopyrenes develop due to lack of shielding between the food and heat source. A metal wall between them absorbs some of the heat.

Do not burn your food in a microwave oven. Since the temperature may go higher than your regular oven, you can produce benzopyrenes. Your regular ovens thermostat cannot go higher than it states. Baking and browning is never done above 425°F. This is your safety feature. If anything in your microwave has

turned dark brown or black or has melted plastic, throw it out!

Supplements that help your body to detoxify the benzopyrenes are:

1. Niacin or niacinamide. These are NAD-builders. Take 50 mg with each meal.
2. Vitamin B_2 (riboflavin). Take 50 mg with each meal.

For unpolluted vitamins see *Sources*.

It would be wise to teach children the habits that maximize their immune strength. Avoiding food toxins that are specifically immune-lowering is most important. Besides the benzopyrenes, certain mold toxins and solvents do this and are found in foods.

Moldy Food

Everything that's animal or vegetable can get moldy. While living things are alive, the mold attackers can be held at bay. As soon as they are dead, molding begins. First it molds; then bacterial action sets in. This is what makes things biodegradable. It is a precious phenomenon. It does away with filth—in an exquisite manner. Without mold and decay the streets of New York would still be full of horse manure from the days of the horse and buggy and our lakes too full of dead fish to swim in.

Every grain has its molds; every fruit has its molds; tea and coffee plants have their molds; as do all herbs, and vegetables. Nuts have their molds; nuts grown in the ground (peanuts) are especially moldy because the earth is so full of mold spores. But the wind carries these spores high up into trees, and even up to the stratosphere. Molds are not very choosy. They have their preference for certain plants and conditions. But the same molds can grow on many plants. This is why aflatoxin, for instance, is found not just in your cereal, bread and pasta but also in nuts, maple syrup, orange juice, vinegar, wine, etc. Where is it not? It is not in dairy products or fresh fruit and vegetables, provided you wash the outside. It is not in meat, eggs, and fish. It is not in water.

Although I find aflatoxin in commercial bread, I do <u>not</u> find it in carefully screened wheat that has had its discolored, shriveled seeds removed before using it for making bread, cereals and noodles. It is <u>not</u> in baked goods bought at

bakeries, left open to air. Evidently the system of wrapping baked goods in plastic keeps moisture trapped and starts the molding process. In spite of adding mold inhibitors, American bread stuff is far inferior to Mexican baked goods in which I do not find aflatoxin!

Here is some good news for cooks: if you bake it yourself, adding a bit of vitamin C to the dough, your breads will be mold-free for an extended period (and rise higher).

Aflatoxin

What is so important about molds? Some of them produce very, very toxic chemicals wherever they grow. They produce some of the most toxic chemicals known to exist. Aflatoxin is one of these. My tests show it is always present in cancer patients; in other words it has built up due to the body's inability to detoxify it in a reasonable time. A great deal of research has been done on aflatoxin. Any library would have more information.

Aflatoxin reaches the liver and simply kills portions of it. After a hefty dose the liver is weakened for a long time—possibly years. Hepatitis and cirrhosis cases always reveal aflatoxin. The liver fights hard to detoxify aflatoxin and manage its own survival. It manages for 2 to 3 weeks; then a portion of it succumbs. So the toxic effects of a dose of aflatoxin aren't even noticeable for several weeks! And without a taste or smell to guide you, how would you know to stop eating the moldy peanut butter or spaghetti? The answer is:

1. make and bake things for yourself
2. test the things you dearly love but can't make
3. treat things that are treatable for molds
4. throw the rest out of your diet

Treatments mentioned in the industrial research journals are hydrogen peroxide, strong alkali such as limewater, metabisulfite (a common reducing agent) and high heat. I have tried heat and vitamin C, which is also a reducing agent.

Just heating a food to the boiling point does not kill the molds. Boiling for many minutes at a higher temperature or baking does kill them (but not ergot,

another mold) and also destroys aflatoxin they produced and left in the food. For foods you can't heat that high, for example nuts that are already roasted, or vinegar, vitamin C comes to the rescue. I suppose it acts a lot like the bisulfate; chemically destroying the mold toxin molecules.

Eradicating Aflatoxin

Simply sprinkling vitamin C over **roasted nuts** is not effective because the molds have penetrated the surface. Rinse the nuts in water first (a lot of mold is removed in this simple way). Cover the nuts with water; add about ¼ tsp. vitamin C powder (for a pint of nuts) and mix. Let stand for 5 minutes. The water penetrates the nuts, taking the vitamin C with it and detoxifies them. Pour off the water and dry the nuts in the oven at low heat. (Don't burn them or you will make benzopyrenes.)

Rice and **pastas** can be demolded partly by cooking and partly by adding vitamin C before or after cooking. There is no need to add so much it affects the flavor. Brown rice is especially moldy.

Vinegars can simply have vitamin C added and placed in the refrigerator.

Honey can be warmed and treated the same way (¼ tsp. per pint).

Bread cannot be salvaged. Switch to bakery or homemade breads. Use it up in a few days, leave in its paper bag. Or slice and place in a plastic bag in the freezer.

Since all foods have both their own and others' molds, there must be thousands of molds. Very many have been studied besides aflatoxin producers.

Zearalenone

> Zearalenone, an anabolic and uterotrophic metabolite, is frequently found in commercial cereal grains and in processed foods and feeds, and is often reported as causative agent of naturally occurring hyperestrogenism and infertility in swine, poultry and cattle.[18]

What this means is, in animals, “zear” looks likes extra estrogen to the body. Does it affect humans the same way? Are high estrogen levels a problem for us? I find nearly every breast cancer case shows a too-high estrogen level for years before the cancer is found! It starts females maturing too early, too. It could cause PMS, ovarian cysts and infertility. Not everybody gets all of these effects. And what is the effect on men and boys of eating an estrogen-like mycotoxin in

their daily diet? This female hormone could have a drastic effect on the maturing process even in small amounts.

Zearalenone ("zear") and aflatoxin both have immune lowering effects. Zearalenone can induce thymic atrophy and macrophage activation.[19] If you have low immunity (low T-cells, low white blood cell count, and so forth), immediately go off moldy food suspects.

"Zear" is the mycotoxin that prevents you from detoxifying benzene. Every AIDS sufferer I see has a crippled ability to detoxify benzene; they also have zear!

The main zear sources I have found so far are popcorn, corn chips, and brown rice. But it was absent in fresh corn, canned corn, corn tortillas, and white rice, making me wonder how it gets in our processed corn products.

Sterigmatocystin

Sterigmatocystin ("sterig") is plentiful in **pasta**. Emphasize baked pasta dishes, not boiled. This raises the temperature much higher than boiling. Better yet, make your own pasta with a pasta maker. U.S. bread flour is quite free of mold; the mold in our pastas must come from using inferior quality flour. Always add vitamin C to pasta before or after cooking.

Ergot

A food mold that causes strange feelings and behavior is *ergot*. Although laws regulate the amount of ergot allowed in foods,[20] this is not enough protection. Ergotoxins, for example LSD, are active in extremely minute (less than a microgram, about one thousandth of a fly speck) quantities. They are not destroyed by heat and are especially toxic to children. I found traces in cereals, whole grain breads, wines, and honey. It can be detoxified by adding vitamin C but takes longer; about 10 minutes. Detoxify all your **honey** as soon as it arrives in your house. Warm it slightly and add vitamin C (1/8 tsp. per cup). Stir with wood or plastic.

Ergot toxicity could explain "Jekyll and Hyde" behavior in children, commonly attributed to "allergies". In fact, the mechanism, inability by the liver to keep up with detoxification, fits well into the "allergic" concept. If your child has undesirable behavior, try going off the moldy food suspects for three weeks (cold cereals, nuts and nut butters, store bought breads and baked goods, syrups).

Substitute cooked cereals, bakery breads, potatoes, and honeys. Add vitamin C to honey, pasta and cooked cereals. Pancakes and waffles made from scratch would be O.K.

Combining alcohol with ergot is more toxic than either is alone. Alcohol seems to drive the toxin deeper into your tissues. I have found ergot and aflatoxin in beer and wine! Perhaps some of the bizarre behavior and speech of intoxication is really due to the mold-alcohol combination. By delaying alcohol detoxification, the mold could even be responsible for deaths "due to" alcoholism. It would be safer to brew your own alcoholic beverages. Start with pristine fruit. Or at least add vitamin C (1/8 tsp. per cup) to the store bought container you are consuming.

All U.S. brands of pasta I tested had mold, including health food brands like the one shown here (left). No Mexican brands of pasta, like the one pictured (right), had any molds.

Fig. 50 Pasta

Older children and adults are quite susceptible to ergot too. If bizarre behavior shows up, such as saying mean and cruel things, expressing unusual, irrational thoughts, feeling emotionless or unreal, try the same diet changes, but put alcoholic beverages, soy sauces and other sauces, and other grain derived foods on the "off" list. Try this diet on yourself if you have a temper or crying spells or frequent colds! Ergot can make you super religious, hearing voices of command or threat. Ergot also causes seizures!

All cold cereals I tested were full of mold toxins (besides solvents), health food varieties were worst.

Fig. 51 Cold cereals

Cytochalasin B

Cytochalasin B (“cyto B”) is another immune lowering fungus. I find it mostly in pasta. It stops cells from dividing. Dead portions of the liver cannot regenerate as they otherwise would after a toxic encounter!

Kojic Acid

Kojic acid is a mycotoxin that appears to be responsible for wood alcohol build up. In other words, the toxic effect prevents you from detoxifying wood alcohol. This leads to pancreas damage, invites pancreatic fluke infestation, and typically results in diabetes. I find it in potatoes; don’t eat potato skins. If you are a potato lover fix your own so you can peel them and remove any gray parts. I have also found it in regular coffee.

T-2 Toxin

T-2 toxin is a mold I have found in all cases of high blood pressure and kidney disease. It is present on dried peas and beans but it can be detoxified in 5 minutes by adding vitamin C to the water they are soaked in. Remember to throw away imperfect ones, first.

Sorghum Molds

Sorghum and millet carry these. Don’t buy sorghum syrup. Rinse millet in vitamin C water before cooking, or add vitamin C to the cooking water.

These mold toxins cause hemorrhaging, appetite loss, and inability to swallow. Elderly people are more easily poisoned than others; their hemorrhages show up as strokes and purple blotches on the skin.

Patulin

Patulin is the major fruit mold toxin. It is present in most common fruits if they are bruised. It is particularly hazardous since the mold that produces it can actually grow in your intestine in patches. At these locations, bowel bacteria, *E. coli* and *Shigella*, can climb through the colon wall to invade you. These bacteria are then free to spread to regions of injury and tumors.

If you have cancer or bowel disease go off fresh fruit (bananas and lemons are OK) for a few weeks. Then choose your fruit meticulously. Peel everything so you can see and avoid every bruise. Also take a 2 tsp. dose of Black Walnut Hull Tincture Extra Strength. This kills these bowel fungi. But you can reinfect with a single soft grape.

Mold Avoidance

We should be much more critical of our food.

Crackers are notoriously moldy. Never let your child eat crackers. Make crisp things in the oven from left over bakery goods. Just sprinkle with cinnamon.

Dried fruits are very moldy. Soak them in vitamin C water. Rinse and bake to dry again. Then store in the refrigerator or freezer. When fresh fruit gets overripe, don’t quickly bake it or preserve it. It’s too late.

Peanut butter (store bought) and other nut butters can't be detoxified by adding vitamin C, due to the mixing problem, even if you stir it in thoroughly. Make your own. Making your own peanut butter is a great adventure (see *Recipes*). Mix it with homemade preserves, honey, marmalade, not very homogeneously so the bright colors and individual flavors stand out in contrast. Having three or four such spreads in the refrigerator will give your children the right perspective on food—homemade is better. Store bought jams are sweeter and brighter in color but strangely low in flavor and often indistinguishable from

each other. Let your children eat the polluted foods that friends and restaurants serve (but not rare-cooked meats) so they can experience the difference. Their livers are strong enough to detoxify occasional small amounts.

Tea is quite moldy if purchased in bags. Although I used to recommend single herb teas (tea mixtures have solvents), I can now only recommend single herb teas from fresh sources in bulk (see *Sources*). This also gets you away from the benzalkonium chloride and possibly other antiseptics in the bag itself. When you get them, store them in their original double plastic bag. These herbs are so fresh, you'll only need half as much to make a cup of tea. Use a bamboo strainer (non metal). Bake the strainer occasionally or put through the dishwasher to keep it sterile.

Packaged herb tea is moldy and polluted with solvents. Get yours in bulk from an herb company.

Fig. 52 Herb Tea

It comes as a surprise that pure, genuine **maple syrup** has the deadly aflatoxin and other molds. You can often see mold yourself, as a thin scum on the surface or an opaque spot on the inside of the glass after the syrup has stood some time, even in the refrigerator. Some mold spores were in it to begin with. Others flew in. After some time they grew enough to be visible. In my testing, aflatoxin can be cleared with vitamin C but sterig and others need to be treated with a high temperature as well. Fortunately, this is easy to do with a syrup. Heat to near boiling while in the original jar with the lid removed. Keep refrigerated afterwards.

Artificial maple flavor did not have benzene, propyl alcohol or wood alcohol, nor molds. **Turbinado sugar** had none of these contaminants either.

Brown sugar had sorghum mold. **White sugar** had propyl alcohol pollution. You can make your own syrup, safely, with artificial flavor and turbinado sugar. Of course, you'll be missing the taste and nutritional minerals provided by the natural maple product but in a contest between nutritional value and toxicity, always choose the safe product.

Fig. 53 Three safe flavorings.

The mold in our **hot cereals** can be spotted. Pick out all dark colored, shriveled bits. This represents most of it. Add honey, and salt while it's cooking —this raises the boiling temperature and detoxifies more. At the end, turn off heat and add a sprinkle of vitamin C powder. Rolled oats never showed molds in my testing, although they have their characteristic fungi, too. Don't let grains mold on your shelves simply from aging. Nothing should be more than six months old. Remember you can't see or smell molds when they begin. Molds must have a degree of moisture. As soon as you open a cereal grain, put the whole box in a plastic bag to keep moisture out. This keeps out weevils too, so you won't have to put the box in the freezer later to kill them.

Anything that is put in the refrigerator or freezer and then taken out develops moisture inside. Store cereals in kitchen cupboards or the freezer.

No government agency can test for all of these mycotoxins in all of our foods. Production and storage methods must be better regulated so as to be fail-safe. Simply sending inspectors out to look into the bins at grain elevators is not sufficient. Crusts of mold, sometimes several feet thick, that form on top of grain bins can be simply shoveled away before the inspector arrives. The humidity and temperature of stored grain should be regulated, requiring automated controls. This would soon be cost effective, too, in terms of reduced spoilage losses and

higher quality prices earned. I believe that zear, aflatoxin and ergot require special regulations. Products that are imported should be subjected to the same tests as ours. Test results should be on the label.

Getting Away From Grains

In view of the many molds that are grain-related, and because these cannot be seen or smelled in pastas, breads, cold cereals, it would be wise to steer away from grain consumption. Always choose potatoes, because it is a vegetable instead of a grain, if you have a choice. The potato appears on your plate the way it was harvested. Whereas grain was hulled, stored for quite a long time, perhaps degerminated (the bran and germ picks up mold the fastest). Then it was mixed with assorted chemicals (fumigation, anti oxidants), each polluted in its own way, packaged again and stored again. Grains have a more tortuous history than potatoes that simply get sprayed.

Fig. 54 Don’t eat the green on the potato.

The spray isn't simple, of course. Scrub it off under the tap. If potatoes weren't heavily sprayed they'd be sprouting in the stores. The spray accumulates in the eyes. Cut away all the eyes. By the time you have done this you may as well have peeled them. But no blemish, no cut, no dark spot inside may be left for you to eat. Don't buy potatoes that show a tint of green on them (the green color is due to *scopolamine*; it is toxic). Red potatoes have different chemistry that doesn't produce the green toxin, buy these often. Store potatoes out of the light, to slow down the greening process. They are still a nutritious, vitamin C-rich food—provided you don't fry them in benzene-polluted, hydrogenated grease!

Fig. 55 Potato harvest of the future.

Potatoes have their molds but they are nicely visible. And washing and peeling does away with them. Old literature advises that potatoes should be harvested by moonlight so the green drug isn't produced in the white varieties. With modern mechanized harvesting this should pose no problem. But perhaps this must await the age of robots.

Pets Teach Health Lessons

Dogs don't eat hay and cats don't eat fruit. This is not simply due to their inability to digest them. Nor to training. Their body wisdom guides them. But we can trick them into eating corn and soybeans by adding the flavors they like and thereby defeat their wisdom the same way we defeat ours. A concoction is made for them that is called “complete nutrition” and we feed this meal after meal, day after day, a most unnatural situation. The liver is deluged with the same set of pollutants time after time and never gets a rest. Humans still obey their body wisdom about varying their meals. This gives the liver a chance to catch up with detoxifying one pollutant while the new one builds up. If the liver is absolutely unable to handle something, you are informed quite quickly with an allergic reaction to the food.

Cats and dogs with their monolithic diet get no opportunity to reject food (except by vomiting or starvation). It is not surprising they are getting cancer with increasing frequency, a situation where the liver can no longer detoxify isopropyl alcohol, a common pollutant in their food.

Should we go back to the old days and make their food for them? Yes, they deserve pure food, they deserve variety. Table scraps would be much less toxic for them than their commercial feed. But what if they like and prefer their

monolithic “scientific”, “complete”, polluted diet? If our food was doused with sugar for breakfast, lunch and supper, we wouldn't care much about what was under the sugar either. And we'd continue wanting sugar, sugar, sugar the way a pet might want its favorite food and nothing else. Such is the deception of flavorings.

All change should be brought about slowly and with kindness for animals and humans alike. Learn what makes a good pet diet. Cats and dogs are both meat eaters. Cook chicken in a pressure cooker to kill all parasites. Put portions in the freezer. Add table scraps, dressed with a little butter, cheese or lard. Don't wash the pet dishes with your own—dishwashers don't reach the boiling point. Serve fresh water daily. Standing water picks up bacteria. Don't let food get more than a day old in the dishes. It picks up molds. Don't feed pets at the table, keep them outdoors during mealtime.

After your pets have stopped eating propyl alcohol polluted food and are not getting propyl alcohol in their shampoos, there is no way they can get cancer. Whatever cancer they have will clear up by this change in diet and by giving them the pet *Parasite Program*.

Now they are back to a natural state and do not host human flukes. What a relief it is not to worry about reinfection from your pets.

Easy Lifestyle Improvements

None of us likes to change a habit. But once it is changed you are back to an automatic way of doing something. By selecting wise habits your improved lifestyle pays you back for the rest of your life.

Living Hand To Mouth

Hands do everything. They pick up things from the floor. They handle money. They touch other peoples' hands. They clean up bottoms. They touch all kinds of doorknobs. And then they pick up food to eat. Some people even lick their fingers when they're sticky or just to turn a page!

What is on the hands that you don't want to eat but can't see? **Bacteria** and **viruses** from coughing and sneezing into your hands! And **cysts**! Cysts are the "eggs" made by parasites. Cysts are so tough not even bleach kills them. They hide under our fingernails when we wash our hands. Then we eat them along with our food. This is called *oral-fecal route*. They hatch in the stomach and go to the intestine to live.

To stop reinfecting yourself the little cysts under the nails need to be killed. Food grade alcohol solution kills them. Buy Everclear™ or Protec (potable) alcohol and make a 5% solution (add ¼ cup of 95% alcohol to a quart of water). Keep it in a small pump bottle at the sink. After using the bathroom and washing your hands, treat your fingernails with alcohol. pump alcohol into one palm. Put the fingernails of the other hand into it. Scratch a bit. Pour it into the other palm and do the remaining fingernails. Rinse.

- **Don't** eat with your hands! Use a fork.
- **Never** eat food off the floor!
- **Always** wash hands after petting an animal!
- **Never** touch the bottoms of shoes! Keep shoes off couch or bed or chair.
- **Always** cough or sneeze into your clothing or a tissue, not your hands.

- **Keep** your fingers out of your mouth. Don't lick your fingers to turn pages or open plastic bags.

Sick persons need a 50% alcohol solution. Add ½ cup 95% alcohol to ½ cup cold tap water or buy plain vodka, 80 to 100 proof. Pour the vodka into the pump bottle. Be careful that nobody tries drinking it. If there are teenagers in the house, add a hefty dose of cayenne to it.

Lugol's iodine will also sterilize your hands. However most commercial Lugol's is polluted with isopropyl alcohol. Ask your pharmacist to make it from scratch for you (there are only two ingredients and water, see *Recipes*). Then make a solution to wash in (1 tsp. to a quart of water). This can stain some things. Do not use "tincture of iodine."

Better Laundry Habits

Boil your underwear. In long-ago days, all sheets, towels, table cloths, and underwear were separated and boiled.

With the convenience of our electric washing machine, we tend to overlook the fact that underwear is always contaminated by fecal matter and urogenital secretions and excretions. Mixing these with socks and towels and dishcloths is all right if you are going to kill everything anyway. But if you don't kill them, as in cold water washes, you are mixing the yeast, parasite eggs, bacterial spores, and fungus from underwear with all the other clothing you and your family wear. An enlightened system would be to add an antiseptic to the wash or rinse cycle. Lime water (calcium hydroxide) or iodine based antiseptics seem obviously simple methods to accomplish this. In the absence of this protection, use dryer heat to do your sterilizing. Underwear should be dried until too hot to handle.

Bleach can kill a lot, but doesn't kill *Giardia* spores and a lot of types of fungus. Don't rely on bleaching. Besides, your skin absorbs it from clothing, it is quite toxic to you, and can cause mental effects.

Commercial detergents are polluted with PCBs and have cobalt added. Both of these are easily picked up through your skin. Use **washing soda** and **borax** in the wash cycle. They do not clean quite as well as modern detergents, but there is less static cling, eliminating the need to put more chemicals in your dryer. For spot removal use homemade bar soap.

Better Kitchen Habits

Once a day, sterilize the sponge or cloth you use to wipe up the table, counter tops and sink. This little piece of contaminated cloth is the most infectious thing in the house, besides the toilet. It's more dangerous than the toilet because you do not suspect it. Sometimes it has a slight odor at first, which may warn you, but most pathogens do not have an odor! As we wipe up droplets of milk, we give the milk bacteria, *Salmonellas* and *Shigellas*, a new home to multiply and thrive in. We add crumbs, picking up molds this way. We add dust, picking up parasite eggs and stages. They all feed on the milk and food residue.

As the counter and table and stove get wiped “clean” a film of contamination is left everywhere. A few varieties may die but most of them don't. The general moisture in the kitchen is enough for them to survive. The cloth or sponge recolonizes the kitchen and dining room table several times a day.

No doubt, the last thing you do before leaving the kitchen is squeeze it dry with your hands. Now all the pathogens are on your hands!

Where do your fingers go? To your mouth to remove a hull or bit of something from your teeth. Or to eat a last bite of something. Or to turn a page of the telephone directory. You have just eaten a culture sampling from your own kitchen sponge. In two hours they are already multiplying in the greatest culture system of all: your body! You have given yourself your next sore throat, or cold or headache. The worst possible habit is to wipe a child's face and hands with the kitchen cloth. Or to have a handy towel hanging from the refrigerator handle.

To sterilize the sponge: **drop it into a 50% solution of grain alcohol** at the end of each day. Keep a wide mouth glass quart jar handy just for this. Keep the jar tightly closed and out of the reach of children. Dunk your sponge and plop it onto the sink. If you stand it on end in the sink it will partly dry overnight.

Another way to sterilize the sponge or cloth is to **microwave it**, after wetting it, for 3 minutes. Any shorter time simply warms and cultures the pathogens and multiplies them. Or **boil the cloth** like our grandparents did. Drying out the dish cloth helps kill many—but not all—pathogens. It takes three days of drying to kill all! Another strategy is to **use a fresh cloth** or sponge each day, putting the used one to dry until laundry day.

During the day, set the sponge on end to start drying and slow down culturing.

Don't eat food directly off the counter top or table top. You wouldn't slice a tomato or egg directly on the counter top. It would pick up something: some little particle of dust or dirt. Treat bread the same way. Always on a new clean surface, such as a plate. The counter and table top have on them whatever is in the kitchen dust and on the wipe cloth. dust is always falling! And the sponge is always culturing. Don't eat the dust!

Keep the cutting board sterile like dishes. Wash it the same way and keep it in the cupboard.

Keep food containers closed. Milk or water glasses are picking up dust as soon as you set them out. Dust is everywhere. Every step on the carpet sends up a puff of dust. Vacuuming sends up a hurricane of dust and distributes bathroom dust to the kitchen and kitchen dust to the bedrooms. So if one person has brought in a new infection, the whole family is exposed to it in hours via the dust.

It is very helpful not to eat the new infectious pathogen. Breathing it is not so damaging. Our noses collect such pathogens and we blow them out again. Touching the infected person is not very damaging either; the pathogens can't get through our skins and since we wash hands before eating we are not at great risk of infection this way. But eating the pathogen is 100% effective in infecting us. The new pathogen is in the dust. The newly contaminated dust drops into your ready and waiting glasses on the table and the open foods. Of course, there is no defense if somebody should cough or sneeze at the table.

Teach children to cough and sneeze into a suitable collecting place like a tissue, not their hands. Pathogens live bountifully on hands. Hands not only provide moisture but often food from the last meal. Hands are second only to the dish cloth in contamination level. If you must cough or sneeze and a tissue is not within reach fast enough, use your clothing! That's what clothing is for—to protect you. Cough and sneeze into your own clothing; this protects the cougher and sneezer, as well as everybody else. A sleeve is handy for children. The inside of your T-shirt for T-shirt wearers. The inside of coat for suited persons. The inside of the neck line for dresses. Of course, paper is best, but in emergency use cloth. Never, never your hands unless you are free to immediately dash into the washroom and clean the contamination off your

hands.

Teach children this old rearranged verse:

If you cough or sneeze or sniff
Grab a tissue, quick-quick-quick!
And if you're sitting at the table
Do it in your sleeve if able.

Better Housekeeping

Throw out as much of the wall to wall carpeting as you can bear to part with. It is injurious to everyone's health, even though it's comforting to bare feet and looks pretty.

Carpets clean our shoes. Modern shoes, with their deep treads, bring in huge amounts of outdoor filth which settles deep down into the carpets. In spite of vacuuming every week, the filth accumulates.

Vacuum the carpets when the children, the sick and elderly are out of the house. The dust raised and distributed throughout the house isn't just dirt, it's infectious dirt. It lands on tables and counters. These get wiped with a cloth or sponge and then applied to dishes. The dust in the kitchen falls on open food and into open containers.

Clean carpets with a “steam cleaner”. When you see how much filth is in the water and realize how much dirt you were living with, you might be willing to trade in the “beauty” of carpets for the cleaner living of smooth floors. Don't add chemicals (commercial cleaning solutions) to the steam cleaning machine; these chemicals leave a residue in the carpet which dries and flies up into the air to add to the dust. Popular stain resistance treatments contain arsenic. Cobalt, which adds “luster” to carpets, causes skin and heart disease after it has built up in your organs. Use borax instead of detergent. Use boric acid to leave a residue that kills roaches and fleas (but not ants). Add vinegar that leaves a residue to repel ants. Nothing controls fleas reliably, except getting rid of the carpets and cloth furniture (keep pets out of bedrooms). Removing <u>all</u> the borax is what brings luster to the carpet. Use citric acid in the rinse water for this purpose. Adding lemon peel to the rinse also adds luster and ant deterrence. Just drop the whole lemon in the tank so it can't block the hoses.

Fleas and other vermin in the carpet simply crawl below the wetness level

when you wash the carpet. Spraying a grain alcohol solution with lemon peel in it (it needs to extract for a half hour) on the damp carpet will reach and kill a lot of these, together with the residual bacteria. The damp carpet lets it spread evenly and reach all the crevices.

We are trapped in our dwellings. Primitive peoples were mobile. This got them away from accumulations of filth and rubbish in their living space. Much living was done outdoors, the cleanest space of all.

Now, air conditioning has made indoor living more comfortable. But also has added new hazards. The strong currents of air blow the dust about continuously. Molds and bacteria that grow right on the air conditioning unit get blown about for all to inhale. Never, never use fiberglass as a filter or to insulate your air conditioner around the sides. It is a carcinogen. And the danger of Freon escaping from a tiny leak is another major health hazard.

Forced air heating systems are undesirable, too. All dirt brought into the house by shoes gets circulated throughout the house by forced air systems of heating or cooling. Old fashioned radiant heat from radiators or a stove did not distribute the dust so effectively. A return to linoleum floor covering for kitchen and bathroom and hardwood for other rooms would be a good step of progress for a health conscious society. Mopping, instead of the vacuum cleaner, keeps dirt to a minimum. Throw rugs at doors and bedside, easy to clean, would “catch the dirt” as was the original intention. Carpets were intended to help keep filth out of the air. These smaller rugs should be laundered weekly.

Furniture should be wood, cane, or plastic, with cushions to soften the impact. These can be washed weekly if the covers are removable. Modern cloth furniture with its foam interior is a repository of filth and fumes and a constant source of infectious dust.

This old fashioned setting is more progressive than our carpeted, modern homes.

Fig. 56 Smooth floors allow every bit of dust to be removed.

Dust your furniture with a damp paper towel. You are picking up and removing highly infectious filth (*Ascaris* and pinworm eggs, pet parasites, “dander” and house mites). Instead of distributing these from room to room, throw the paper towel away after each room is done. Use plain water or vinegar water (50%), not a chemical combination which further pollutes the air.

Clean windows with vinegar water, too. Use a spray bottle.

Keep your dishes in cupboards. This keeps them free of dust. This principle is ancient. It is tempting to leave some of them out. If you must keep the juicer or dishes outside of cupboards, keep them covered or placed upside down so they don't catch dust. Even inside cupboards, store them upside down. When using the “good” dishes or glasses, that haven't been used in a while, wash them first.

Windows Open Or Closed?

In places like Chicago where you can smell the air as you approach the city, it is wiser to keep your windows shut. You can't breath the industrial “soup” all day and night and expect to stay healthy. Of course, it all enters the houses anyway. Central air conditioning and a plain carbon filter at the furnace location (see *Sources*) may be the best solution in spite of blowing dust around the house. Keep the vents to the bedrooms closed to reduce the air turbulence there but leave the cold air return open. Clean the vents in other rooms each week along with floors and carpets by pulling up the grating and reaching down the passage

as far as possible.

If you believe the air is free of highway exhaust and industrial smoke open the windows every day. This will let some of the indoor toxins blow away. Asbestos, fiberglass, Freon, radon and plain dust can be reduced to a minimum by keeping windows open. If you are ill, sit outdoors (on the porch) as much as you can. Escape to a suitable climate that makes this possible.

Just a few decades ago, many people had summer living quarters that were different from winter living quarters. Gone was all the accumulated infectious dust of half a year of habitation.

Don't have a basement where you stockpile toxic items. Basements invite mold, mice and radon besides toxic things. Fumes travel upward where you live! Keep your toxic things in the attic. If there is no attic, store them in the utility room. Close off the ventilation between utility room and the rest of your house. If you have none of these, perhaps because you live in a senior citizen community or condominium, don't keep any toxic things stored anywhere. Don't save any leftover paints, solvents or cleaners. Buy such small quantities that you can afford to throw it all away when you are done with them.

Live on top of the earth as was intended by nature.

Never have a basement room “finished” for actual living space. Don't buy a house that has a “lower level” built into the earth. This will be the most polluted and dangerous room in your house. If you are ill, move out of such a room. There is no way that it can be “cleaned up”. Move to the other end of the house and furthest away from an attached garage door.

What Kind Of Heat

The worst is coal. The best is none. Breathing coal fumes during the beginning of the industrial age may have brought the new lung diseases: tuberculosis (TB), and pneumonia. It may also have worsened alcohol addiction (beryllium toxicity). Choose electric heat if possible. Even though electricity is based on other fuel consumption, you don't have to breathe those fumes directly.

Moving into the summer kitchen got you away from the accumulation of filth from winter!

Fig. 57 Summer and winter living quarters

Wood stoves can be made safe by making sure the chimney works properly. Never use a lighter fluid. Don't fill the house with smoke when stoking.

Minimize your use of fossil fuels in every way you can.

Getting Rid of Mites

We do not tolerate external parasites like bedbugs, lice, ticks, leeches. Bedbugs were once a scourge amongst northern Europeans. I remember our parents spraying for them (kerosene) in the bedroom. This only “controlled” them. What eliminated them was a law against sale of used mattresses. Lice were originally “controlled” by frequent washing, louse combs, and ironing the seams of clothing. What eliminated them was the cutting of long hair as a societal practice. But what about **mites**? They live with us and other animals.

Fig. 58 Mite

Mites are too tiny to see, tiny enough to ride on a dust particle as if it were a

magic carpet. They resemble insects. Chiggers are really mites. Mange in animals is a mite infestation. Dust mites live on our dander (scales of dead skin).

Get rid of their breeding places: beds, cloth covered chairs and soft sofas. Humans leave enough dander behind in these places to support these ultra small insects. Cover mattresses with plastic covers. Use throws on easy chairs and sofas and wash them often. Never allow a pet into the bedroom or the dust will have tapeworm eggs as well as mites. Throw out rugs that have been pet-beds. Spray the air with a mist of 50% grain alcohol before vacuuming. If you have an illness wear a mask to vacuum. Deep, soft, wall to wall carpets compromise an ancient concept: everything should be washable and cleanable, without throwing the dirt into the air for humans to inhale. Vacuuming a carpet blasts mites and tape eggs into the air. Never shake bedding or rugs where the dust will blow back into the house behind you.

Mites don't bite us but we inhale them as they float in the ever present dust in our homes. The mucus in our lungs traps them and in a few days they die, only to release a drove of *Adenoviruses* (common cold virus) in us.

Four Clean Ups

Chronic health problems are not due to exposures of the past. They are ongoing. Your body is constantly fighting to remove pollutants. In order to stay sick, you must be constantly resupplied! These four clean ups—dental, diet, body, home—are aimed at removing parasites and pollutants at their source. Only then can your body heal.

Dental Clean Up

(This section on dentistry was contributed by Frank Jerome, DDS)

Dr. Jerome: The philosophy of dental treatment taught in America is that teeth are to be saved by whatever means available, using the strongest, most long lasting materials. Long-term toxic effects are of little concern. The attitude of the majority of dentists is: whatever the American Dental Association (ADA) says is OK, they will do.

A more reasonable philosophy is that there is no tooth worth saving if it damages your immune system. Use this as your guideline.

The reason dentists do not see toxic results is that they do not look or ask. If a patient has three mercury amalgam fillings placed in the mouth and a week later has a kidney problem, will she call the dentist—or the doctor? Will they ever tell the dentist about the kidney problem or tell the doctor about the three fillings? A connection will never be made.

It is common for patients who have had their metal fillings removed to have various symptoms go away but, again, they do not tell the dentist. The patient has to be asked! Once the patient begins to feel well they take it for granted, and don't make the connection, either. If everybody's results were instantaneous, there would be no controversy.

Find an alternative dentist. They have been leading the movement to ban mercury from dental supplies. Not only mercury, but all metal needs to be banned. If your dentist will not follow the necessary procedures, then you must find one that will. The questions to ask when you phone a new dental office are:

1. Do you place mercury fillings? (The correct answer is NO. If they do, they probably don't have enough experience in the use of non-metal composites.)

2. Do you do root canals? (The correct answer is NO. If they do, they do not understand good alternative dentistry.)

3. Do you remove amalgam tattoos? (The correct answer is YES. Tattoos are pieces of mercury left in the gum tissue.)

4. Do you treat cavitations? (The correct answer is YES. By cleaning them.) The complete name of *cavitations* is *alveolar cavitational osteopathosis*. They are holes (cavities) left in the jawbone by an incompletely extracted tooth. A properly cleaned socket which is left after an extraction will heal and fill with bone. Dentists routinely do NOT clean the socket of tissue remnants or infected bone. A dry socket (really an infected socket) is a common result. These sockets never fully heal. Thirty years after an extraction, a cavitation will still be there. It is a form of *osteomyelitis*, which means bone infection.

Ninety percent or more of dental offices will not be able to answer ANY of the above questions correctly. If you allow the work to be done by a dentist who does not understand the importance of the above list, you could end up with new problems. Find the right dentist first even if you must travel hundreds of miles. There are 6,000 to 10,000 dentists who should be able to help. Some can do part of the work and refer you to a specialist for the rest. Five hundred to one thousand of these dentists can do it all.

Normal treatment cost is about $1,000 for replacement of 6 to 8 metal fillings including the examination and X-rays. For people with a metal filling in every tooth, or for the extraction of all teeth (plus dentures), it may be up to $3,000 (or more in some places).

Remember, the simpler the treatment, the better. If the dentist says that he or she can change your metal fillings to plastic but it would be better to <u>crown</u> them, say “NO!”

Guidelines For A Healthy Mouth

The guidelines can be summarized as:

1. Remove all metal from the mouth.

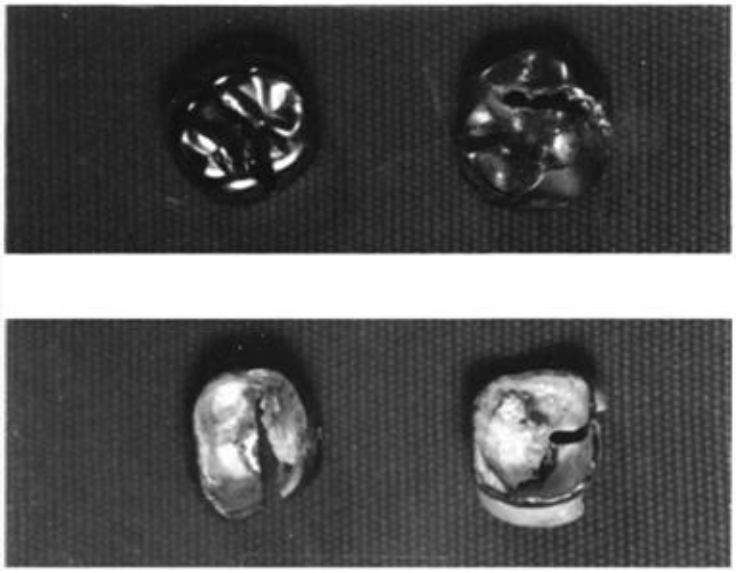
2. Remove all infected teeth and clean cavitations.

If you have	What to do
Metal fillings	change to plastic fillings
Inlays and onlays	change to plastic fillings
Crowns (all types)	change to plastic crowns
Bridges	change to plastic crowns, partials
Metal partials	change to plastic partials(Flexite™)
Pink dentures	change to clear plastic
Porcelain denture teeth	change to plastic denture teeth
Badly damaged teeth	become extractions
Root canals	become extractions
Braces and implants	avoid
Cavitations	need to be surgically cleaned
Temporary crowns	use plastic
Temporary fillings	use Duralon™

Fig. 59 Dental replacements

Dr. Clark: Removing all metal means removing all root canals, metal fillings and crowns. Take out all bridge work or partials made of metal and never put them back in. But you may feel quite attached to the gold, so ask the dentist to give you everything she or he removes. Look at the underside. You will be glad you switched.

The stench of the infection under some teeth may be overwhelming as they are pulled. Bad breath in the morning is due to such hidden tooth infections, not a deficiency of mouthwash!



The top surfaces of tooth fillings are kept glossy by brushing (you swallow some of what is removed). Underneath is tarnish and foulness. Ask to see your crowns when they are removed.

Fig. 60 Tops and bottoms of some metal crowns.

All metal must come out, no matter how glossy it looks on the surface. Metal does not belong in your body. It is an unnatural chemical. Do this as soon as you have found a dentist able to do it. Find a dentist with experience and knowledge about this subject. It is more than replacing acknowledged culprits like mercury-amalgam fillings. This is metal-free dentistry. Only metal-free plastic should be put back in your mouth.

Dr. Jerome: If your dentist tells you that mercury and other metals will not cause any problems, you will not be able to change his or her mind. Seek treatment elsewhere!

Your dentist should do a complete X-ray examination of your mouth. Ask for the *panoramic* X-ray rather than the usual series of 14 to 16 small X-rays (called full mouth series). The panoramic X-ray shows the whole mouth including the jaws and the sinuses. This lets the dentist see impacted teeth, root fragments, bits of mercury buried in the bone and deep infections. Cavitations are visible in a panoramic X-ray that may not be seen in a full mouth series.

The cost of removing metals should be viewed in the proper light. It took years or decades to get into your present condition. When you do a lot of dental repair in a short time, it can seem to be costly. Unfortunately, many people are in a tight financial position because of the cost of years of ineffective treatment,

trying to get well.

Your dentist may recommend crowning teeth to “protect” or strengthen them. Unfortunately, the very concept of crowning teeth is flawed. First, the enamel is removed from a tooth to prepare for the crown. This is permanent and serious damage! Many teeth, up to 20%, may die after being crowned and will need to be extracted. For this reason, you should only get REPLACEMENT crowns and NO NEW crowns. Your metal crowns can be changed to plastic. (Remember, no metal must be left under the crown.)

If you have many crowns, you should have them all removed as quickly as possible. But you should not spend more than two hours in the dentist's chair at any one time. That is too much stress for your body.

Dr. Clark: Don’t accept intravenous (IV) treatments during amalgam removal. Both IV bags and the supplements used in them are polluted with propyl alcohol, benzene, and wood alcohol.

Dr. Jerome: It is quite all right to have temporary crowns placed on all teeth that need them in the first visit. You may then go back and complete treatment over the next 6 to 12 months. It is common to find a crowned tooth to be very weak and not worth replacing the crown, particularly if you are already having a partial made and could include this tooth in it.

Dr. Clark: We are accustomed to thinking that plastic is metal-free. This is wrong. The original dental plastic, methyl methacrylate was metal-free. But modern plastic contains metal. The metal is ground up very finely and added to the plastic in order to make it harder, give it sheen, color, etc.

Dr. Jerome: Dentists are not commonly given information on these metals used in plastics. The information that comes with dental supplies does not list them either. Most dentists never look at a dental materials book after they graduate. The ADA, however, has a library full of such information.[21]

Dr. Clark: There are many lanthanide (Rare Earth) metals used in dental plastic. Their effects on the body from dentalware have NOT been studied. Yet their cancer-promoting ability is known in many cases.[22] Only metal-free plastic is safe.

Dr. Jerome: These are the acceptable plastics; they can be procured at any dental lab.

- Plastic for dentures: Methyl Methacrylate. Available in clear and pink. Do not use pink.[23]
- Plastic for partial dentures: Flexite™ Available in clear and pink. Do not use pink.
- Plastic for fillings: Composite Materials. This is the material that has been used in front teeth for 30 years. It has been used in back teeth for 10 years. There are many brands and there are new ones being marketed constantly. The new ones are very much superior to those used 10 years ago and they will continue to improve. They do, however, contain enough barium or zirconium to make them visible on X-rays. There are no alternatives available without these metals.

Dr. Clark: Composites with barium are not good, but I haven't seen enough barium toxicity from fillings at this time to merit advising extraction instead. Hopefully, a barium-free variety will become available soon to remove this health risk.

Dr. Jerome: Many people (and dentists too) believe that porcelain is a good substitute for plastic. Porcelain is aluminum oxide with other metals added to get different colors (shades). The metal DOES come out of the porcelain! It has many technical drawbacks as well. Porcelain is not recommended. Sometimes the white composite fillings are called porcelain fillings but they are not. They also require more tooth structure to be removed.

If you have a large bridge, it cannot be replaced with a plastic bridge because it isn't strong enough. A large bridge must be replaced with a removable partial (Flexite™).

The methods used to remove metals and infections are technical and complicated. See dental information in *Sources*.

Dr. Clark: I'd like to thank Dr. Jerome for his contributions to this section, and his pioneering work in metal-free dentistry. I hope more dentists acquire his techniques.

Horrors Of Metal Dentistry

Why are highly toxic metals put in materials for our mouths? Because not everyone agrees on what is toxic at what level. Just decades ago lead was

commonly found in paint, and until recently in gasoline. Lead was not less toxic then, we were just less informed! The government sets standards of toxicity, but those “standards” change as more research is done (and more people speak out). You can do better than the government by dropping your standard for toxic metals to zero! Simply remove them.

The debate still rages over mercury amalgam fillings. No one disputes the extreme toxicity of mercury compounds and mercury vapor. 'The ADA feels that mercury amalgam fillings are safe because they do not vaporize or form toxic compounds to a significant degree. Opponents cite scientific studies that implicate mercury amalgams as disease causing. Many dentists advocate mercury amalgam fillings simply because they are accepted by the ADA, which they believe protects them from malpractice litigation. Why risk your health and life on their opinions? Remember everything corrodes and everything seeps, so amalgams must too.

Cadmium is used to make the pink color in dentures! Cadmium is five times as toxic as lead, and is strongly linked to high blood pressure.

Occasionally, thallium and germanium are found together in mercury amalgam tooth fillings. Thallium causes leg pain, leg weakness, and paraplegia. If you are in a wheelchair without a very reliable diagnosis, have all the metal removed from your mouth. Ask the dentist to give you the grindings. Try to have them analyzed for thallium using the most sensitive methods available, possibly at a research institute or university.

I was astonished to find thallium in mercury amalgams! It couldn't be put there intentionally, look how toxic it is:

TEJ500 HR: 3

THALLIUM COMPOUNDS

Thallium and its compounds are on the Community Right To Know List.

THR: Extremely toxic. The lethal dose for a man by ingestion is 0.5-1.0 gram. Effects are cumulative and with continuous exposure toxicity occurs at much lower levels. Major effects are on the nervous system, skin and cardiovascular tract. The peripheral nervous system can be severely affected with dying-back of the longest sensory and motor fibers. Reproductive organs and the fetus are highly susceptible. Acute poisoning has followed the ingestion of toxic quantities of a thallium-bearing depilatory and accidental or suicidal ingestion of rat poison. Acute poisoning results in swelling of the feet and legs, arthralgia, vomiting, insomnia, hyperesthesia and paresthesia [numbness] of the hands and feet, mental confusion, polyneuritis with severe pains in the legs and loins, partial paralysis of the legs with reaction of degeneration, angina-like pains, nephritis, wasting and weakness, and lymphocytosis and eosinophilia. About the 18th day, complete loss of the hair on the body and head may occur. Fatal poisoning has been known to occur. Recovery requires months and may be incomplete. Industrial poisoning is reported to have caused discoloration of the hair (which later falls out), joint pain, loss of appetite, fatigue, severe pain in the calves of the legs, albuminuria, eosinophilia, lymphocytosis and optic neuritis followed by atrophy. Cases of industrial poisoning are rare, however. Thallium is an experimental teratogen [used to induce birth defects for study]. When heated to decomposition they [sic] emit highly toxic fumes of Tl [thallium]. See also THALLIUM and specific compounds.[24]

Fig. 61 Thallium excerpt.

Thallium pollution frightens me more than lead, cadmium and mercury combined, because it is completely unsuspected. Its last major use, rat poison, was banned in the 1970s. Every wheelchair patient I tested was *Positive* for

thallium! One current use for thallium is in Arctic/Antarctic thermostats. When added to mercury the mercury will stay liquid at lower temperatures. Are mercury suppliers then providing the dental industry with tainted amalgam?

The cancer causing or carcinogenic action of metals has been studied for a long time, although it doesn't get attention by our regulatory agencies. A scientific book on this subject was published in 1980.[25] One table from this book is shown on. We can see that chromium and nickel compounds are the most carcinogenic metals. Nickel is used in gold crowns, braces, and children's crowns!

Fig. 62 More dental metal.

Note that the form of the metal is very important. For instance chromium is an essential element of *glucose tolerance factor*, but most of its other compounds are extremely toxic. In general, xenobiotic compounds (foreign) are to be avoided! Metal doesn't belong in our foods or in our bodies.

Dental Rewards

After your mouth is metal and infection-free, notice whether your sinus condition, ear-ringing, enlarged neck glands, headache, enlarged spleen, bloated condition, knee pain, foot pain, hip pain, dizziness, aching bones and joints improve.

Fig. 63 Beautiful plastic mouth.

Keep a small notebook to write down these improvements. It will show you which symptoms came originally from your teeth. Symptoms often come back! So go back to your dentist, to search for a hidden infection under one or more of your teeth, or where your teeth once were! That infection can be the cause of tinnitus, TMJ, arthritis, neck pain, loss of balance, and heart attacks!

Fig. 64 Ugly metal in mouth.

Dentures can be beautiful. Of course, plastic isn't natural, but it is the best compromise that can be made to restore your mouth. At least it isn't positively charged like metals; it can't set up an electric current nor a magnetic field in your mouth, all of which may be harmful.

Do not be swayed by arguments that plastic is not as strong as metal. You see dentures everywhere and they seem strong enough to eat with. You will be told that “noble” metals like gold and platinum and silver are OK, that they are “inert” and do not corrode or seep. Nothing could be more untrue. You may be keeping them glossy by the constant polishing action of your toothpaste. But if you look at the underside, the view is frightful. **Everything tarnishes and everything seeps.** You wouldn't expect even a gold or silver coin that was dropped in a fountain 50 years ago to be intact. As metal corrodes your body absorbs it!

In breast cancer, especially, you find that metals from dentalware have dissolved and accumulated in the breast. They will leave the breast if you clear them out of your mouth (and diet, body, home). **The cysts shrink and are simply gone.** No need to do surgery!

Diet Clean Up

Breakfast

Cook your cereal from scratch. Don't eat cold cereal; it has numerous solvents and molds. Buy hot cereals that say “no salt added,” like cream of wheat, steel cut oats or old fashioned oats,[26] millet, corn meal, cream of rice, or Wheatena. Cook it with milk to add nutritive value. Add your own (non-aluminum) salt and a pinch of vitamin C before cooking. Make granola from a recipe (see *Recipes*). Use honey, or brown sugar. Add raisins that were soaked for 5 minutes in vitamin C water. Use whipping cream or butter (both boiled) if you need to gain weight. Isn't this a delicious way to start your day! Add cinnamon to flavor, or frozen fruit and honey.

Fig. 65 Unpolluted breakfast cereals

Or start your day with fried potatoes, an egg, and glass of milk. don't worry about cholesterol since you will be doing *Liver Cleanses* anyway. (We have been told that eggs carry *Salmonella* bacteria. I found *Salmonellas* only on the outside shell and the egg carton—never inside! Could the researchers have accidentally transferred the bacteria from the shell to the inside while they were testing?)

The milk should be 2% or more butterfat because the calcium in milk cannot be absorbed without at least this much fat. Eat homemade yogurt and add honey or homemade preserves yourself. You need 3 cups of a milk product each day. Homemade buttermilk is fine. If you don't tolerate milk, and get diarrhea from it, try a milk digestant tablet to go with it. Start with only ¼ cup at a time. Do not choose chocolate milk. There is no substitute for milk; calcium tablets are not satisfactory. Vegetable matter, although high in calcium, does not give you *available* calcium either, unless you buy a juicer and make vegetable juice out of it. Eating fish can give you a lot of calcium, but it is in the tiny bones hidden in the fish. Don't try to remove them. Canned salmon has a lot of calcium; tuna does not. On a day that you eat fish, you would not need milk. Goat milk is probably better than cows' milk, but more difficult to get used to.

Lunch

Cook your food from scratch. Don't start with cans or packages or frozen items to make some recipe. In fact, don't bother with any fancy recipes. Just cook two or three vegetables for lunch and eat them with butter and salt or homemade sauces. Bread and milk rounds it out, plus fruit (not canned or frozen). Soup is a nice change. Cook it with all the vegetables you can find. Don't start with a can or packet or cube. Use a bit of onion and genuine herbs to give it zest. Thyme and fenugreek, together, make a flavorful combination you can purchase in capsules. Just pull apart and season.

If all this is too much work, make fresh vegetable juice once a week and freeze enough so that you can have a daily nutritious meal just by pouring a glass of it, together with bread and yogurt or milk.

Never diet during illness

This is a rule based on common sense. A weight-loss diet must wait at least two years.

Bake your own bread! I found aflatoxin in commercial bread after just four days in my breadbox, but none in homemade bread even after two weeks! Aflatoxin is a most potent carcinogen and immunosuppressant. Aflatoxin is the toxin in your diet that keeps you from clearing propyl alcohol from your body (see 389)! Aflatoxin is a substance made by mold; bread starts to mold on the grocery store shelf. Don't buy plastic-wrapped bread. Don't ever salvage moldy food, whether it is fruit, breads or leftovers in the refrigerator. Throw them out. Buy a bread maker. It can do everything, including baking the bread. Use unbleached (unbrominated) flour and add ½ tsp. vitamin C powder per loaf to help retard mold further (it also makes the bread rise higher).

Supper

Cook your supper from scratch. Emphasize fish for animal food, not beef, pork, turkey or chicken. Don't buy breadcrumbs, use your own. Don't buy batter, make your own. Use genuine eggs, not substitutes. Wash your hands after handling raw meat or eggs.

Make your own salad and salad dressing out of olive oil, fresh lemon juice or white distilled vinegar (apple cider vinegar has aflatoxins), honey, salt and herbs to flavor. If your digestion isn't strong enough for raw vegetables or fruit, make juice. Get a sturdy juicer and make your juice about half carrot juice and half

from vegetables like celery, squash, lettuce, and broccoli. Make your own tomato sauce with pure herb seasoning, not from a jar or can (home canned foods are fine, of course, as long as they are not made in a big aluminum pot with aluminum-containing salt).

Cook real potatoes, not instant varieties. Peel them to get rid of Kojic acid (mycotoxin) and scopolamine (the green part). Make mashed potatoes from scratch, with milk, not box potatoes, nor chips nor French fries. Chips and fries were made in chemical grease called “hydrogenated.” There is a large amount of nickel in hydrogenated fats.[27] Fry your potatoes in butter, lard or olive oil. Find butter that is not wrapped in foil and is not salted. Salt your own butter, using aluminum-free salt.[28] Don't wrap potatoes in foil to bake, coat with butter or olive oil. Don't eat the peels.

Eat no meat that hasn't been cooked as thoroughly as if it were pork.

Other animals are as parasitized as we, full of flukes and worms and *schistosomes* in every imaginable stage, and if the blood carries these, would we not be eating live parasites if we eat animals in the raw state? We have been taught to cook thoroughly any pork, fish or seafood. Now we must cook thoroughly any beef, chicken or turkey. It must be at cooking temperature (212°F or 100°C) for 20 minutes. Freezing is not adequate. Canned meats are safe from living parasites, but are not recommended due to added chemicals.

Beverages

Drink 6 kinds of beverages:

- milk
- water
- fruit juices
- vegetable juices
- herb teas
- homemade (see *Recipes*)

This means getting off caffeine. And if you are already fatigued, this means you might be even more fatigued for a short time. You might have headaches

from withdrawal, too. But they will only last 10 days. Mark your calendar and count off the days. Take headache medicine, if necessary, but make sure it does not contain caffeine. For energy, to replace caffeine, take one arginine (500 mg, see *Sources*) upon rising in the morning and before lunch. Soon you won't need it.

Cutting down on coffee, decaf, soda pop and powdered drinks won't do. You must be completely off. They contain very toxic solvents due to careless, unregulated production methods. Much is imported and can't be sufficiently regulated.

Even though grain (drinking) alcohol is the recommended substitute for propyl alcohol, that doesn't mean you may safely drink it. It is inadvisable to drink any form of alcohol at least until you are fully recovered.

1. Milk: 2% or higher, drink three 8 oz. glasses a day. Alternate brands. Buttermilk will do. Homemade yogurt is fine. Goat milk is also fine. Start with ¼ cup and increase gradually, if you are not used to it. If you do not drink milk because it gives you more mucous, try to drink milk anyway. If you have other reactions, like diarrhea, try milk digestant tablets (available at health food stores). Milk is too valuable to avoid: there are many unwanted chemicals in most brands of milk, but it is solvent-free, mold-free and very nutritious. The only exception should be for serious symptoms, like swelling, colitis, flu, or chronic diarrhea.

But all milk, whether goat or cow, is contaminated with *Salmonella* and *Shigella* bacteria as well as fluke parasite stages. Cattle are immunized against *Salmonella* but it does not prevent its persistence in the bowel. All these are very harmful. Pasteurization does not kill all of them. Only heating to a rolling boil makes milk safe. To do this in the easiest way, pour 1 or 2 quarts milk into an enamel double boiler or microwavable glass jar. Stay in the kitchen while the heat is on. When the bubbles have risen to indicate boiling, turn off the heat. You may throw away the “skin”. Pour into glass jar and refrigerate. Another easy way is to use a pressure cooker that holds several pint jars of milk. All dairy products that have only been pasteurized are still contaminated. Ultra pasteurization does not improve matters. Dairy products that cannot be sterilized should not be consumed. It may be possible to find sterilized milk in paper containers on the store shelf—not in the refrigerator; if it wasn't sterile it would go foul in a day! Canned milk has solvent pollution. Powdered milk has both solvent and bacterial pollution.

2. Water: 2 pints. Drink one pint upon rising in the morning, the other pint in the afternoon sometime. The cold water faucet may be bringing you cadmium, copper or lead, but it is safer than purchased water, which inevitably has solvents in it. Let it run before using it. Filters are rather useless because water pollution comes in surges. A single surge of PCB contaminates your filter. All the water you use after this surge is now polluted, so you will be getting it chronically, whereas the unfiltered water cleans up again after the surge passes. Until you can test your own water for solvents, PCBs and metals, no expensive filter is worth the investment. An inexpensive pure carbon filter that is replaced every month may improve your tap water. Inflexible plastic pitchers fitted with a carbon filter pack are available (see *Sources*). Never buy filters with silver or other chemicals, even if they are just added to the carbon. Keep the filter sterile by soaking in diluted grain alcohol weekly.

3. Fruit juice: fresh squeezed only. Some stores make it while you wait. If they freeze some of it, you could purchase the frozen containers. Bottled fruit juices have traces of numerous solvents, as do the frozen concentrates, as do the refrigerated ones, don't buy them. You have to see it being made, but watch carefully: I recently went to a juice bar where they made everything fresh, before your very eyes. And I saw them take the fruit right from the refrigerator and spray it with a special wash “to get rid of any pesticides", then put a special detergent on it to clean off the wash! So instead of getting traces of pesticide, I got traces of propyl alcohol![29] Another grocery store had a machine that squeezed the oranges while you watched. But if you did not watch them filling the jugs, you missed seeing them add a tablespoon of concentrate, from a bottle out of sight, to give it better flavor. It still qualifies as “Fresh squeezed 100% orange juice,” but thanks to that concentrate it now has toluene and xylene in it! Best of all, buy a juicer, select completely unbruised fruit, wash with plain water, and make your own juice (enough for a week—freeze it in half pint plastic bottles). For stronger flavor, leave some of the peel in the juice.

4. Vegetable juice: fresh or frozen only. If you or a friend would be willing to make fresh juice, this would be much better than purchased juice. Start with carrot juice. Peel carrots (don't scrape them, it's too easy to miss small dirt spots) and remove all blemishes carefully, then rinse. Drink ½ glass a day. After you are accustomed to this, add other vegetables and greens to the juice to make up half of it. Use celery, lettuce, cabbage, cucumber, beet, squash, tomato, everything raw that you normally have in your refrigerator. Then drink one glass a day.

5. **Herb tea**: fresh or bulk packaged. Tea bag varieties are moldy. Buy a non-metal (bamboo is common) tea strainer. Sweeten with honey or brown sugar with vitamin C added.

6. **Homemade beverage**. If you will miss your coffee or decaf, try just plain hot water with boiled whipping cream. Sweeten with honey. Please see *Recipes* for many more suggestions.

Horrors In Commercial Beverages

Commercial beverages are especially toxic due to traces of solvents left over from the manufacturing process. There are solvents in decaffeinated beverages, herb tea blends (not single herb teas), carbonated drinks, beverages with NutraSweetä, flavored coffee, diet and health mixes, and fruit juices, even when the label states “not from concentrate” or “fresh from the orchard,” or “100% pure.”

It is allowable to use solvents to clean machinery used in bottling (please look again at)! It is also allowable to use solvents to make spice oleoresins, which are used as flavoring.

> 21 CFR 173.240 (4-1-94 Edition) Isopropyl Alcohol.
>
> Isopropyl alcohol may be present in the following foods under the conditions specified:
>
> In spice oleoresins as a residue from the extraction of spice, at a level not to exceed 50 parts per million.
>
> In lemon oil as a residue in production of the oil, at a level not to exceed 6 parts per million.
>
> [Discusses its use in hops extract.]

Here is a summary of other solvents mentioned:

Solvent	Allowable residue in spice oleoresins	Paragraph in 21 CFR
Acetone	30 PPM	173.210
Ethylene dichloride	30 PPM	173.230
Methyl alcohol	50 PPM	173.250
Methylene chloride	30 PPM	173.255
Hexane	25 PPM	173.270
Trichloroethylene	30 PPM	173.290

Fig. 66 Lawful uses of solvents in food

I have found all these solvents and others in commercial beverages! Some of the solvents I have found are just too toxic to be believed! Yet you can build the test apparatus yourself, buy foods at your grocery store, and tabulate your own results. I hope you do, and I hope you find that the food in your area is cleaner than mine! Remember that the Syncrometer® can only determine the presence or absence of something, not the concentration. There may only be a few parts per

billion, but a sick person trying to get well cannot afford any solvent intake. For that matter, none of us should tolerate any of these:

- **Acetone** in carbonated drinks
- **Benzene** in store-bought drinking water (including distilled), store-bought fruit juice (including health varieties)
- **Carbon tetrachloride** in store-bought drinking water
- **Decane** in health foods and beverages
- **Hexanes** in decafs
- **Hexanedione** in flavored foods
- **Isophorone** in flavored foods
- **Methyl butyl ketone** and **Methyl ethyl ketone** in flavored foods
- **Methylene chloride** in fruit juice
- **Pentane** in decafs
- **Propyl alcohol** in bottled water, commercial fruit juices, commercial beverages.
- **Toluene** and **xylene** in carbonated drinks
- **Trichloroethane**(TCE), **TC Ethylene** in flavored foods
- **Wood alcohol** (methanol) in carbonated drinks, diet drinks, herb tea blends, store-bought water, infant formula

Fig. 67 Some unsafe beverages

If you allowed a tiny drop of kerosene or carpet cleaning fluid to get into your pet's food every day, wouldn't you expect your pet to get sick? Why would you not expect to be sick with these solvents in your daily food? I imagine these solvents are just tiny amounts, introduced by sterilizing equipment, the manufacturing process, and adding flavor or color. Flavors and colors for food must be extracted somehow from the leaves or bark or beans from which they come. But until safe methods are invented, such food should be considered unsafe for human consumption (or pets or livestock!).

Food Preparation

Cook your food in glass, enamel, ceramic or microwavable pots and pans. Throw away all metal ware, foil wrap, and metal-capped saltshakers since you will never use them again. If you don't plan to fry much (only once a week), you might keep the Teflon™ or Silverstone™ coated fry-pan, otherwise get an enamel coated metal pan. Stir and serve food with wood or plastic, not metal utensils. If you have recurring urinary tract infections, you should reduce your metal contact even further; eat with plastic cutlery. Sturdy decorative plastic ware can be found in hardware and camping stores. Don't drink out of Styrofoam cups (styrene is toxic). Don't eat toast (many toasters spit tungsten all over your bread and make benzopyrenes besides). Don't buy things made with baking powder (it has aluminum) or baked in aluminum pans. Choose goods made with baking soda and sold in paper or microwavable pans. Don't run your drinking water through the freezer or fountain or refrigerator. Don't heat your water in a coffee maker or teakettle. Don't use a plastic thermos jug (the plastic liner has lanthanides) the inside must be glass. Don’t drink from a personal water bottle (it

begins to breed bacteria) unless you sterilize it daily.

Why are we still using stainless steel cookware when it contains 18% chromium and 8% nickel? Because it is rustproof and shiny and we can't see any deterioration. **But all metal seeps!** Throw those metal pots away. Get your essential minerals from foods, not cookware.

Never, never drink or cook with the water from your hot water faucet. If you have an electric hot water heater the heating element releases metal. Even if you have a gas hot water heater, the heated water leaches metals or glues from your pipes. If your kitchen tap is the single lever type, make sure it is fully on cold for cooking. Teach children this rule.

Food Guidelines

It is impossible to remember everything about every food, but in general do not buy foods that are highly processed. Here are a few foods; see if you can guess whether they should be in your diet or not.

breads	Yes, but only from a bakery, and never wrapped in plastic.
toast	No. It has benzopyrene and tungsten. Yes, if made on a cookie sheet or in a frying pan.
cheese	Yes, if used in baked dishes.
chicken	Only if cooked for 20 minutes at boiling point, as in soup, or canned (never prepare raw chicken yourself).
wine with dinner	No.
peanut butter	Yes if you grind it yourself and add ¼ tsp. vitamin C powder as you grind.
cottage cheese	No, it can't be sterilized easily.
desserts	Yes, but again, only if flavored with safe extracts.
rice	Yes, if vitamin C is added before cooking. Use white only, brown is too moldy.
pasta	Yes, with homemade sauce and vitamin C.
Jell-Otm	No, it has artificial flavor and color.
	Yes, but not “imitation”, cholesterol-free or cholesterol-reduced

egg dishes	varieties.
fish, seafood	Yes!
soy foods (tofu)	No. It's the extensive processing that taints it.
soup	Yes, if seasoned only with herbs (no bouillon cube).
sugar	Yes, Turbinado or brown if treated with vitamin C.
herb tea	Yes, if not in a bag and not in a mixture of herbs.
cheesecake	Yes.

Fig. 68 Some good foods

Choose brands with the shortest list of ingredients. Alternate brands every time you shop.

All breads I tested had mold if they were in plastic.

Fig. 69 Bread, plastic, mold

Dining Out

Restaurants (excluding fast food) are generally quite safe to eat at. Here are some do’s and don’ts:

Do carry your own aluminum-free salt and vitamin C powder with you.

Do ask for plastic cutlery.

Do drink the water if from the tap.

Do ask for boiled, not just steamed, milk.

Don’t eat or drink from Styrofoam. If getting food “to go,” get it in clear plastic containers, or ask them to line the Styrofoam container with paper or plastic wrap, and line the Styrofoam cup with a plastic baggy.

Don’t use their ketchup and condiments (they have been standing out too long).

Here is a list of things that are generally safe to order:

pancakes, French toast, waffles	Don't use their imitation syrup (has benzoate), use honey instead.
eggs	Any style except soft boiled and scrambled. The white should be solid.
hash browns	If lightly fried, not deep fried.
soup	Only if nothing else is available. (It probably came in a can and was cooked in an aluminum pot and is full of aluminized salt.)
vegetarian sandwiches	But no soy products (too processed).
baked or boiled potatoes	Use only cheese sauce, bring your own salt; don't eat the skin.
cooked vegetables	Broccoli, Brussels sprouts, beets, corn, squash and so forth.
vegetable salads	Don't eat the croutons, bacon bits, and anything that doesn't look fresh.
vegetarian dishes	But no soy ingredients and or sauces. Fresh ketchup OK.
bread and biscuits	White only, not toasted, not “cholesterol-free” varieties.
fish and seafood	Anything but deep fried (the oil may have benzene) is fine: baked, steamed, fish cakes, seafood cocktails, etc.
Mexican food	Any of the numerous baked dishes.

Chinese food	Except dishes with tofu or MSG.
fruit cup	With honey and cinnamon.
fruit pies, cobblers	But not with ice cream (every flavor has benzene).
lemon or lime meringue pie	Indulge yourself.

Fig. 70 Good restaurant foods.

As you see your symptoms disappear, one after another, you will feel the magic of healing. Many sick persons have 50 or more symptoms to start out! They could fill two sheets of paper, one symptom to each line. It can be quite shocking to see a list of all your symptoms.

Sometimes a new symptom appears as fast as an old one disappears. The coincidence makes it tempting to believe that one symptom turns into a different one. But it is not so. If a new symptom appears, it is because another pathogen has become activated due to a new toxin. Try to identify the new item. Stop using any new food, supplement, or body product, even if it is a health variety, and see if it goes away.

Body Clean Up

We are living in a very fortunate time. We are not expected to all look alike! The 60's brought us this wonderful freedom. Freedom to dress in a variety of styles, use make-up or no make-up, jewelry or no jewelry, any kind of hair style, any kind of shoes.

You will need to go off every cosmetic and body product that you are now using. Not a single one can be continued. They are full of titanium, zirconium, benzalkonium, bismuth, antimony[30] , barium[31] , strontium[32] , aluminum, tin, chromium, not to mention pollution solvents such as benzene and PCBs.

Do not use any commercial salves, ointments, lotions, colognes, perfumes, massage oils, deodorant, mouthwash, toothpaste, even when touted as “herbal” and health-food-type. See *Recipes* for homemade substitutes.

People are trying desperately to use less toxic products. They seek health for themselves. So they reach for products that just list herbs and other natural

ingredients. Unfortunately, the buyers are being duped. The Food and Drug Administration (FDA) requires all body products to have sufficient antiseptic in them. Some of these antiseptics are substances you must avoid! But you won't see them on the label because manufacturers prefer to use quantities below the levels they must disclose. And by using a variety of antiseptics in these small amounts they can still meet sterility requirements. The only ingredient you might see is “grapefruit seed” or similar healthy-sounding natural antiseptic. This is sad for the consumer of health food varieties.

- I have seen rocks sold as “Aluminum-Free Natural Deodorant”. You rub the rock under your arms. It works because the rock is made of magnesium-aluminum-silicate.
- Men's hair color has lead in it.
- Lipstick has barium, aluminum, titanium.
- Eye pencil and shadow have chromium.
- Toothpaste has benzene, tin, and strontium.
- Hair spray has propyl alcohol and PCBs. BEWARE! Stop using it today.
- Shampoo, even health varieties, has propyl alcohol! BEWARE! Stop using it today.
- Cigarettes have lead, mercury, nickel and *Tobacco Mosaic virus.*
- Chewing tobacco has ytterbium

Some of the unnatural chemicals listed are present because of residues in the manufacturing process, but others you will actually see listed on the label!

Propyl alcohol and wood alcohol are present because the tubing used to fill the bottles is sterilized and cleaned with them. Ice cream machines are “oiled” with a gel containing petroleum products. This could explain why I always find benzene in ice cream.

Fig. 71 Examples of commercial "food lube."

How can propyl alcohol in shampoo get into your body in significant amounts? The skin is more absorbent than we realize, and time and time again I see cancer victims who have gone off every body product except their favorite shampoo. They harbor propyl alcohol until they make that final sacrifice. It is better to switch shampoos than to not need any due to radiation and chemotherapy!

See *Recipes* for easy-to-make, natural cosmetics. But you might consider just stopping them all. Especially if you're going on vacation.

Use nothing that you wouldn't use on a new-born baby. This is a permissive age. You will be the only one feeling "naked." Others won't even notice. Don't forget advertising is aimed at you, even if other people's eyes are not!

Don't even use soap unless it is homemade soap (see *Recipes*) or borax straight from the box. Borax was the traditional pioneer soap. It is antibacterial and can be made into a solution. It is also a water softener and is the main ingredient in non-chlorine bleach. Borax can remove grease, too, and some stains. But even borax is not natural to your body and it is therefore wise to use as little as necessary. See *Recipes* for antibacterial borax soap.

Don't use toothpaste, not even health-food varieties. To clean teeth, use plain water or chemically pure baking soda (see *Sources*)—but dissolve it in water first, otherwise it is too abrasive. Or brush with hydrogen peroxide food grade, not the regular variety (see *Sources*). Don't use floss; use 2 or 4-pound monofilament fish line. Floss has mercury antiseptics (with thallium pollution!). Throw away your old toothbrush—solvents don't wash away.

Dishes and clothing are primary source of PCBs.

Fig. 72 Detergents with PCBs

homemade soaps pure borax

Fig. 73 Safe soaps

Don't use mouthwash. Use saltwater (aluminum-free salt) or food grade hydrogen peroxide (a few drops in water).

Don't use hair spray.

Don't use massage oils of any kind. Use olive oil.

Don't use bath oil. Take showers, not baths, if you are strong enough to stand. Showers are cleaner.

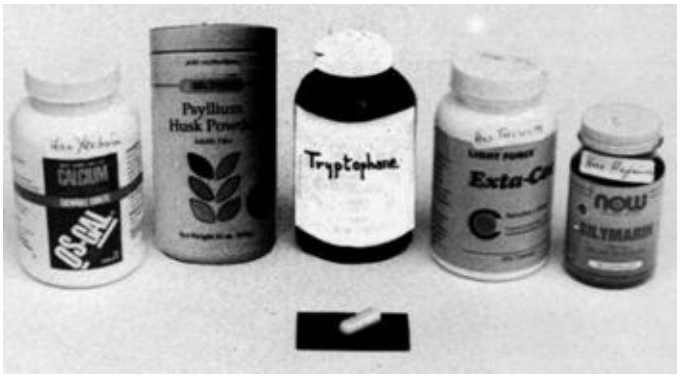
Don't use perfumes or colognes.

Don't use commercial lotions or personal lubricants.

Stop Using Supplements

Stop using your vitamin supplements. They, too, are heavily polluted. This is the saddest, most tragic part of your instructions. I have found solvents, heavy metals and lanthanides in 90% or more of the popular vitamin and mineral

capsules and tablets I test. These substances will do more harm in the long run than the supplement can make up for in benefits.



The capsule in the foreground is a notorious tryptophane capsule. It had the following pollutants: PCBs, mercury, ruthenium, thulium, strontium, praseodymium, aluminum, benzalkonium.

Fig. 74 Many supplements are polluted.

Most of the varieties of vitamin C that I have tested are polluted with thulium! Until all vitamins and minerals and other food supplements have been analyzed for pollutants, after they are encapsulated or tableted, they are not safe. We need more disclosure on our products. No manufactured product is pure. We can't expect that. But at least we should be able to tell what impurities we are getting, and how much.

It is possible to do detailed analysis of foods or products at a reasonable price. Look at the bottle of common table salt, sodium chloride that is used by beginning chemistry students to do experiments. It must be thoroughly analyzed for them because minute impurities affect their results. (Those minute impurities, like lead, affect you, too.) Look at the label on the bottle in the picture. Even after all these tests, the cost of laboratory salt is only $2.80 per pound.[33]

It is most important not to be fooled by ingredient claims, like “made from organically grown vegetables”. Sure that's great, but the analysis *I* trust would be done on the final, cleaned, cooked and packaged product on the shelf. The package is a major unlisted ingredient.

Fig. 75 Pure salt

Toxic solvents like decane, hexane, carbon tetrachloride and benzene will get more flavor or fat or cholesterol out of things than metabolizable grain alcohol. Of course, the extraction process calls for washing out the solvent later. But it can't all be washed out, and a detailed analysis on the final product would give the public the information they need to make informed choices.

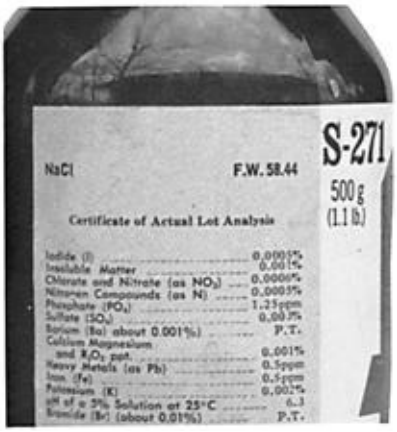
All supplements must be tested for purity by yourself. If this cannot be done, don't take them.

Polluted supplements do much more harm than good. Get your super-nutrition by juicing vegetables of all kinds and making herbal teas.

Safe Supplements

There are, no doubt, lots of safe supplements to be had. The problem is knowing which they are. The nature of pollution is such that one bottle might be safe, while another of the same brand is not. In view of this, as I found a polluted bottle, I stopped using any more of that brand. That is why I am reduced to recommending only the ones in the *Sources* at this time.

Vitamin C, in crystal form, is a must in your lifestyle. It helps the liver, and possibly other organs, detoxify things. It also helps retard mold, and perhaps even destroys aflatoxins! Keep some next to your refrigerator so it is handy when you put away groceries. Add 1/8 tsp. to maple syrup, vinegar, cooked cereal, fruit juice, and leftovers. Have ¼ tsp. (1 gram) with each meal.



Common salt for student use is thoroughly analyzed for pollution. The label gives you the final "Actual Lot Analysis" of the product. It is not expensive.

Fig. 76 Laboratory salt label

Vitamin B_2, 100 mg. This is the vitamin that helps detoxify benzene! Take one to three a day. While recovering from AIDS you need 3 tablets three times a day.

Vitamin B_6, 250 mg, and B-complex, 50 mg. Undoubtedly these help the liver and kidneys in many ways. One a day.

Magnesium oxide, 300 mg., is another must. Take one or two a day. It is a major mineral; all of our cells need lots of it. Only leafy vegetables provide it.

Hydrogen peroxide, food grade. It is advantageous to kill bacteria and viruses to some extent every day. Hydrogen peroxide lets you do this. It should never come in contact with metal, including its container or metal tooth fillings. If you get a few drops on your skin it may turn white and sting, but does no harm, so simply wash it off. Instructions for its use come with the product.

Herbs. These are excellent supplements, both in bulk and capsules, <u>but not extracts, concentrates, or concoctions</u>. There are many books that describe their uses.

Thioctic acid or lipoic acid. Presumably this chelates (traps and prepares for elimination) heavy metals, and helps the liver in detoxifying obscure and deadly poisons. Everyone would benefit from 100 mg. per day. I find it outstanding, and give it to many ill persons, even when not mentioned in the case histories. It comes as a 100 mg. capsule (see *Sources*). I use it at doses from one capsule, 3 times a day, to 2 capsules, 5 times a day. I have seen no side effects at these

dosages, even in very sick persons.

Lugol's Iodine Solution (see *Recipes*) is old-fashioned "iodine." Iodine has a distinctive trait: it hangs up on anything and everything. In fact, it attaches itself so quickly we consider everything it touches as "stained." This is just the property we want to make it safe for use. The amount you use is immediately hung up, or attached, to your mucous and can not be quickly absorbed into the blood or other organs. It stays in the stomach. And for this reason it is so useful for killing vicious bacteria like *Salmonella*.

Do not take Lugol's iodine if you know you are allergic to iodine. It could be fatal.

Six drops of Lugol's solution can end it all for *Salmonella*. If you have gas and bloating, pour yourself ½ glass of water. Add 6 drops of Lugol's (not more, not less), stir with wood or plastic, and drink all at once. The action is noticeable in an hour. Take this dose 4 times a day, after meals and at bedtime, for 3 days in a row, then as needed. This eradicates even a stubborn case of *Salmonella*.

Notice how calming 6 drops of Lugol's can be, soothing a manic stage and bringing a peaceful state where anxiety ruled before.

Lugol's is perfectly safe (if not allergic) to take day after day, when needed, because of its peculiar attaching property. It arrives in the stomach, reattaches to everything in proximity. Doomed are all *Salmonellas*; doomed also are eggs of parasites that might be in the stomach (cysts).

Naturally, one would not leave such medicine within the reach of children. Also, one would not use anything medicinal, including Lugol's unless there were a need, like cancer, AIDS, or bowel disease. When the gas and bloating problem has stopped, stop using Lugol's. If one or two doses of Lugol's cures the problem, stop. Store it in a perfectly secure place. In the past, 2/3 of a teaspoon (60 drops) of Lugol's was the standard dose of iodine given to persons with thyroid disease. Six drops is small by comparison.

Turmeric and **fennel** are herbs also used as cooking spices. They can eradicate invasive *E. coli* and *Shigella* bacteria! They are completely harmless, and are part of the *Bowel Program*.

Other supplements. The concept of supplementing the diet is excellent, but the pollution problem makes it prohibitive. Use only supplements and brands

recommended in *Sources,* although the best approach is to test them yourself with your Syncrometer® . I can't guarantee the brands in *Sources* will stay pure. If in doubt, leave it out.

Home Clean Up

This is the easiest task because it mostly involves throwing things out. Hopefully your family and friends will jump to your assistance.

- The basement gets cleaned.
- The garage gets cleaned.
- Every room in the house gets cleaned.

Your Basement

To clean your basement, remove all paint, varnish, thinners, brush cleaners, and related supplies. Remove all cleaners such as carpet cleaner, leather cleaner, rust remover. Remove all chemicals that are in cans, bottles or buckets.

You may keep your laundry supplies: borax, washing soda, white distilled vinegar, bleach and homemade soap. You may keep canned goods, tools, items that are not chemicals. You may move your chemicals into your garage. Also move any car tires and automotive supplies like waxes, oil, transmission fluid, and the spare gas can (even if it is empty) into your garage or discard them.

Seal cracks in the basement and around pipes where they come through the wall with black plastic roofing cement. In a few days it will be hard enough to caulk with a prettier color. Spread a sheet of plastic over the sewer or sump pump.

Your Garage

Do you have a garage that is a separate building from your home? This is the best arrangement. You can move all the basement chemicals into this garage. Things that will freeze, such as latex paint, you may as well discard. But if your garage is attached, you have a problem. Never, never use your door between the garage and house. Walk around the outside. Don't allow this door to be used. Tack a sheet of plastic over it to slow down the rate of fume entrance into the

house. Your house acts like a chimney for the garage. Your house is taller and warmer than the garage so garage-air is pulled in and up as the warm air in the house rises. See the drawing.

In medieval days, the barn for the animals was attached to the house. We think such an arrangement with its penetrating odors is unsavory. But what of the gasoline and motor fumes we are getting now due to parked vehicles? These are toxic besides! This is even more medieval.

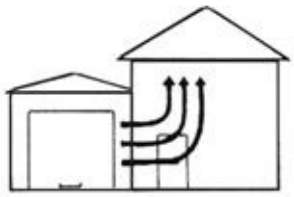


Fig. 77 Garage fumes

If your garage is under your house, you cannot keep the pollution from entering your home. In this case, leave the cars and lawnmower outside. Remove cans of gasoline, solvents, etc. Put up a separate shed for these items.

Special Clean Up for Freon (CFCs)

Because I consider Freon to be the top health hazard in our home, I recommend turning in your refrigerator for a non-CFC variety. Dispose of all spare units. Remove window air conditioners or test the dust in your home for Freon. Have your car's air conditioning system checked. Dispose of old pressurized cans. Even one whiff is too much. It never leaves the body because the body has no detoxification methods for it!

Only one useful reaction with Freon comes to mind. Freon is thought to be responsible for the ozone "hole" at the South Pole. Would Freon react with ozone supplied to your body and thereby become biodegradable? Indeed, it does…but only if you drink it as ozonated water! Other ozone routes, as intravenous or rectal, have not been observed to be as effective.

If you are following your progress with the Syncrometer®, you will see that Freon now appears in the liver for the first time. (Before this, it was marooned in the parathyroids, thymus, and other organs.) You may also detect a feeling like indigestion. You must come to the assistance of your liver. Even ozonated Freon

is extremely burdensome to the liver.

A combination of herbs (Liver Herb Drink in *Recipes*) rescues the liver from its plight, and prevents the indigestion. After drinking liver herbs you will see that the Freon now appears in the kidneys. Yet it is marooned there unless you assist them. Take the *Kidney Cleanse* to assist the kidneys so they can finally excrete the Freon into the urine.

It's an elaborate detoxifying program and usually takes six to eight weeks to get most of the Freon out. Afterward, continue the programs at one-fourth dosage for half a year.

Forane is one of the new refrigerants. Although toxic, at least I observe it in the liver directly, suggesting that your body is capable of handling it. Remember your new refrigerator will still be using a toxic coolant, and it would be best to keep it outside or at least vented to the outside.

Special Clean Up for Fiberglass

Fiberglass insulation has microscopically small bits of glass that are free to blow into the air. When house drafts pull it into the air you will inhale them. They cut their way through your lungs and organs like millions of tiny knives, spreading through your body, since there is no way out for them. You smell nothing and feel nothing. This makes it a very sinister poison. Your body, though, recognizes these sharp, pointed bits and tries to stop their spread by sequestering them in cysts.

Most solid malignant tumors contain fiberglass or asbestos, another glass-like particle. In nearly all cases a hole can be found in the ceiling or walls, leading to fiberglass insulated parts of the house. When these holes are sealed in an air-tight manner the house air no longer is *Positive* for fiberglass. Covering with paneling is not sufficient. Check your dwelling for uncovered fiberglass. Repair immediately. Search for small screw holes intended for pictures, or electric outlet plates that are missing.

Also remove fiberglass jackets from water heater and fiberglass filter from furnace. Replace with foam or carbon. Best of all, hire a crew to remove it all from your home, and replace insulation with blown-in shredded paper or other innocuous substance.

<u>Never</u> build a new house using fiberglass for <u>any</u> purpose.

Special Clean Up for Asbestos

The biggest source of asbestos is not building materials! It is the clothes dryer belt and hair dryer! To be safe, remove the belt from your dryer and check to see if it says “Made in USA” on the belt itself. If so, it is OK. If not, it is imported, and probably contains asbestos. Exchange it for a USA belt (see *Sources*).

Hair dryers, too, may be imported and shed asbestos. It is especially hazardous to be aiming a stream of hot asbestos right at your face! If you can't find a safe model (see *Sources*), or are unsure, don't use any. If you have cancer or are ill, no one in the house should use an unsafe hair dryer.

Turn off radiators and electric heaters and cover them with big plastic garbage bags, or paint them, or remove them. They give off asbestos if their paint is old.

Your House

To clean the house, start with the bedroom. Remove everything that has any smell to it whatever: candles, potpourri, soaps, mending glue, cleaners, repair chemicals, felt markers, colognes, perfumes, and especially plug-in air “fresheners”. Store them in the garage, not the basement. Since all vapor rises, they would come back up if you put them in a downstairs garage or basement.

Do not sleep in a bedroom that is paneled or has wallpaper. They give off arsenic and formaldehyde. Either remove them or move your bed to a different room. Leave the house while this is being done. If other rooms have paneling or wallpaper, close their doors and spend no time in them.

Next clean the kitchen. Take all cans and bottles of chemicals out from under the sink or in a closet. Remove them to the garage. Keep only the borax, washing soda, white distilled vinegar and homemade soap. Use these for all purposes. For exact amounts to use for dishwasher, dishes, windows, dusting, see *Recipes*. Remove all cans, bottles, roach and ant killer, moth balls, and chemicals that kill insects or mice. These should not be stored anywhere. They should be thrown out. Remember to check the crawl space, attic and closets for hidden poisons also. To keep out mice, walk all around your house, stuffing holes and cracks with steel wool. Use old-fashioned mouse traps. For cockroaches and other insects (except ants) sprinkle handfuls of boric acid[34] (not borax) under your shelf paper, behind sink, stove, refrigerator, under carpets, etc. Use vinegar on your kitchen wipe-up cloth to leave a residue that keeps out ants. Do this regularly. To wax the floor, get the wax from the garage and put it back there. A sick person

should not be in the house while house cleaning or floor waxing is being done.

Remove all cans and bottles of “stuff” from the bathroom. The chlorine bleach is stored in the garage. Someone else can bring it in to clean the toilet (only). Leave only the borax soap, homemade soap, and grain alcohol antiseptic. Toilet paper and tissues should be unfragranced, uncolored. All colognes, after shave, anything you can smell must be removed. Family members should buy unfragranced products. They should smoke outdoors, blow-dry their hair outdoors or in the garage, use nail polish and polish remover outdoors or in the garage.

Do not keep new foam furniture in the house. If it is less than one year old, move it into the garage until you are well. It gives off formaldehyde. So does new clothing; it is in the sizing. Wash all new clothes before wearing. If you have a respiratory illness, move all the clothes in the clothes closet out of your bedroom to a different closet.

Do not use the hot water from an electric hot water heater for cooking or drinking. It has tungsten. Do not drink water that sits in glazed crock ware (the glaze seeps toxic elements like cadmium) like some water dispensers have. Do not buy water from your health food store that runs through a long plastic hose from their bulk tank (I always see cesium picked up from flexible clear plastic). Also ask them how and when they clean their tank. Best is to observe that it is done with non-toxic methods.

If your house is more than 10 years old, change all the galvanized pipe to PVC plastic. Although PVC is a toxic substance, amazingly, the water is free of PVC in three weeks! If your house has copper pipes don’t wait for cancer or schizophrenia to claim a family member. Change all the copper pipe to PVC plastic immediately. If the pipes are not accessible, ask a plumber to lay an extra line, outside the walls. This is less expensive, too.

If you have a water softener, by-pass it immediately and replace the metal pipe on the user side of the softener tank. Softener salts are polluted with strontium and chromate; they are also full of aluminum. The salts corrode the pipes so the pipes begin to seep cadmium into the water. After changing your pipes to plastic, there will be so little iron and hardness left, you may not need a softener. If the water comes from a well, consider changing the well-pipe to PVC to get rid of iron. While the well is open, have the pump checked for PCBs. Call the Health Department to arrange the testing. If you must have softening

after all this, check into the new magnetic varieties of water softener (although they only work well when used with plastic plumbing).

The cleanest heat is electric. Go total electric if possible. If you must stay with gas, have a furnace repair person check your furnace and look for gas leaks before the heating season starts. Don't call the gas company even though it is free. The gas company misses 4 out of 5 leaks! The Health Department does not miss any; call them! House builders and contractors are also reliable in their gas leak detection.

Bioelectronics

The most important electronic device to make or buy is a **zapper**—a compact pulse generator operating from a common 9-volt battery whose output is about 30 KHz. It kills all parasites, bacteria, viruses, molds, and fungi even though their individual resonant frequencies are either higher or lower (50 KHz to 900 KHz). Building a zapper is described in an earlier chapter.

The next most useful device to have is a **Syncrometer®**. It lets you diagnose yourself and monitor your progress until you are cured. It consists of an audio oscillator circuit with your body as part of the circuit. Utilizing samples of parasites or pollutants, it lets you test for them in any product or body tissue. I include a design that you can make yourself.

A third very useful device is a **frequency generator.** You can use it to electrocute individual organisms, or together with the Syncrometer® to find an organism's particular frequency. You need one that operates in the parasite, bacteria and virus ranges, from 50 KHz to 900 KHz. It must also be able to select a particular frequency, like 434 KHz, quickly and accurately. Frequency generators are available for as little as $300.00, but it is worth paying a little more to get a digital display of the frequency.

Making A Syncrometer®

This is an *audio oscillator circuit* in which you include yourself by means of a handhold. You listen to the current in your circuit with a loudspeaker. Other oscillator circuits will work, too. A lot of fascinating opportunities present themselves with this concept.

I have previously published three ways to build the Syncrometer® circuit.[35] Here is the circuit diagram:

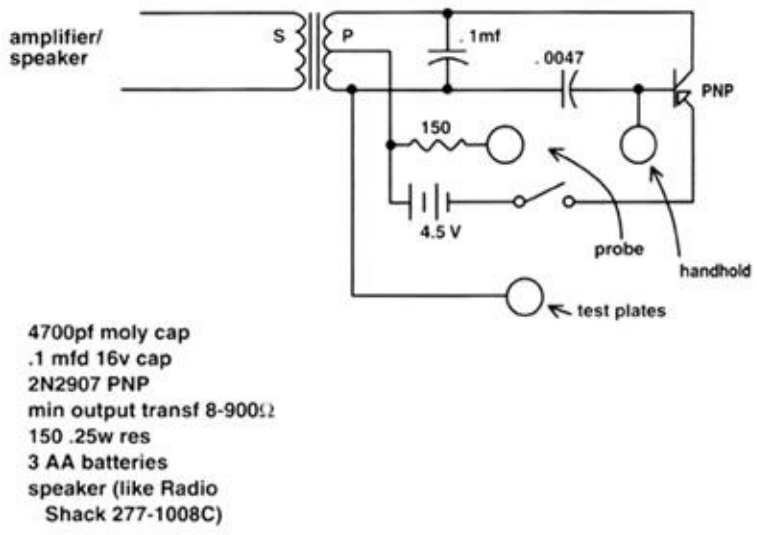

Fig. 78 Syncrometer® schematic.

If you are not an electronics enthusiast, you can still assemble a Syncrometer® using a hobby kit. No soldering is required. Here is what you need:

Making a Hobby Kit Syncrometer®

Item	**Radio Shack Cat. No.**
200 in One Electronic Project Lab by Science Fair	28-262
3 AA 1½ volt batteries	
Alligator clip test jumpers	You need 2.
Handhold. A four inch length of ¾ inch copper pipe, like for plumbing. These dimensions are critical to assure maximum skin contact.	
Probe. A banana plug.	Precision Mini-Hook Test Lead Set (contains two, you only need one) 278-1160A
Pencil, new.	

Fig. 79 Syncrometer® parts list.

Build The Electrosonic Human in the *200 in One Electronic Project Lab*. It takes about 10 minutes.

Later, when you use the probe to press against your knuckle you may find getting the right sound is painful. In this case try substituting the .005 microfarad capacitor for the .01 microfarad capacitor in the circuit.

Attach the Probe. The Archer Precision Mini-Hook Test Lead Set has a banana plug for the probe on one end and a mini-hook on the other end for easy attachment to the circuit. Tape a long, new pencil to the probe to make it easier to hold. Connect the Probe to middle post of the primary side of the transformer (it also connects to the negative battery post). You will not be using the two connections the instructions tell you to hold.

Attach the Handhold. Clip the Handhold to one end of an alligator clip test jumper, and clip the other end to the base (B) of the transistor used in the circuit.

Attach an alligator clip to the post of the transformer that connects to the two capacitors. This will go to the **test plates**.

Final test. Turn the control knob on and keep turning the potentiometer to nearly the maximum. (This reduces the resistance. The schematic has a 150 ohm fixed resistor in place of the potentiometer.) Make sure you have good batteries installed. Test the circuit by briefly touching the Probe to the Handhold. The speaker should produce a sound like popping corn. If it does not, check that your alligator clips are not bending the spring terminals so much that other wires attached there are loose. Finally, turn switches OFF.

Making Test Plates

This is the box you attach to the basic Syncrometer® circuit. It has test plates to put your test substances and tissue samples on. the wiring in it is arranged so that you can test for a toxin in a product, as well as search in yourself. This means you can search for *Salmonella* in the milk or cheese you just ate, not just for *Salmonella* in your stomach.

Only if the resonant frequency of an item on one plate is equal to the resonant frequency of an item on the other plate will the entire circuit oscillate or resonate! This implies the two plates have something in common. By putting a known pure sample on one plate you can reliably conclude the other sample contains it if the circuit resonates.

You may build a test plate box into a cardboard box (such as a facial tissue box) or a plastic box. Here are the instructions for the cardboard box model.

Test Plates Parts List

- Stiff paper.
- Aluminum foil.
- A facial tissue box is easiest. A plastic project box, about 7” x 4” x 1½,” makes a more durable product, but requires a drill, and you should discard any metal lid it comes with.
- 3 bolts (tapered heads) about 1 inch long, 1/8 inch diameter and 6 washers and nuts to fit.
- toggle switch with OFF-ON positions.
- Alligator clip test leads.

Test Plates Assembly

Cut two 3-1/2 inch squares out of stiff paper such as a milk carton. Cover them with 4½ inch squares of aluminum foil, smoothed evenly and tucked snugly under the edges. You have just made yourself a set of open capacitors. Turn the box upside down and draw squares where you will mount them at the ends of the box. Don't actually mount them, to save wear and tear on them, until the rest of the box is complete.

Mount the ON OFF switch on the front of the box, underneath the right hand plate. Line it up so ON is downward and OFF is up. (An electronics shop can determine this for you at the time of purchase.) Label the box with ON and OFF signs.

Two bolts will be reserved for the plates. The third bolt is used as a terminal where the current from the oscillator circuit will arrive. Make a hole on the side of the box, near the left hand plate and mount the bolt so it sticks half way inside and halfway outside the box. It does not matter whether the head is inside or outside. Tighten it there with a nut on each side of the box. Label it TERMINAL. It merely means connecting place.

Mark the center of each square that you drew and each capacitor you built. Pierce first with a pin; follow with a pencil until a round hole is made at the center. Mount each plate with a bolt, fastening it below with a nut. Washers are optional.

The left side connection (terminal) gets attached to the left plate (bolt) with an alligator clip. Use another clip to attach the same left plate (bolt) to the ON OFF switch (there are two connections, use either one). Finally attach the ON OFF switch connection you didn't use to the right plate (bolt). Make sure the connections at the switch are not touching each other; you might tape them to guard against this.

All these connections should be checked carefully to make sure they are not touching others accidentally. But if you leave the box open so you can see any problems and use clear tape around connections to prevent accidental touching to the wrong connection, it should work OK.

Finally, trace your current. It comes in from the Syncrometer® at the main terminal on the left. It is brought to the left plate. When the switch is ON it is simultaneously brought to the right plate. Notice that the plates are not connected to anything else. They are simply capacitors, letting current in and out momentarily and at a rate that is set by the frequency of the oscillator circuit, about 1,000 hertz. This frequency goes up as the resistance (of the circuit or your body) goes down.

The probe and handhold allow you to include yourself in the Syncrometer® circuit. You grasp these when testing. This makes you part of the circuit.

The speaker lets you "listen" to the current. As resistance drops, current goes higher and frequency goes up. As frequencies go higher in the circuit, pitch goes higher. You will be comparing the sound of a standard "control" current with a test current.

Using The Syncrometer®

Fill a saucer with cold filtered tap water. Fold a paper towel four times and place it in this dish. It should be entirely wet.

Cut paper strips about 1 inch wide from a piece of white, unfragranced, paper towel. Dampen a paper strip on the towel and wind it around the copper pipe

handhold to completely cover it. The wetness improves conductivity and the paper towel keeps the metal off your skin.

- Start with the test plate switch at OFF.
- Turn the control knob (potentiometer) on, and to near maximum.
- Touch each plate with the probe, while holding the copper pipe with one hand. Only the left plate should give you a sound from the speaker. Turn the test plate switch ON. Now both plates should give you a sound when the probe touches them.
- Turn the test plate switch OFF again.
- Pick up the handhold, squeeze it free of excess water.
- Pick up the probe in the same hand, holding it like a pen, between thumb and forefinger.

Dampen your other hand by making a fist and dunking your knuckles into the wet paper towel in the saucer. You will be using the area on top of the first knuckle of the middle finger or forefinger to learn the technique. Become proficient with both. Immediately after dunking your knuckles dry them on a paper towel folded in quarters and placed beside the saucer. The degree of dampness of your skin affects the resistance in the circuit and is a very important variable that you must learn to keep constant. Make your probe as soon as your knuckles have been dried (within two seconds) since they begin to air dry further immediately.

With the handhold and probe both in one hand press the probe against the knuckle of the other hand, keeping the knuckles bent. Press lightly at first, then harder, taking one half second. Repeat a half second later, with the second half of the probe at the same location. There is an additive effect and you get two chances to listen to the current. All of this takes less than two seconds. Don't linger because your body will change and your next probe will be affected.

Subsequent probes are made in exactly the same way. As you develop skill, your probes will become identical. Plan to practice for one or two hours each day. It takes most people at least twelve hours of practice in order to be so consistent with their probes that they can hear the slight difference when the circuit is resonant.

For reference you may wish to use a piano. The starting sound when you touch down on the skin should be F, an octave and a half above middle C. The sound rises to a C as you press to the knuckle bone, then slips back to B, then back up to C-sharp as you complete the second half of your first probe. If you have a multi-tester you can connect it in series with the handhold or probe: the current should rise to about 50 microamps. If you have a frequency counter the frequency should reach 1000 Hz. You should arrive at C-sharp just before the probe becomes painful.

Two things change the sound of the probes even when your technique doesn't change.

1. The patch of skin chosen for probing will change its properties. The more it is used, the redder it gets and the higher the sound goes when you probe. Move to a nearby location, such as the edge of the patch, when the sound is too high to begin with, rather than adjusting the potentiometer.

2. Your body has cycles which make the sound go noticeably higher and lower. If you are getting strangely higher sounds for identical probes, stop and only probe every five minutes until you think the sound has gone down to standard. This could take five to twenty minutes. Learn this higher sound so you can avoid testing during this period.

You may also find times when it is impossible to reach the necessary sound without pressing so hard it causes pain. You may adjust the potentiometer if that helps.

All tests are momentary.

This means less than one second. It is tempting to hold the probe to your skin and just listen to the sound go up and down, but if you prolong the test you must let your body rest ten minutes, each time, before resuming probe practice!

For our purposes, it is not necessary to locate acupuncture points.

Resonance

The information you are seeking is whether or not there is *resonance,* or *feedback oscillation,* in the circuit. If there is the test is **YES** (positive). You hear resonance by comparing the second probe to the first. You can never hear resonance on the first probe, for reasons that are technical and beyond the scope

of this book. You are not merely comparing pitch in the two probes. During resonance a higher pitch is reached faster; it seems to want to go infinitely high.

Remember that more electricity flows, and the pitch gets higher, as your skin reddens or your body changes cycle. These effects are not resonance.

Resonance is a small extra hum at the high end of the probe. As soon as you hear it, stop probing. Your body needs a short recovery time (10 to 20 seconds) after every resonant probe. The longer the resonant probe, the longer the recovery time to reach the standard level again.

Using musical notes, here is a NO (*Negative* result): F-C-B-C# (first probe) F-C-B-C# (compare, it is the same sound). Here is a YES (positive) result: F-C-B-C# (first probe) F-D (stop quickly because you heard resonance). In between the first and second probe a test substance will be switched in as described in lessons below.

It is not possible to produce a resonant sound by pressing harder on the skin, although you can make the pitch go higher. To avoid confusion it is important to practice making probes of the same pressure. (Practice getting the F-C-B-C# tune.)

Making Pure Water for Testing Purposes

Since the water you purchase is likely to have solvents in it and since your tap water may be polluted with heavy metals and since your (or a store's) filtration system may be clogged, it is important to make your own pure water.

Purchase a “filter pitcher” made of hard, opaque plastic, not the clear or flexible variety (see Sources). Fill the pitcher with cold tap water, only, not reverse osmosis, distilled, or any other water, since solvents do not filter out as easily as heavy metals. The filter should be made of carbon only. To make test substances, use fresh water in the pitcher and pour.

If your water has lead, copper or cadmium from corroded plumbing, the filter will clog in five days of normal use. So use this pitcher sparingly, just for making test substances and for operating the Syncrometer®.

Lesson One

Purpose: To identify the sound of resonance in the circuit.

Materials: Potentized (homeopathic) solutions. Prepare these as follows: find three medium-sized vitamin bottles, glass or plastic, with non-metal lids. Remove any shreds of paper sticking to the rim. Rinse well with cold tap water. Then rinse again with filtered water.

Pour filtered water into the first bottle to a depth of about ½ inch. Add about 50 little grains of table salt using the tip of a plastic knife. This is a "pinch." Replace the lid. Make sure the outside is clean. If not, rinse and dry. Now shake hard, holding it snugly in your hand. Count your shakes; shake 120 to 150 times. Use elbow motion so each shake covers about an eight inch distance. Shaken samples are different from unshaken ones, that's why this is so important. When done label the bottle on its side and lid: SALT #1. Wash your hands (without soap).

Next, pour about the same amount of filtered water into the second and third bottles. Open SALT #1 and pour a small amount, like 1/4 to 1/2 of a teaspoon (do not use a spoon) into the second and third bottles. Close all bottles. Now shake the second bottle the same as the first. Clean it and label it SALT #2. Do the same for the third bottle. Label it SALT #2 also and set aside for Lesson Four.

These two solutions have unique properties. Salt # 1 always resonates. Use #1 to train your ear. SALT #2 shouldn't resonate. Use #2 to hear when you (your body's internal resistance) have returned to the standard level.

1. Turn the Syncrometer® ON.

2. Place the SALT #2 bottle on the right test plate.

3. Start with the plate switch OFF.

4. Make your first probe (F-C-B-C#).

5. Flip the plate switch ON, taking only one half second. Brace your hand when switching so it is a fast, smooth, operation.

6. Make the second probe (F-C-B-C#). Total probe time is 2½ seconds. Count it out, "a thousand and one (done with first probe) a thou. (done with switching) a thousand and one (done with second probe)."

7. The result should be a NO (negative). If the second probe sounds even a little higher you are not at the standard level. Wait a few more seconds and go

back to step 3.

8. If the first result was NO, remove SALT #2 and put SALT #1 on. Put the test plate switch back to OFF and repeat the test. This time the circuit was resonating. Learn to hear the difference between the last two probes so that a resonant probe can be terminated early (reducing rest time).

9. The skin must now be rested. When SALT #1 is placed in the circuit there is always resonance whether you hear it or not. Therefore, always take the time to rest the skin.

10. How can you be sure that the skin is rested enough? Any time you want to know whether you have returned to the standard level, you may simply test yourself to SALT #2 (just do steps 3 through 6). While you are learning, let your piano also help you to learn the standard level (starts exactly at F). If you do not rest and you resonate the circuit before returning to the standard level, the results will become aberrant and useless. The briefer you keep the resonant probe, the faster you return to the standard level. Don't exceed one half second when probing SALT #1. Hopefully you will soon hear resonance within that time.

This lesson teaches you to first listen to the empty plate, then to SALT #2, to check for standard state. Then to compare the empty plate to SALT #1 to check for resonance. In later lessons we assume you checked for your standard level or are quite sure of it.

Practice hearing resonance in your circuit every day.

White Blood Cells

Checking for resonance between your white blood cells and a toxin is the single most important test you can make.

Your white blood cells are your immune system's first line of defense. In addition to making antibodies, interferon, interleukins, and other attack chemicals, they also “eat” foreign substances in your body and eliminate them. By simply checking your white blood cells for toxins or intruders you save having to check every other tissue in your body. Because no matter where the foreign substance is, chances are some white blood cells are working to remove it.

It took me two years to find this ideal indicator, but it is not perfect.

Tapeworms are a notable exception. They can be encysted in a particular tissue which will test positive, while the white blood cells continue to test negative. Also, when bacteria and viruses are in their latent form, they do not show up in the white blood cells. Fortunately, in their active form they show up quite nicely. **Freon** is an example of a toxin that is seldom found in the white blood cells; but typically, the white blood cells are excellent indicators of toxins.

Making a White Blood Cell Specimen

Obtain an empty vitamin bottle with a flat plastic lid and a roll of clear tape. The white blood cells are not going into the bottle, they are going on the bottle. The bottle simply makes them easy to handle. Rinse and dry the bottle. Make a second specimen on a clean glass slide if available. Squeeze an oil gland on your face or body to obtain a ribbon of whitish matter (not mixed with blood). Pick this up with the back of your thumb nail. Spread it in a single, small streak across the lid of the bottle or the center of the glass slide. Stick a strip of clear tape over the streak on the bottle cap so that the ends hang over the edge and you can easily see where the specimen was put (see photo). Wipe the lid beside the tape to make sure all white blood cells are covered. For the slide, apply a drop of balsam and a cover slip (see *Sources*). Both types of preparation will give you identical results. The bottle type of white blood cell specimen is used by standing it on its lid (upside down) so that the specimen is next to the plate. The lid is used because it is flat, whereas the bottom of most bottles is not.

Fig. 80 Bottle with white blood cells taped to top.

Lesson Two

Purpose: To add a white blood cell specimen to the circuit and compare sound.

Method:

1. Turn the Syncrometer® ON.
2. Start with test plate switch OFF.
3. Place the white blood cell specimen on the left plate. Place some junk food in a plastic baggy on the right plate.
4. Eat some of the junk food.
5. After ½-minute listen to the current. Flip the plate switch ON and listen again.
6. If the circuit is now resonating, the junk food is already in <u>your</u> white blood cells. It is toxic.

Take vitamin C and a B-50 complex to clear it rapidly; it may have had propyl alcohol or benzene in it. Test every 5 minutes afterward to see how long it takes to clear out.

Lesson Three

Purpose: To determine the purity of the filtered water you are making.

Method: Pour a few tsp. of filtered water into a bottle or plastic bag. Place your white blood cell specimen on one plate and the water sample on the other. Listen to your circuit. Taste your filtered water. After ½-minute, listen to your circuit again, just as in Lesson Two. If it appears in your white blood cells at any time you can conclude the water is not pure. You <u>must</u> have pure water available to you before continuing.

Lesson Four

Purpose: To determine your percent accuracy in listening for resonance.

Materials: The SALT #1 and SALT #2 solutions you made for Lesson One.

Method: Move the SALT #1 and SALT #2 labels to the bottom of the bottles so you can not tell which bottle is which.

1. Turn the Syncrometer® ON.
2. Start with the test switch OFF.
3. Mix the bottles up, select one at random, and place it on the right plate.
4. Listen to the current.
5. Flip the plate switch ON and make your second probe.
6. Resonance indicates a SALT #1, no resonance indicates SALT #2. Check the bottom. Remember to rest after the SALT #1, whether or not you heard resonance.
7. Repeat steps 3 through 5 a number of times. Work toward getting three out of three correct. Practice every day.

Troubleshooting:

a) If you repeat this experiment and you keep getting the same bottles "wrong", start over. You may have accidentally contaminated or mislabeled the outside of the bottle, or switched bottle caps.

b) If you get different bottles wrong each time, the plates may be contaminated. Wash the outside of the bottles and rinse with filtered water and dry. Wipe the plates very gently too, with filtered water and dry. Or replace the plates.

c) If all the bottles read the same, your filtered water is polluted. Change the filter.

Preparing Test Substances

It is possible to prepare dry substances for testing such as a piece of lead or grains of pesticide. They can simply be put in a plastic bag and placed on the test plate. However, I prefer to place a small amount (the size of a pea) of the substance into a ½ ounce bottle of filtered water. There will be many chemical reactions between the substance and the water to produce a number of test substances all contained in one bottle. This simulates the situation in the body.

Within the body, where salt and water are abundant, similar reactions may occur between elements and water. For example, a strip of pure (99.9% pure) copper placed in filtered water might yield copper hydroxide, cuprous oxide,

cupric oxide, copper dioxide, and so forth. These may be similar to some of the reaction products one might expect in the body, coming from a copper IUD, copper bracelet or the copper from metal tooth fillings. Since the electronic properties of elemental copper are not the same as for copper compounds, we would miss many test results if we used only dry elemental copper as a test substance.

Impure Test Substances

It is not necessary to have pure test substances. For instance, a tire balancer made of lead can be easily obtained at an auto service station. Leaded gasoline and lead fishing weights also make good test substances for lead. There is a disadvantage, though, to using impure test substances. You are including the extra impurities in your test. If your lead object also has tin in it, you are also testing for tin. Usually, you can infer the truth by some careful maneuvering. If you have searched your kidneys for leaded gasoline, fishing weights and tire balancers and all 3 are resonant with your kidneys, you may infer that you have lead in your kidneys, since the common element in all 3 items is lead. (You will learn how to specify a tissue, such as your kidneys, later.)

Using pure chemicals gives you certainty in your results. You can purchase pure chemicals from chemical supply companies (see *Sources*). Your pharmacy, a child's chemistry set, a paint store, or biological supply company can also supply some.

The biggest repository of all toxic substances is the grocery store and your own home.

You can make test substances out of your hand soap, water softener salt, and laundry detergent by putting a small amount (1/16 tsp.) in a ½ ounce glass bottle and adding about 2 tsp. filtered water. (Or for quick testing just put them dry or wet in a sealed plastic baggy.) Always use a plastic spoon.

Here are some suggestions for finding sources of toxic products to make your own toxic element test. If the product is a solid, place a small amount in a plastic bag and add a tablespoon of filtered water to get a temporary test product. For permanent use put it in a small amber glass bottle. If the product is a liquid, pour a few drops into a glass bottle and add about 2 tsp. filtered water. Keep all toxic substances in glass bottles for your own safety. Small amber glass dropper

bottles can be purchased by the dozen at drug stores (also see *Sources*). Seal your test bottles with tape for safety and to prevent evaporation.

Aflatoxin: scrape the mold off an orange or piece of bread; wash hands afterward.

Acetone: paint supply store or pharmacy.

Arsenic: 1/16 tsp. of arsenate pesticide from a garden shop. A snippet of flypaper.

Aluminum: a piece of aluminum foil (not tin foil) or an aluminum measuring spoon.

Aluminum silicate: a bit of salt that has this free running agent in it.

Asbestos: a small piece of asbestos sheeting, an old furnace gasket, 1/4 inch of a clothes dryer belt that does not say "Made in USA", or a crumb of building material being removed due to its asbestos content (ask a contractor).

Barium: save a few drops from the beverage given clients scheduled for an X-ray. Lipstick that has barium listed in the ingredients.

Benzene: an old can of rubber cement (new supplies do not have it). A tsp. of asphalt crumbs from a driveway.

Beryllium: a piece of coal; a few drops of "coal oil" or lamp oil.

Bismuth: use a few drops of antacid with bismuth in it.

Bromine: bleached "brominated" flour.

Cadmium: scrape a bit off a galvanized nail, paint from a hobby store.

Cesium: scrape the surface of a clear plastic beverage bottle.

CFCs (Freon): ask an electronics expert for a squirt from an old aerosol can that used Freon as a cleaner. (Squirt into water, outdoors, put the water in a sample bottle.)

Chromate: scrape an old car bumper.

Cobalt: pick out the blue and green crumbs from detergent. A sample of cobalt containing paint should also suffice.

Chlorine: a few drops of pure, old fashioned Clorox.™

Copper: ask your hardware clerk to cut a small fragment off a copper pipe of the purest variety or a ¼ inch of pure copper wire.

Ergot: a teaspoon of rye grains, or rye bread. Add grain alcohol to preserve.

Ether: automotive supply store (engine starting fluid).

Ethyl alcohol (grain alcohol): the purest "drinking" alcohol available. Everclear™ in the United States, Protec™ (potable) in Mexico.

Fiberglass: snip a fragment from insulation.

Fluoride: ask a dentist for a small sample.

Formaldehyde: purchase 37% at a pharmacy. Use a few drops only for your sample.

Gasoline: gas station (leaded and unleaded).

Gold: ask a jeweler for a crumb of the purest gold available or use a wedding ring.

Kerosene: gas station.

Lead: wheel balancers from a gas station, weights used on fishing lines, lead solder from electronics shop.

Mercury: a mercury thermometer (there is no need to break it), piece of amalgam tooth filling.

Methanol: paint supply store (wood alcohol).

Nickel: a nickel plated paper clip, a washed coin.

Patulin (apple mold): cut a sliver of washed, bruised apple.

PCB: water from a quarry known to be polluted with it (a builder or electrical worker may know a source).

Platinum: ask a jeweler for a small specimen.

Propyl alcohol: rubbing alcohol from pharmacy (same as propanol or isopropanol). Use a few drops only, discard the rest. Do not save it.

PVC: glue that lists it in the ingredients (polyvinyl chloride).

Radon: leave a glass jar with an inch of filtered water in it standing open in a basement that tested *Positive* to radon using a kit. After 3 days, close the jar. Pour about 2 tsp. of this water into your specimen bottle.

Silicon: a dab of silicon caulk.

Silver: ask a jeweler for a crumb of very pure silver. Silver solder can be found in electronics shops. Snip the edge of a very old silver coin.

Sorghum mold: 1/8 tsp. sorghum syrup.

Styrene: a chip of Styrofoam .

Tantalum: purchase a tantalum drill bit from hardware store.

Tin: scrape a tin bucket at a farm supply. Tin solder. Ask a dentist for a piece of pure tin (used to make braces).

Titanium: purchase a titanium drill bit from a hardware store.

Toluene: a tube of glue that lists toluene as an ingredient.

Tungsten: the filament in a burned out light bulb.

Vanadium: hold a piece of dampened paper towel over a gas stove burner as it is turned on. Cut a bit of this paper into your specimen bottle and add 2 tsp. filtered water.

Xylene: paint store or pharmacy.

Zearalenone: combine leftover crumbs of three kinds of corn chips and three kinds of popcorn.

This list gets you off to a good start. Since few of these specimens are pure,

there is a degree of logic that you must apply in most cases. If you are testing for barium in your breast, a *Positive* result would mean that a barium-containing lipstick tests *Positive* and a barium-free lipstick is negative.

A chemistry set for hobbyists is a wonderful addition to your collection of test specimens. Remember, however, the assumptions and errors in such a system. A test for silver using silver chloride might be negative. This does not mean there is no silver present in your body; it only means there is no silver chloride present in the tissue you tested.

You are bound to miss some toxins; don't let this discourage you. There is more than enough that you can find.

The most fruitful kind of testing is, probably, the use of household products themselves as test substances. The soaps, colognes, mouthwash, toothpaste, shampoo, cosmetics, breads, dairy products, juices and cereals can all be made into test specimens. Put about 1/8 tsp. of the product in a small glass bottle, add 2 tsp. filtered water and ¼ tsp. grain alcohol to preserve it. For temporary purposes use a plastic baggy and water only. If you test *Positive* to your household products in your white blood cells you shouldn't use them, even if you can not identify the exact toxin.

For a list of toxins and solvents I use. To order pure substances see *Sources* for “chemicals for testing.”

Making Organ Specimens

To test for toxic elements or parasites in a particular organ such as the liver or skin, you will need either a fresh or frozen sample of the organ or a prepared microscope slide of this organ. Meat purchased from a grocery store, fresh or frozen, provides you with a variety of organ specimens. Chicken, turkey, beef or pork organs all give the same results. You may purchase chicken gizzards for a sample of stomach, beef liver for liver, pork brains for brain, beef steak for muscle, throat sweet breads for thymus, tripe for stomach lining. Other organs may be ordered from a meat packing plant.

Trim the marrow out of a bone slice to get bone marrow. Scrub the bone slice with hot water to free it of marrow to get a bone specimen. Choose a single piece of meat sample, rinse it and place it in a plastic bag. You may freeze it. To make a durable unfrozen sample, cut a small piece, the size of a pea, and place it in an amber glass bottle (½ oz.). Cover with two tsp. filtered water and ¼ tsp. of grain

alcohol (pure vodka will do) to preserve it. These need not be refrigerated but if decay starts, make a fresh specimen.

Pork brains from the grocery store may be dissected to give you the different parts of the brain. Chicken livers often have an attached gallbladder or piece of bile duct, giving you that extra organ. Grocery store “lites” provides you with lung tissue. For kidney, snip a piece off pork or beef kidney. Beef liver may supply you with a blood sample, too. Always wash hands and rinse with grain alcohol after handling raw meat.

I use ½ oz amber glass bottles with bakelite caps (see *Sources*) to hold specimens. However, plastic bags or other containers would suffice. After closing, each bottle is sealed with a Parafilm™ strip to avoid accidental loosening of the cap. You may use masking tape.

To make a specimen of skin, use hangnail bits and skin peeled from a callous, not a wart. A few shreds will do. Remember, they must be very close to the test plate when in use; add 2 tsp. filtered water and ¼ tsp. grain alcohol.

Making a Complete Set of Tissue Samples

My original complete set was made from a frozen fish. As it thawed, different organs were cut away and small pieces placed in bottles for preserving in filtered water and grain alcohol. In this way, organs not available from the grocery store could be obtained. The piece of intestine closest to the anus corresponds to our colon, the part closest to the stomach corresponds to our duodenum. The 2 layers of the stomach and different layers of the eye, the optic nerve and spinal cord were obtained this way.

Fig. 81 Some purchased parasite and tissue slides

Another complete set of tissue samples were obtained from a freshly killed steer at a slaughter house. In this way the 4 chambers of the heart were obtained, the lung, trachea, aorta, vein, pancreas, and so forth.

Purchasing a Complete Set of Tissue Samples

Slides of tissues, unstained or stained in a variety of ways for microscope study give identical results to the preparations made by yourself in the ways already described. This fact opens the entire catalog of tissue types for your further study. See *Sources* for places that supply them.

You now have a set of organ samples, either fresh, frozen, preserved or on slides. You also have a set of test substances, whether chemical compounds, or elements, or products. Your goal is to search in your own organs and body tissues for the substances that may be robbing you of health.

Keeping yourself healthy will soon be an easy, daily routine.

Body Fluid Specimens

Each of these fluids should be prepared by putting about ¼ tsp. in a ½ oz amber glass bottle. Add about 2 tsp. filtered water and ¼ tsp. grain alcohol for preservation. Undiluted specimens do not work for reasons that are technical and beyond the scope of this book. It is important *not* to shake the specimen, but to mix gently.

Urine. It is desired to have a pure, uninfected urine sample as a tissue specimen. Since this cannot be proved with certainty, obtain several urine samples from different persons whom you believe to be healthy and make several test specimens in order to compare results. Label your specimens Urine A (child), Urine B (woman), Urine C (mine), and so forth.

Semen. A sample from a condom is adequate. Aged specimens (sent by mail, unpreserved and unrefrigerated) work well also. Use one to ten drops or scrape a small amount with a plastic knife.

Blood. One to ten drops of blood should be used. Clotted or chemically treated blood is satisfactory. A blood smear on a slide is very convenient.

Milk. Cow's milk is too polluted with parasites to be useful. Electronically, a dead specimen is equivalent to a live specimen, so that pasteurization of the milk does not help. A human milk specimen is preferred.

Saliva. Use your own, if you have deparasitized yourself and test *Negative* to

various fluke stages. Otherwise find a well friend or child.

Specifying a tissue is the most powerful investigative technique in your arsenal. Any of your tissue samples can be tested for any of your toxic substances.

Lesson Five

Purpose: To watch substances travel through your body.

Materials: Prepare a pint of brown sugar solution (white sugar has propyl alcohol pollution) using filtered water. Use about 1 tsp. brown sugar, 1/8 tsp. vitamin C (to detoxify sorghum mold), and a pint of filtered water. Do not shake it; gently mix. Make a sample bottle by pouring about ½ inch into a clean used vitamin bottle. Rinse and dry the outside of the sample bottle. Finally wash your hands with plain water.

Method:

1. Test your skin for the presence of brown sugar, using the newly made sample bottle and your skin specimen. It should not be there (resonate) yet.
2. Prepare a paper applicator by tearing the corner from a white unfragranced paper towel. Fold it to make a wick.
3. Dip the paper wick in the pint of sugar water and apply it to the skin of your inner arm where you can rub freely. Rub it in vigorously for about 10 seconds (otherwise it takes minutes to absorb). Leave the shredded wick on the skin and tape it down with a piece of clear tape about 4 inches long (this increases the time you have to work). Quickly wash your fingers.
4. Place your skin tissue specimen on one plate and the sugar specimen bottle on the other plate.
5. Probe for resonance every 5 seconds. As soon as you hear resonance, implying that the skin has absorbed the sugar solution (which may take a full minute), replace the skin specimen with one of liver and listen for resonance again. There should be none, yet.
6. Alternate between the skin and liver. Soon the skin will be clear and the liver will resonate. Also check the pancreas and muscles to see how quickly

sugar arrives there.

7. Check white blood cells and kidneys. It should not appear here (unless it is polluted with a toxin).
8. After five to ten minutes the sugar will be gone from all of these tissues and your experiment is ended. Wash your arm with plain water.

Notice that you have only a few minutes to get all your testing done after the skin has absorbed the test substances.

Lesson Six

Purpose: To verify the propyl alcohol and benzene lists.

Method: We will use the Syncrometer® to test for a toxin in a product. Assemble the products named in the propyl alcohol list and benzene list...as many as you can find. Also make sample bottles of benzene and propyl alcohol.

1. Place the propyl alcohol test substance on one plate and your products, in turn, on the other.
2. Listen to the current with only one of the plates in the circuit. Then listen with both plates in (the test plate switch ON). This method can detect one part per quadrillion in concentration. It is not as sensitive as the skin test (Lesson Five).
3. Repeat, with the benzene test substance.

Even tiny amounts of solvents are toxic! They must not be consumed or be left in our environment.

1) Salmonella, Shigella, aflatoxin, ergot,zearalenone, patulin test sticks; 2) ozonizer; 3) Lugol's; 4) vitamin C powder; 5) sodium/potassium salt; 6) fresh powdered herb spices; 7) food zapper; 8) benzene, propyl alcohol, wood alcohol test sticks; 9) heavy metals and lanthanides test sticks.

Fig. 82 Table of the future.

I have found that too many unsuspected products test *Positive* to benzene. This is such a global tragedy that people must protect themselves by using their own tests. Rather than assurances, regulatory agencies should provide the consumer with cheap and simple tests (dipsticks and papers so we need not lug our Syncrometer® around). Even if some test should fail, not all tests would fail to find an important pollutant like benzene. It would come to public attention much faster than the present debacle has.

You Can Now Test Three Different Ways!

When you test with a substance on one plate and nothing on the other, you are searching your entire body for that substance. Such a test is not very sensitive.

By putting a tissue sample on the other plate you are testing for the substance specifically in that tissue, and this is much more sensitive. The tissue need not be the white blood cells. To find mercury in your kidneys you would use a mercury sample on one plate, and a kidney sample on the other. The technique is the same as when you use white blood cells.

If you put a substance on each plate, a resonating circuit means the two samples have something in common. For example, if you have mercury on one plate and some dental floss on the other, a *Positive* result indicates mercury in

the floss.

Lesson Seven

Purpose: To test for the presence of aluminum in your brain and your foods.

Materials: An aluminum measuring spoon, a tsp. of free flowing aluminized salt, a square inch of aluminum foil, a package of pork brain from the grocery store, kept frozen. (Other animal sources will do). Or a stained slide of cerebrum, cerebellum or other brain tissue.

Method:

1. Cut a piece of brain tissue (about 1 tsp.) and place in a plastic bag.
2. Place the aluminum samples in separate plastic bags. Add filtered water to each, about 1 tbs. Keep all surfaces and your hands meticulously clean (do not use soap).
3. Place the aluminum sample on one plate and the brain sample on the other plate.
4. Probe for resonance. If the circuit resonates <u>you</u> have aluminum in <u>your</u> brain.
5. If your aluminum specimen actually has cadmium or copper in it, you are <u>also</u> testing for these in your brain. Repeat the aluminum test with other aluminum objects. If they <u>all</u> resonate, you <u>very, very likely</u> have aluminum in your brain. If you can, test yourself to cadmium and copper, separately. If you don't have these in your brain, the aluminum test result is even more likely to be correct.
6. Of course, it would be desirable to have absolute certainty about this. To achieve this, purchase pure aluminum or an Atomic Absorption Standard. These are available from chemical supply companies.
   If you do have aluminum in your brain, where is it coming from?
7. Leave your purest aluminum test substance on one plate, and replace the brain sample with these items, testing them one at a time. Remember to rest after each *Positive* result.

- a teaspoon of cottage cheese or yogurt taken from the top of a container of a foil-capped variety
- a piece of cream cheese or butter that was wrapped in foil
- a chip of bar soap or a bit of hand lotion
- a piece of cake or rolls baked in an aluminum pan
- a piece of turkey skin or hot dish that was covered with aluminum foil
- anything baked with baking powder
- a carbonated beverage from an aluminum can

Alternative Lesson:

To test for dental metal in your tissues. Use a piece of amalgam from an old tooth filling. This tests for the rest of the alloys in amalgam fillings as well as mercury. If you can't get a piece of mercury amalgam, use a mercury thermometer (don't break it, just put the bulb on the plate). Choose tissues like kidney, nerves, brain, liver, in addition to white blood cells.

I have never dissected human tissues and subjected them to confirmatory laboratory tests. It seems reasonable that because skin and tongue are directly provable, that other tissues work similarly.

Testing the Air

Fine particles and gas molecules that are in the air stick to the dust and eventually fall down onto the table, kitchen counter, and other places. Every night a film of dust accumulates, even though you can’t see it. To test for air pollutants, gather some dust. Wipe the kitchen table and counter with a dampened piece of paper towel, two inches by two inches square. Place it in a zippered baggie. Do not get old dust, like from the top of the refrigerator or back shelves, because it does not represent the current air quality.

Testing Someone Else

Seat the person comfortably with their hand resting near you. Choose the first knuckle from the middle or first finger just like you do for yourself. Since you are touching this person, you are putting yourself in the circuit with the subject.

To exclude yourself, you need to add inductance to yourself. A coil of about 10 microhenrys, worn next to the skin, works well and is easily made. Obtain insulated wire and wrap 24 turns around a ball point pen (or something about that size), closely spaced. Cut the ends and tape them down securely. Keep it in a plastic bag, even when in your pocket. A commercial inductance of 4.7 microhenrys, worn touching your skin also works well. It can be worn on a string necklace. (Remember to remove the necklace when testing yourself.) The inductance acts as an RF (radio frequency) choke, limiting the alternating current that can flow through you while testing another person.

Test your inductor in this way. Repeat Lesson One with the coil next to your body. No resonance, even to SALT #1, should occur. If it does, make the coil bigger. Remove the inductor when you are not testing others.

Lesson Eight

Purpose: To detect aluminum in the brain of another person.

Materials: same as previous lesson, you wear the inductor.

Method:

1. Place the aluminum sample on one plate and the brain sample on the other plate.
2. Give the other person the handhold. You use the probe. Hold their finger steady in yours.
3. Probe the other person for resonance. The first probe is with only one plate in the circuit. The second is with both plates in the circuit. Resonance implies there is aluminum in the person's brain.

Saliva Testing

This may become your most useful test. The saliva has in it a bit of almost everything toxic that is in you. But it is not the first tissue to carry the HIV virus or a bit of a tapeworm stage. Nevertheless, *Salmonella* in your liver, mercury in

your kidneys, aluminum in the brain all show up in the saliva, too. And saliva can be sent by mail or stored in the refrigerator. It should be frozen for long storage to prevent mold invasion. Or it may have grain alcohol added to preserve it. This test is not as sensitive as having the person present in the circuit, though.

To make a saliva specimen, place a two inch square piece of white, unfragranced paper towel (tear, don't cut) in a light-weight zippered baggy. Hold the open baggy near your mouth. Don't touch the paper towel with your fingers. Drool or spit onto the paper towel until half of it is damp. Zip it shut. Before testing, add enough filtered water to dampen the whole piece of paper.

Lesson Nine

Purpose: To search for shingles or *Herpes*.

Materials: A saliva specimen from the person being tested; they may be thousands of miles away. Also a specimen of the virus. This can be obtained from someone else's lesions—one droplet is enough, picked up on a bit of paper towel. the whole thing, towel and all, can be pushed into a glass bottle for preserving. Water and alcohol should be added. It can also be put on a slide, *Herpes, homemade*. A homeopathic preparation of the virus does not give accurate results for this kind of testing, due to the additional frequency imposed on it by potentizing. (However, homeopathic preparations can be used if the potency matches the tissue frequency where it resides. Hopefully, some way of using homeopathic sources will soon be found.)

Method: Place the saliva specimen in its unopened baggy on one plate. You may wish to open it briefly, though, to add enough filtered water to wet all the paper and add ¼ tsp. grain alcohol to sterilize or preserve it.

Place the virus specimen on the other plate and test as usual (like Lesson Six). A *Positive* result means the person has active *Herpes*.

The main disadvantage of saliva testing is that you do not know which tissue has the pathogen or the toxin. You can only conclude that it is present. Usually this is enough information to carry out a corrective program.

Surrogate Testing

Although saliva testing is so easy, it is also possible to use an adult as a surrogate when testing a baby or pet. The pet or baby is held on the lap of the

surrogate. A large pet may sit in front of the person. The handhold is held by the surrogate and pressed firmly against the body of the baby or pet. It can be laid flat against the arm, body or leg of a baby and held in place firmly by the whole hand of the adult. The paper covering should be wet. For a pet, the end is held firmly pressed against the skin, such as between the front legs or on the belly. The other hand of the adult is used for testing in the usual way. The adult must wear an inductor for surrogate testing as well as you, the tester.

An ill or bedridden person may be tested without inconvenience or stress. He or she rests their whole hand on the skin of your leg, just above the knee. A wet piece of paper towel, about 4 inches by 4 inches is placed on your leg, to make better contact. You must use an inductor for yourself with this method. You may now proceed to probe on your hand instead of the ill person's.

Lesson Ten

Purpose: To test for cancer.

Materials: Ortho-phospho-tyrosine. Here are four ways to obtain some:

1. Order a pure sample from a chemical company (see *Sources*). Place a few milligrams (it need not be weighed) in a small glass bottle, add 2 tsp. filtered water and ¼ tsp. grain alcohol.

2. All persons with cancer have ortho-phospho-tyrosine in their urine as well as in the cancerous tissue. It is seldom found in other body fluids. Obtain a urine specimen from a friend who has active cancer. Freeze it if you can't prepare it immediately. Keep such specimens well marked in an additional sealed plastic bag. Persons who have recently been treated clinically for cancer are much less likely to have ortho-phospho-tyrosine in the urine.

Urine cannot be considered a chemical in the same way as a sugar or salt solution. Urine is a tissue and has its own resonant frequency as do our other tissues. If combined with another tissue on the test plates, it will not resonate as if a solution of pure ortho-phospho-tyrosine were used. To use urine as an ortho-phospho-tyrosine specimen, you must:

a) Pour a few drops of urine into your specimen bottle

b) Add about 2 tsp. of filtered water

c) Add a few drops of grain alcohol

Gently mix, do not shake. Rinse and dry the outside of the bottle. Label it “urine/cancer”.

3. Cancer victims also have other growth factors being produced in their bodies. These are the same as can be found in mother's milk—for example, epidermal growth factor and insulin-like growth factor. Obtain a sample of mother's milk and use it to make another test substance for cancer. A few drops is enough.

4. There is still another way to prepare an ortho-phospho-tyrosine test sample. Common snails from a fish tank or outdoor snails are the natural hosts for *Fasciolopsis buski* (human intestinal fluke) stages. The stages will produce ortho-phospho-tyrosine when the snails are fed fish food polluted with propyl alcohol. Over half the fish food cans I purchased had propyl alcohol pollution. Buy several brands of fish food. Test them for propyl alcohol and benzene. Obtain some snails, put them in a tank, feed them propyl alcohol polluted fish food. (Feed a separate group of snails benzene polluted fish food to obtain samples of HIV.) After two days put each snail in a zipped plastic bag, and test them individually against someone diagnosed with cancer or their saliva. The snails that the person tests *Positive* to have ortho-phospho-tyrosine. Put these snails in the freezer to kill them humanely, then crush them and place in a specimen bottle with 50% grain alcohol to preserve. The bottles can be kept sealed and at room temperature.

Similarly, your benzene snails can be tested against someone known to be HIV positive. Any snails that test *Positive* can be used to prepare an HIV test specimen in the same way. The fish food must be tested for both benzene and propyl alcohol pollution, and separated appropriately, or you run the risk of making specimens that have both ortho-phospho-tyrosine and HIV.

Method:

1. Test for cancer by placing the test sample you just made (any of the four) on one plate and a white blood cell sample on the other plate.

2. If you resonate with both samples in the circuit you have cancer. Immediately, search for your cancer in your breast, prostate, skin, lungs, colon, and so forth.

3. To be more certain, test yourself to the other kinds of test samples. You should not resonate.

As you know by now, you can confirm the cancer by testing yourself to propyl alcohol and the human intestinal fluke in the liver. you should eliminate propyl alcohol from use, and zap all parasites. Keep testing yourself for cancer until it is gone. It should take less than one hour. Also continue to test yourself for propyl alcohol and the intestinal fluke in the white blood cells; make sure they are gone. Also test yourself for aflatoxin and Freon.

Lesson Eleven

Purpose: To test for HIV.

Materials: Purchase a few milligrams of Protein 24 antigen (a piece of the HIV virus core) or the complete HIV virus on a slide (see *Sources*). You may use the vial unopened if only one test specimen is needed. To make more specimens, use about 1 milligram per ½ ounce bottle. Add 2 tsp. filtered water and ¼ tsp. grain alcohol. Or prepare an HIV specimen from snails as described in the previous Lesson.

Method: Search in the thymus (throat sweet breads), vagina and penis for the virus because that is where it will reside almost exclusively for the first year or two. If you don't have those tissue specimens, you could search in urine, blood, saliva, or white blood cells, but only a *Positive* result can be trusted. Also search for the human intestinal fluke and benzene in the thymus. Of course, a *Positive* test in these tissues is very significant. If you are positive, zap parasites immediately. You should test *Negative* in less than an hour. Remove benzene polluted items from your lifestyle. Also test yourself to several varieties of popcorn, brown rice, and corn chips as an indication of zearalenone, which must be eliminated in order to get well. Follow up on yourself every few days to be sure your new found health is continuing. Test yourself for Freon.

Lesson Twelve

Purpose: To test for diseases of all kinds.

Materials: Use slides and cultures of disease organisms. Homemade preparations of strep throat, acute mononucleosis, thrush (*Candida*), chicken pox, *Herpes* 1 and 2, eczema, shingles, warts, measles, yeast, fungus, rashes, colds, sore throats, sinus problems, tobacco virus, and so forth can all be made by swabbing or scraping the affected part. A plastic spoon or bit of paper towel works well. Put a small bit on a slide. Add a drop of balsam and a cover slip. Or

put the towel in a bottle, add water and alcohol as described previously. Microscope slides can greatly expand your test set (see *Sources*).

Method: Test yourself for a variety of diseases, using your white blood cell specimen first. Then search in organs like the liver, pancreas, spleen. Notice how many of these common illnesses don't “go away” at all. They are alive and well in some organ. They are merely not making you sick!

Lesson Thirteen

To test for AIDS.

Materials: Benzene sample, slides of tissue samples like thymus, liver, pancreas, penis, and vagina. Also a collection of disease specimens such as the ones used in the previous lesson.

Method: Search in the thymus for benzene. If it is *Positive* throughout the day, you are at risk for developing AIDS, although you may not be ill. Search other tissues for benzene. The more tissues with benzene in them the more serious the situation. Immediately search all your body products and foods for benzene.

Stay off benzene polluted items forever.

Tally up the diseases you tested *Positive* for in Lesson Twelve. Test at least ten. If you had more than half *Positive* you already have AIDS. (50% is my standard, you may set your own; an ideal standard for defining a healthy person should be 0% positive.)

Lesson Fourteen

Purpose: To test for aflatoxin.

Materials: Do not try to purchase a pure sample of aflatoxin; it is one of the most potent carcinogens known. Having it on hand would constitute unnecessary hazard, even though the bottle would never need to be opened. Simply make specimens of beer, moldy bread, apple cider vinegar, and any kind of peanuts using a very small amount and adding filtered water and grain alcohol as usual.

Method: Test yourself for these. If you have all of them in your white blood cells and the liver then you very, very probably have aflatoxin built up. Next,

test your daily foods for their presence in your white blood cells. Those that test *Positive* must be further tested for aflatoxin. Notice the effect of vitamin C on aflatoxin in your liver. Find a time when your liver is *Positive* to aflatoxin (eat a few roasted peanuts from a health food store and wait ten minutes). Take 1 gram vitamin C in a glass of water. Check yourself for aflatoxin every five minutes. Does it clear? If not, take 5 or 10 grams vitamin C. How long does it take?

Lesson Fifteen

Purpose: To test for parasites.

Method: If you test *Positive* to your pet's saliva, you have something in common—a parasite, no doubt. You must search your muscles and liver for these, not saliva or white blood cells, because they are seldom seen in these. Zap yourself for parasites until you no longer test *Positive* to your pets' saliva.

Tapeworms and tapeworm stages can not (and should not) be killed with a regular frequency generator. Each segment, and probably each scolex in a cysticercus has its own frequency and might disperse if your generator misses it. Only zapping kills all and is safe for tapeworms.

Be sure to treat your pet on a daily basis with the pet *Parasite Program*.

Lesson Sixteen

Purpose: To test for fluke disease.

A small number of intestinal flukes resident in the intestine may not give you any noticeable symptoms. Similarly, sheep liver flukes resident in the liver and pancreatic flukes in the pancreas may not cause noticeable symptoms. Their eggs are shed through the organ ducts to the intestine and out with the bowel movement. They hatch and go through various stages of development outdoors and in other animals. But if you become the total host so that various stages are developing in your organs, you have what I term *fluke disease*. I have found that cancer, HIV, diabetes, endometriosis, Hodgkin's disease, Alzheimer's disease, lupus, MS and “universal allergy syndrome” are examples of fluke disease.

You can test for fluke disease in two ways: electronically and by microscope observation.

Materials: Cultures or slides of flukes and fluke stages from a biological supply company (see *Sources*) including eggs, miracidia, redia, cercaria, metacercaria. Body fluid specimens to help you locate them for observation under a microscope.

Method: Test for fluke stages in your white blood cells first. If you have any fluke stages in your white blood cells you may wish to see them with your own eyes. To do this, you must first locate them. Place your body fluid samples on one plate, your parasite stages on the other plate, and test for as many as you were able to procure, besides adults. After finding a stage electronically, you stand a better chance of finding it physically with a microscope.

Lesson Seventeen

Purpose: To see how sensitive your measurements can be. (How much of a substance must be present for you to get a *Positive* result?)

Materials: filtered water, salt, glass cup measure, 13 new glass bottles that hold at least ¼ cup, 14 new plastic teaspoons, your skin tissue sample, paper towel.

Method: Some of the best measurement systems available today are immunological (such as an ELISA assay) and can detect as little as 100 fg/ml (femtograms per milliliter). A milliliter is about as big as a pea, and a femtogram is 1/1,000,000,000,000,000th (10^{-15}) of a gram!

1. Rinse the glass cup measure with filtered water and put one half teaspoon of table salt in it. Fill to one cup, stirring with a plastic spoon. What concentration is this? A teaspoon is about 5 grams, a cup is about 230 ml (milliliters), therefore the starting concentration is about 2½ (2.5) gm per 230 ml, or .01 gm/ml (we will discuss the amount of error later).

2. Label one clean plastic spoon “water” and use it to put nine spoonfuls of filtered water in a clean glass bottle. Use another plastic spoon to transfer one spoonful of the .01 gm/ml salt solution in the cup measure to the glass bottle, stir, then discard the spoon. The glass bottle now has a 1 in 10 dilution, and its concentration is one tenth the original, or .001 gm/ml.

3. Use the “water” spoon to put nine spoonfuls of filtered water in bottle #2. Use a new spoon to transfer a spoonful of salt solution from bottle #1 to bottle #2 and stir briefly (never shake). Label bottle #2 “.0001 gm/ml”.

4. Repeat with remaining bottles. Bottle #13 would therefore be labeled ".000000000000001 gm/ml." This is 10^{-15} gm/ml, or 1 femtogram/ml.

5. Do the skin test with water from bottle #13 as in Lesson Five. If you can detect this, you are one hundred times as sensitive as an ELISA assay (and you should make a bottle #14 and continue if you are curious how good your sensitivity can get). If you can not, try to detect water from bottle #12 (ten times as sensitive as ELISA). Continue until you reach a bottle you can detect.

Calculate the error for your experiment by assuming you could be off by as much as 10% when measuring the salt and water adding up to 20% error in each of the 13 dilutions. This is a total error in bottle #13 of 280%, or at most a factor of 3. So bottle #13 could be anywhere from 0.33 to 3 femtogram/ml. if you can detect water from bottle #13, you are definitely more sensitive then an ELISA, in spite of your crude utensils and inexpensive equipment! Note that the starting error of using 2.5 gm instead of 2.3 gm only adds another 10% error.

If you want to calculate how many salt molecules you can detect, select the concentration at the limit of your detection, and put 2 drops on a square inch of paper towel and rub into your skin. Assume one drop can be absorbed. If you can detect water from bottle #13, you have detected 510,000 molecules (10^{-15} fg/ml divided by 58.5 gm/M multiplied by 6.02×10^{23} molecules/M divided by 20 drops/ml). Water in bottle #12 would therefore have 10 times as many molecules in one drop, and so forth. Even if your error is as much as a factor of 2 (100%), you can still get a good idea of what you can measure.

Atomic absorption standards start at exact concentrations; it is easy to make a more exact dilution series with them. When testing for iridium chloride by this skin test method, I was able to detect 3025 molecules!

Troubleshooting:

Always extend your set until you get a *Negative* result (this should happen by at least bottle #18). If you always "detect" salt, then you shook the bottle!

Never try to reuse a bottle if you spill when pouring into it. Get another new bottle.

Sensitivity of Pollutant-In-Product Testing

Get some slides of *Salmonellas* and *Shigellas* and find some milk that tests

Positive to at least one. Make a dilution series of the milk up to bottle #14, being careful not to shake the bottles. Start with 2 drops of milk in bottle #1. Use an eye dropper to deliver 2 drops to subsequent bottles. Begin testing at bottle #14, using the slide that tested positive. You will learn to search by frequency later. My sensitivity was routinely around bottle #12, for a variety of pathogens. It was the same for toxic elements starting with standard solutions, about 1000 µg/ml, showing this method is less sensitive than skin testing.

Microscopy Lesson

Purpose: To *observe* fluke stages in saliva and urine with a microscope.

Materials:

a. A low power microscope. High power is not needed. A total of 100x magnification is satisfactory for the four common flukes, *Fasciolopsis, sheep liver fluke, human liver fluke*and *pancreatic fluke.*

b. Glass slides and coverslips.

c. A disposable eye dropper.

d. For sanitation purposes (wiping table tops, slides, microscope and your hands) a 50% to 70% alcohol solution (not rubbing alcohol!) is best. Dilute 95% grain alcohol 7 parts alcohol plus 3 parts water. Vodka or 76% grain alcohol can be used undiluted.

e. Formaldehyde, 20%. Formaldehyde 37% is commonly available at pharmacies. Dilute this with equal parts of filtered water to get 18½%, which is close enough to 20%, for the purpose of "fixing" (killing) the specimens. Store in a glass bottle in the garage, away from sunlight. Label. Specimens that are fixed properly do not lose their life-like appearance.

f. Iodine solution. This is only useful for the urine specimens. Lugol's iodine and tincture of iodine are both useful. Ask a pharmacist to prepare *Lugol's Iodine Solution* for you, as follows:

- 44 grams (1½ oz) iodine crystals
- 88 grams (3 oz) potassium iodide crystals

Dissolve both in 1 liter (quart) filtered water. This may take a day of frequent shaking.

Fig. 83 Microscope, slides and coverslips

Method for saliva:

1. Pour the 20% formaldehyde into a small amber bottle or other receptacle to a depth of about 1/8 inch. Keep tightly closed.
2. The person to be tested is asked to salivate into the bottle so the organisms are immediately “fixed” without undergoing cooling first. The total volume should be about double the original amount of formaldehyde used. Make a mark on the container so the subject knows how much to produce. The resultant concentration of formaldehyde will be about 10%.
3. Shake the bottle a few times. Set it aside for 24 hours to settle (less if testing is urgent).
4. With a dropper, draw up some of the bottom settlings. Put one drop on a slide and apply a coverslip.
5. View under low power of microscope. Compare objects you observe with specimens obtained on slides from biological supply companies.

Note: Persons with HIV and moderate AIDS will show about one to ten parasite stages per slide. It requires several hours of searching. Persons with HIV

and severe AIDS show 10 or more fluke stages per slide; this makes the task of finding them much easier. Persons with terminal untreated cancer have many more fluke stages than relatively well persons.

Method for urine:

1. Prepare bottles of formaldehyde fixative ahead of time. Put about ¼ to ½ inch of 20% formaldehyde in each. Keep tightly closed.

2. Add freshly voided[36] urine from cancer or HIV sufferers to the formaldehyde in approximately equal amounts, resulting in a 10% formaldehyde solution. Shake immediately. Let settle several hours. The sediment has a higher number of fluke stages. Cancer victims with cervical or prostate cancer will show higher numbers of stages in urine than other cancer types.

3. Staining the slide is optional. It helps to outline fluke stages slightly. Prepare Lugol's solution as described above.

Slides may be stained in either of these two ways:

• Put a drop of "fixed" urine on a slide. Add a drop of 50% Lugol's (dilute 1:1 with filtered water). Apply coverslip.

• Put a drop of "fixed" urine on a slide. Apply coverslip. Add 1 to 3 drops of 50% Lugol's to edge of coverslip and allow it to seep in.

Note: persons who have been treated for cancer or HIV using any of the known drugs may show only 1 to 2 fluke parasite stages per drop of saliva or urine. For this reason, you may need to search through 20 or more slides to find flukes. Very ill persons may show up to 10 parasites per drop (slide).

Taking Pictures Of What You See

You may be unsure of what you see even if you have the microscope slides of labeled flukes and their stages to study and compare. In real life, they vary so much in shape and size that absolute identification is difficult without experience. Unfortunately in a few hours, just as you are getting proficient, your magnificent specimens will be drying out and unfit for observation. To preserve them longer you can seal the edges by painting around the coverslip with fingernail clear enamel. Or dribble hot sealing wax along the edges and then place them in sealed plastic bags (one per bag). Melt sealing wax in a metal jar lid. Make an applicator from a piece of coat hanger wire bent in the shape of a

small square to fit around the coverslip and a handle.

Or take photographs. To take pictures of what you see under the microscope you will need a photomicrographic camera, which costs $200.00 and up (see *Sources*). It is easy to use. Remember to label your pictures so you know which slide they came from.

Even photographs do not scientifically prove identity of parasite stages, but it is very good evidence. Proof would require that the saliva or urine sample could be cultured and seen to produce the known parasite stages.

Using A Frequency Generator

Frequency generators come in all sizes and costs and capabilities. If you can purchase one that reads out the frequency for you in numbers (digital type) and lets you produce a fraction of a kilohertz by turning a dial, it meets your most elementary needs. It should also be possible to set it on positive offset (100% positive) and still give you 5 volts. Then it can be used as a zapper. You should also be able to select a sine wave or square wave.

The advantages of having a frequency generator are that you can do your own diagnosing. You can find, in a few minutes:

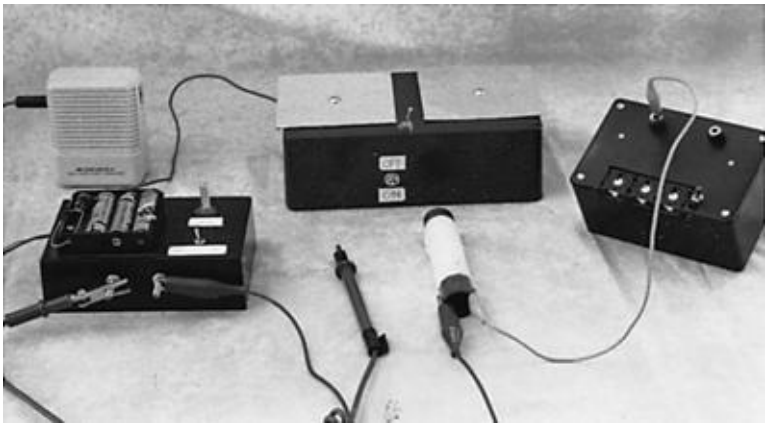
1. Which invaders you have by dialing in to their frequencies.
2. At what frequencies <u>you</u> are broadcasting to the world.
3. What frequencies are used by other living things.

The Theory

Every living animal and every cell type <u>produces</u> its own frequencies and <u>responds</u> to these frequencies as well. We may speak of frequencies but we really mean waves, waves of energy. All waves have a frequency associated with them, so it’s not really misleading to say frequencies when we really mean waves.

When the animal is alive it <u>produces</u> them, when it is dead it still <u>responds</u> to some of them. It is like the opera singer and the glass goblet. The opera singer <u>produces</u> frequencies in the air. The goblet <u>responds</u> to them because of its structure, not because it’s alive. The goblet “picks up” on that particular

frequency of sound because its own “resonant” frequency is exactly the same. If the singer sings loud enough the goblet shatters from the vibrations set up in it. An identical goblet, made of plastic, would not have the same resonant frequency.



The Syncrometer® at left is attached to the handhold. The frequency generator at right is also clipped to the handhold.

Fig. 84 Setup for finding resonant frequencies.

There is not merely a structural and chemical difference between the living and non living. Living things are transmitting energy of some unique kind. And with your simple device, you will be able to trap this energy. And measure its exact frequency. This is not the same as understanding its makeup and source. We must leave that to others. But we can observe and use our observations to track down bacteria and other parasites. We can track down pollutants. We can measure our health quantitatively and perhaps in the future predict life expectancy.

The Syncrometer® traps the frequencies that match the ones in the material on the test plates and delivers them to an audio speaker in a range that you are able to hear. **Instead of test tissues or pathogens, we are now going to use pure test frequencies!** Remarkably, few things have overlapping frequencies, making this technique extremely useful for identification, even without a specimen!

Lesson Eighteen

Purpose: To search for the intestinal fluke in your body by listening to its broadcast frequency at 434 KHz.

Method: Turn on the frequency generator, select a frequency a short distance

above the one you are interested in, like 438 KHz, turn the voltage (amplitude) down to less than one volt. Select sine waves. The lead coming from the frequency generator will have two connections, usually red and black (ground). We will not use the black (ground), just tape it out of the way. Pick up the handhold and probe in the usual way. Attach the red lead coming from the generator to your handhold. This makes two wires attached to your handhold. Although there is nothing on the test plates, they must be connected as usual with the switch at OFF (one plate is still ON).

Turn the Syncrometer® ON. Probe yourself as usual. Your body's waves are being sent to the capacitor (plate) in the test plate box. The frequency from the Syncrometer® is sent there, too. And now the 438 KHz waves from the generator are being sent there as well. Three different frequencies are mingling on the plate! If the two from your body and the generator are the same, the circuit will oscillate, and you will hear resonance. Turn the generator to 437 and probe again. Next, 436.

Sometimes, you can hear the resonance start to build. Continue on.

Next try 435. Then 434.

If your body is emitting a frequency of 434 KHz (coming from a live intestinal fluke inside you) it will be reinforced by the generator's 434 KHz. The reinforcement will put oscillations or resonance in the circuit, the same as you are accustomed to hearing with the Syncrometer® . If there was none, you don't have the intestinal fluke anywhere in your body. Confirm this by starting at 430 KHz and working your way up.

If you hear resonance, you do have it. You may wish to verify this independently using a prepared slide of the fluke. Kill your flukes immediately as described in the next lesson.

Lesson Nineteen

Purpose: Killing the intestinal fluke with a frequency generator.

Materials: A frequency generator, two handholds with alligator clip leads for them.

Method: Wrap a single layer of paper towel over each of the two handholds. Wet them under the tap; squeeze out excess water. Clip them to the red and

black wires of the frequency generator. (We use both wires for this purpose.) Dial up 434 KHz. Set the amplitude (voltage) at 10 volts. Grasp the handholds in each hand and hold on for three minutes. That is all. You have killed whatever tiny invader has a resonant frequency the same as the setting on the generator. Remember to zap all the stages, too; see *Pathogen Frequencies*.

If your frequency generator has a **positive offset** capability, you can use it like a zapper, and a single session will kill all pathogens, provided it is 100% offset and can give at least 5 volts at this setting. When using this technique, the generator can be set to any frequency from 2 KHz to 800 KHz, and you should go for 7 minutes. But even a small percentage of negative voltage will ruin this effect and do more harm than good! To be certain your generator is set correctly it would be best to observe the output on an oscilloscope.

Experiment with other voltage settings. Notice that less than one volt is also effective.

Lesson Twenty

Purpose: To find the bandwidth of a small living animal.

Materials: A fly, beetle or other insect, Syncrometer®, frequency generator.

Discussion: Persons using a Syncrometer® might have already tried putting a small insect on one of the plates. The circuit always resonates when you join the circuit at the handhold and probe. Even the tiniest ant placed in a glass bottle or plastic baggy will resonate the circuit. Unless it is too far away from the plate. If it has climbed up the side you will lose the resonance. At least one foot must be touching the bottom of the bottle. If the animal is dead this ceases. Obviously the living thing is affecting the circuit differently before and after death. Is it some kind of a wave form energy? To find its frequency you must add another frequency that will reinforce or interfere with the frequency already on the plate. Adding the generator frequency does just that.

Method: Use the same method as described in the last Lesson; however for an ant or fly, start at 1,000 KHz and proceed upward in big steps like 10 KHz. Use the right test plate which is controlled by the ON-OFF switch. Always listen to the current with the switch OFF, first, then ON. Move the frequency up and repeat. Continue until you hear resonance. Stop immediately. Rest your skin and go back down to the nonresonant frequency region. Move up in smaller steps this time. Repeat and repeat until you feel sure you know just where the

resonance begins. But where does it end?

Start testing well above the suspected range taking big steps downward until you reach a resonant frequency. Rest and repeat until you find the upper limit of resonant frequencies. Record the bandwidth, for example, 1009-1112 KHz.

Lesson Twenty One

Purpose: To see if similar living things interfere with each other when put on the plate together.

Materials: Two identical living insects or very small living things.

Method: Find the broadcast range of each one separately and then together on the plate.

Note: Identical living things do not interfere with each others' frequencies.

Lesson Twenty Two

Purpose: To see if different living things interfere with each other when put on the plate together.

Method: Find the lower and upper end of the broadcast range of two different living things, such as a fly and a beetle or 2 kinds of flies or beetles. Then put them on the plate together. Notice there is no resonance in the accustomed range for either of them. They are interfering with each other on the plate.

Now add the 2 lower ends, then the two upper ends. Also subtract the 2 lower ends, then the two upper ends. For example imagine two insects, one with a spectrum of 1000 to 1090 KHz, the other with a range of 1050 to 1190 KHz. Adding the lower ends gives us 2050 KHz. Subtracting the lower ends gives us 50 KHz. Adding the upper ends gives 2280. Subtracting the upper ends gives 100. Now search for resonance at 50, 100, 2050, 2280 KHz. (These last two may be outside the range of your frequency generator. Choose more primitive life forms which have lower frequency bandwidths to stay within your limit.)

Notice that you hear resonance at exactly these frequencies and not above or below them. This is evidence for modulation of the frequencies: namely fusing them together.

Lesson Twenty Three

Purpose: To find your own bandwidth of emitted frequencies.

Materials: A frequency generator that goes up to 10 MHz. If yours only goes to 2 MHz you can still investigate the lower end of your band.

Method: You do not need to put yourself on the plate, since you are already there by being in the circuit at the handhold. However, if you are measuring someone else, they can simply touch the plate with a finger. Attach the frequency generator to the circuit at the handhold.

Since human adults begin to emit at about 1560 KHz, start searching at 1550, going upward in 1 KHz steps until you hear resonance.

Younger or healthier humans start emitting at a lower frequency and sometimes end at a higher frequency. In other words, they broadcast on a wider band.

Very young infants begin their band at about 1520 KHz. Could you ever regain this ability?

Most adults terminate at 9375 KHz

By eliminating molds from my diet, killing as many parasites and removing as many toxins as I became aware of, I have been able to expand my bandwidth from an initial 1562-9457 KHz in 1990 to 1520-9580 KHz in 1994! I hope this challenges you to accomplish a health improvement reflected in an even broader bandwidth for yourself.

Lesson Twenty Four

Purpose: To find the effect of a variety of things on the lower end of your spectrum, such as body temperature, eating, time of day, rainy weather, feeling sick. Notice that you may not change for weeks at a time, then suddenly see a shrinking of your bandwidth. You may assume you have eaten a mold. Search for mold frequencies from 75 KHz to 295 KHz. Or test in your liver with mold samples. If this is *Positive* go on a mold free diet—watching carefully for mold in your white blood cells. Even after removing the mold from your diet, so that no molds appear in your white blood cells, notice that your bandwidth does not recover. It regularly takes 2-3 weeks for mine to recover.

Surely, this sheds light on the poisonous effect of eating bad food.

Lesson Twenty Five

Purpose: To find an emission spectrum using a saliva sample.

Materials: A regular frequency generator.

Method: Search for the bottom of the resonant frequency band as in the previous lesson.

You may store it in the refrigerator for a few weeks without seeing a change. After that the band begins to shrink.

Lesson Twenty Six

Purpose: To observe the effect of dying on the bandwidth.

Method: Freeze the insect you tested in Lesson Twenty to kill it humanely. Repeat the search for its bandwidth. Note the bandwidth has become very narrow.

Note the bandwidth also depends on the accuracy of your particular frequency generator.

Lesson Twenty Seven

Purpose: To find unknown invaders of your body.

Method: Start at 900 KHz and proceed down to 77 KHz in 1 KHz steps, to search for all pathogens. If you find a resonating frequency, go to the Pathogen Frequency Chart to identify likely candidates for it. Verify the identity of the invader by using a slide or culture specimen. If your pathogen remains unidentified, add it to the chart. This lets you determine whether the next illness is new or a recurrence of this one. Or just kill it.

Use the frequency generator at one pathogen's frequency. Wait ten minutes and retest all of the ones you found. Only that one will be gone. Now **zap**, wait ten minutes, and test again for all of the ones you found. Notice they are all gone. After one hour, search yet again for the pathogens you had. Any that are back must have come from an internal source not reached by the zapper current, like from the bowel or an abscess.

Lesson Twenty Eight

Purpose: To observe the action of a positiveoffset frequency on a very small animal. Does the animal die or is it just incapacitated?

Materials: A slug or small earthworm.

Method: Place the small animal in a plastic container like a cottage cheese carton. Add a few tsp. of water to wet the bottom. Attach a metal teaspoon to each of the generator clips. Place them on opposite sides in the carton and fasten with tape. Set the generator to positive offset at a frequency of about 30 KHz and 5 to 10 volts. Experiment with different voltages and compare effectiveness. Measure the time it takes for the animal to seem lifeless. You may try to revive it by keeping it for some time in the presence of food. Retest its emission band.

Lesson Twenty Nine

Purpose: To kill the bacteria in dairy products.

Materials: A glass of regular pasteurized milk, a carton of cottage cheese. A zapper.

Method: Search for *Salmonellas* and *Shigellas* first in the milk and cottage cheese. Search by frequency, using the chart, or with slides of these bacteria. If you don't find any, search different dairy foods until you find some bacteria. Attach metal teaspoons to the red and black leads of the generator. Place them inside the milk glass or cottage cheese carton, across from each other. Secure with masking tape. Attach the zapper. Zap them for 7 minutes. Remove the electrodes and wait 5 minutes. Test again for the same bacteria. They should be gone (but the food is not safe to eat due to the metal released from the teaspoons).

These experiments point to some exciting possibilities. Perhaps water supplies as well as foods and medicines could be sterilized this way. Perhaps sewage could be treated more efficiently, electrically. Best of all, maybe you could protect yourself from unsanitary products. If you do decide to explore this possibility, remember not to put metals in your mouth or food. Nor to use currents greater than 10 milliamps, or for longer than 10 minutes.

There are many commercially available function generators that can meet your needs. Two are shown here.

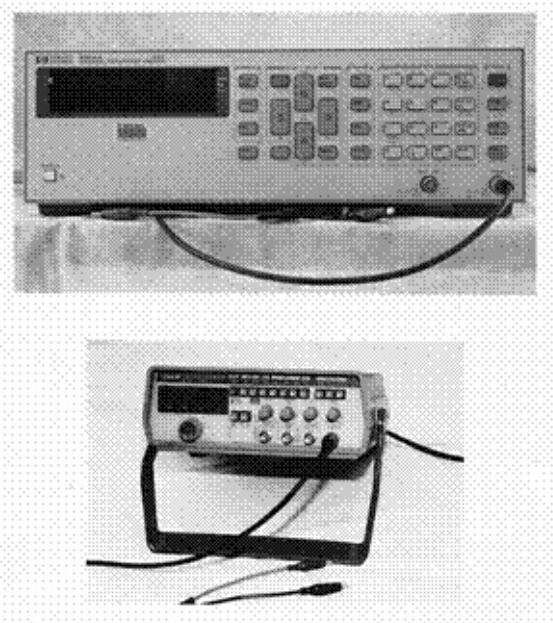


Fig. 85 Function generators

Recipes

Read old recipe books for the fun and savings of making your own nutritious food. Change the recipes to avoid processed ingredients. Here are some I found:

Beverage Recipes

Anything made in your own juicer is fine. Experiment with new combinations to create different flavorful fruit and vegetable juices. Consider the luxury of preparing gourmet juices which satisfy your own individual palate instead of the mass-produced, polluted varieties sold at grocery stores. Remember to wash all fruit, including citrus before juicing. This removes the ever-present pesticides and common fruit mold.

Lemonade

1 cup fresh lemon juice, 1 cup honey, 1½ quarts water. Bring honey and water to a boil if you plan to keep it several days. Then add lemon juice and store in the refrigerator.

All honey and maple syrup should have vitamin C added to it as soon as it arrives from the supermarket. Warm it first; then stir in ¼ tsp. per pint.

Fresh Tomato Juice

Simmer for ½ hour: 12 medium-sized raw, ripe tomatoes, ½ cup water, 1 slice onion, 2 ribs celery with leaves, ½ bay leaf, 3 sprigs parsley. Strain these ingredients. Season with: 1 tsp. salt (aluminum-free), ¼ tsp. paprika, ½ tsp. honey. Serve thoroughly chilled. Makes about 4 servings.

Fresh Pineapple Juice

Peel a pineapple. Remove all soft spots. Cut it into cubes. Extract the juice by putting the pineapple through a food grinder or a blender. There will be very little pulp. Strain the juice and serve it on ice with sprigs of mint. Makes about 1½ cups of juice. Mix the pulp with an equal amount of clover honey and use as

topping (kept in freezer) for homemade ice cream (below), pancakes, or yogurt.

Maple Milk Shake

For each milk shake, blend or shake together: 1 glass of milk and 2 tablespoons maple syrup.

Remember, all milk gets boiled.

Yankee Drink

Mix together 1 gal. water, 3 cups honey, ½ cup fresh lemon juice or distilled white vinegar, and 1 tsp. ginger.

Hot Vanilla Milk

Add one inch of vanilla bean and one tsp. honey to a glass of milk and bring to a near boil. You may add a pinch of cinnamon or other pure spice. You may even use vanilla extract (see *Sources*).

Red Milk

Equal parts fresh carrot juice (use a juicer) and sterilized milk. Save the carrot pulp for salads and soups.

C-Milk

Milk can absorb a surprising amount of vitamin C powder without curdling or changing its flavor. Try ½ tsp. in a glass of cold milk.

My Own Soda Pop

Excellent for stomach distress. Put 1 tsp. citric acid, 2 tbs. vegetable glycerin (see *Sources*), 2 tbs. honey, and 1 lemon, juiced by hand, into a quart jar and fill with cold water. Refrigerate until ready to use. Then add 1 tsp. baking soda (chemically pure only, see *Sources*) and shake a few times, keeping the lid tight. Pour over a few ice cubes. Many variations are possible: other fruit concentrates, made in the blender, can be used along with some lemon juice; for example, 2 blended whole apples (peeled), blended pineapple, orange or grapefruit. Always add a bit of lemon to give it zip. You may add a pinch of ginger or other pure

spice.

Note: The amount of sodium in ½ tsp. baking soda is .476 grams. If you have heart disease, high blood pressure, or edema, use potassium bicarbonate instead. Ask your doctor what an acceptable amount of sodium or potassium bicarbonate is. I would suggest limiting yourself to one glass of soda pop a day, even if you do not have heart disease.

Another Note: the citric acid kills bacteria, while the carbonation brings relief.

My Own Super C-Pop

An excellent way to get lots of vitamin C into a child and relieve stomach distress at the same time. Squeeze 1 slice of lemon and 1 whole orange into an 8 ounce bottle that has a tight lid. Add 1 tsp. vitamin C powder (ascorbic acid), ¼ tsp. citric acid, and 2 tbs. vegetable glycerin (you may also experiment with honey for sweetness). Fill the bottle to the top with cold water. Then add ½ tsp. chemically pure baking soda and close tightly. Shake briefly and serve immediately.

Half And Half

Mix equal parts whipping cream and milk or water. Boil and chill.

Buttermilk-C

Stir 1 tsp. vitamin C powder into a glass of milk. Add a pinch of potassium chloride. Additional seasoning may be pepper and herbs. Stir and enjoy.

Food Recipes

Despite the presence of aflatoxins, benzopyrenes, and solvents in many foods, it is possible to have a delicious and safe diet. Many persons need to gain weight, and with the emphasis in today's society on losing weight, consider yourself lucky in this respect. Help yourself to lots of butter, whipping cream, whole milk, avocados, and olive oil. Make your own preserves and baked goods, including breads. Remember, when you are recovering from a major illness it is essential not to diet to lose weight. You must wait two years after you are recovered to try to lose weight.

Daily Foods

Dairy products should contain at least 2% fat to enable you to absorb the calcium in them.

All milk should be sterilized

…by boiling it for 10 seconds. If it makes mucous, you already have a chronic respiratory infection. Try to clear this up.

Change brands every time you shop to prevent the same pollutants from building up in your body.

If frying or cooking with fat, use only olive oil, butter or lard (the BHT and BHA preservatives in lard are OK except for seizure sufferers). Mix them for added flavor in your dishes. Never use margarine, Crisco™ or other hydrogenated fats. Do not cook over flames or grill, even when electric.

Eat lots of **fresh fruits and vegetables.** Wash them off only with cold tap water, not commercial food "wash". Scrub hard with a stiff bristled brush. Then cut away blemishes. Always peel potatoes, apples, and carrots. Modern dirt is full of chemicals and is toxic to you.

Be sure to drink plenty of **plain water** from your cold faucet throughout the day, especially if it is difficult for you to drink it with your meals. If you don't like the taste of your own tap water, try to get it from a friend with newer plumbing. Use a polyethylene (opaque) water jug from a grocery store to transport it. Never drink water that has been run through a water softener or copper plumbing or has traveled through a long plastic hose. Don't drink water that has stood in a container for a day. Dump it and sterilize the container. To further improve flavor and to dechlorinate attach a small faucet filter made of carbon only. Or buy a filter pitcher (see *Sources*). Don't drink water that has stood in the filter pitcher very long, either.

Because commercial **cold cereals** are very convenient, but have solvents, here are two replacements.

Two Granolas

7 cups rolled oats (old fashioned, not quick)
1 tsp. salt
1 cup wheat germ (fresh, not defatted)
½ cup honey
½ cup sunflower seeds, immaculate quality
½ cup milk (no need to sterilize, it is being baked)

½ cup melted butter
1 cup raisins, rinsed in vitamin C water

Mix dry ingredients together. Mix liquid ingredients and add gradually, while tossing until thoroughly mixed. Place in large ungreased pans and bake in slow (250°) oven. Stir occasionally, baking until brown and dry, usually 1-2 hours. Store in airtight container in freezer.

6 cups rolled oats
½ cup raw wheat germ
1 cup sesame seeds
1 cup sunflower seeds (raw, unsalted)
1 tsp. cinnamon
½ cup melted butter
½ cup honey

Preheat oven to 250°. Toss all ingredients in mixing bowl. Spread thinly on a baking sheet and bake 20-25 minutes. Stir often in order to brown evenly. When golden, remove and let cool. Makes 12 cups.

If you would like to add nuts to your granola recipes, rinse them in cold tap water first, to which vitamin C powder has been added (¼ tsp. per pint). This removes aflatoxins.

Peanut Butter

Use fresh unsalted roasted peanuts—they will be white on the first day they arrive at the health food store from the distributor. (Ask when they will arrive.) Or shell fresh roasted peanuts yourself, throwing away all shriveled or darkened nuts. Grind, adding salt and vitamin C (¼ tsp. per pint) as you go. For spreadability, especially for children, grind an equal volume of cold butter along with the peanuts. This improves spreadability and digestibility of the hard nut particles. This will probably be the most heavenly peanut butter your mouth has ever experienced.

Light colored, roasted peanuts in the shell had no aflatoxin.

Fig. 86 Peanuts

Sweetening and Flavoring

Brown Sugar. Although I am prejudiced against all sugar from a health standpoint, my testing revealed no benzene, propyl alcohol, wood alcohol. However it does contain sorghum mold and must be treated with vitamin C to detoxify it. Add ¼ tsp. to a 1 pound package; knead until well mixed.

Maple syrup. Add vitamin C to newly opened bottle, ¼ tsp. to retard mold. Keep refrigerated and use promptly.

Flavoring. Use maple, vanilla (both natural and artificial), and any pure spice. They are free of molds and solvents.

Honeys. Get at least 4 flavors for variety: linden blossom, orange blossom, plain clover and local or wild flower honey Add vitamin C to newly opened jar to detoxify ergot mold (¼ tsp. per pint).

Jams and jellies. They are not safe unless homemade.

Fruit syrup. Use one package frozen fruit, such as cherries, blueberries or raspberries. Let thaw and measure the amount in cups (it might say on the package). Add an equal amount of clover honey to the fruit. Also add ¼ tsp. vitamin C powder. Mix it all in a quart canning jar and store in the refrigerator. Use this on pancakes, cereal, plain yogurt and homemade ice cream too. Use to make your own flavored beverages in a seltzer maker or to make soda pop. If you wish to use fresh fruit, bring it to a boil to sterilize. Use it up in a few days or boil to sterilize it again.

Note for diabetics

Diabetics must not use artificial sweeteners. Nor can they use all the sweeteners listed. Try stevia powder instead.

Preserves

Keep 3 or 4 kinds on hand, such as peach, pineapple, and pear. Peel and chop the fruit. It should not have any bruises. If you use a metal knife, rinse the fruit lightly afterwards. Add just enough water to keep the fruit from sticking as it is cooked (usually a few tablespoons). Then add an equal amount of honey, or to taste and heat again to boiling. Put in sterile jars in refrigerator. Make marmalade the same way, slicing the fruit and peel thinly. Always add vitamin C

powder to a partly used jar to inhibit mold. Never use up partly molded fruit by making preserves out of it. Throw it out.

C Dressing

½ cup olive oil
¼ cup fresh lemon juice or white distilled vinegar
1 tsp. thyme, fenugreek or both (capsules are freshest)
1 tsp. vitamin C powder
½ tsp. brown sugar

Combine the ingredients in a clean salad dressing bottle. Shake. Refrigerate. The basic recipe is the oil and vinegar in a 2:1 ratio. After mixing these, add any pure spice desired. Or add fresh tomato chunks for creaminess.

Cheese Sauce

Add milk to cheese in equal amounts. Gradually heat to boiling while stirring. Add more of either to obtain the desired consistency. Boil 10 seconds. Use immediately.

Sour Cream-C

2 cups heavy whipping cream, previously boiled
¼ tsp. citric acid
¼ tsp. vitamin C powder
1 tsp. fresh onion juice or other seasoning (optional)

Stir until smooth, refrigerate 2 hours.

Yogurt

Buy a yogurt maker. Be sure and use boiled milk.

Soups

All homemade soups are nutritious and safe, provided you use no processed ingredients (like bouillon), or make them in metal pots. Use herbs and aluminum-free salt to season. Always add a dash of vitamin C or tomato juice or vinegar to draw out calcium from soup bones for you to absorb.

Fish and Seafood recipe

Any kind of fish or seafood is acceptable, provided it is well-cooked. Don't buy food that is already in batter. The simplest way to cook fish is to poach it in milk. It can be taken straight from the freezer, rinsed, and placed in ¼ inch of milk (unboiled is fine) in the frying pan. Heat until it is cooked. Turn over and

repeat. Throw away the milk. Serve with fresh lemon and herbs.

Baked Apples

Peel and core carefully. Remove all bruises (this is where the patulin is). Cut in bite-sized pieces, add a minimum of water and cook or bake minimally. Add a squirt of lemon juice when done. Serve with cinnamon, whipping cream and honey.

Ice creams

…from the grocery store are loaded with benzene and other solvents. Fortunately there are ice cream makers that do everything (no cranking)! Or try our recipe which uses a blender. Be sure not to add store bought flavors, except vanilla or maple.

5-Minute Ice Cream

(Strawberry) Use 2 half-pints of whipping cream, previously boiled, 1 package of frozen strawberries (about 10 oz.), and ½ cup clover honey. Pour frozen strawberries into blender. Pour whipping cream and honey over them. Blend briefly (about 10 seconds), not long enough to make butter! Pour it all into a large plastic bowl. Cover with a close fitting plastic bag and place in freezer. Prepare it a day ahead. Try using other frozen fruits, such as blueberries and cherries. Keep a few berries out of the blender and stir them in quickly with a non-metal spoon before setting the bowl in the freezer. There are many ice cream recipes to be found in old cook books. Avoid those with raw eggs or processed foods as ingredients. You may add nuts if you rinse them in vitamin C water.

Cookies, cakes and pies

Bake them from scratch, using unprocessed ingredients. Use simple recipes from old cook books.

7-Day Sample Menu

Because processed foods have many toxins, you must cook as much from scratch as possible. So for convenience sake, keep your meals simple in

preparation. You may want to prepare ahead and refrigerate your dressings and toppings. Or you could make a hot soup for dinner, refrigerate, and eat the leftovers for lunch. Don't save leftovers more than two days. Make sure they are covered. Try baking several potatoes at one time, refrigerate and put them in a salad the next night. Variety is the spice of life, so combine the allowed foods in the most creative ways you can imagine. And don't forget herbs and spices; learn to use them from old cook books.

	Breakfast	Lunch	Dinner
Day 1	Granola and honey with milk, half n' half or whipping cream 1 cup fresh squeezed fruit juice Water Milk	Fresh ground peanut butter and preserve sandwich Soup Milk Water	Orange roughy fish Fresh green beans with butter Baked potato with Sour Cream-C topping or fresh chives Pie (homemade) Milk 1 cup fresh squeezed or frozen vegetable juice Water
Day 2	Egg (limit is 2) Fried potatoes 1 glass milk Peppermint herb tea Fresh orange juice	Bagel (from bakery) Sour Cream-C Tomato 1 cup vegetable juice Water Milk	Homemade bean or lentil soup Sardines Dinner roll and butter Salad Homemade dressing Ice cream (homemade) Water
Day 3	Cream of Wheat™ cooked with raisins and milk Banana Peppermint herb tea ½ cup milk Water	Tuna sandwich with olives and butter Soup Milk Water	Baked sweet potato with butter and sweetening. Fresh broccoli with cheese sauce Bread and butter Chopped, peeled pear and whipping cream 1 cup vegetable juice Milk Water
Day 4	French toast with maple syrup Egg Homemade grapefruit juice Milk Water	Avocado and sour cream sandwich ½ cup vegetable juice Bread and butter Water	Lobster or sautéed shrimp Fresh asparagus Potatoes, any style ½ cup vegetable juice Water Milk
Day 5	Cooked cereal 1 glass milk Sliced banana with whipping cream and honey 1 glass water	Cold potato salad with C Dressing Soup ½ cup vegetable juice Custard Water Milk	1 can sardines or salmon in easy-open can (can openers shed metal) Salad of lettuce, tomato, olives, avocado with homemade dressing Bread with butter Ice-cream (optional) ½ cup vegetable juice Water Milk
Day 6	Egg and homemade biscuit with honey and butter Milk Fruit juice (homemade) Water	Homemade peanut butter sandwich ½ cup vegetable juice Milk Water	Gourmet pizza: home baked bread topped with olive oil, sliced tomato or homemade sauce, grated cheese, sardines or anchovies, chopped vegetables, garlic and onion Salad Milk Water
Day 7	Pancakes Banana or chopped fruit with cream Milk Water	Salmon sandwich (from flip top can) ½ cup vegetable juice Milk Water	Stir-fry vegetables: broccoli, carrots, cabbage, in olive oil and butter Bread and butter Pie (optional) Milk Water

Remember, take vitamin C and B-complex with each meal.

Too Sick To Cook, Too Tired To Eat

Pick three meals from the sample menu that need no cooking and eat them every day.

Recipes for Natural Body Products

You can use just borax (like 20 Mule Team Borax™) and washing soda (like Arm & Hammer Super Washing Soda™) for all types of cleaning including your body, laundry, dishes and your house! You don't need all of those products you see in commercials for each special task!

Even if you have dry skin, difficult hair or some other unique requirement, just pure borax will satisfy these needs. A part of every skin problem is due to the toxic elements found in the soaps themselves. For instance aluminum is commonly added as a “skin moisturizer”. It does this by impregnating the skin and attracting water, giving the illusion of moist skin. In fact you simply have moist aluminum stuck in your skin which your immune system must remove. While borax won't directly heal your skin or complexion, it does replace the agents that are causing damage, so that healing can occur.

Borax Liquid Soap

Empty 1 gallon jug
1/8 cup borax powder
Plastic funnel

Funnel the borax into the jug, fill with cold tap water. Shake a few times. Let settle. In a few minutes you can pour off the clear part into dispenser bottles. This is the soap!

Easier way: use any bottle, pour borax powder to a depth of a ½ inch or so. Add water. Shake. When you have used it down to the undissolved granules, add more water and shake again. Add more borax when the undissolved granules get low.

Keep a dispenser by the kitchen sink, bathroom sink, and shower. It does not contain aluminum as regular detergents and soaps do, and which probably contribute to Alzheimer's disease. It does not contain PCBs as many commercial and health food varieties do. It does not contain cobalt (the blue or green granules) which causes heart disease and draws cancer parasites to the skin. Commercial detergents and non-soaps are simply not safe. Switch to homemade bar soap and borax for all your tasks! Borax inhibits the bacterial enzyme *urease* and is therefore antibacterial. It may even clear your skin of blemishes and stop your scalp from itching.

For Laundry

Borax (½ cup per load). It is the main ingredient of non-chlorine bleach and has excellent cleaning power without fading colors. Your regular laundry soap

may contain PCBs, aluminum, cobalt and other chemicals. These get rubbed into your skin constantly as you wear your clothing. For bleaching (only do this occasionally) use original chlorine bleach (not “new improved” or “with special brighteners”, and so forth). Don’t use chlorine if there is an ill person in the house. For getting out stubborn dirt at collars, scrub with homemade bar soap first; for stains, try grain alcohol, vinegar, baking soda.

For Dishes

Don't believe your eyes when you see the commercials where the smiling person pulls a shining dish out of greasy suds. Any dish soap that you use should be safe enough to eat because nothing rinses off clean. Regular dish detergents, including health brands, are now polluted with PCBs. They also contain harmful chemicals. Use borax for your dishes. Or use paper plates and plastic (not Styrofoam) cups.

In The Dishwasher

Use 2 tsp. borax powder pre-dissolved in water. If you use too much it will leave a film on your dishes. Use vinegar in the rinse cycle.

In The Sink

Use a dishpan in the sink. Use ¼ cup borax and add a minimum of water. Also keep a bit of dry borax in a saucer by the sink for scouring. Don't use any soap at all for dishes that aren't greasy and can be washed under the faucet with nothing but running water. Throw away your old sponge or brush or cloth because it may be PCB contaminated. Start each day by sterilizing your sponge (it harbors Salmonella) or with a new one while the used one dries for three full days. Clean greasy pots and pans with a paper towel first. Then use homemade bar soap.

Shampoo

Borax liquid is ready to use as shampoo, too. It does not lather but goes right to work removing sweat and soil without stripping your color or natural oils. It inhibits scalp bacteria and stops flaking and itching. Hair gets squeaky clean so quickly (just a few squirts does it) that you might think nothing has happened! You will soon be accustomed to non-lathery soap. Rinse very thoroughly because you should leave your scalp slightly acidic. Take a pint container to the shower with you. Put ¼ tsp. citric (not ascorbic) acid crystals (see *Sources*) in it.

For long hair use a quart of rinse. Only **citric acid** is strong enough to get the borax out, lemon juice and vinegar are not. After shampooing, fill the container with water and rinse. Rinse your whole body, too, since citric acid is also anti-bacterial. All hair shampoo penetrates the eye lids and gets into the eyes although you do not feel it. It is important to use this natural rinse to neutralize the shampoo in your eyes. (Some people have stated that citric acid makes their hair curlier or reddens it. If this is undesirable, use only half as much citric acid.) Citric acid also conditions and gives body and sheen to hair.

Make a bottle of borax liquid to fill your soap dispensers and shampoo bottle. Use citric acid to rinse and condition.

Fig. 87 Borax and citric acid

Hair Spray

I don't have a recipe that holds your hair as well as the bottle of chemicals you can buy at the store. Remarkably a little lemon juice (not from a bottle) has some holding power and no odor! Buy a 1 cup spray bottle. Squeeze part of a lemon, letting only the clear juice run into the bottle. Fill with water. Keep it in the refrigerator. Make it fresh every week. Spraying with just plain water is nearly as good! For shinier hair, drop a bit of lemon peel into the bottle.

Homemade Soap

A small plastic dishpan, about 10” x 12”
A glass or enamel 2-quart sauce pan
1 can of lye (sodium hydroxide), 12 ounces
3 pounds of lard (BHT and BHA are OK here)
Plastic gloves

1. Pour 3 cups of very cold water (refrigerate water overnight first) into the 2-quart saucepan.

2. Slowly and carefully add the lye, a little bit at a time, stirring it with a wooden or plastic utensil. (Use plastic gloves for this; test them for holes first.) Do not breathe the vapor or lean over the container or have children nearby. Above all use no metal. The mixture will get very hot. In olden days, a sassafras branch was used to stir, imparting a fragrance and insect deterrent for mosquitoes, lice, fleas, ticks.

3. Let cool at least one hour in a safe place. Meanwhile, the unwrapped lard should be warming up to room temperature in the plastic dishpan.

4. Slowly and carefully, pour the lye solution into the dishpan with the lard. The lard will melt. Mix thoroughly, at least 15 minutes, until it looks like thick pudding.

5. Let it set until the next morning; then cut it into bars. It will get harder after a few days. Then package.

If you wish to make soap based on olive oil, use about 48 ounces. It may need to harden for a week.

Liquid Soap

Make chips from your homemade soap cake. Add enough hot water to dissolve. Add citric acid to balance the pH (7 to 8). If you do not, this soap may be too harsh for your skin.

Skin Sanitizer

Make up a 5 to 10% solution of food grade alcohol. Food grade alcohols are grain (ethyl) alcohol or vodka. Find a suitable dispenser bottle. Mark it with a pen at about one tenth of the way up from the bottom. Pour 95% grain alcohol (190 proof) to this mark (for 50% grain alcohol or vodka make your mark one fifth of the way up). Add water to the top. Keep shut. You may add a chip of lemon peel for fragrance.

Use this for general sanitizing purposes: bathroom fixtures, knobs, handles, canes, walkers, and for personal cleanliness (but use chlorine bleach for the toilet

bowl once a week). Always clean up after a bowel movement with wet toilet paper. This is not clean enough, though. Follow with a stronger damp paper towel. This is still not clean enough; use a final damp paper towel with skin sanitizer added. After washing hands, sanitize them too, pouring a bit on one palm and put finger tips of the other hand in it, scratch to get under nails, repeat on other hand. Rinse with water.

Do not use this recipe, nor keep any bottles of alcohol in the house of a recovering alcoholic

Deodorant

Your sweat is odorless. It is the entrenched bacteria feeding on it that make smells. You can never completely rid yourself of these bacteria, although they may temporarily be gone after zapping. The strategy is to control their numbers. Here are several deodorants to try. Find one that works best for you:

Vitamin C water. Mix ¼ tsp. to a pint of water and dab it on. Then dab on cornstarch.

Citric Acid water. Mix ¼ tsp. to a pint of water and dab it on. Then dab on cornstarch.

Only a few drops of these acids under each armpit are necessary. If these acids burn the skin, dilute them more. Never apply anything to skin that has just been shaved!

Corn starch. Many people need only this. Dab it on.

Use only unpolluted **cornstarch** (see *Sources*).

Baking soda has been deleted as a deodorant because benzene was found in some boxes.

Lemon juice. This acid is not as strong, use what you need.

Pure alcohol (never rubbing alcohol). The food grade alcohols are grain alcohol and vodka. Dab a bit under each arm and/or on your shirt or blouse, then dab on cornstarch. If the alcohol burns, dilute it with water. Be very careful not to leave the bottle where a child or alcoholic person could find it. Pour it into a

different bottle!

Pure zinc oxide. You may ask your pharmacist to order this for you. She or he may wish to make it up for you too, but do not let them add anything else to it. It should be about 1 part zinc oxide powder to 3 parts water. It does not dissolve. Just shake it up to use it. After you get it home, you can add cornstarch to it to give it a creamy texture. Heat 3 tsp. cornstarch in 1 cup of water, to boiling, until dissolved and clear. Cool and add some to the zinc oxide mixture (about equal parts). Store unused starch mixture in the refrigerator. Only make up enough for a month.

Alcohol and zinc oxide. This is the most powerful deodorant. Apply alcohol first, then the zinc oxide, then dab on cornstarch.

Remember that you need to sweat! Sweating excretes toxic substances, especially from the upper body. Don't use deodorant on weekends. Go to the sink and wipe clean the armpits like our grandparents did. Often, just plain cornstarch is enough! These homemade deodorants are not as powerful as the commercial varieties—this is to your advantage.

Brushing Teeth

Buy a new toothbrush. Your old one is soaked with toxins from your old toothpaste. Use only water or chemically pure baking soda if you have any metal fillings. Put a pinch in a glass, add water to dissolve it. Use food-grade hydrogen peroxide (see *Sources)* if you have only plastic fillings. Dilute it from 35% to 17½% by adding water (equal parts). Store hydrogen peroxide only in polyethylene or the original plastic bottle. Use 4 or 5 drops on your toothbrush. It should fizz nicely as oxygen is produced in your mouth. Your teeth will whiten noticeably in 6 months. Before brushing teeth, floss with 4 or 2 pound monofilament fish line. Double it and twist for extra strength. Rinse before use. Floss and brush only once a day. If this leaves you uncomfortable, brush the extra times with plain water and a second “water-only” toothbrush. Make sure that nothing solid, like powder, is on your toothbrush; it will scour the enamel and give you sensitive teeth, especially as you get older and the enamel softens. Salt is corrosive—don't use it for brushing metal teeth. Plain water is just as good.

For Dentures

Use salt water. It kills all germs and is inexpensive. Salt water plus grain alcohol or food-grade hydrogen peroxide makes a good denture-soak.

Mouthwash

A few drops of food grade hydrogen peroxide added to a little water in a glass should be enough to make your mouth foam and cleanse. Don't use hydrogen peroxide, though, if you have metal fillings, because they react. Don't use regular drug store variety hydrogen peroxide because it contains toxic additives. Health food store varieties contain solvents from the bottling process. See *Sources*. Never purchase hydrogen peroxide in a bottle with a metal cap.

For persons with metal tooth fillings, use chemically pure baking soda or just plain hot water. A healthy mouth has no odor! You shouldn't need a mouthwash! If you have breath odor, search for a hidden tooth infection or cavitation.

Contact Lens Solution

A scant cup of cold tap water brought to a boil in glass saucepan. After adding ¼ tsp. aluminum free salt and boiling again, pour into a sterile canning jar. Refrigerate. Freeze some of it.

Lip Soother

For dry, burning lips. Heat 1 level tsp. sodium alginate plus 1 cup water until dissolved. After cooling, pour it into a small bottle to carry in your purse or pocket (refrigerate the remainder). Dab it on whenever needed. If the consistency isn't right for you, add water or boil it down further. You can make a better lip soother by adding some lysine from a crushed tablet, vitamin C powder, and a vitamin E capsule to the alginate mix. If you have a persistent problem with chapped lips, try going off citrus juice.

Foot Powder

Use a mixture of cornstarch and zinc oxide poured into a salt shaker with a lid. Add long rice grains to fight humidity. You may also try arrow root or potato starch. If you don’t have zinc oxide use plain cornstarch.

Skin Healer Moisturizer Lotion

1 tsp. sodium alginate
1 cup water

Make the base first by heating these together in a covered, non-metal pan until completely dissolved. Use low heat—it will take over an hour. Use a wooden spoon handle to stir. Set aside. Then make the following mixture:

¼ tsp. Vitamin C (ascorbic acid) (You may crush tablets)
¼ tsp. lysine (crush tablets)
2 tbs. pure vegetable glycerin
2 vitamin E capsules (400 units or more, each)
1 tsp. apricot kernel oil (olive oil will do)
1 tbs. lemon juice from a lemon or ¼ tsp citric acid (this is optional)
1 cup water

Heat the water to steaming in a non-metal pan. Add vitamin C and lysine first and then everything else. Pour into a pint jar and shake to mix. Then add the sodium alginate base to the desired thickness (about equal amounts) and shake. Pour some into a small bottle to use as lip soother. Pour some into a larger bottle to dispense on skin. Store remainder in refrigerator. (See *Sources* for sodium alginate, vegetable glycerin and apricot kernel oil. Sodium alginate is also available in capsule form at some health food stores.)

Other Skin Healers

Vitamin C powder (ascorbic acid, not the same as citric acid). Put a large pinch into the palm of your hand. With your other hand pick up a few drops of water from the faucet. Rub hands together until all the powder is dissolved and dispensed. It may sting briefly. Do this at bedtime, especially for cracked, chapped hands. Include lips if they need it.

Vitamin E oil. Vitamin E oil from Now Foods was not polluted at the time of this writing, but for the future it would be safer to rely on capsules. Snip open a capsule and rub into skin.

50% Glycerin. Dilute 100% vegetable glycerin with an equal amount of water. This is useful as an after shave lotion.

Vitamin C liquid. Mix ¼ tsp. vitamin C powder in one pint water (crushed tablets will do). This is useful as an after shave lotion and general skin treatment.

Apricot Kernel Oil. This is a very light oil, useful as an after shave lotion and general skin treatment.

Cornstarch (see *Sources*). Use on rashes, fungus, moist or irritated areas and to prevent chafe.

Combining several of these makes them more effective.

Dry skin has several causes: too much water contact, too much soap contact (switch to borax), low body temperature, not enough fat in the diet, or parasites.

Massage Oil

Use olive oil. It comes in very light to heavy textures. Pick the right one for your purpose. Alginate mixtures can be used instead of, or added to, oil. Starch solutions are good, too.

Sunscreen Lotion

Purchase PABA (see *Sources*) in 500 mg tablet form. Dissolve 1 tablet in grain alcohol or vodka. Grind the tablet first by putting it in a plastic bag and rolling over it with a glass jar. It will not completely dissolve even if you use a tablespoon of the alcohol. Pour the whole mixture into a 4 ounce bottle of homemade skin softener. Be careful not to get the lotion into your eyes when applying it. A better solution is to wear a hat or stay out of the sun. Remember to *take* PABA as a supplement, too (500 mg, one a day).

Nose Salve

(When the inside of the nose is dry, cracked and bleeding.)

Pour ½ tsp. pure vegetable glycerin into a bottle cap. Add ½ tsp. of water.

Applicator: use a plastic coffee stirrer or straw; cut a slit in the end to catch some cotton wool salvaged from a vitamin bottle and twist (cotton swabs, cotton balls and wooden toothpicks are sterilized with mercury which in turn is polluted with thallium). Dip it into the glycerin mixture and apply inside the nose with a rotating motion. Do each nostril with a new applicator.

Quick Corn Starch Skin Softener

4 tsp. corn starch (see *Sources*)
1 cup water

Boil starch and water until clear, about one minute.

Cornstarch Skin Softener

1 tsp. lysine powder or 8 tablets, 500 mg each
1 tsp. Vitamin C powder (ascorbic acid); or 8 tablets, 500 mg each
3 tsp. cornstarch (see *Sources*)
Vitamin E, 1 capsule 400 mg
¼ tsp. apricot kernel oil (optional)
1 cup water

Boil starch and water until clear, about one minute. Add other ingredients and stir until dissolved. Cool. Pour into dispenser bottle. Keep refrigerated when not in use. Apply after washing dishes and after showering.

After Shaves

Vitamin C. ¼ tsp. vitamin C powder, dissolved in 1 pint water.

Apricot kernel oil.

Vegetable glycerin. Equal parts glycerin and water or to suit your need.

Personal Lubricants

Heat these together: 1 level tsp. sodium alginate and 1 cup water in a covered non-metal pan until completely dissolved. Use very low heat and stir with a wooden spoon handle. It takes a fairly long time to get it perfectly smooth. After cooling, pour into a small dispenser bottle. Keep the remainder refrigerated.

Or, mix and heat 4 tsp. cornstarch and 1 cup water until completely dissolved in a covered saucepan. Use non-metal dishes and a non-metal stirring spoon. Cool. Pour some into dispenser bottle. Refrigerate remainder. This is many person's favorite recipe.

Baby Wipes

Cut paper towels in quarters and stack in a closable plastic box. Run tap water over them, drain the excess. Add 1 tsp. grain alcohol and/or borax liquid on top. Close. Put a dab of the Quick Cornstarch Softener recipe on top of each wipe as you use it.

People Wipes

¼ tsp. powdered lysine (you may crush tablets)
¼ tsp. Vitamin C powder (you may crush tablets)
¼ cup vegetable glycerin
1 cup water

Prepare wipes by cutting paper towels in quarters. Use white, unfragranced towels that are strong enough to hold up for this use. Fold each piece in quarters again and stack in a plastic zippered baggy. Pour the fluid mixture over the stack and zip. Store a bag full in the freezer to take on car trips. If you want to keep them a month or more, add 1 tbs. grain alcohol or vodka to the recipe.

For bathroom use, dampen a roll of paper towels under the cold tap first. Then pour about ¼ cup of the mixture over the towel roll around the middle. Store in plastic shopping bag or stand in plastic waste basket.

Recipes For Natural Cosmetics

Eye liner and Eyebrow Pencil

Get a pure charcoal pencil (black only) at an art supply store. Try several on yourself (bring a small mirror) in the store to see what hardness suits you. You may need to wet it with water or a vitamin E perle first. Don't put any chemicals on your *eyelids*, since this penetrates into your eye. To check this out for yourself, close your eye tightly and then dab lemon juice on your eyelid. It will soon burn! Everything that is put on skin penetrates. Otherwise the nicotine patch and estrogen patch wouldn't work. Not even soap belongs on your eyelids! Charcoal pencils are cheap. Get yourself half a dozen different kinds so you can do different things.

You could also use a capsule of activated charcoal. Empty it into a saucer. Mix glycerin and water, half and half, and add it to the charcoal powder until you get the consistency you like. Use a brush for eyelashes; use a finger for eyebrows.

Lipstick

Beet root powder (see *Sources*)
100% vegetable glycerin

Combine 1 tsp. vegetable glycerin and 1 tsp. beet root powder in a saucer. Stir until perfectly smooth. Then add ½ tsp. of vitamin E oil. Snip open vitamin E capsules or buy vitamin E oil (see *Sources*). Very thick olive oil can be substituted. Apply liberally with your finger or a lipstick brush. Do not purse or rub your lips together after application. To make the lipstick stay on longer, apply 1 layer of lipstick, then dab some corn starch over the lips, then apply another layer of lipstick. Store in a small glass or plastic container in the refrigerator, tightly covered in a plastic bag.

Face Powder

Use cornstarch from the original box. You may also try arrow root starch or potato starch. Use your fingers or a tissue to apply because applicators can carry

bacteria.

Blush (face powder in a cake form)

Add 50% glycerin to cornstarch in a saucer to make a paste. Slowly add beet root powder to the desired color. Use part of a charcoal capsule to darken it, if desired. A drop of food grade alcohol will also darken it. To make 50% glycerin, add equal parts of glycerin and water. Try to make the consistency the same as your brand name product, and you can even put it back in your brand name container.

Recipes For Household Products

Floor Cleaner

Use washing soda from the grocery store. You may add borax and boric acid (to deter insects except ants). Use white distilled vinegar in your rinse water for a natural shine and ant repellent. Do not add bleach to this. For the bathroom floor use plain bleach water—follow the label. Never use chlorine bleach if anybody in the home is ill or suffers from depression. Use grain alcohol (1 pint to 3 quarts water) for germ killing action instead of chlorine.

Furniture Duster and Window Cleaner

Mix equal parts white distilled vinegar and water. Put it in a spray bottle.

Furniture Polish

A few drops of olive oil on a dampened cloth. Use filtered water to dampen.

Insect Killer

Boric acid powder (not borax). Throw liberal amounts behind stove, refrigerator, under carpets and in carpets. Since boric acid is white, you must be careful not to mistake it for sugar accidentally. Keep it far away from food and out of children's reach. Buy it at a farm supply or garden store (or see *Sources*). It will not kill ants.

Ant Repellent

Spray 50% white distilled vinegar on counter tops, window sills and shelves and wipe, leaving residue. Start early in spring before they arrive, because it takes a few weeks to rid yourself of them once they are established. If you want immediate action, get some lemons, cut the yellow outer peel off and cover with grain alcohol in a tightly closed jar. Let stand at least one hour. Use 1 part of this concentrate with 9 parts water in a spray bottle. Mix only as much as you will use because the diluted form loses potency. Spray walls, floors, carpets wherever you see them. The lemon solution even leaves a shine on your counters. Use both vinegar and lemon approaches to rid yourself of ants.

To treat the **whole house**, pour vinegar all around your foundation, close to the wall, using one gallon for every five feet. Expect to damage any foliage it touches. Reapply every six months.

Flower and Foliage Spray

Food-grade hydrogen peroxide. See instructions on bottle.

Moth Balls

I found this recipe in an old recipe book. Mix the following and scatter in trunks and bags containing furs and woolens: ½ lb. each rosemary and mint, ¼ lb. each tansy and thyme, 2 tbs. powdered cloves.

Carpet Cleaner

Whether you rent a machine or have a cleaning service, don't use the carpet shampoo they want to sell, even if they "guarantee" that it is all natural and safe. Instead add these to a bucket (about four gallons) of water and use it as the cleaning solution:

Wash water	Rinse water
1/3 cup borax	¼ cup grain alcohol
	2 tsp. boric acid
	¼ cup white distilled vinegar **or**
	4 tsp. citric acid

Borax does the cleaning; alcohol disinfects, boric acid leaves a pesticide residue, and the vinegar or citric acid give luster. If you are just making one pass

on your carpet, use the borax, alcohol, and boric acid. Remember to test everything you use on an unnoticed piece of carpet first.

Health Improvement Recipes

Black Walnut Hull Tincture

This new recipe is four times as strong as the previous one, so it is called **Black Walnut Hull Tincture <u>Extra Strength</u>**.

Your largest enamel or ceramic (not stainless steel, not aluminum) cooking pot, preferably at least 10 quarts
Black walnuts, in the hull, each one still at least 50% green, enough to fill the pot to the top
Grain alcohol, about 50% strength, enough to cover the walnuts ½ tsp. vitamin C
Plastic wrap or cellophane
Glass jars or bottles

The black walnut tree produces large green balls in fall. The walnut is inside, but we will use the whole ball, uncracked, since the active ingredient is in the green outer hull.

Rinse the walnuts carefully, put them in the pot, and cover with the alcohol. Sprinkle on half the vitamin C. Seal with plastic wrap and cover; let sit for three days. Pour into glass jars or bottles, discarding walnuts, and divide the remaining vitamin C amongst the jars. If the glass jar has a metal lid, first put plastic wrap over the top before screwing on the lid. Potency is strong for several years if unopened, <u>even if it darkens</u>.

You have just made <u>Extra Strength</u> Black Walnut Hull Tincture. It is stronger than the concentrate made with just a few black walnuts in a quart jar (my earlier recipe), because there are more walnuts per unit liquid. In addition, you will not dilute it before use (although when you take it, it will usually be in water).

When preparing the walnuts, rinse only with cold tap water. You may need to use a brush on areas with dirt. If you are not going to use all of them in this batch, you may freeze them in a zippered plastic bag. Simply refrigerating them does not keep them from turning black and useless. The pot of soaking walnuts should not be refrigerated. Nor does the final tincture need any refrigeration.

Exposure to air does cause the tincture to darken and lose potency. To reduce air exposure, fill the pot as much as possible, without touching the plastic wrap, while still keeping a snug fitting lid. Even more importantly, the glass jars or

bottles you use to store your tincture should have as little air space as possible, without touching the plastic wrap on top. A large jar should be divided into smaller ones when you are ready to use it. The idea is not to have partial jars, with a lot of air space, sitting for longer than a month or so.

There are several ways to make a 50% grain alcohol solution. Some states have Everclear,™ 95% alcohol. Mix this half and half with water. Other states have Everclear that is 76.5% alcohol. Mix this three parts Everclear to one part water. Yet another method is to buy vodka that is 100 proof. This is already 50% alcohol.

Remember, never use any kind of purchased water to make tincture.

Black Walnut Hull Tincture (Regular Strength)

This is the potency I used originally. It is included here in case you prefer it or wish to treat a pet. The Extra Strength recipe is four times as potent as the original recipe, so it must be diluted in quarters. (Similarly, if you have a lot of the Regular Strength left and want to use it in place of Extra Strength, simply take four times as much.)

Black Walnut Hull Tincture Extra Strength
Grain Alcohol, about 10%

Mix one part extra strength tincture with three parts of the 10% alcohol. Store in glass containers same as described above.

There are several ways to make a 10% grain alcohol solution. Some states have Everclear™, 95% alcohol. Mix this one part Everclear™ to nine parts water. Other states have Everclear™ that is 76.5% alcohol. Mix this 1 part Everclear™ to 7 parts water. Yet another method is to buy vodka that is 100 proof (50% alcohol) and mix one part vodka with four parts water.

Black Walnut Hull Extract (Water Based)

Because you do not know how commercially available extracts were made, and may not be able to test for solvent pollution, it is wisest to make it yourself!

This recipe is intended for alcoholic persons: cover the green balls in the 10 quart (non-metal) pot with cold tap water. Heat to boiling, covered. Turn off heat. When cool, add vitamin C, cover with plastic wrap, and the lid. Let stand for 1 day. It will be darker than the tincture. Do not dilute. Pour into freezable containers. Refrigerate what you will use in two days and freeze the rest. Add

vitamin C after thawing or during refrigeration (¼ tsp. per quart).

For use: in programs calling for Extra Strength Black Walnut Hull Tincture use four times as much of this water based recipe (8 tsp. instead of 2 tsp. Extra Strength).

Important Note: do not use bottled or purchased water to make this tincture or you could pollute it with benzene!

Quassia recipe

Add 1/8 cup Quassia chips to 3 cups water. Simmer 20-30 minutes. Pour off 1/8 cup now and drink it fresh. Refrigerate remainder. Drink 1/8 cup 4 times/day, until a total of ½ cup of chips is consumed. Flavor with spices.

Emmenagogue (Menstrual Period Inducer)

Here are four herbs that can each bring on your period. They can be started anytime but the most effective time is before your next calculated period time (count days as if you never missed a period).

1 oz sassafras bark
1 oz rue (cut)
1 oz marjoram herb
1 oz blue cohosh root
4½ cups boiling water

Add the herbs to the boiling water and turn down to simmer, covered, for 20 minutes. Do not boil. Strain and refrigerate in sterile glass jar. Pour one cup for yourself in the morning. Let warm to room temperature, and sip between meals, making it last until supper.

Bowel Program

Bacteria are always at the root of bowel problems, such as pain, bloating and gassiness. They can not be killed by zapping, because the high frequency current does not penetrate the bowel contents.

Although most bowel bacteria are beneficial, the ones that are not, like *Salmonellas* and *Shigellas*, are extremely detrimental because they have the ability to invade the rest of your body and colonize a trauma site or weakened organ. These same bacteria colonize a cancer tumor and delay healing after the malignancy is stopped.

Another reason bowel bacteria are so hard to eradicate is that we are constantly reinfecting ourselves by keeping a reservoir on our hands and under our fingernails.

So the first thing to do is **improve sanitation**. For a serious problem, use 50% grain alcohol (100 proof vodka) in a spray bottle at the bathroom sink. Sterilize your hands after bathroom use and before meals.

Secondly use **turmeric** (2 capsules 3 times a day, this is the common spice) which I find helps against *Shigella*, as well as *E. coli*. Expect orange colored stool.

Third use **fennel** (1 capsule 3 times a day).

Fourth use **digestive enzyme tablets** with meals as directed on the bottle. (But only as long as necessary, because these frequently harbor molds.)

Fifth use a single 2 tsp. dose of **Black Walnut Hull Tincture Extra Strength**. Add it to a ½ glass of water and sip over a 15-minute period. Stay seated until any side effect from the alcohol wears off.

Sixth take **Cascara sagrada** capsules if constipated (start with one capsule a day, use up to maximum on label). Remember to drink a cup of hot water upon rising in the morning. This will begin to regulate your elimination.

It can take all six to get rid of a bad *Shigella* problem in a week. Afterward, you must continue to eat only sterile dairy products. Note that the *Kidney Cleanse* is often effective with bowel problems. Try it also.

You will know you succeeded when your tummy is flat, there is not a single gurgle, and your mood improves!

Constipation Tea

Constipation is often caused by *E. coli* and *Salmonella* from dairy foods, or from killing "good" bowel bacteria with antibiotics (killing a few by zapping actually restores good flora). Eat foods that restore the body's good bowel flora: vegetables, sterilized milk (the milk sugar is essential), lots of water.

There are a lot of remedies for constipation, but many people enjoy this tea:

1 tbs senna tea leaves
½ tsp. mint leaves

Boil for one minute in a quart of water; add a dash of vitamin C and brown sugar to taste. Sip through the day to avoid “belly-ache”. It can take years for the body's flora to “right themselves” after an antibiotic session, be patient.

Weight Reduction

Here are two ancient herbal recipes for obesity. I have not personally determined their effectiveness.

Fucus

2 oz *Fucus vesiculosus*, cut (see *Sources*)
3 cups cold tap water

Boil for 15 minutes, covered. Cool. Dose: ¼ cup four times a day on an empty stomach. After one week increase dose to ½ cup. You may add any flavoring desired.

Watch the pot carefully as it comes to a boil. If it boils over, you will have a month of stove-cleaning to do. The odor of *Fucus* boiling is wretched. So is the taste. Maybe garlic (fresh) would improve it.

Fennel

1 oz fennel seed (crushed or powdered is fine)
3 cups cold tap water

Boil water, pour over herb. Steep 30 minutes. Strain. Add 4 oz honey (optional). Drink one cup each day.

You could take them both together, along with the *Bowel Program*, to be more successful, but the best single weight reducer is the *Liver Cleanse*.

Kidney Cleanse

½ cup dried Hydrangea root
½ cup Gravel root
½ cup Marshmallow root
4 bunches of fresh parsley
Goldenrod tincture (leave this out of the recipe if you are allergic to it)
Ginger capsules
Uva Ursi capsules
Vegetable glycerin
Black Cherry Concentrate, 8 oz
Vitamin B6, 250 mg
Magnesium oxide tablets, 300 mg

Measure ¼ cup of each root and set them to soak, together in 10 cups of cold tap water, using a non-metal container and a non-metal lid (a dinner plate will do). After four hours (or overnight) add 8 oz. black cherry concentrate, heat to boiling and simmer for 20 minutes. Drink ¼ cup as soon as it is cool enough. Pour the rest through a bamboo strainer into a sterile pint jar (glass) and several

freezable containers. Refrigerate the glass jar.

Boil the fresh parsley, after rinsing, in 1 quart of water for 3 minutes. Drink ¼ cup when cool enough. Refrigerate a pint and freeze 1 pint. Throw away the parsley.

Dose: each morning, pour together ¾ cup of the root mixture and ½ cup parsley water, filling a large mug. Add 20 drops of goldenrod tincture and 1 tbs. of glycerin. Drink this mixture in divided doses throughout the day. Keep cold. Do not drink it all at once or you will get a stomach ache and feel pressure in your bladder. If your stomach is very sensitive, start on half this dose.

Save the roots after the first boiling, storing them in the freezer. After 13 days when your supply runs low, boil the same roots a second time, but add only 6 cups water and simmer only 10 minutes. This will last another 8 days, for a total of three weeks. You may cook the roots a third time if you wish, but the recipe gets less potent. If your problem is severe, only cook them twice.

After three weeks, repeat with fresh herbs. You need to do the *Kidney Cleanse* for six weeks to get good results, longer for severe problems.

Also take:

- Ginger capsules: one with each meal (3/day).
- Uva Ursi capsules: one with breakfast and two with supper.
- Vitamin B6 (250 mg): one a day.
- Magnesium oxide (300 mg): one a day.

Take these supplements just before your meal to avoid burping.

Some notes on this recipe: this herbal tea, as well as the parsley, can easily spoil. Heat it to boiling every fourth day if it is being stored in the refrigerator; this resterilizes it. If you sterilize it in the morning you may take it to work without refrigerating it (use a glass container).

When you order your herbs, be careful! Herb companies are not the same! These roots should have a strong fragrance. If the ones you buy are barely fragrant, they have lost their active ingredients; switch to a different supplier. Fresh roots can be used. Do not use powder.

- Hydrangea (*Hydrangea arborescens*) is a common flowering bush.
- Gravel root (*Eupatorium purpureum*) is a wild flower.
- Marshmallow root (*Althea officinallis*) is mucilaginous and kills pain.
- Fresh parsley can be bought at a grocery store. Parsley flakes and dried parsley herb do not work.
- Goldenrod herb works as well as the tincture but you may get an allergic reaction from smelling the herb. If you know you are allergic to this, leave this one out of your recipe.
- Ginger from the grocery store works fine; you may put it into capsules for yourself (size 0, 1 or 00).

There are probably dozens of herbs that can dissolve kidney crystals and stones. If you can only find several of those in the recipe, make the recipe anyway; it will just take longer to get results. Remember that vitamin B6 and magnesium, taken daily, can prevent oxalate stones from forming. But only if you stop drinking tea. Tea has 15.6 mg oxalic acid per cup[37]. A tall glass of iced tea could give you over 20 mg oxalic acid. Switch to herb teas. Cocoa and chocolate, also, have too much oxalic acid to be used as beverages.

Remember, too, that phosphate crystals are made when you eat too much phosphate. Phosphate levels are high in meats, breads, cereals, pastas, and carbonated drinks. Eat less of these, and increase your milk (2%), fruits and vegetables. Drink at least 2 pints of water a day.

Cleanse your kidneys at least twice a year.

You can dissolve all your kidney stones in 3 weeks, but make new ones in 3 days if you are drinking tea and cocoa and phosphated beverages. None of the beverage recipes in this chapter are conducive to stone formation.

Liver Herbs

Don’t confuse these liver herbs with the next recipe for the *Liver Cleanse*. This recipe contains herbs traditionally used to help the liver function, while the

Liver Cleanse gets gallstones out.

6 parts comfrey root, *Symphytum officinale* (also called nipbone root)
6 parts tanner's oak bark, *Quercus alba* (white oak bark)
3 parts gravel root, *Eupatorium purpureum* (queen of the meadow)
3 parts Jacob's staff, *Verbascum thapsus* (mullein herb)
2 parts licorice root, *Glycyrrhiza glabra*
2 parts wild yam root, *Dioscorea villosa*
2 parts milk thistle herb, *Silybum marianum*
3 parts walnut bark, *Juglans nigra*, (black walnut bark)
3 parts marshmallow root, *Althea officinalis* (white mallow)
1 part lobelia plant, *Lobelia inflata* (bladder pod)
1 part skullcap, *Scutellaria lateriflora* (helmet flower)

Mix all the herbs. Add ½ cup of the mixture to 2 quarts of water. Bring to a boil. Put lid on. Let sit for six hours. Strain and drink 1½ cups per day. Put the strained herbs in the freezer and use them one more time.

Liver Cleanse

Cleansing the liver of gallstones dramatically improves digestion, which is the basis of your whole health. You can expect your allergies to disappear, too, more with each cleanse you do! Incredibly, it also eliminates shoulder, upper arm, and upper back pain. You have more energy and increased sense of well-being.

Cleaning the liver bile ducts is the most powerful procedure that you can do to improve your body's health.

But it <u>should not</u> be done before the *Parasite Program*, and for <u>best results</u> should follow the *Kidney Cleanse* and any dental work you need.

It is the job of the liver to make bile, 1 to 1½ quarts in a day! The liver is full of tubes (*biliary tubing*) that deliver the bile to one large tube (the *common bile duct*). The gallbladder is attached to the common bile duct and acts as a storage reservoir. Eating fat or protein triggers the gallbladder to squeeze itself empty after about twenty minutes, and the stored bile finishes its trip down the common bile duct to the intestine.

<u>For many persons, including children, the biliary tubing is choked with gallstones</u>. Some develop allergies or hives but some have no symptoms. When the gallbladder is scanned or X-rayed nothing is seen. Typically, they are not in the gallbladder. Not only that, most are too small and not calcified, a prerequisite for visibility on X-ray. There are over half a dozen varieties of gallstones, most of which have cholesterol crystals in them. They can be black, red, white, green or tan colored. The green ones get their color from being coated with bile. Notice in the picture how many have imbedded unidentified objects. Are they fluke remains? Notice how many are shaped like corks with longitudinal grooves

below the tops. We can visualize the blocked bile ducts from such shapes. Other stones are composites—made of many smaller ones—showing that they regrouped in the bile ducts some time after the last cleanse.

At the very center of each stone is found a clump of bacteria, according to scientists, suggesting a dead bit of parasite might have started the stone forming.

As the stones grow and become more numerous the back pressure on the liver causes it to make less bile. Imagine the situation if your garden hose had marbles in it. Much less water would flow, which in turn would decrease the ability of the hose to squirt out the marbles. With gallstones, much less cholesterol leaves the body, and cholesterol levels may rise.

Fig. 88 These are gallstones.

Gallstones, being porous, can pick up all the bacteria, cysts, viruses and parasites that are passing through the liver. In this way “nests” of infection are formed, forever supplying the body with fresh bacteria. No stomach infection such as ulcers or intestinal bloating can be cured permanently without removing these gallstones from the liver.

Cleanse your liver twice a year.

Preparation.

- You can't clean a liver with living parasites in it. You won't get many stones, and you will feel quite sick. Zap daily the week before, or get through the first three weeks of the parasite-killing program before attempting a *Liver Cleanse*. If you are on the *Maintenance Parasite*

Program, you are always ready to do the cleanse.

- Completing the *Kidney Cleanse* before cleansing the liver is also highly recommended. You want your kidneys, bladder and urinary tract in top working condition so they can efficiently remove any undesirable substances incidentally absorbed from the intestine as the bile is being excreted.

- Do any dental work first, if possible. Your mouth should be metal free and bacteria free (cavitations are cleaned). A toxic mouth can put a heavy load on the liver, burdening it immediately after cleansing. Eliminate that problem first for best results.

Ingredients

Epsom salts	4 tablespoons
Olive oil	half cup (light olive oil is easier to get down)
Fresh pink grapefruit	1 large or 2 small, enough to squeeze 2/3 to 3/4 cup juice
Ornithine	4 to 8, to be sure you can sleep. Don't skip this or you may have the worst night of your life!
Large plastic straw	To help drink potion.
Pint jar with lid	

Choose a day like Saturday for the cleanse, since you will be able to rest the next day.

Take no medicines, vitamins or pills that you can do without; they could prevent success. Stop the *Parasite Program* and kidney herbs, too, the day before.

Eat a no-fat breakfast and lunch such as cooked cereal with fruit, fruit juice, bread and preserves or honey (no butter or milk), baked potato or other vegetables with salt only. This allows the bile to build up and develop pressure in the liver. Higher pressure pushes out more stones.

2:00 PM. Do not eat or drink after 2 o'clock. If you break this rule you could feel quite ill later.

Get your Epsom salts ready. Mix 4 tbs. in 3 cups water and pour this into a jar. This makes four servings, ¾ cup each. Set the jar in the refrigerator to get ice cold (this is for convenience and taste only).

6:00 PM. Drink one serving (¾ cup) of the ice cold Epsom salts. If you did not prepare this ahead of time, mix 1 tbs. in ¾ cup water now. You may add 1/8 tsp. vitamin C powder to improve the taste. You may also drink a few mouthfuls of water afterwards or rinse your mouth.

Get the olive oil and grapefruit out to warm up.

8:00 PM. Repeat by drinking another ¾ cup of Epsom salts.

You haven't eaten since two o'clock, but you won't feel hungry. Get your bedtime chores done. The timing is critical for success; don't be more than 10 minutes early or late.

9:45 PM. Pour ½ cup (measured) olive oil into the pint jar. Squeeze the grapefruit by hand into the measuring cup. Remove pulp with fork. You should have at least ½ cup, more (up to ¾ cup) is best. You may top it up with lemonade. Add this to the olive oil. Close the jar tightly with the lid and shake hard until watery (only fresh grapefruit juice does this).

Now visit the bathroom one or more times, even if it makes you late for your ten o'clock drink. Don't be more than 15 minutes late.

10:00 PM. Drink the potion you have mixed. Take 4 ornithine capsules with the first sips to make sure you will sleep through the night. Take 8 if you already suffer from insomnia. Drinking through a large plastic straw helps it go down easier. You may use ketchup, cinnamon, or brown sugar to chase it down between sips. Take it to your bedside if you want, but drink it standing up. Get it down within 5 minutes (fifteen minutes for very elderly or weak persons).

Lie down immediately. You might fail to get stones out if you don't. The sooner you lie down the more stones you will get out. Be ready for bed ahead of time. Don't clean up the kitchen. As soon as the drink is down walk to your bed and lie down flat on your back with your head up high on the pillow. Try to think about what is happening in the liver. Try to keep perfectly still for at least 20 minutes. You may feel a train of stones traveling along the bile ducts like marbles. There is no pain because the bile duct valves are open (thank you Epsom salts!). **Go to sleep**, you may fail to get stones out if you don't.

Next morning. Upon awakening take your third dose of Epsom salts. If you have indigestion or nausea wait until it is gone before drinking the Epsom salts. You may go back to bed. Don't take this potion before 6:00 am.

2 Hours Later. Take your fourth (the last) dose of Epsom salts. Drink ¾ cup of the mixture. You may go back to bed.

After 2 More Hours you may eat. Start with fruit juice. Half an hour later eat fruit. One hour later you may eat regular food but keep it light. By supper you should feel recovered.

How well did you do? Expect diarrhea in the morning. Use a flashlight to look for gallstones in the toilet with the bowel movement. Look for the green kind since this is proof that they are genuine gallstones, not food residue. Only bile from the liver is pea green. The bowel movement sinks but gallstones float because of the cholesterol inside. Count them all roughly, whether tan or green. You will need to total 2000 stones before the liver is clean enough to rid you of allergies or bursitis or upper back pains permanently. The first cleanse may rid you of them for a few days, but as the stones from the rear travel forward, they give you the same symptoms again. You may repeat cleanses at two week intervals. Never cleanse when you are ill.

Sometimes the bile ducts are full of cholesterol crystals that did not form into round stones. They appear as a “chaff” floating on top of the toilet bowl water. It may be tan colored, harboring millions of tiny white crystals. Cleansing this chaff is just as important as purging stones.

How safe is the *Liver Cleanse*? It is very safe. My opinion is based on over 500 cases, including many persons in their seventies and eighties. None went to the hospital; none even reported pain. However it can make you feel quite ill for one or two days afterwards, although in every one of these cases the *Maintenance Parasite Program* had been neglected. This is why the instructions direct you to complete the parasite and kidney rinse programs first.

CONGRATULATIONS

You have taken out your gallstones without surgery! I like to think I have perfected this recipe, but I certainly can not take credit for its origin. It was invented hundreds, if not thousands, of years ago, THANK YOU, HERBALISTS!

This procedure contradicts many modern medical viewpoints. Gallstones are thought to be formed in the gallbladder, not the liver. They are thought to be few, not thousands. They are not linked to pains other than gallbladder attacks. It is easy to understand why this is thought: by the time you have acute pain attacks, some stones are in the gallbladder, are big enough and sufficiently calcified to see on X-ray, and have caused inflammation there. When the gallbladder is removed the acute attacks are gone, but the bursitis and other pains and digestive problems remain.

The truth is self-evident. People who have had their gallbladder surgically removed still get plenty of green, bile-coated stones, and anyone who cares to dissect their stones can see that the concentric circles and crystals of cholesterol match textbook pictures of "gallstones" exactly.

Lugol's Iodine Solution

It is too dangerous to buy a commercially prepared solution. It is certain to be polluted with propyl alcohol or wood alcohol. Make it yourself or ask your pharmacist to make it up for you. The recipe to make 1 liter (quart) is:

44 gm (1½ ounces) iodine, granular
88 gm (3 ounces) potassium iodide, granular

Dissolve the potassium iodide in about a pint of the water. Then add the iodine crystals and fill to the liter mark with water. It takes about 1 day to dissolve completely. Shake it from time to time. Keep out of sight and reach of children. Do not use if allergic to iodine. Be careful to avoid bottled water for preparation.

Vitamin D Drops

1 gram cholecalciferol (see Sources)
10 cups olive oil

Mix in a non-metal container. It may take a day of standing to dissolve fully. Refrigerate. Ten drops contain 40,000 iu. Use within a year.

Pathogen Frequencies

Living creatures emit a range of frequencies, also called *bandwidth*. As they age, the bandwidth shrinks. When they die, sometimes all that is left is a single frequency.

Most of the organisms listed below are dead on commercially available and prepared slides (see *Sources* for biological supply companies). However they still exhibit a 5 KHz bandwidth, probably due to testing with a frequency generator that was only accurate to 100 Hz, and also due to using more voltage than necessary (like when a powerful radio station comes in at its own frequencies and ones nearby, too). Some testing was done with a more accurate frequency generator at a lower power level so some bandwidths are reported much more narrowly.

If the same person retests the same specimens with the same equipment within a few days, the results will be absolutely identical (within 1 Hz) 90% of the time. Why a few of the results will not be identical is not known. However different people, and even the same person at different times of the year, can notice that the perceived frequencies shift by as much as 3 KHz (still less than 1% change).

Some specimens have more than one range listed; this may be characteristic of the organism or may be due to having an undocumented organism on the same microscope slide.

Blank locations represent organisms for whom there are prepared slides available, but whose bandwidth has not been determined.

Bandwidth Of Organism Families

In general, the smaller the organism the lower the frequency and narrower the bandwidth. This chart shows the major families studied and where they fall in the spectrum.

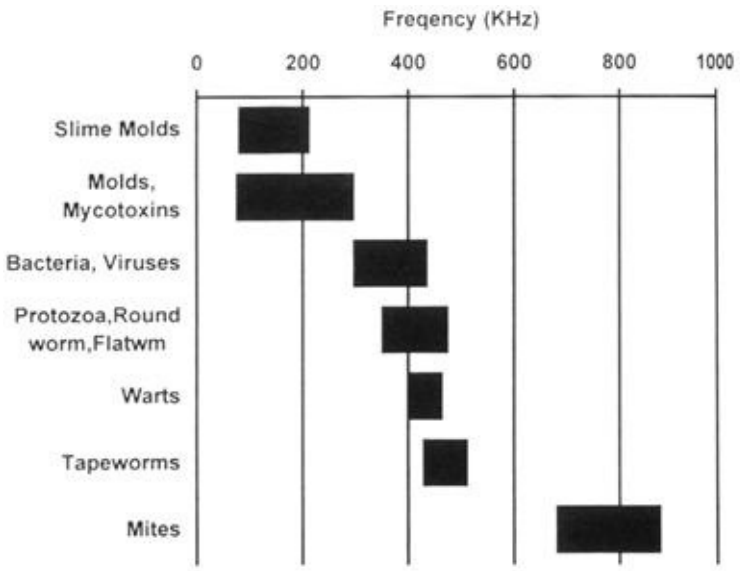

Fig. 89 Chart of bandwidths for organism families.

Trypanosoma equiperdum	434.6	451.25	448,442,438
Trypanosoma gambiense	393.75	398.7	396
Trypanosoma lewisi (blood smear)	424.5	426.0	425
Trypanosoma rhodesiense	423.5	428.55	426
Urocleidus	442.35	450.0	447

Wart Frequencies

(Most of these are from homemade slides.)

	Low Freq	High Freq	Use freq gen for 3 min @
Wart BS	402	406	404
Wart CC	426	432.35	430
Wart FR	459.3	464.75	462
Wart HA	434.8	444.1	442,437
Wart HRCm	438.9	448.55	446,441
Wart human papilloma plantar	404.7	406.75	405
Wart human papilloma virus	402.85	410.7	407
Wart JB	418.75	422.4	420
Wart L arm	343.65	345.95	344
Wart papilloma cervix smear	404.05	404.6	404.3

Tapeworms

Tapeworms are segmented. The first segment is the head, called the *scolex*. Tapeworms grow by adding a new segment to their body.

Tapeworms can have very large bandwidths (range of frequencies), and it

varies by the length of the specimen! It is as if each new segment has a unique, and slightly lower, frequency.

Do not use a frequency generator to kill tapeworms. If you accidentally kill middle segments instead of working your way up from the bottom, you may conceivably promote dispersion! Use only a zapper.

	Low Freq	High Freq
Cysticercus fasciolaris	436.4	440.05
Diphyllobothrium erinacei (Mansoni) (scolex)	467.25	487.55
Diphyllobothrium erinacei eggs		
Diphyllobothrium latum (scolex)	452.9	472.3
Dipylidium caninum (proglottid composite)	439.55	444.3
Dipylidium caninum (scolex)	451.95	472.15
Echinococcus granulosus	451.6	461.5
Echinococcus granulosus (cysts)	441.15	446.5
Echinococcus granulosus (eggs)		
Echinococcus multilocularis	455.85	458.35
Heterophyes heterophyes		
Hymenolepis cysticercoides	478.0	481.75
Hymenolepis diminuta	445	481.15
Hymenolepis diminuta ova		
Hymenolepis nana eggs		
Moniezia (scolex)	430.35	465.2
Moniezia expansa (composite)	430.35	465.2
Moniezia expansa eggs		
Multiceps serialis	453.6	457.8
Pigeon tapeworm		
Taenia pisiformis (cysticercus)	475.2	482.1
Taenia pisiformis eggs (ova)	465.2	469.7
Taenia saginata (cysticercus)	476.5	481.05
Taenia saginata eggs		
Taenia solium (cysticercus)	475	475
Taenia solium (scolex)	444.0	448.9
Taenia solium eggs		

Mite Frequencies

These are the organisms that cold viruses ride in with!

Mite	KHz
Demodex folliculorum follicle mite	682
Dermatophagoides dust mite	707
Meal mite	718
Ornithonyssus bird mite	877,878
Sarcoptes scabei itch	735

Miscellaneous Frequencies

	KHz
Blue-green Algae	256

Bryozoa cristatalla	396
Mucor mucedo	288
Rhizobium meliloti	330
Rotifer	1151

It's easy to make homemade slides when you or a family member is ill. Finding out the frequencies of these illnesses helps you identify them (use the Pathogen Frequency Chart) and also lets you know if you are chronically getting them back.

Unidentified pathogens	Low Freq	High Freq
A cold virus HRC	395.8	395.8
Fungus EW	362.0	364.9
Fungus JWB	397.2	400.75
Tooth decay	384.3	387.2
Tooth decay (N)	367.9	375.05
Tooth decay (N) (2nd range)	326.95	331.5
Tooth decay (N) (3rd range)	293.2	297.4
Tooth plaque I	378.8	383.05
Tooth plaque I (2nd range)	294.7	298.25
Tooth plaque I (3rd range)	233.1	238.2
Tooth plaque II	384.95	387.05
Tooth plaque II (2nd range)	278.75	284
Tooth plaque II (3rd range)	212.15	218
Tooth plaque II (4th range)	340.15	344.8
Tooth plaque II (5th range)	305.5	310.35

Toxic Elements

Although not living, solvents and toxins must exhibit characteristic frequencies, otherwise how could the Syncrometer® detect specific ones? This needs further exploration.

Most of the toxic elements I use are metals, heavy metals and lanthanides. But some are not; examples are PCBs and formaldehyde.

Some important elements are missing, like iron, zinc and manganese. This is because I never could find them present in the white blood cells, and I finally gave up searching for them.

Below is a list of the 70 or so toxic elements I use. Most of them were obtained as atomic absorption standard solutions and are, therefore, very pure. This prevents mistakes in identifying a toxin. They were stored in ½ ounce amber glass bottles with bakelite caps and permanently sealed with plastic film since testing did not require them to be opened (they get close enough to the frequency field). The exact concentration and the solubility characteristics are

not important in this qualitative test. The main sources of these substances in our environment are given beside each item.

Toxic Substance	Sources
Aflatoxin B	beer, bread, apple cider vinegar, moldy fruit, nuts
Aluminum	cookware, deodorant, lotions, soaps
Aluminum silicate	salt, water softener
Antimony	fragrance in lotions, colognes
Arsenic	pesticide, “treated” carpet, wallpaper
Asbestos	clothes dryer belt, hair blower, paint on radiators
Barium	lipstick, bus exhaust
Benzalkonium chloride	Toothpaste
3,4 Benzopyrene	flame cooked foods, toast
4,5 Benzopyrene	flame cooked foods, toast
Beryllium	hurricane lamps, gasoline, dentures, kerosene
Bismuth	colognes, lotions, antacids
Boron	
Bromine	bleached “brominated” flour
Cadmium	galvanized water pipes, old tooth fillings
Cerium	tooth fillings
Cesium	clear plastic bottles used for beverages
Chlorine	from Chlorox™ bleach
Chromium	cosmetics, water softener
Cobalt	detergent, blue and green body products
Copper	tooth fillings, water pipes
Dysprosium	paint and varnish
Erbium	packaging for food, pollutant in pills
Europium	tooth fillings
Europium oxide	tooth fillings, catalytic converter
Fiberglass	dust from remodeling or building insulation
Formaldehyde	foam in mattresses and furniture, paneling
Gadolinium	tooth fillings
Gallium	tooth fillings
Germanium	with thallium in tooth fillings (pollutant)
Gold	tooth fillings
hafnium	hair spray, nail polish, pollutant in pills
Holmium	usually found in presence of PCBs
Indium	tooth fillings
Iridium	tooth fillings
Lanthanum	computer and printing supplies
Lead	solder joints in water pipes
Lithium	printing supplies
Lutetium	paint and varnish
Mercury	tooth fillings
Molybdenum	auto supplies
Neodymium	pollutant in pills
Nickel	tooth fillings, metal glasses frames
Niobium	pollutant in pills, foil packaging for food
Palladium	tooth fillings
Platinum	tooth fillings
Polychlorinated biphenyl PCB	detergent, hair spray, salves
Polyvinyl chloride acetate (PVC)	glues, building supplies, leaking cooling system
Praseodymium	pollutant in pills
Radon	cracks in basement cement, water pipes
Rhenium	spray starch
Rhodium	tooth fillings
Rubidium	tooth fillings
Ruthenium	tooth fillings

Samarium	tooth fillings
Scandium	tooth fillings
Selenium	
Silver	tooth fillings
Sodium fluoride	toothpaste
Strontium	toothpaste, water softener
Tantalum	tooth fillings
Tellurium	tooth fillings
Terbium	pollutant in pills
Thallium acetate	pollutant in mercury tooth fillings
Thorium nitrate	earth (dust)
Thulium	pollutant in many brands of Vitamin C
Tin	toothpaste
Titanium	tooth fillings, body powder
Tungsten	electric water heater, toaster, hair curler
Uranium acetate	earth (dust)
Vanadium pentoxide	gas leak in home, candles (not necessarily lit)
Ytterbium	pollutant in pills
Yttrium	pollutant in pills
Zirconium	deodorant, toothpaste

Solvents

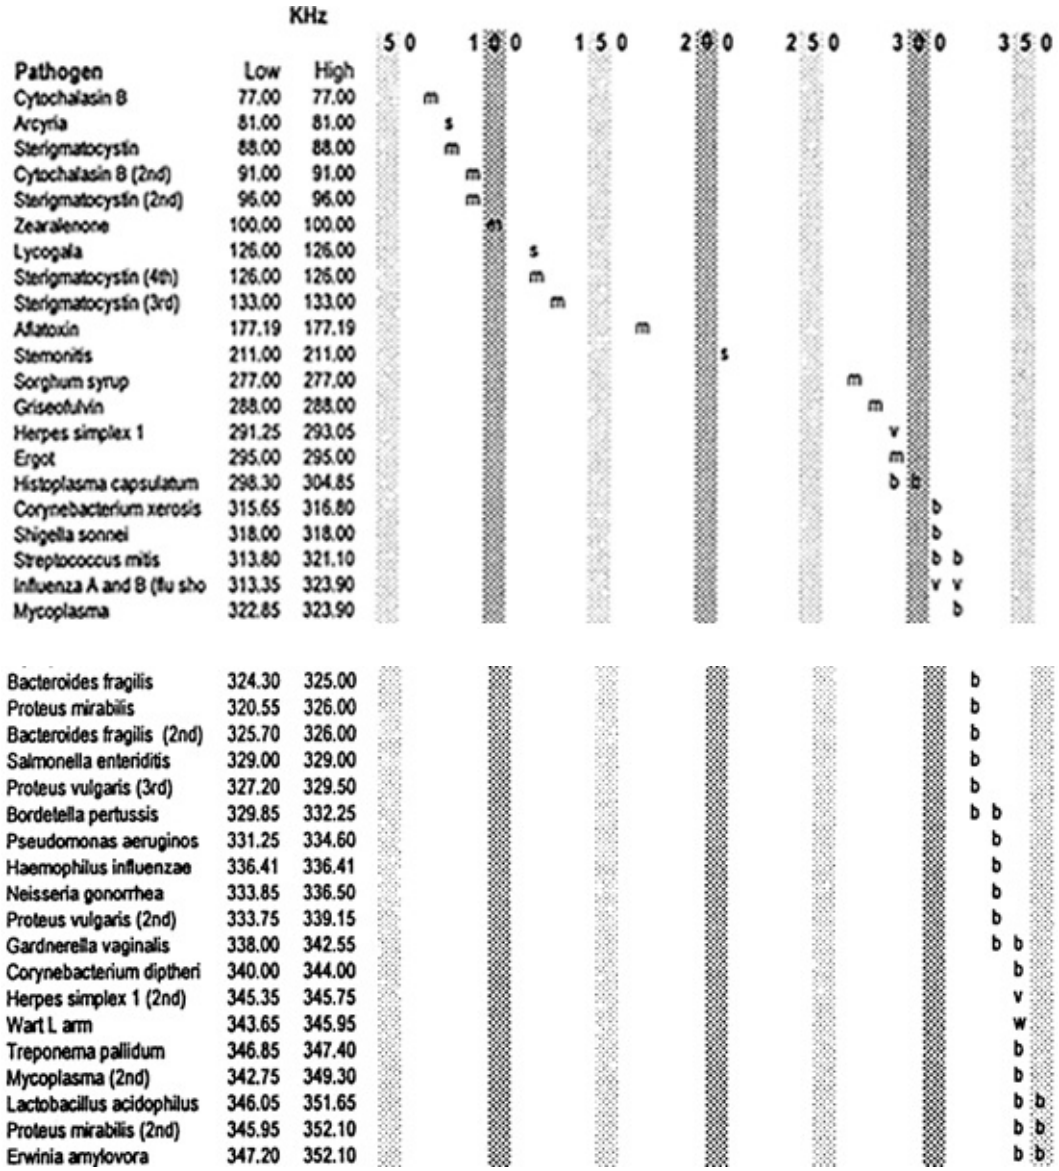
This is a list of all the solvents I use together with the main source of them in our environment. These are chemicals, very pure, obtained from chemical supply companies, unless otherwise stated. Those marked with an asterisk (*) were the subject of a recent book *The Neurotoxicity of Solvents* by Peter Arlien-Soburg, 1992, CRC Press.

Solvent	Source
1,1,1, Trichloro ethane* (TCE)	flavored foods
2, 5-Hexane dione*	flavored foods
2 Butanone* (methyl ethyl ketone)	flavored foods
2 Hexanone* (methyl butyl ketone)	flavored foods
2 Methyl propanol	
2 Propanol (propyl alcohol)	see the propyl alcohol list
Acetone	store-bought drinking water, cold cereals, pet food, animal feed
Acetonylacetone (2,5 hexanedione)	flavored foods
Benzene	see the benzene list
Butyl nitrite	
Carbon tetrachloride	store-bought drinking water, cold cereals, pet food, animal feeds
Decane	health food cookies and cereals
Denatured alcohol	obtained from pharmacy
Dichloromethane* (methylene chloride)	store-bought orange juice, herb tea blends
Gasoline regular leaded	obtained at gasoline station
Grain alcohol	95% ethyl alcohol obtained at liquor store
Hexanes*	decaffeinated beverages
Isophorone	flavored foods
Kerosene	obtained at gasoline station
Methanol (wood alcohol)	colas, artificial sweeteners, infant formula
Mineral oil	lotions
Mineral spirits	obtained from paint store

Paradiclorobenzene	mothballs
Pentane	decaffeinated beverages
Petroleum ether	in some gasolines
Styrene*	Styrofoam dishes
Toluene*	store-bought drinking water, cold cereals
Trichloroethylene* (TCEthylene)	flavored foods
Xylene*	store-bought drinking water, cold cereals

Pathogen Frequency Chart

Use this chart if you know the frequency and wonder what the pathogen might be.



Serratia marcescens	349.45	352.10	b b

Sources

This list was accurate as this book went to press. Only the vitamin sources listed were found to be pollution-free, and only the herb sources listed were found to be potent, although there may be other good sources that have not been tested. The author has no financial interest in, or influence on any company listed, except for having family members in the Self Health Resource Center.

Note to readers outside the United States of America:

Sources listed are typically companies within the United States because they are the ones I am most familiar with. You may be tempted to try a more convenient manufacturer in your own country and hope for the best. I must advise against this! In my experience, an uninformed manufacturer most likely has a polluted product! Your health is worth the extra effort to obtain the products that make you well. One bad product can keep you from reaching that goal. This chapter will be updated as I become aware of acceptable sources outside the United States. Best of all is to learn to test products yourself.

Item	Source
Amber glass or polyethylene bottles, ½ ounce	Continental Packaging Solutions (large quantities); Self Health Resource Center; Drug store,
Apricot kernel oil	Starwest Botanicals, Inc., Self Health Resource Center
Arginine	Spectrum Chemical Co.; Seltzer Chemicals, Inc. , Self Health Resource Center
Artemesia (wormwood) seed	R.H. Shumway, Self Health Resource Center
Baking soda (sodium bicarbonate)	Spectrum Chemical Co. , Self Health Resource Center
Beet root	San Francisco Herb & Natural Food Co. , Self Health Resource

	Center
Belts for clothes dryer	Three that tested *Negative* to asbestos are: Maytag™ 3-12959 Poly-V belt, Whirlpool™ FSP 341241 Belt-Drum Dr. (replaces 660996), and Bando™ V-Belt A-65. Bando American makes other belts, some of which might be the right size for your dryer. Call for a dealer near you, make sure it says “Made In America”, not all do.

Finale

I hope you have come to the same happy conclusion that I did a few years ago! That we humans don't have hundreds of different maladies and disturbances. **We only have two!** Things that crawl or climb into us. And toxins: unnatural chemicals that we unknowingly inhale or consume.

The living things are both large and small: from worms we can see, to microscopic bacteria, viruses and fungi. The non living things are pollutants in our air, food, dental metal and body products. Taking in a lot of pollutants hampers the body's ability to kill and get rid of the invaders. And so, gradually, as we get older or sicker, the body's invaders get the upper hand and take over. Don't be discouraged if you have lupus, cerebral palsy, cirrhosis, or any complex-sounding disease. Every disease is an example of the same process.

The good news is that our body can reclaim its sovereignty by throwing the rascals out. We must assist by throwing the pollutants out. Fortunately, we don't have to do the whole job ourselves, we only need to assist. Our body has miraculous powers to clean itself up.

By reducing chronic disease to two problems, it becomes manageable. Ill health, even aging, can be reversed. Health comes back and rewards you.

With the new electronic insights and technology, our parasitic invaders can be vanquished with the closing of a switch. Preventing reinfection is the bigger challenge. Similarly, pollutants can be uncovered in as short a time as days, short enough to turn any sick, even terminal, sufferer's verdict around before tragedy occurs.

The tragedies of surgery, organ replacements, radiation, chemotherapies, doses of drugs, even death can be avoided. Reversing illness and turning into a shining example of your former healthy self could be the most exciting adventure of your life.

Killing your invaders is an easy matter: you simply purchase or build the device that can do that and take the proper herbs. Cleaning up dentalware is under your control, too—a financial expense not beyond your reach, hopefully. Trading your body products for unpolluted varieties is a job but not

insurmountable. Cleaning your environment may be the stumbling block. If you can't unpollute your air, water, carpets, furniture, move. Move to a healthier dwelling! Get rid of it all. Like a cat that moves her kittens to a safer place, just move.

The healthiest house is no house. If you have been quite ill, move far enough south to avoid heating and cooling. Sit outside in the shade all day. Use your new wisdom and sharp eye to choose a new dwelling as free of pollutants as you can. No refrigerator indoors. No window air conditioner. No fiberglass insulation. No fossil fuels. No attached garage. No carpets or stuffed furniture, no foam bedding, no fresh paint, no pesticide. Go primitive. Health is primitive. You were born primitive—with health. Even if you weren't, you can undo much of the “inherited” damage.

Don't listen to the new doomsayers, who persuade you nothing can be done unless a gene is replaced. Your genes have been reliable for millions of years. Genes are the most reliable of all biological chemicals in your body. They are not faulty. They are hampered in their tasks. They are commandeered by metals and other species’ genes. Those of parasites, bacteria, and viruses. They wouldn't be there if pollutants weren't there. They allow invaders into the most jealously guarded recess of your being: your genes. But now you can throw the rascals out and reclaim your territory. It is not new genes that you need. You simply need your own genes back on the job, directed by your own body, working for you.

1. The dermatron was invented decades ago and made famous by Dr. Voll. Establishment science disdained it!

2. AM radio broadcasts are from 540,000 Hz to 1,600,000 Hz (slight overlap with lower end of human band), FM is 88,000,000 to 108,000,000 Hz (out of the human range).

20. Canada allows one ergot grain per 300 grains of #3 or #4 wheat.

21. Call the American Dental Association at (800) 621-8099 (Illinois (800) 572-8309, Alaska or Hawaii (800) 621-3291). Members can ask for the Bureau of Library Services, non-members ask for Public Information.

22. Thulium and ytterbium have been studied for their tumor-seeking ability. See page 321 in the book *METAL IONS In BIOLOGICAL SYSTEMS, Vol. 10, Carcinogenicity and Metal Ions*. Editor Helmut Sigel 1980.

23. The pink color is from mercury or cadmium which is added to the plastic.

24. *Dangerous Properties of Industrial Materials*, 7th ed. by N. Irving Sax and Richard J. Lewis Sr., Van NOSTRAND, Reinhold N.Y. 1989.

25. The title is *Carcinogenicity and Metal Ions*. It is volume 10 of a series called *Metal Ions in Biological Systems*, edited by Helmut Sigel. A university

chemistry library should have this book. It has a fascinating chapter on the leukemias by two scientists from the Academy of Sciences of the USSR, E. L. Andronikashvili and L. Mosulishvili. Their brilliant work and discussion was largely responsible for my pursuit of the whole subject of cancer.

26. Rolled oats have 235 mcg nickel per serving of 4 ounces, picked up from the rollers, according to *Food Values* 14th ed. by Pennington and Church, 1985. I have only found nickel in the "one-minute" or "instant" variety of oats, however.

27. 114 mcg/100 g. Taken from *Food Values* 14th ed. by Pennington and Church, 1985.

28. Salt has aluminum in it to keep it from caking. Buy salt that has magnesium carbonate as its anti-caking agent. Sea salt must be baked for 5 minutes at 400ºF to destroy molds. Or buy chemically pure salt (see *Sources*).

29. Yes, I took a sample of the wash to test.

30. Breast cancer cases show titanium, zirconium, benzalkonium, bismuth and antimony accumulation in the breast.

31. Barium is described in the *Merck Index* as "Caution: All water or acid soluble barium compounds are POISONOUS." 10th ed. p. 139 1983.

32. This element goes to bones.

33. You will pay about $8.00 per pound (Spectrum Chemical Co.) for USP (United States Pharmaceutical) grade. But the same analysis is done on the cheaper grades, and my point is that the analysis is cost effective enough that it should be done on our daily foods.

34. Boric acid is available by the pound from farm supply stores and from Now Foods. Because it looks like sugar keep it in the garage to prevent accidental poisoning.

35.In The Cure for all Cancers and The Cure for HIV/AIDS.

36. Urine that has cooled even slightly below body temperature does not show *miracidia* and *redia*in their original shapes.

37. Taken from *Food Values* 14ed by Pennington and Church 1985.

If you have advanced cancer, you have no time to lose. You must accomplish three things with great haste to recover:

- stop the malignancy
- shrink your tumors
- remove the toxicity in your vital organs that leads to mortality.

If you have been given less than six months to live go directly to the 21 Day Cancer Curing Program. As soon as you are making progress, you can come back and read the explanations in the other chapters.

Also read the case histories; see how hopeless the situation was and how simple it is to stop the cancer, shrink the tumor, and feel safe from ever having cancer again.

Is It Really A CURE?

The word **cure** in the title was chosen, rather than **treatment**, because it is scientifically accurate.

When the true cause of an illness has been found and, by removing it, the illness can be stopped or prevented, a true cure has also been found. When the cause is not found but the symptoms can be removed, helpful as this is, you have only found a treatment. My research was a search for the causes of cancer, how they might be removed, and whether their removal would lead to relief from the disease. I did not search merely for relief from the disease as most regular cancer research does. Even research into gene-replacement does not address the cause of numerous mutations in cancer. Nor does finding better ways to kill tumor cells. They are treatments.

Syncrometer® technology described in this book makes searching for causes and cures possible. Hopefully, there will also be a return to a search for the cure of diseases like diabetes, heart disease, multiple sclerosis, Parkinson's, and a lot of others that are now merely being treated.

Notice to the Reader

The opinions and conclusions expressed in this book are mine alone. They are based on my scientific research and on specific case studies involving my patients. Be advised that every person is unique and may respond differently to the treatments described in this book. On occasion I have provided dosage recommendations where appropriate. Again, remember that we are all different and any new treatment should be applied in a cautious, common sense fashion.

The treatments outlined herein are not intended to be a replacement for other forms of conventional medical treatment. Please feel free to consult with your physician or other health care provider.

I have indicated throughout this book the existence of serious pollutants in food, dental materials and even medicine and intravenous supplies. These pollutants were identified using a testing device of my invention known as the Syncrometer®. Complete instructions for building and using this device are contained in my first book *The Cure For All Cancers* and in the *Syncrometer® Science Laboratory Manual*, published in 2000. Therefore anyone can repeat the tests described and verify the results.

The Syncrometer®, an audio frequency oscillator is more accurate and versatile than the best existing testing methods. A way to determine the degree of precision is also presented. However at present it only yields positive or negative results, it does not quantify. The chance of a false positive or a false negative is about 5%, which can be lessened by test repetition.

It is in the public interest to know when a single bottle of a single product tests positive to a serious pollutant. If one does, the safest course is to avoid all bottles of that product entirely, which is what I repeatedly advise. These recommendations should be interpreted as intent to warn and protect the public, not to provide a statistically significant market analysis. It is my fervent hope that manufacturers use the new electronic techniques in this book to make purer products than they ever have before. As the technology advances from manual to automated performance, it should become an industry standard tool, at very low cost.

It is also in the public interest to disseminate the information about cancer in

this book, even before clinical evaluations of properly “blinded” treatment protocols are made, because the advice in this book does not interfere with existing treatment. Formal validations may take decades, during which time the suffering is great.

Since avoidance of certain foods and products is central to my method for pursuit of health, it is my hope that many persons train themselves in Syncrometer® use. Others may elect to use testing laboratories. See *Sources* for some that use the latest technology and are willing to test supplements, foods, body products, and biological specimens (such as surgery and biopsy specimens) for the pollutants I discuss in this book.

Special Tribute

This work is dedicated to the unsung heroes of so-called "alternative" cancer therapies, both past and present. With their own money, and on their own time, they chose to do battle against humanity’s most tragic mystery disease, cancer. Although this disease dates back to antiquity, its wild acceleration in the past 100 years has baffled us all. Facing the mythical monsters of the Greek literature in ancient times with mere rocks or swords could not have been more daunting than this disease. This challenge was often undertaken or continued even with the ridicule of peers, impending bankruptcy, and on-going lawsuits. Their compassion for cancer sufferers is immeasurable. If it were not for their writings, I could not have made my own discoveries. Knowledge is built upon knowledge. I am deeply grateful to all these persons for their sacrifice of life’s comforts to further the cause of truth and to describe their work: Max Gerson, Virginia Livingston Wheeler, Harold W. Manner, Andrew C. Ivy, Robert R. Rife, William F. Koch, Ernst T. Krebs Jr. There are many more for whom this tribute is intended. Some had an MD, some had a Ph.D., some had both, and others none. No matter, they had the right stuff. Their hard work stands as a monument to the essential goodness of humanity.

Acknowledgments

The smallest coincidence can be the hinge on which future events turn. So it was for the microscope slide of *Fasciolopsisbuski*, made by Frank Jerome, DDS. It turned out to be the malignancy-causing parasite as described in *Cure For All Cancers*. Now, once again Dr. Jerome supplied a microscope slide he made in his parasitology class long ago. This time it was the rabbit fluke, *Hasstilesia tricolor*. The rabbit fluke turned out to be the true source of *Clostridium*, the tumor causing bacterium. My sincere Thank You!

In 1996, the collaboration with Patricia Connolly-Gorzen made possible our discovery of dental toxins and better dental practices.

Gratitude is also due to Elizabeth Sorrells, whose dedication was equally amazing. Thanks are due to the entire staff of the International Diagnostic Center, especially the pathologist, Dr. Miguel A. Ruiz, for their unique contributions.

I gratefully acknowledge the help of my son, Geoffrey Clark, as administrator of the International Diagnostic Center, provider of malonate-free food, environmentally safe lodging, and later as computer editor of this book. This project could not have been done without him.

The help of my sister, Edna R. Bernstein, was also indispensable, as literature researcher.

Gratitude is due to the Mexican dentist C.D. Joachin J. Zavala, and oral surgeon, C.D. Benjamin Arechiga C.M.F. Without their expertise, none of our terminally ill cancer patients could have recovered.

The discovery of fungal growth in tumors and its elimination was made in collaboration with Erika Hüther M.D. Many thanks!

And finally, Mexico itself is to be commended on its research-friendly climate. I am truly grateful to this forward-looking country that made this venture possible.

An Invitation

This book, *The Cure For All Advanced Cancers*, is about a completely self-sufficient cancer therapy that can be carried out by the patient at home at fairly low cost. It seldom requires medical care.

At one time **scurvy**, a vitamin C deficiency disease, was so life threatening it required medical care, but it no longer does. We all know what to do: eat fresh fruit and vegetables. It took 400 years from the discovery of its cure (1535) to utilization of the cure by the public in the early 1900's. Yet it had been published in medical journals many times![1] It took the unrelated orange juice industry to bring it to the public's attention in the early 1900's.

Why did it take so long to put into practice a simple truth, like the importance of eating fresh fruit and vegetables? Because ordinary people, not able to read the medical journals, had no way to learn of it. Unless the public has access to the great truths uncovered by scientists, they cannot learn them even now.

Cancer as an epidemic is now 100 years old. Some of its true causes were already known 100 years ago, like parasites (in several animals), [2] coal tar, [3] synthetic dyes, [4] and over-fried foods. [5] But these discoveries were ignored rather than treasured, as befell the scurvy cure.

Hopefully the age of computers will set free the bird of truth as was never before possible. Patients now have easy access to information just like doctors and researchers do.

Yet this book is not a critique of current clinical management of cancer. No experiments were done on age-matched patients with similar cancers comparing my treatments to chemotherapy, radiation or surgery. Scientific/clinical evaluations await the future. The good news is that this new method is not incompatible with clinical treatments in most respects. But the use of certain vitamins may be considered undesirable by your oncologist if she/he is planning certain chemotherapies. There is a very large body of research literature that discusses the use of supplements in cancer.[6] Your oncologist may wish to peruse some of the references cited in this research report as well as throughout this book.

Most victims of cancer have been given an accurate diagnosis, meaning a label for their cancer. After this a **protocol** (procedure) for this particular cancer was applied, taken from a scientifically acquired bank of data. Here is a sample: MMM chemotherapy regimen for breast cancer, MOB chemotherapy regimen for cancer of the cervix, MOCCA chemotherapy regimen for myeloma, MOPP/ABVD chemotherapy regimen for Hodgkin's disease, and MOPLACE chemotherapy regimen for MOPP- and ABVD-resistant Hodgkin's disease.[7] Radiation and surgery protocols are also carefully described and prescribed. All this data and its efficacy are undoubtedly correct, taken within the boundaries of the varied assumptions made to get them.

A huge catalog of such data exists, with the precise protocol for each category and sub-category of cancer. Your doctor may still be creative and flexible <u>within</u> this protocol or use a <u>new experimental procedure</u>, which is another statistically derived protocol.[8]

Remember that oncologists are highly trained in the sciences; they do want the best for you. They must practice within the boundaries of conventional treatments or risk losing their license to practice. The result may be something that over treats or under treats. This is unavoidable. They too would like to know the cause and effect relationships that underlie cancer and do not try to cover up ignorance.

When you are first contemplating the options available to you, try to choose the best of both worlds for yourself. You will be torn in different directions.

A fictional example, about a painful toe, may help:

> One day, you tell your doctor your toe hurts and has been painful for several months. You are given a blood test, a physical examination, and some painkillers. You are asked to return in a few weeks. When you return and there has been no change, you are referred to a foot specialist.
>
> The new doctor scans, measures, palpates and Doppler-auscultates your foot and toe; details on posture, gait, health history, and family foot problems are noted. All the results, put together after a complete workup, give you a label (diagnosis): *prosematis*. This label is now looked up in a huge catalog that is kept current by professional and government committees. There are very many entries of similar but slightly different conditions, like "pseudo prosematis," "atypical prosematis," "idiopathic prosematis." Success in treatment depends on the diagnosis being absolutely accurate. (A large part of the work and expense that goes into cancer treatment is in the accuracy of the diagnosis.) The catalog gives you the treatment protocol: ACP, IHO/W, PMT/GA in order of effectiveness for your prosematis.
>
> ACP means Amputation up to the exact Center of the Pain location. "When a circle is drawn according to pain intensity determined by artificially produced pain around that point and a pain intensity scale is used to determine the diameter of," and so forth. Exact details fill a page or more.
>
> IHO/W means Immersion in Hot Oil or hot Water for prescribed periods of time after immobilization in various ways and appropriate anesthesia, etc.
>
> PMT/GA means Pressure is to be applied on top of (or from the bottom of) the center of the pain location to MT (maximum tolerated) with or without local anesthesia. The doctor can creatively decide whether GA (general anesthesia) may be used and the length of time to apply pressure in order to maximize treatment. It is explained to you that the treatment is effective for five years in 30% of cases but you will be carefully followed to catch the earliest recurrence.

You, the patient, may be shocked almost to tears, and ask the doctor how your toe pain could warrant such drastic measures, whether this really is prosematis.

Yet, this seems like a foolish question when your own educational training tells you the diagnosis was scientifically acquired, the measuring devices were all accurate, and a thousand scientific studies support the catalog of protocols for prosematis. Undoubtedly, the treatment is effective and will work for you. You tell yourself you must simply trust.

Only a modern human being could be so duped. These recommendations would be hilariously funny to a primitive person who would first of all throw away their shoes! But in your ignorance, walking to work each day in fashionable shoes, it is entirely serious.

Suppose you go home, too depressed to eat the rest of the day. You imagine how your toeless foot will look and wonder if prosthesis exists. Will your spouse have more of an aversion to your toeless foot, or prosthesis? You take your shoes off and step into a hot shower. You tearfully watch TV. Then you notice the pain is temporarily gone. You keep out of those shoes and take more hot footbaths. Being scientifically oriented, you try more changes: a better diet, stopping bad habits, and resting your foot. Eventually, you clear it up yourself!

You can't help wondering how a clinical treatment could be so wrong, when all the data that went into it were so right. You wonder why ordinary things, not scientific in nature, like shoe fit, diet, and foot use did not come under scrutiny. The doctors were all kind and sympathetic, thoroughly believing in their

treatment methods (and outlawing others for your protection). You may conclude, as I did, that a totally "scientific" system of belief and treatment could still be quite wrong, even though, admittedly, the treatments like amputation to cure prosematis would be 100% effective.

"Prosematis" is a fictional disease I made up to illustrate how more serious diseases, like cancer, are treated. Scientific data are used. Scientific data are a collection of accurately obtained, statistically sound measurements. Science is not the culprit. But its application requires wisdom—a human quality. It can be lacking in any individual or profession. Yet, we all have some of it.

An example of wisdom for an individual might be changing daily habits when cancer threatens, such as improving diet, stopping addictions, and stopping the use of recognized carcinogens. This book will elaborate on these.

An example of wisdom for the medical profession would be searching for carcinogens in the tumorous organ. Then searching for the same carcinogens in the patient's air, water, food, and body products.

For example the dye "butter yellow" is known to cause elevated alkaline phosphatase levels in animals. Many cancer patients show elevated alkaline phosphatase levels, too. Researchers should search for butter yellow in these cancer patients. To my knowledge such a study has not been done, nor do I see evidence of this whole approach! Here's another example. Scientists know that broken chromosomes are characteristic of nearly every cancer.[9] [10] They also know that heavy metals, like copper, cadmium, and the lanthanides ("rare earths") cause chromosomes to break.[11] Yet doctors do not send biopsy specimens to a lab for heavy metal analysis!

Ordinary laypersons have a great deal of wisdom. This book will help you to practice and express your wisdom. You can build the same diagnostic and monitoring tool that I have used: instructions are in *The Cure for all Cancers* and in the recently published *Syncrometer® Science Laboratory Manual*. Your wisdom, together with others', is much needed. When wisdom is accumulated, it can contribute to a new bank of information for persons in the future that face the same dilemma you faced. Wisdom can be gained by communicating and listening to others in similar predicaments. It is my cherished belief that you and others can solve human health problems with unprecedented speed and success.

I invite you to do so.

The Tumor

In this book, I will show you the true nature of tumors, why they grow and even multiply. Why they are dangerous. By removing the causes of tumor growth, you will be able to shrink your tumors.

Even if you have a non-tumorous form of cancer, the same causes are at work. All cancers are alike.

We have all believed that cancer is a single disease, that a malignant cell starts it all. This is not true. Cancer is two diseases. Malignancy is the second and last disease to set in. By curing this last disease, (malignancy), as we did in *The Cure For All Cancers*, the earlier disease becomes visible. This earlier, first disease is tumor-growing. It is a distinct and different disease from malignancy.

We have also believed that tumors, unless they are malignant, need not be feared, that they may be called benign, or merely a lesion, implying safety. This is like a zebra on the African plains believing that a lion that is standing very still, nearby, need not be feared. This is, again, not true.

Your body has built-in tumor shrinkers. Obviously, they are not working. Why? They are blocked. You only need to unblock them. It does not take months or years to unblock them. It only takes days to do this and begin the shrinking process.

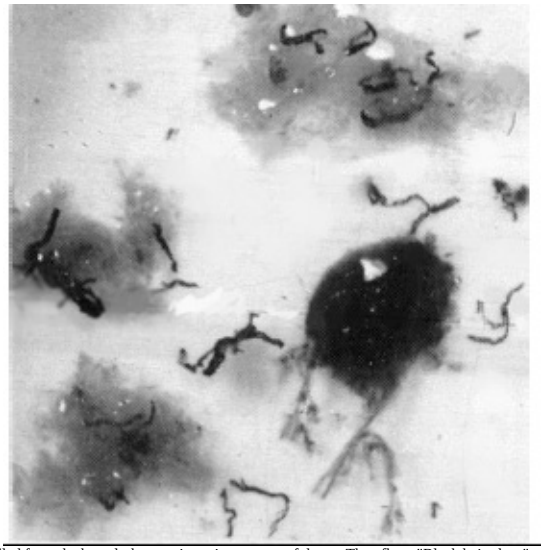
You will see it happen, on x-rays or by blood test results. You may feel it happen when pressure and pain are reduced. But how the body shrinks your tumors, or gets rid of cells that have acquired numerous mutations, the exact mechanism involved, is still a mystery. Even the p53 mutations, the hallmark of cancers, disappear! Oncogenes, such as the MYC family, stop reproducing. (We will talk about all these later.) The details must wait for future research. The good news is that it does happen, predictably, not by chance or "spontaneous remission."

Malignancy Review

Now that we can cure both the malignancy and the tumor growth, we may reflect: it makes good sense that malignancy and tumor growth are two distinct diseases. After all, the malignancy is simply the result of invasion of your tumors by a fluke parasite, ***Fasciolopsis buski***, and the presence of **isopropyl alcohol**.

Fig. 1 Human intestinal fluke

The common name for this parasite is **human intestinal fluke**. It goes through its larval stages in your tumors, instead of in its usual secondary host, a snail. Your body serves the same purpose as the snails—it provides food and shelter for the parasite. But at a huge cost! If isopropyl alcohol is present also, we will make abundant hCG and ortho-phospho-tyrosine (which I use as cancer markers[12]). Surprisingly there are two ways you can get isopropyl alcohol into your body. Some bacteria produce it, and it is used as an antiseptic in many of our body products and food!



These were expelled from the bowel; they are in various stages of decay. They float. "Black hairy legs" are strings of eggs.

Fig. 2 Five flukes

Obviously, then, the most important thing to do first is eliminate these parasites, bacteria, and unnatural chemicals. This, in turn, eliminates the two dominant growth stimulators hCG and ortho-phospho-tyrosine.

Tumor Tour

hCG is **human Chorionic Gonadotropin**, the same hormone a mother produces in her placenta to protect the growing baby from attack by her own immune system.[13] hCG will protect the tumor cells from attack, no doubt, by your immune system. hCG is only present when isopropyl alcohol is present and organic germanium ("good" germanium) is absent, suggesting that it may result from a specific mutation (a mutation is a change in your genes). We will see evidence for this theory later.

Ortho-phospho-tyrosine is a powerful growth stimulant, perhaps made by the parasite larvae themselves, perhaps induced in our cells by the intestinal fluke parasite. Whatever the mechanism is, the explosive growth that results has disastrous consequences: metastasis to far flung places in the body. No amount of surgery, radiation, or chemotherapy and no amount of alternative therapy (vitamins, health potions, immune boosters) can keep up with such a *mitosis* (cell division) explosion.

But killing this parasite and all its tiny larval stages stops it in about a week, using the parasite-killing program discussed in *The Cure For All Cancers*. In advanced cancer we will use doses that kill all parasites and all their stages in the first twenty-four hours. Fortunately, the advanced cancer program is well tolerated by even the sickest person. We can then turn our attention to shrinking the tumors so you can get well. All this can be accomplished in three weeks so I call it **The 21 Day Program**.

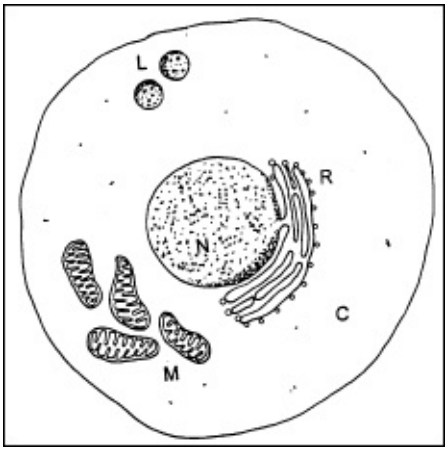
Tumor Cell Handicaps

Tumor cells are a very special breed. They have become like drones, doing nothing, in a busy beehive. Tumor cells do nothing to contribute to the organ they live in. Liver cells do liver work. Pancreas cells do pancreas work. Bone cells do bone work. But tumor cells do no work. It is not by choice, though.

A Syncrometer® is a new electronic device, which is described in *The Cure For All Cancers*. With it you can identify objects and chemicals in your tissues very accurately. The techniques used are described in the *Syncrometer® Science Laboratory Manual*.

Tumor cells have no tools to work with; this means they have no enzymes, nor RNA to make enzymes. RNA is *ribonucleic acid*, the blueprint for making proteins, and my Syncrometer® never detects any in advanced tumors. RNA is necessary to make all proteins (enzymes are proteins).

Tumor cells do not even have the raw materials to make proteins; this means they have no *amino acids*. Besides this, the tumor cells' energy-generators are mostly shut down, and the ones remaining are old and decrepit. The energy-generators in a living cell are the *mitochondria*. The mitochondria are shriveled, misshapen, and few in number.[14] It is the mitochondria's job to turn out energy, which will be the cells' fuel. Cell fuel is called adenosine triphosphate (ATP). We can hardly expect the tumor cells to do any work if neither the equipment (enzymes), nor the material (amino acids), nor the fuel (ATP) are available.



A healthy cell is a very busy place, with mitochondria (M) that use oxygen to turn out energy, the cytoplasm (C) where glycolysis takes place, the lysosomes (L) that tackle invading bacteria, the nucleus (N) where your genes make the RNA that will produce your proteins, the ribosomes (R) that stud the membranes attached to the nucleus, where proteins are actually made.

Fig. 3 A cell with nucleus, cytoplasm, mitochondria, etc.

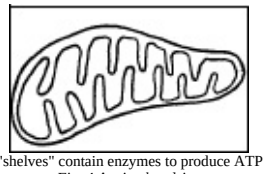
The mitochondria are in a broken down condition for two reasons: (1) constant interference by **malonic acid**, and (2) lack of thyroid hormones.

Malonic acid is constantly being eaten because it occurs in some common foods. It also trickles in from tapeworm larvae and fluke worms lodged in us and from a completely unnatural source, plastic teeth (we will discuss malonic acid later).

But the lack of *thyroxine*, a major thyroid hormone, is not due to a weak thyroid gland as in an ordinary low-thyroid condition. The thyroid gland makes its daily quota of thyroxine (five grains each day) and ships it out via the blood stream to each one of our 50 billion body cells! It must enter each cell to deliver

its activating effect. But as the thyroxine enters the tumor cell, and approaches the mitochondria, it is attacked by *thiourea*. Thiourea destroys the thyroid hormone. This does not happen in the neighboring healthy tissue.

You might be asking yourself why we care if tumor cells are malnourished, have dysfunctional mitochondria, and other abnormalities. After all, aren't we trying to kill them? The answer is no, we are not. We are trying to heal them! Then tumors shrink and the tissue returns to normal.



Internal "shelves" contain enzymes to produce ATP energy.
Fig. 4 A mitochondrion

Yet, thiourea is a normal chemical, made by each cell to facilitate cell division. It is only doing its job. Unfortunately it is being overproduced by the tumor cell, in its own effort to heal itself. Living things are supposed to heal themselves whenever they are wounded or injured in some way. Our cells instinctively know they must multiply themselves to heal. This provides healthy, young cells to fill the gaping hole or to replace the injured cells. The damaged cells are digested. Tumor cells are busily healing themselves by such multiplication. Why don't they stop? Are they never done healing? Why don't they stop dividing in two when they are done healing? What are they healing from?

Tumor Cell Division

They don't stop because the "brakes" on cell division are not being used. This allows the accelerator of cell division, thiourea, to be on continuously. The brakes are another chemical made by each cell for itself, called *pyruvic aldehyde*. (We will often call it the "brakes.") The brakes are gone. Pyruvic aldehyde can seldom be detected by the Syncrometer® in the tumor-tissue. So, not only is there an accelerated multiplication of cells going on, but the brakes slowing them down are gone. At the same time the excess thiourea destroys the thyroid hormones, and without thyroxine the mitochondria can't do their work.

Why are the brakes gone? Pyruvic aldehyde is susceptible to *amines*, much as car brakes are susceptible to drops of oil. Amines react and combine with pyruvic aldehyde until it is all gone.

Our cells normally make thiourea for one minute, followed by pyruvic aldehyde for one minute, and so on, back and forth, like a pendulum, to keep a balance between the accelerator and the brakes on cell division. But when massive amounts of amines appear in the cell, there may be no brakes on cell division for fifteen minutes at a time, followed by just one minute of pyruvic aldehyde, typical of a fast growing tumor.

Why are there so many amines around? Some amines are produced naturally by our cells, perhaps to do exactly this—release the brakes by combining with pyruvic aldehyde on a tight schedule. But the excessive amount of amines in tumor cells is produced by bacteria. Simple bacteria! They have entered the cells as they always try to do. But for some reason the tumor cells can neither kill them, nor free themselves of them. The predator is living within! The cells' primitive solution to this impasse is to divide itself (release the brakes on cell division), so at least one of the two newly formed cells will escape and be free of the attacker, assuring survival. Like a fingernail you accidentally hit with a hammer, the nail will fall off eventually and reveal a new one growing underneath.

Tumor Cell Bacteria

If only we could help them heal, the impasse would be over. How to help them is the subject of this book.

It is understandable now, why tumor cells are not able to do any work. They are sick. Bacteria have attacked them. Their toxic amines have removed the brakes. Without brakes thiourea production is endless and thyroxine can't reach the mitochondria. Mitochondria are dependent on thyroxine.[15] Without it the generator-like enzymes cannot burn the food molecules that are waiting to be oxidized into ATP. This part of our metabolism is called *respiration*. Without enough energy, tumor cells only divide and contribute nothing. Unless you count making a cozy home for *Fasciolopsis* larval stages! That parasite then contributes ortho-phospho-tyrosine to accelerate them into malignancy.

Ordinarily when bacteria attack, either your cells or the bacteria win the battle. It is a life and death struggle. If the bacteria win, your cells die. They do not become tumor cells. They are dead and will be removed by your white blood cells. But if your cells win, the bacteria die and are digested by special little "fortresses" inside your cells called *lysosomes*. Unfortunately, thyroxine is

needed to activate your lysosomes too! Because tumor cells are short on thyroxine an impasse is occurring. They neither die, nor can they kill their invaders. They are half alive and half dead. They are in a twilight zone, trying to solve the impasse by dividing.

Tumor-making bacteria are of a special kind, too: *Clostridium* species. They have the ability to make DNA in a special bacterial way.[16] They make huge amounts of DNA from RNA by the enzyme, *ribonucleotide reductase*. Their enzyme requires vitamin B_{12}, which you supply.

Clostridium species of bacteria are the constant companions of tumors, supplying the DNA, the toxic amines, and even the isopropyl alcohol, which will eventually contribute to malignancy. The bacteria are thriving, while flooding your cells with excess DNA that can be used for cell division. Some of the bacterial DNA will certainly get integrated (joined) with your own DNA. And most certainly, any viruses infecting the bacteria will seize their chance, too, to join and **transform** your DNA.

"Transformation" is a scientific term that describes what happens when your genes (DNA) have been joined by foreign DNA, such as from a virus. Your cells become changed (transformed), stopping their normal RNA and protein formation. The virus genes now hidden amongst your own can be triggered by common chemicals (as anyone with chronic *Herpes* infection knows) to reproduce. And some virus genes tell your cells to multiply! They have become *oncogenes*, genes that cause tumors.[17] Such an event is quite possible, even probable, when hordes of *Clostridium* bacteria have invaded your cells without killing them or being killed. This should not happen. It was not meant to happen.

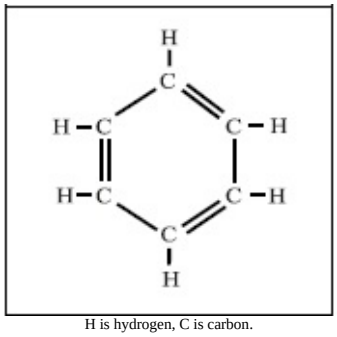
Cell Defense Mechanisms

Cells that are struggling for their lives call out for help. They call for your immune system. They call for a temperature rise. They call for oxidizers. They call for reducers. Ultimately, they call for self-destruction in a self-sacrificing way to protect you. So that you could never develop an aggressive tumor. But what will go wrong?

- Your immune system will fail.
- Your temperature will not rise.

- Your oxidizers will vanish.
- Your reducing power will disappear.

How will your immune system fail? Perhaps the flood of hCG incapacitates it.[18] Perhaps the metals arriving on the site destroy your white blood cells' ability to find and "home-in" on the infected cells.[19] Perhaps the absence of germanium (the "good," organic kind) suppresses immunity and does not let interferon be made.[20] Perhaps our increasing exposure to benzene is crippling our immune system.[21] Perhaps our white blood cells are smothered with ferritin or immobilized due to lanthanides (discussed in detail later). We do not yet know. But lowered immunity is a hallmark of cancer. The most significant observation I make with the Syncrometer® is that glutathione (GSH) is absent! Although I am not sure what the exact connection is, I observe that all healthy cells have glutathione, and all cells with bacteria, heavy metal, or malonic acid, do not. I conclude that your glutathione has been destroyed by trying to detoxify these. So for many reasons your cells cannot depend on your immune system to assist them.



H is hydrogen, C is carbon.

Fig. 5 A benzene molecule

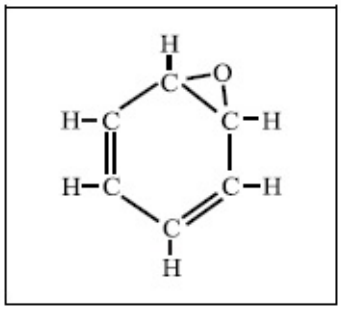
Your body tries to raise its temperature. This will cook and fry many invaders. But a cancer patient's body does not respond. In fact, cancer sufferers are extra cold. Their body temperature is often more than one degree colder than normal! Is this the work of toxic amines? Is it a thyroid gland problem, beyond the local effect of thiourea? The answer still eludes us, but the result is that your struggling cells will not get the temperature rise they need.

Your body's oxidizers will vanish. *Oxidation* means burning up by adding an oxygen atom or by subtracting an electron. Here is an example of oxidizing benzene (which looks simple, but is very difficult to do in your body).

Each line between the carbon atoms represents two electrons being shared. Sharing creates a strong bond between them, like two people holding hands

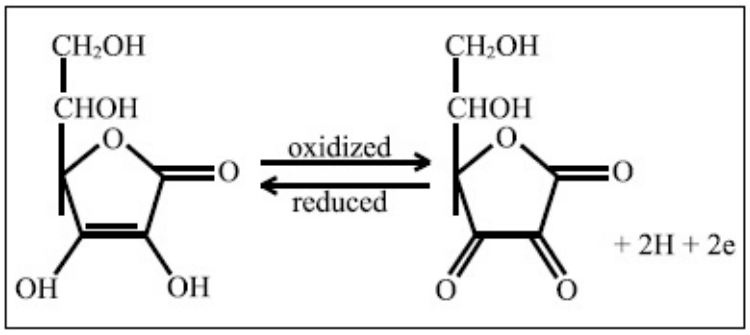
tightly.

Your body has the necessary enzyme to pry apart one of these strong bonds, and pull out an electron or insert an oxygen atom. The advantage gained is that the oxidized benzene atom is more soluble in water (namely urine) and can be excreted through the kidneys. Oxidation is used to detoxify substances as well as to burn food into energy.



O is an oxygen atom.
Fig. 6 Benzene beginning to be oxidized

The detoxifying enzymes belong to a family called *cytochrome P450 enzymes*. But they must have **iron** to function. If you live in a home with copper water pipes, the excess copper in your water is competing with the iron in your food. It is well known that iron is lacking in cancer patients.[22] Other oxidizers like diamine oxidase, D-amino acid oxidase,[23] rhodizonic acid, and cytochrome C are also missing. We will discuss more on oxidation later.



L-ascorbic acid dehydroascorbic acid

Vitamin C can give up two electrons (two hydrogen atoms go also).
Fig. 7 Two states of vitamin C

Your body's reducers will disappear. When oxidizer-chemistry fails, the opposite can be tried, *reduction*. Now atoms of oxygen are removed or electrons are added. **Vitamin C** is a reducer. It gives away its own electrons to the chemical the body wishes to reduce. It gives away its hydrogen atoms too, and then is itself called *dehydroascorbate*. **Cysteine** and **glutathione** are two other

reducers.[24] Reduction, like oxidation, is strong chemistry, but in a cancer patient this mechanism is very weak. There is very little reducing power in the blood.[25] Why someone loses their reducing power is not known, but I think it's largely due to exposure to heavy metals, like nickel and chromium from stainless steel cookware, or cadmium from galvanized water pipes, or mercury, thallium and germanium (the toxic kind) from amalgam tooth fillings.

Your beleaguered cells are reaching a crisis. They are losing their immunity, bacteria are attacking them, so they are trying to multiply themselves out of this predicament, and, of course, trying to self-destruct at a stepped up pace, too. We will discuss self-destruction later, but obviously the end result for a person with tumors is that self-destruction did not keep up with cell division, and a small mass formed.

Cell Mutations

Meanwhile, as the cells are multiplying faster and faster, a sinister development takes place. The very act of mitosis (cell division) exposes the *chromosomes* to chemicals that might cause mutations. The protective nuclear membrane is temporarily gone, leaving the genes naked in the cell sap, called *cytoplasm*. Normally mitosis is done quickly and not very often, to reduce this risk. But in the *Clostridium*-infected cells, mitosis is going on much more frequently due to the overabundance of thiourea. A scientist, looking at a specimen of a very early tumor sees many more nuclei going into mitosis—they become densely stained when dyes are applied that color DNA, making it easy to spot and count the cells that are in mitosis. This gives scientists a measure of the rate of mitosis. The problem with constant mitosis is that it increases exposure of your genes to the hazards of *mutagens* (substances that cause mutations) in the cytoplasm.

Look at the drawing of intestinal cells.[26] They are piling up due to too much mitosis. It is a beginning "adenoma" typical of benign or pre-malignant tumors.

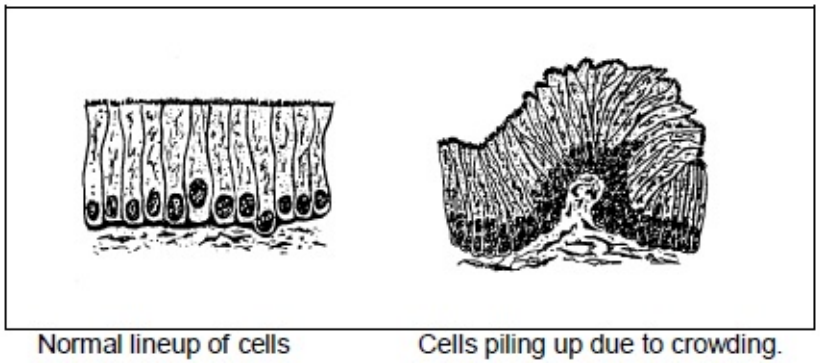


Fig. 8 Beginning tumor formation

Soon mutations abound in this fast-multiplying tissue. But they will not be random mutations. They will be mostly **p53**, **LDH** and **alkaline phosphatase enzyme**, **vitamin A**, **bcl-2** and **bax** mutations. (We will discuss these soon.)

Metal In Cells

I do not understand why a tissue in distress or simply in accelerated mitosis attracts so many things. It attracts heavy metals. It attracts dyes. It attracts more bacteria and parasites. It attracts mutagens and carcinogens (these are chemicals specifically known to cause mutations or tumors). But it also attracts good things, like vitamins and immune boosters. This attractive force, which I call *morbitropism*, deserves intensive study.

If morbitropism attracts even minute quantities of toxins, is that significant? Yes. That peculiarity was noticed quite early in cancer research. Numerous small doses of a carcinogen, were more effective than fewer large doses.[27] [28] In this respect, it was similar to the carcinogenic action of radiation: again, the smaller the dose, the more effective it was.[29] So that is why I advise people not to wear metal jewelry, to remove toxic tooth fillings, to change their metal water pipes to plastic, and avoid processed food (it has traces of dyes and antiseptic chemicals). Although the dose seems small, these particular toxins, over time, can be deadly.

Other attractive forces have already been studied: the liver attracts liver flukes, even if they are injected into a fish, far away from the liver near the tail; the flukes can somehow "home in" to the liver. The attraction of certain metals, like thulium, gallium, and technetium specifically to cancer sites has been the feature making bone scans possible. Cobalt is specially attracted to dividing cells.[30] The attractive force between bacteria and white blood cells can be "felt"

for long distances; it is destroyed by heavy metals and fungus toxins.[31]

Perhaps some of these are not true forces—but just an accident of shape or chemistry, the way a kitchen sink drains and "attracts" water because of the hole in the base. Perhaps cell division itself makes cells act like a "sink."

Whatever the mechanism, heavy metals now arrive at the tiny site undergoing rapid mitosis: copper, cobalt, vanadium, germanium, lead, mercury, thallium, nickel, cadmium, and the lanthanides ("rare earth" elements). As well as arsenic, asbestos, Freon, silicone, urethane, acrylic acid, and other non-metals. Copper, cobalt, and vanadium are always there, detected by the Syncrometer®; the others are often there. Most of them are known mutagens.[32] Together, they begin using up all the sulfur that is available in the cells: all the cysteine, methionine, taurine, glutathione, SAM, pantothenic acid, coenzyme A, and vitamin B_1 (thiamin) because these all contain sulfur.

Metals (except the lanthanides) typically combine with sulfur to form sulfides. This also detoxifies them in the body, solubilizing them, so they can be excreted. Soon the cells are in sulfur bankruptcy. Cysteine and methionine are amino acids, glutathione is a reducer and immune-supporter, SAM and coenzyme A do other vital chemistry, and pantothenic acid and vitamin B_1 are essential parts (cofactors) that enzymes must have to do their work. So metals cause depletion of some of your most vital compounds.

Metal sulfides can be escorted out of the body via the kidneys and intestines. After your sulfur is used up, the plain metals remain in circulation and are attracted to the tiny hyperactive tissue where cell division is accelerated.

Lanthanide metals cannot be detoxified this way. They belong to a special group of metals that are highly magnetic (paramagnetic), second only to iron.

They were once called "Rare Earths", though of course they are not rare. But they were so difficult to separate, one from another, that getting any one in pure form was rare indeed. There are 15 in all; although two other elements, yttrium and scandium, are often added to the group. The Syncrometer® detects all the lanthanides in the metals used to restore teeth!

They are also found as pollutants in **sprayed** produce, which includes nearly all fruit and vegetables in the supermarket. They are not found in drinking water

except for one kind: reverse-osmosis water. If you have such water, you can send it to a testing lab to be checked for thulium, yttrium and/or ytterbium. Evidently, the membrane used for treating such water has these lanthanides in it. And some varieties of vitamin C are contaminated with thulium. This, too, can be checked by a testing lab.

The lanthanides do more sinister damage than regular heavy metals. They disturb your own DNA production; it begins too late (by 13 seconds)[33] but then runs overtime. The extra DNA is pushed into the lysosomes where the Syncrometer® now detects the enzyme DNAse, which will happily destroy it. Yet, it represents danger.

The lanthanides seem to fill up your cells with iron deposits and calcium deposits. The link between lanthanum and calcium deposits has been studied[34], but the Syncrometer® detects more. Cells "choked" with iron and calcium are not able to hoist a "flag" that begs your body to digest them. The flag is a cell chemical called **phosphatidylserine**; it can be forced to stick out of the cell membrane just like a real flag! In every normal tissue some worn out cells need to be digested, so healthy tissues are Positive for phosphatidylserine. But tumors test Negative for it, indicating this essential function is missing. "Raising" the "flag" attracts two common digestive enzymes, pancreatin and lipase, made by your pancreas in large amounts at mealtime. Children and healthy adults have these enzymes present in every organ at all times, but as you may guess, the Syncrometer® detects neither of these in tumors.

So the lanthanides are preventing self-digestion—the very mechanism that lets tumors enlarge.

Uranium, a radioactive metal, is also found in the tumor. It, too, must come from metal tooth fillings since the Syncrometer® finds uranium in about $^{2}/_{3}$ of all amalgam ordered fresh from the factory! If you have six amalgam fillings in your mouth your chance of not having uranium is one in 729.

PAHs In Cells

Non-metal mutagens also arrive at the threatening tumor site, apparently attracted in the same fashion. For instance, the Syncrometer® detects polycyclic aromatic hydrocarbons (PAHs) at tumor sites. Some PAHs are extremely carcinogenic. Are they drawn by morbitropism? Or simply drawn by the "sink

effect" of *purines* and *pyrimidines* that are present. Purines and pyrimidines are the *bases* that form part of all DNA. During cell division, DNA, with its *purines* and *pyrimidines*, are abundant in the cytoplasm, not hidden inside the nucleus. PAHs dissolve especially well in purines.[35] Carcinogenic PAHs, therefore, are particularly attracted to fast dividing cells.

Decades ago, the common purine in coffee, called **caffeine**, was seen to easily dissolve PAHs.[36] And therefore attract them. The question then, was, is there anything in the human body to be attracted? Do we ever have PAHs, or things like PAHs, in our bodies? It was an intriguing question in the 1930's and 40's. All the more intriguing because of the resemblance between the PAHs and our own cholesterol molecules!

Look at the sample of PAHs. Hundreds of similar, though slightly different PAHs can be made in a lab and many of them will be carcinogenic.

Many PAHs are produced naturally in decaying organic matter such as coal tar[37] (from fossil vegetation) or crude oil (from ancient dinosaur bodies) or a grilled hamburger. Notice that they are combinations of benzene-like rings (look at the hexagonal shape of benzene, alone). Benzene is a flat molecule, making the entire PAH flat. This will be an important feature.

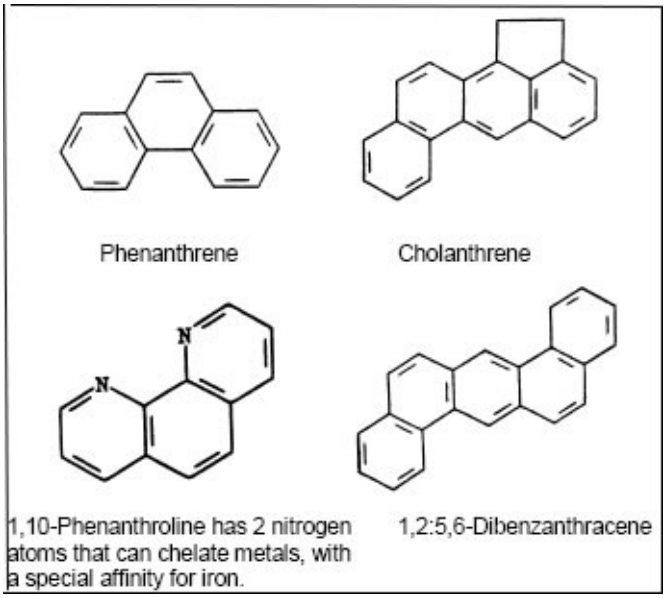

Fig. 9 Four common PAHs

Compare the PAH molecules with a cholesterol molecule. It, too, is very large, made up of benzene-like rings stuck together. It too will be flat. But the

rings do not have double bonds—not yet! So cholesterol is not carcinogenic—yet!

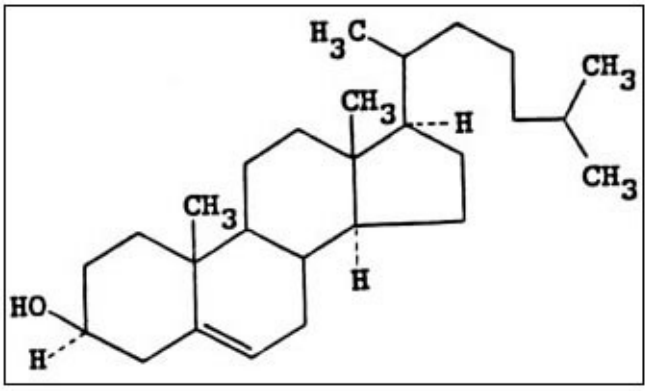

Fig.10 Cholesterol

Heating cholesterol to a very high temperature, as in open fire grilling, does put double bonds into it and does make PAHs out of it.[38]

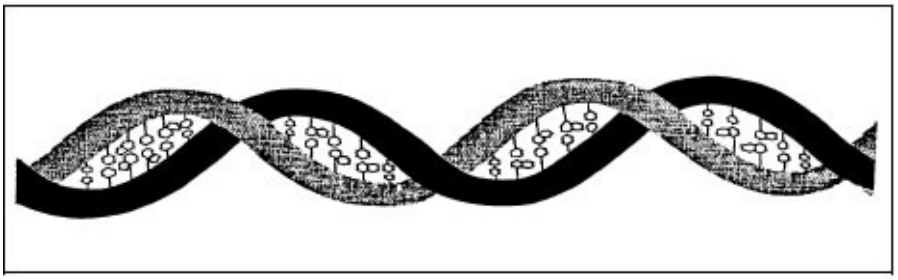
Yet, our own bodies never get that hot. Could there be enzymes that change our own cholesterol to PAHs? Yes. They were never found in the research studies of the 1930's and 40's. But the Syncrometer® detects numerous PAHs that could be made from our own cholesterol (listed further on). But only when *Ascaris* is present! *Ascaris* is the common roundworm of cats and dogs. It parasitizes us, too, though it is less obvious.

Many of our hormones, including estrogen and testosterone, are made from cholesterol, and therefore have a similar structure, and could be turned into PAHs as well.

Even vitamin D is made from cholesterol, and in the presence of Ascaris turns into vitamin D2 instead of the normal vitamin D3. Such interference in our metabolism by a parasite should be carefully studied.

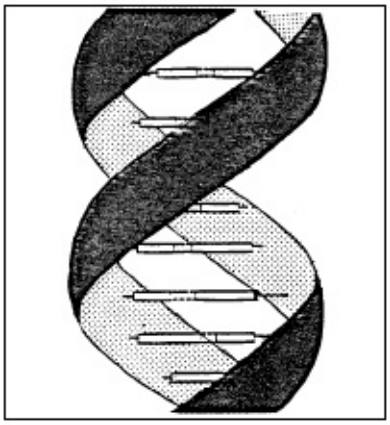
PAHs Invade DNA

Both cholesterol and PAH molecules are thin, flat, and shun water—just like the **bases** in our nucleic acids, our purines and pyrimidines. This similarity will lead to mutations!



Two nucleic acid threads wound around each other.
Fig. 11 DNA

Each of our chromosomes is made of a double thread of nucleic acid. Along the way are bases keeping them close together like thousands of hands clasped together. There are thousands of bases in each gene and over a thousand genes in each thread of nucleic acid. The double thread is wound around into a spring shape; this shortens it and makes it manageable. Only when a purine base is held by a pyrimidine base is the bond strong enough to hold the two threads close together. So while one thread has a purine base, the other has a pyrimidine and vice versa. But along a single thread, any assortment is possible. The neighboring thread will always provide the correct base to pair with it. **Obviously, the total number of purines must always equal the total number of pyrimidines.**



The double threads of nucleic acid are twisted like a spiral staircase. The "rungs" are made of a purine base from one thread and a pyrimidine base from the other thread. The bases attract each other with a force. The spaces between the "steps" can be invaded by PAHs or cholesterol derivatives.
Fig. 12 DNA and bases

The spring-like shape allows the bases to be stacked like the steps of a spiral staircase, at the same time keeping the threads close together in a tight fit. Yet, cholesterol-like molecules can break into this careful arrangement when the chromosomes are lying unprotected in cytoplasm during mitosis. Cholesterol-like molecules are very thin and flat and are perfectly suited to slide between the bases and get stuck there. In this way they cause mutations. It is called

intercalation. It is probably quite accidental, happening when cholesterol-like molecules are plentiful nearby.

Our bodies have developed elaborate systems of getting rid of old cholesterol and hormones safely by detoxifying them. But the detoxification products themselves have molecular shapes dangerously similar to the mutagens of the PAH family. Could cholesterol occasionally and erroneously be turned into a carcinogenic PAH? My evidence shows that it does,[39] and other researchers have also considered the possibility.[40]

The Syncrometer® detects a host of carcinogenic chemicals of the polycyclic hydrocarbon class in every tumor, even in warts. These were called "carcinogenic" originally because a minute quantity of a PAH could be injected into a mouse or other animal, or rubbed onto the skin, and sometime later—often many months—tumors would appear, predictably. These tumors could be removed and planted in a different animal, causing new tumors[41]-they had developed a life of their own! So they were called "cancerous."

Here are some PAH-like carcinogens detected by the Syncrometer® in every tumor, whether benign or malignant:

- 20-methylcholanthrene. This was deemed to be the most carcinogenic of all chemicals when it was discovered; $^{1}/_{10}$ of a mg ($^{1}/_{10}$ of a flyspeck) placed under the skin of a mouse, would induce tumors many months later and would kill the mouse.
- 1,10-phenanthroline, somewhat similar to phenanthrene, and normally accompanied by its iron-derivative *ferroin*. Although iron combines with it the most, this is no guarantee that other precious minerals are not stolen the same way. 1,10-phenanthroline by itself never appears in the urine; only ferroin does. This means that iron is required to detoxify phenanthroline so it can leave the body. If there is not enough iron to spare for this ignominious task, 1,10-phenanthroline is simply left in the tissues, waiting to grab up any loose iron, starving the tissues which must have it. Cancer patients are inundated in this phenanthroline. Gradually, all the vital organs become starved in this way. Phenanthroline will not go away unless iron is supplied. Even 10 days after the last Ascaris larva has been killed, phenanthroline is just as plentiful as before. Only after a week of intensive supplementing with ferrous glucanate, will the phenanthroline disappear.

And only then will there be some iron for the body to use. The urine meanwhile has been pouring out ferroin.

- Phorbol (phorbol-12-myristate-13-acetate, or "PMA") one of a family of naturally occurring tumor promoters.[42]
- 1, 2:5, 6- dibenzanthracene, a very potent tumor inducer.
- 3,5 cholestadiene, a tumor inducer and oxidation product of cholesterol.
- Chrysene, an oxidation product of cholesterol and tumor inducer.

Some carcinogens, studied by early scientists, were so long lasting after a single minute dose that they could still be seen by a fluorescence-meter seven or eight months later! This explained why it might take so very long (a long "latency") for cancer induction. The carcinogen was tightly intercalated, could not be detoxified or pulled out, and was causing mutations all that time.

PAHs From Parasites

How can these powerful mutation-causing chemicals be produced in our own bodies and allowed to intercalate themselves between the bases of our nucleic acids? Is our body manufacturing its own demise? It is actually not our own doing at all! It is the foreign biochemistry of our parasites! (I will sometimes call it mis-biochemistry.)

Ascaris worms are responsible for the 1,10 phenanthroline, 20-methylcholanthrene, and dozens of related carcinogens! Tapeworm stages contribute phorbol and dibenzanthracene!

Ascaris worms also bring two harmful bacteria: *Rhizobium leguminosarum* and *Mycobacterium avium*/cellulare. More research is needed to determine whether these are really responsible for our mis-biochemistry.

Tapeworm stages bring *Streptomyces* bacteria, which spread through the body. It could be these that are actually responsible for the tapeworm mis-biochemistry. *Streptomyces* are also known for their production of *mycins*, some of which are potent inhibitors of RNA and protein formation. Some are used as antibiotics, like streptomycin. The Syncrometer® detects an assortment of these mycins in tumorous organs.[43]

So although PAHs are one of the biggest abnormalities in a tumor, they are caused by parasites, one of the easiest problems to eliminate!

Once parasites and bacteria, including *Clostridium*, are gone, PAHs and their mutations are gone! Excess DNA for mitosis is gone, the amines coming from bacteria are gone, so pyruvic aldehyde (brakes) can return the cells to slow mitosis. Next thiourea levels decrease; allowing thyroxine to replenish, and a whole host of cell functions begin to normalize!

Fungus And Benzene

Fungus, too, plays a significant role. Fungus species produce special chemicals called **mycotoxins** to fight the bacteria that are constantly trying to take away their feeding grounds. That is why our most popular antibiotics are mycotoxins.

Three mycotoxins, which are especially bad for a cancer patient are **aflatoxin** (on peanuts), **patulin** (on apples), and **zearalenone** (on Russet potatoes). Actually, the molds that manufacture these mycotoxins grow everywhere in such abundance that we have government agencies to monitor them, even in animal feed. But the presence of zearalenone in Russet potatoes is not controlled by an agency (because it is my own recent discovery). That is why I recommend eating only red and white potatoes.

Aflatoxin and patulin were studied decades ago by scientists. Aflatoxin is a large flat molecule that intercalates between the bases of our nucleic acids. Patulin combines directly with our nucleic acids, also causing them to mutate.

Aflatoxin seeks out the liver. Patulin seeks out the parathyroid gland, according to the Syncrometer®. But zearalenone seeks out fat. It can be found in our skin-fat when we are well and in our organ-fat when we are ill. While it is in our fat tissue, it very slowly detoxifies into benzene![44] To my knowledge this is the first and only incidence of benzene formed by a plant or animal. It is, of course, quite abnormal to have zearalenone in our fat. Mother Nature depended on our parents to teach us not to eat moldy food!

Benzene destroys our "good" (organic) germanium, changing it into "bad" (inorganic) germanium.

In advanced cancer, the body becomes riddles with patches of fungus, growing as if we were a loaf of bread or pound of cheese. Aspergillus and Penicilluim species are present, making their aflatoxin, but no penicillin is ever

detected. Potato rot becomes a runaway fungus in some. Cabbage-black fungus is sometimes the dominant variety. Occasionally, mucor mucor dominates, especially in bone sarcomas; it is a slimy fungus.

Which fungus is yours? This depends on which parasites dominate your internal landscape. While healthy your body often undertakes a major kill-off. If Fasciola and Fasciolopsis are killed, but cannot be removed, they begin to ferment and mold. This process is seen in a fish tank in a pet store. At the bottom are a few dead fish. Around them is a halo of reflective material. This is made of fungus stems. A dead fly, too, turns into a puff of fungus in a short time. The Syncrometer® detects common Baker's yeast and sorghum mold in the place where Fasciola and Fasciolopsis were before. The name sorghum mold was given to it by me, since it was present in a number of sorghum syrup samples. Its correct name is not known. The fungus Chaetomium takes over dead paragonimus flukes. Since parasites cluster together, fungi growing after them, turn into a tangled mass. There are even "second generation fungi", those that germinate after an earlier fungus dies. If we kill the sorghum fungus and yeast (with Pau D'Arco herb or by zapping) they release large amounts of cobalt, and new fungus grows of the Aspergillus and Penicilluim varieties. If we kill these (with more Pau D'Arco or zapping), large amounts of copper are released. If Paragonimus is killed, it grows Chaetomium fungus, which releases vanadium and germanium.

Because the advanced cancer patient has parasites in the tissues, where they can not be easily removed, it is important to kill them slowly enough to be able to avoid explosive fungal invasion.

The heavy metals shed by the fungal growth are the same as I always detect in any tumor, copper, cobalt, vanadium and germanium. These elements must have been stolen from your body's supply, now turned into their useless inorganic form. They will now compete with (poison) enzymes that use the organic form of these elements. Then they will be excreted in the urine. What a waste of precious elements. You are becoming depleted.

What role does fungus play in tumor growth? Does it merely supply mycotoxins? Does it supply the bulk around which tumor cells twine and bind themselves, producing "roots" and "fibers" and "coats"? Its true role is not yet known but it may be a vital one for the tumor. When all the fungus in a tumor is killed, the mass collapses and melts to nothingness, giving much the same

picture as radiation would.

Germanium and Asbestos

Good germanium (called carboxyethylgermanium sesquioxide) brings us special immunity; it induces **interferon**[45] and raises the helper-to-suppresser ratio of our **T-cells**.[46] Good germanium protects our chromosomes from virus invasion.[47]

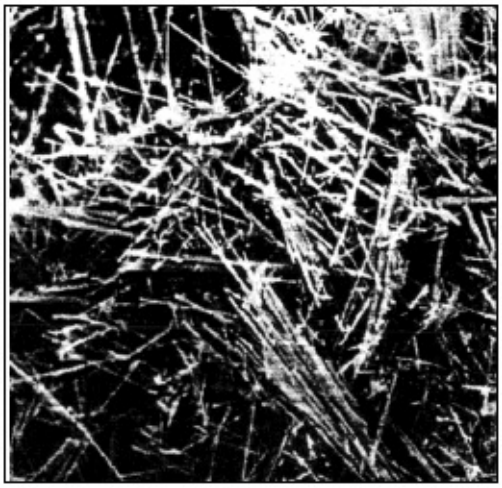


Fig. 13 Asbestos is needle-shaped

Another way that good germanium is turned into bad germanium is by asbestos. The Syncrometer® detects asbestos everywhere in our environment. For instance on apples and plums, undoubtedly picked up from conveyer belts that contain asbestos, because when the fruit is washed and the stem and blossom removed, the Syncrometer® finds the asbestos gone. Sugar also tests positive to asbestos, possibly from also being transported on belts, and you can not wash sugar! So many of our sweetened foods are polluted with small amounts of asbestos.

As soon as it is swallowed, your white blood cells try to remove it by "eating" the sharp asbestos needles. Unfortunately, the asbestos wins the battle and is soon free again, but your white blood cells will continue to fight. Your body tries another plan: cover the tips with a protein that will act like gum, keeping the needles together and blunted.[48] The protein chosen is *ferritin*. Ferritin molecules are shaped like hollow balls with pinholes in the sides. Their job is to collect iron by stuffing it through the pinholes to collect inside. When ferritin tries to coat asbestos, which has glass-like spears, the ferritin balls are torn open, letting out

the iron already collected inside. The freed iron inside the cell is a trigger to the genes that now make more ferritin. We see much more ferritin made in the presence of asbestos. So much, in fact, that the entire white blood cell becomes smothered by it.

Exposed iron is highly oxidizing—it over-oxidizes everything in the vicinity, including good germanium, making it bad.

How bad is "bad"? Oxidized germanium may be responsible for attacking the spleen somehow and causing the anemia that is a common cause of death for cancer sufferers, because the Syncrometer® always detects bad germanium at the spleen. It appears to seek out the spleen. More research is needed here. But certainly depleting good germanium reduces our immunity. More importantly, **when the Syncrometer® does not detect good germanium it always detects mutations in the form of p53 and excess hCG**. This implies good germanium is necessary to prevent cancer, and other research suggests this also.[49]

Unfortunately, it does little good to take organic germanium supplements! There are two reasons for this. Commercially, the organic forms are made in a laboratory so traces of inorganic germanium, such as germanium dioxide, are still present; and secondly, unless you get rid of asbestos (and benzene), your body will inevitably change the good germanium to bad again.

Fortunately, asbestos can be removed in days from your vital organs by avoiding asbestos contaminated foods and drinking lots of fluids. So that, too, gets top priority along with parasite-killing in the 21 Day Program, removing ferritin from the white blood cells is described.

More Mutagens and Tumor Formers

I detect many other mutagens, besides PAHs, in tumors. Here are a few:

- **Betapropiolactone** (not a PAH) also associated with *Ascaris*; a tumor inducer.
- **Ortho-amino-azotoluene** (the active portion of Sudan IV), **Sudan Black B**, and **4-diaminoazobenzene** (DAB), three of numerous *azo* dyes, pervasively present in foods, clothing, as well as hair dyes. They cause mutations that raise the blood LDH and alkaline phosphatase while causing

disappearance of vitamin A-related body chemicals. Vitamin A is a growth regulator!

- **Fast Green**, **also called Food Green 3**, a dye that is legitimately used to color fruits and vegetables. The dye is part of the universal sprays applied to them, including wax, mold inhibits antibacterials, etc. It is simply all eaten with bananas, grapefruit, eggplant, cucumbers, etc.
- **Urethane**, a pollutant from the plastics industry (commonly seeping from plastic teeth); it is a potent tumor former.[50]
- **Hydroxyurea**, associated with *Ascaris*. It kills white blood cells. (Used for this purpose as treatment for some leukemias!) It combines with ribonucleotide reductase.
- **Cycloheximide**, associated with tapeworm larvae; it inhibits protein formation in you, but assists viruses.
- **Acrolein and acrylic acid**, made by overheating oils or seeping from plastic teeth, but large amounts produced by *Ascaris* larvae. Induces DNA overproduction.

No doubt all the **environmental carcinogens** we have been told about, like tobacco smoke, pesticides, and saccharine, are now headed toward the handicapped organ too. There is no detoxifying ability there and no immunity; they must simply pile up there.

So, instead of getting help from the rest of the body in response to its cries, the tiny mass, trying desperately to throw off its bacteria and heal, is getting malicious metals and merciless mutagens sent its way. Yet, it must struggle on, whipped by thiourea, choked by malonic acid and dyes, constantly tripped by mutations. It will not grow into an uncontrolled tumor, though, as long as it can still self-destruct (*apoptose*) as fast as it multiplies. This is the state of a wart.

Warts, First Cousins To Tumors

A wart, too, has an assortment of heavy metals detected by the Syncrometer®. It has the mutagens made by mis-biochemistry of *Ascaris* and tapeworm stages. It even has p53 mutations and MYC oncogenes.

But it can keep up its self-destruction, its apoptosis. Its *bcl*-2 gene is working properly. The bcl-2 gene produces bcl-2 for thirty seconds, followed by *bax* for thirty seconds, in endless continuity. Bax, in turn, is produced by your bax gene.

The ratio of these two gene products determines the rate of apoptosis. A wart has started to multiply abnormally, but its genes that govern killing off excess cells still work, so a wart's growth reaches a limit.

A true tumor is also multiplying abnormally, but its apoptosis mechanism is broken, so it grows limitlessly. If we could keep from mutating our bcl-2 and bax genes, our small, helpless masses would stay that way.

Cell Problems Intensify

But by now, our small mass has a large quantity of metals and dye accumulated. Besides, these toxins are spreading to our vital organs: the spleen, bone marrow, liver, and parathyroids. The effects of mis-biochemistry (parasite induced mutagens, like 1,10-phenanthroline) are spreading, too.

I find cancer sufferers are usually not dying of cancer (tumor formation), as such, but of metal and dye toxicity! And of mis-biochemistry. This means that as glad as you will be to see your tumors shrink, you must not become complacent! You must also remove the toxins!

Sulfur levels are getting too low to let metal sulfides be formed for safe excretion. Inorganic copper, cobalt, germanium, thulium (a lanthanide), vanadium, and azo dyes will become the "ultimate toxins", the deadly reapers for the entire body.

Copper combines with 1,10-phenanthroline, as well as iron. Copper-phenanthroline complexes cause wholesale chromosome breaks.[51] Cobalt activates the clostridial enzyme that makes DNA out of RNA,[52] and it activates *arginase*,[53] an enzyme that supplies polyamines, necessary for growing tissues. Toxic germanium stops protecting us from p53 and hCG mutations. Even the normally beneficial iron can join the harmful metals when it produces oxygen radicals.[54] Vanadium combines with abnormally exposed nucleic acids. Normally phosphate combines with nucleic acids to form "nucleoside phosphate complexes" called nucleotides. But the chemistry of vanadium is rather similar to phosphate. So it forms "nucleoside vanadyl complexes." Vanadyl complexes are well known to molecular biologists as *synthetic RNAse inhibitors*, which I observe displace your natural ones.

Cobalt does much more damage. Wherever I detect inorganic cobalt, there is

no acetyl coenzyme A. Acetyl Co A is at the very hub of your body's metabolism. You can't engage the Krebs cycle to make energy with a low level of acetyl CoA. Nor can you make fat. Maybe this is why cancer patients get emaciated losing more and more weight. It is called cachexia. Hydrazine sulfate can turn this around in a single day in some mysterious way. Vanadium does much more damage, too.

Vanadyl complexes cause *p53* mutations. p53 is the gene that makes our "policeman" protein.[55] It stands guard over our nucleic acid threads. It can recognize mutations, like intercalation, and stop those cells from multiplying. It allows no further gene duplication until the mutation has been "fixed." The PAH or other mutagen must be pulled or snipped out from between the bases and any missing bases replaced correctly before p53 will release its hold. Without the p53 policeman, mutations are propagated.

The p53 gene seems to be an easy target. Not only azo dyes and vanadium cause mutations. The presence of tapeworm larvae results in mutations, too. Yet all these mutations are vetoed by the presence of good germanium!

When the p53 gene has become mutated, it does not do its job; multiplication is allowed to go on and on, in spite of the gross mutations that are now occurring. These mutations are now passed along. If p53, also called the "tumor suppresser gene", is incapacitated, how long can the hyperactive little mass be controlled so a tumor does not develop? Everything now depends on bcl-2 and bax. If this last mechanism fails, you will have a tumor.

The Final Defense

More and more mutations, many of them translocations (misplacement) of chromosome parts, are occurring now that p53 is off duty (mutated). Bits of chromosomes litter the cytoplasm making it look like a war zone. This is what the cytologist searches for when a biopsy is sent to her/his lab. The cells are completely disabled as productive members of their community due to these mutations. Yet they must multiply, because *Clostridium* is filling the cells with toxic amines, the brakes (pyruvic aldehyde) are out, and the accelerator (thiourea) given full reign.

It is only a matter of time before the bcl-2 gene will also mutate.[56] Its characteristic mutation is yet another translocation. After this, the cells cannot

self-destruct.

The Syncrometer® detects overproduction of bcl-2 protein in all growing tumors, whether benign or malignant. It should be produced for thirty seconds only, out of each minute. Now it is produced for forty seconds, leaving only twenty seconds for bax.

bax, a protein bit from another gene, should be detectable for its share of time, the remaining thirty seconds out of each minute. Healthy tissues, right beside the tumor-growing organ are producing bax at the proper rate. In a growing tumor, bax is always under produced. Gradually the ratio worsens, until it appears as if bcl-2 is always present and bax is not. bcl-2 and bax decide whether a cell will self-destruct by starting to digest itself internally.

Recall that cells filled with lanthanides, and therefore, calcium and iron deposits cannot be digested externally by pancreatin and lipase. When neither internal nor external digestion is possible, you have a rapidly growing tumor.

The Conspiracy Gains Control

We have now seen a dozen contributors to the tumor-growing process. They interact like the pieces of a puzzle. Is it possible to determine which piece comes first? And which comes next? Is there an orderly sequence? A jigsaw puzzle can be put together starting with any piece. Perhaps the pieces that go into making a tumor can all combine independently, too. Or perhaps there is a specific sequence. Only more scientific research can answer this question correctly. Meanwhile, we can imagine various ways. Here is one:

1. Tapeworm larvae and other parasites infect our tissues, releasing malonic and maleic acids, which interfere with respiration (the making of ATP in mitochondria). We also get malonic acid from sprayed food and plastic teeth.

2. Invading *Clostridium* bacteria supply DNA, isopropyl alcohol, and toxic amines in the vicinity of large parasites.

3. These amines can shift the balance between pyruvic aldehyde and thiourea

production in favor of thiourea, speeding up cell division, mitosis.

4. Excess thiourea consumes thyroid hormones (like thyroxine), which in turn disables lysosomes, your cells' bacteria killers, and mitochondria. The body is frequently able to kill large numbers of parasites. But those stuck in the tissues can't be removed before fungus invades, releasing aflatoxin, copper, cobalt and vanadium.

5. Metal and non-metal toxins are attracted to the sick cells by forces not completely understood, but commonly observed, which I call morbitropism.

6. Heavy metals consume our sulfur and sulfur compounds; reducing power declines. Metals cause mutations.

7. Oxidizing defenses decline, too, as p450 enzymes decline, due to insufficient iron. Iron is depleted by combining with 1,10-phenanthroline.

8. Lanthanides get stuck in cells, causing calcium and iron deposits. These block the "flag" for external digestion, phosphatidylserine. (Calcium also causes extra cell division.) Without the flag, pancreatin and lipase don't digest these abnormal.

9. Major carcinogens (PAHs and others) are produced by two very common parasites, *Ascaris* and tapeworms. These carcinogens are now absorbed preferentially by the fast dividing cells.

10. Parasite-related bacteria (*Streptomyces*, *Mycobacterium avium*/*cellulare*, *Rhizobium leguminosarum* species, and the c-MYC related virus) contribute in ways that are not yet clear and cause symptoms of illness such as night sweats.

11. Mutations occur.

12. Azo dyes from food, clothing, and body products can no longer be detoxified and are attracted to our vital organs as well as locations of rapid cell division. Azo dyes cause further mutations.

13. Enough mutations occur to disable the cells' oxidizing and reducing powers. Some enzymes are overproduced while the growth regulators, vitamin A receptors, are under produced. The cell can still divide, however.

14. Good germanium is gone, so vanadium causes p53 mutations by forming ribonucleotide vanadyl complexes. Tapeworm stages or their bacteria also can induce p53 mutations.

15. bcl-2 and bax genes become deregulated so that self-destruction of disabled cells (apoptosis) does not occur quickly enough.

16. The small mass becomes an aggressively growing tumor. If it were transplanted into a different healthy animal, it would take its immortality, its *Clostridium* and other parasites, and its mutations with it. It would grow and consume its new host.

17. If the human intestinal fluke (*Fasciolopsis buski*) finds the tumor, and isopropyl alcohol is present (*Clostridium* makes it), then ortho-phospho-tyrosine is produced, and I consider the tumor to be malignant.

It makes good sense that part of a tissue can become a runaway tumor, unable to stop its endless cell multiplication when a dozen or so common factors are present.

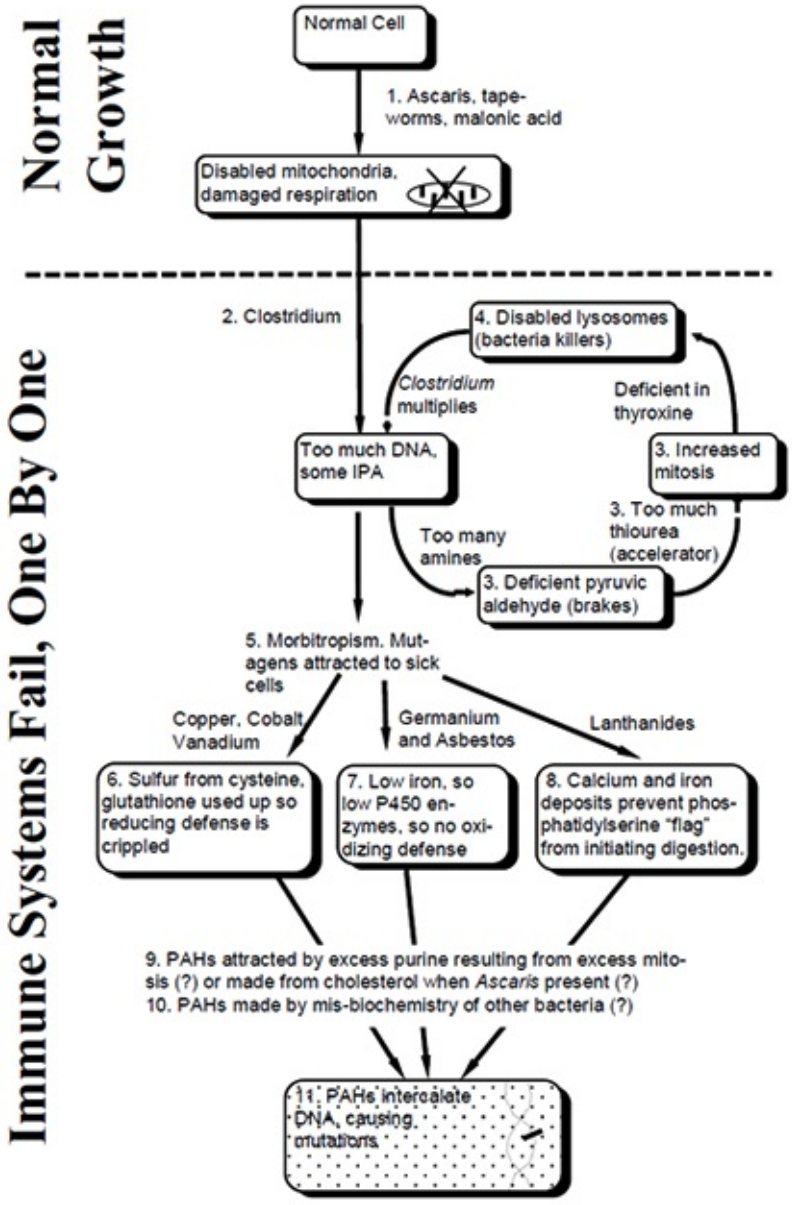
The prevailing concept is that tumors have become "uncontrollable". My observations point the finger of guilt at the rest of the body, not the tumor itself. It is the rest of the body that has supplied the magnetic metal, asbestos, fungus and bacteria. It will do no good to remove the tumors although it helps temporarily; the disease is systemic; they will simply grow again.

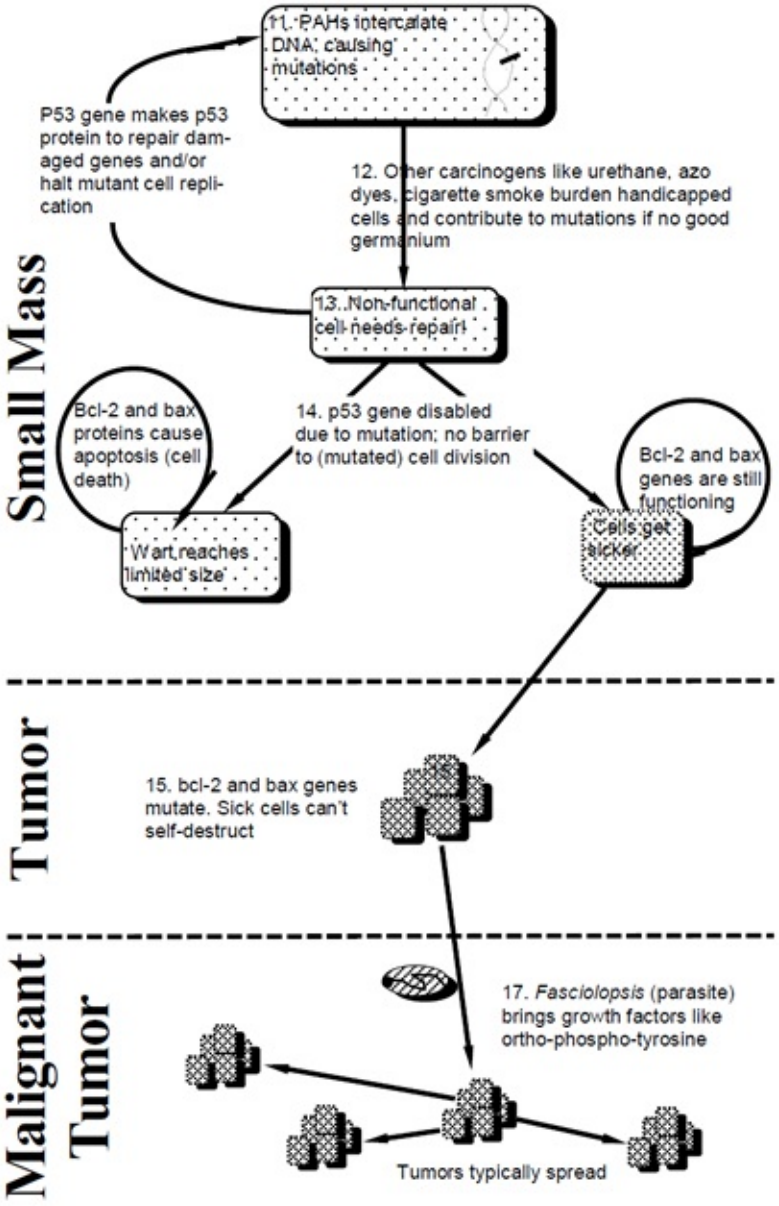
It is tempting to think that the dozen tumor-causers discussed here are the only ones of any significance. This may not be true. They may merely be the prevalent factors in our society. There may be other ways a tissue can become tumorous. Much more research is needed.

But for the present, removing these returns over 95% of cancer patients to health, while tumors shrink and disappear! How can this be accomplished most speedily and efficiently?

Cancer Diagram

A picture of these steps is on the next two pages.





Small Mass
Tumor
Malignant Tumor
11. PAHs intercalate DNA, causing mutations
P53 gene makes p53 protein to repair damaged genes and/or halt mutant cell replication
12. Other carcinogens like urethane, azo dyes, cigarette smoke burden handicapped cells and contribute to mutations if no good germanium
13. Non-functional cell needs repair!
Bcl-2 and bax proteins cause apoptosis (cell death)
14. p53 gene disabled due to mutation; no barrier to (mutated) cell division
Bcl-2 and bax genes are still functioning
Wart reaches limited size
Cells get sicker
15. bcl-2 and bax genes mutate. Sick cells can't self-destruct
17. Fasciolopsis (parasite) brings growth factors like ortho-phospho-tyrosine
Tumors typically spread

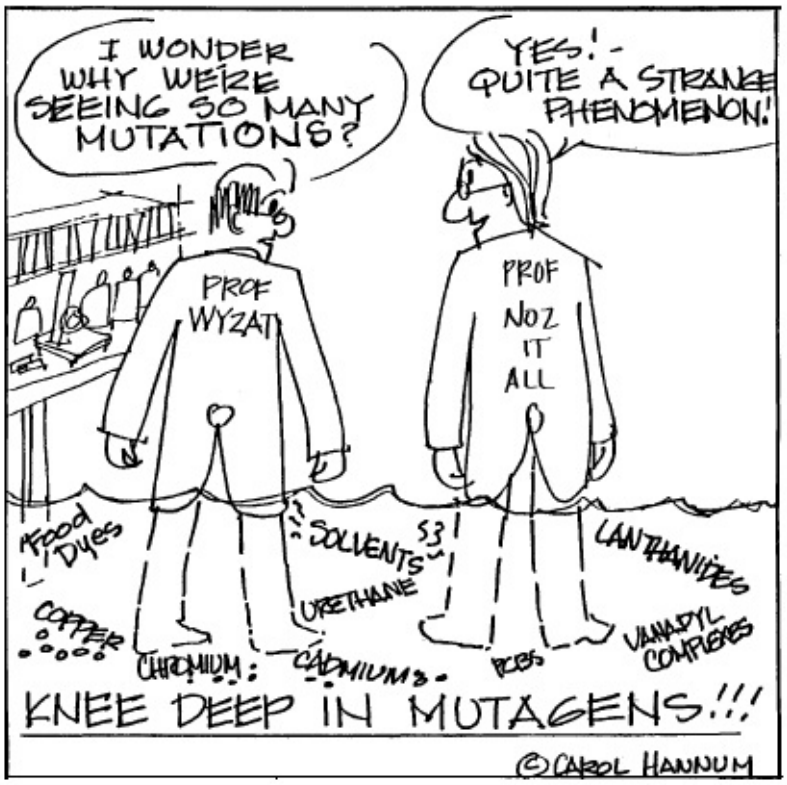


Fig. 14 Parts per trillion analysis is now possible

Use the earlier book, *The Cure For All Cancers*, as a reference guide for your life-style and environmental changes.

The Tasks

In spite of a myriad of problems that beset an advanced cancer patient, there are still only two causes for all of them: parasites (including bacteria) and toxins. Specifically, there are three tasks:

- Kill Clostridium bacteria.
- Kill all other parasites.
- Remove metals, fungus, and several other carcinogens from your body.

Killing *Clostridium* will be the most challenging because it involves dental work. Killing other parasites will be the easiest, and if you have already read *The Cure For All Cancers*, you may have already begun using the herbal parasite-killing program and the zapper. We will review this with special emphasis on preventing reinfection.

Removing heavy metals (including the lanthanide elements), fungus growth, and carcinogens like urethane, asbestos, acrylic acid and azo dye, is also easy because it is part of the same dental solution, together with diet changes.

Killing Clostridium

Clostridium bacteria are *anaerobes*. This means they are very primitive, not even tolerating oxygen. Their origin goes back to the time when the earth had no oxygen. To survive, they have found clever ways to avoid oxygen. They may live with other bacteria that use up the oxygen around them. They may live inside parasites that shelter them from oxygen. They may live in canned food, oxygen free if they have been allowed to enter during canning (botulism is caused by *Clostridium botulinum*). They may live at the bottom of deep wounds, like punctures, where oxygen does not enter because circulation is bad (tetanus is caused by *Clostridium tetani*). If oxygen suddenly appears, they quickly make capsules around themselves, like heavy armor, to survive until it becomes anaerobic again.

Clostridium Colonies

We are *aerobic* beings. All of our cells need and use oxygen. We do not have an organ or a location that is naturally oxygen-free. But we do have a location—in the colon—that is low in oxygen and could be made oxygen-free artificially. Other bacteria, in very large numbers, could use up the oxygen so *Clostridium* species could live there, too. But it would be a precarious existence. The colon would frequently need new supplies of *Clostridium* to reinforce the colony there. That is what actually happens.

The presence of Clostridium bacteria in our intestines has been considered normal by scientists. Yet, I did not detect them in young children.[57] Instead they had Bifidus bacteria, which adults did not have. Evidently at some time while growing up, the *Bifidus* disappear and *Clostridium* takes over. Several Mexican persons who were tested also did not harbor *Clostridium*. Yet, all American persons, even when well, harbored *Clostridium* in the intestinal tract. But only in the colon, not higher up.

Cancer patients, though, harbor *Clostridium* throughout the intestine, reaching all the way to the stomach! They harbor a seething mass of *Clostridium* bacteria.

The cancerous organ, even as far away as the brain or eye, has been invaded by *Clostridium*, too. In very advanced cancer, the entire body is invaded. The Syncrometer® detects *Clostridium* (and extra DNA) in dozens of tissues. They are probably able to circulate freely, now, even in the blood stream.

It would probably be advantageous for the patient to receive hyperbaric oxygen therapy for an hour each day for a week; this would reoxygenate the tissues the fastest, and kill most of the *Clostridium*. Our clinic did not have the use of a hyperbaric oxygen chamber. Yet, they can be vanquished in other ways, too. They can be pushed back down the tract, all the way to the colon, and even eliminated from there. But then, mysteriously, the colon is promptly re-inoculated! From where?

The only truly anaerobic location in our bodies is artificial—a prosthesis! We have unknowingly built one into our teeth during tooth repair! If our teeth become colonized with *Clostridium*, they become a source of distribution to the colon and tumors.

Tooth fillings, if imperfectly applied, create a crevice between tooth and filling that is suitable for anaerobes to live in. Dead teeth also invite *Clostridium*.

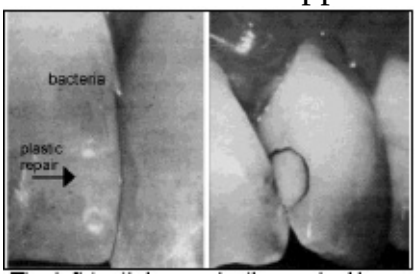
If your teeth have gray or bluish-black discoloration, you probably have *Clostridium* infection. It is fairly easy to spot, visually, in a dead or filled tooth. But of course it is hidden from view under a cap or crown or simply under a filling. Usually, many species of Clostridium grow together. I test for six species. They are usually all present when there are large plastic fillings, and when crowns, root canals, or dead teeth are present.

The next time you have a tooth extracted ask the dentist to give it to you, so you can search for the thin, black lines of Clostridium invasion yourself.

Clostridia are not necessarily present under small fillings, such as those in front teeth. It is probably easier to get a small filling to stick perfectly to the tooth than a large one, so no crevice develops.

Evicting The Colonies

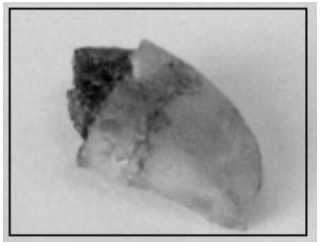
Once the teeth and colon have been colonized by *Clostridium*, they can not be easily eradicated. No immune power can reach the colony in the teeth; there is no circulation to the fillings! So all immune support fails.



The left tooth has a plastic repair. Above this is discoloration due to bacterial invasion. The plastic filling in the tooth on the right has a black outline of bacteria.

Fig. 15 Teeth with visible bacteria

Are there other ways? Can an antibiotic be used to counteract the *Clostridium* continually? Can the rest of the body be sufficiently oxygenated to prevent invasion by *Clostridium*? Can the tooth crevice, causing **microleakage**, be sealed off so bacteria couldn't escape into the body? Could the bacteria in the crevice and tooth be killed by zapping? Some of these ideas are promising, but I find the best way to kill Clostridia is brushing with oregano oil, a natural penetrant and antiseptic.



This tooth with its crown removed reveals a black surface underneath and fine gray lines of further invasion of the tooth. It is invariably *Clostridium* at work.

Fig. 16 Black tooth under crown

But if you have advanced cancer, you can not risk a temporary solution—don't delay. Extract all your decayed teeth—teeth with caps, crowns, root canals, and large fillings of any kind. You will be accomplishing more than just eliminating Clostridium bacteria, as you will soon see.

While you are waiting for your first dental appointment, you can begin to clear Clostridium bacteria from the intestinal tract. No antibiotics, no change in diet, no extra lactobacillus or Bifidus bacteria taken as a supplement can clear them. Only one substance, normally found in your stomach, can banish them. It is *betaine*, together with *hydrochloric* acid (HCl). Neither alone is completely effective.

- Betaine or betaine hydrochloride (betaine HCl), about 300 mg (see *Sources*), take three, three times a day with food.
- Hydrochloric acid (USP) 15 drops of a 5% solution stirred into food and put into your beverages at mealtime. Total: 45 drops a day. **Do not put drops directly into your mouth!** It will dissolve your teeth.

All Clostridium species (as represented by my set of six slides) will be gone from the colon, all the way up to the stomach in three days, but not gone above the stomach nor in your tumors. They are trickling down from your infected teeth. This is waiting for the dental work to be completed. Meanwhile, you should be brushing with oregano oil, just ½ drop on your toothbrush. Increasing the betaine or hydrochloric acid does not help.

Your body will feel an incredible relief when the clostridium-infected teeth are gone. People describe this as the lifting of a weight. The effect is similar to removing a thorn that is deeply imbedded in you. No antibiotics and no bandaging can control the blood poisoning that will develop if you do not extract the thorn. There is no alternative to pulling it out, and the relief is immediate.

After extracting your decaying toxic teeth you still must do careful Dental Aftercare (discussed later), but the big step has been taken and you may now feel secure you can recover from your tumor-disease.

Clostridium housed in your tumors is protected from oxygen and your immune system! Only one herbal substance can penetrate the tough coat around a tumor. It is oregano oil (not diluted!). It takes 20 drops in a single dose to reach Clostridium inside tumors or bone marrow or the brain. Fortunately, the stomach tolerates it well, although the mouth does not tolerate even ½ drop!

Clostridium Carriers

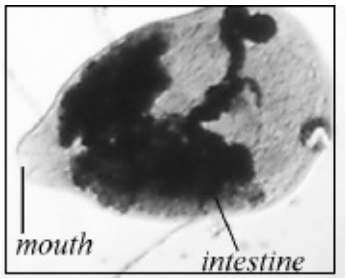


Fig. 17 Rabbit fluke

Although the earth is teeming with clostridia of all varieties we do not get infected from eating them with dirt accidentally. But that doesn't mean you don't have to be very careful when preparing food. Because in dirt is a more sinister parasite, the **rabbit fluke**.

The rabbit fluke, *Hasstilesia tricolor*, brings *Clostridium* into our bodies indirectly, the way the Trojan horse brought its soldiers. *Hasstilesia* goes directly to the esophagus after it is eaten. Here the clostridia emerge and while attempting to travel through our bodies, may find a dead parasite or a tooth crevice to survive in, as well as the colon.

The colon will be more anaerobic as we age, perhaps because it usually becomes more sluggish in later years. In this way *Clostridium* becomes a permanent member of the "flora."

As if *Clostridium* isn't bad enough, I find *Hasstilesia* also brings *Streptococcus* bacteria, c- MYC (an oncogene that could cause cells to divide), *Plasmodium malariae* (a protozoon), and *Besnoitia* (another protozoon)! Everywhere the rabbit fluke goes these five "friends" go too. Fortunately, they

are all killed by the herbal parasite program and zapping.

To kill *Clostridium*, you need to:

- Get rid of the source. Use the Parasite-Killing Program in the next section to eradicate the rabbit fluke.
- Get rid of colonies in the colon. Take betaine and hydrochloric acid.
- Get rid of colonies in the teeth. We discuss this in the Dental Work chapter.
- Get rid of colonies inside tumors. Take the original concentrated oregano oil.

Kill All Parasites

We will fight parasites in many ways. With herbs, with electricity, with ozonated oil, with cysteine (an amino acid), and with hydrochloric acid. Getting rid of parasites would be absolutely impossible using clinical medicines that can kill only one or two parasites each. Such medicines also tend to make you quite ill. Flagyl is used for amoebas and Giardia; when the correct dosage is used, it can cause extreme nausea and vomiting. Imagine taking ten such drugs to kill a dozen of your parasites! Good news, perhaps, for the drug makers but not for you.

Herbal Parasite Program

Three herbs can rid you of over 100 types of parasites! And without so much as a headache! Without any interference with any drug that you are already on! Does this sound too fantastic? Just too good to be true? They are nature's gift to us. The herbs are:

- Black Walnut Hulls (only when they are green)
- Wormwood
- Cloves (only freshly ground)

In *The Cure For All Cancers* I give instructions for making your own (green) black walnut hull tincture extra strength, and grinding your own cloves. But in this book I expect you do not have time to do that. Reliable sources for ordering these (and other) products are given in the chapter.

If you are incapacitated or bedridden, pencil in a higher dose for yourself in the 21 Day Program.

How much to take, and how often is summarized in the *21 Day Cancer Curing Program* chapter. But here are some important points.

We have seen persons who were bedridden get out of bed within a week after taking ten teaspoons daily. Perhaps in these cases the tumors themselves were releasing the parasites in large numbers.

The tincture can be diluted in water and sweetened or spiced.

Don't spread the dose out longer than one half hour.

If swallowing is difficult or even repulsive, spoon it down carefully; do not gulp it, to avoid nausea. You may also add two drops of peppermint oil (see Sources) to block nausea. Stay seated, to avoid dizziness. Do not drive a car afterward in case you do feel dizzy or nauseated. Eating 10 minutes afterwards can help. So can going straight to bed.

You should help your liver detoxify the alcohol in the tincture by taking niacinamide, 500 mg, each time you take a dose of tincture.

Take the wormwood and clove capsules one at a time, carefully. Have bread within reach in case a capsule sticks or nausea is felt. Eat bread if there is any discomfort afterward. Allergic reactions are very, very rare, but if you are susceptible to allergies, keep your medicine nearby.

How often should you repeat the parasite program? Daily, until your tumors are gone. This is because your tumors shelter parasites (along with *Clostridium*, dyes, and other toxins). As your tumors drain, parasites emerge, and must be killed. If you have liver disease, making the alcohol prohibitive, or if there is stomach cancer where bleeding is a risk, use the non-alcoholic varieties (see *Sources*).

If you are the caregiver, how often should you do the parasite-killing program to protect your patient? Although the answer is somewhat arbitrary, repeating it once a week is recommended.

Zapping Parasites

Zapping is a way of killing bacteria and parasites electrically. Even fungus can be killed this way. You can make a zapping device yourself; the instructions are given in *The Cure For All Cancers*; total cost is around $35.00.

It runs off an ordinary 9volt transistor battery, and is harmless to you. I find it kills parasites, bacteria and fungus wherever the electricity reaches. But some locations that are not reachable are tooth crevices, the intestinal tract, gallstones, and the inside of tumors. In spite of these limitations, the benefits can often be felt with each use! In addition, the benefits accumulate with each use, whether felt or not. In fact, I have preliminary evidence that zapping can raise immunity by removing the abnormal coating of ferritin on the outside of white blood cells. We will discuss ferritin coating later.

In the 21 Day Program you are instructed to zap every day. A "zap" consists of seven minutes of electrical current, a rest of about 20 minutes, another seven minutes of current, another 20 minute rest, and a final seven minutes of current.

The reason for doing three seven minute sessions is that smaller parasites and bacteria typically emerge from parasites that are killed. After these are killed, more bacteria and viruses emerge. So it takes at least three sessions to kill them all.

Zapping has an advantage over herbal killing in that eggs inside dying parasites are killed, too. And fungal spores are killed along with fungal growth. No dissemination occurs. Herbal killing is slower and allows eggs to escape into the blood for dispersal. If you are using only herbs be sure to use cysteine and ozonated oil as a final mop-up.

Cysteine

After taking the herbal parasite program, later in the same day, begin the **mop-up** program. This is to kill escaped viruses and the eggs still trapped inside dead parasites.

The mop-up program consists of cysteine and ozonated oil. The dosages are given in Day 1 of the 21 Day Program. Because your own tumors will be reinfecting you, you need to mop up daily as well as kill parasites until tumors have shrunk.

Because cysteine is a reducer and ozonated oil an oxidizer, they must <u>not be</u>

taken together to retain effectiveness.

The cysteine and ozonated oil will be very good for you in other ways, too. Cysteine gives you reducing power and precious sulfur. Ozonated oil gives you oxidizing power that reaches into distant places like bile ducts. Since they have opposite actions, they must be kept apart for at least five hours.

You may sometimes experience minor side effects from taking cysteine. Fatigue and nausea is the most common. Tearing eyes and dripping nose are common too. Dizziness may occur. All this is avoided, though, just by eating. Have bread handy or wait till mealtime to take your dose of cysteine. Side effects lessen with each dose taken and wear off in an hour.

A strong and beneficial diuretic effect may also be noticed.

The cysteine should be the L variety, like “l-cysteine”, not “d-cysteine” which is unnatural. It may be “cysteine hydrochloride” or simply free “cysteine.” But not “cystine”; that is a different amino acid.

Ozonated Oil

Ozone has molecules made of three atoms of oxygen stuck together. Oxygen in the air consists of just two atoms stuck together. The extra oxygen atom in ozone is easily released, making it a good oxidizer.

Ozonated oil gives you no noticeable side effects, but it should not be taken more than necessary. One could expect the extra oxygen to jump across from oil molecules to your fat molecules, aging them too soon. In my experiments ozonated oil did not oxidize vitamin C, nor cysteine or glutathione, nor ferrous iron. Fortunately the dose is small (one tablespoon), so unknown risks are small. Yet it is advisable to take vitamin E (see *Sources*), a known anti-oxidant, after taking ozonated oil. Give the oil five hours to do its work, first.

Ozonated oil is not generally available in health food stores, and even if it were, it may have a short shelf life. I have not researched the effectiveness of ozonated olive oil kept at room temperature for more than a day, or refrigerated for longer than a week, or in the freezer for more than a month. So it’s best to make your own, and make it fresh.

You can easily make your own ozonated oil. Purchase an ozonator (see

Sources) and a bottle of olive oil. Add a pinch of vitamin B_2 and 4 drops HCl (5%) per cup to the oil and shake to destroy any benzene and to kill *Ascaris* eggs. Attach an aerator to the end of your ozonator hose and drop it to the bottom of the olive oil. Aerators are available at any pet store; if possible choose ceramic or wood. If the bubbles make the oil flow over the top, pour more of it off. Turn the ozonator on before dropping the hose in the bottle. Ozonate for 25 minutes (not longer). When done, cap the bottle and store in freezer till you are ready to use it. It melts quickly when needed. If it has aged more than a month, make a fresh supply.

Ozonators can cost from $200.00 to $700.00. So you may be tempted to skip the one tablespoon of ozonated olive oil that is required. Don't! It is an essential part of your recovery! You may need more ozonated oil in the future, and also ozonated water. An ozonator is a good investment.

Now parasites, particularly *Fasciolopsis*, *Ascaris*, tapeworm larvae, and rabbit fluke, are gone!

Ozonated oil can be mixed with vegetables or a casserole dish. Remember, it should be taken at least five hours after cysteine to avoid clashing with it.

> …except the ones marooned in your tumors, and soon those will be eliminated, too.

But not gone is the dead parasite, now stuck in your brain, prostate, bone marrow or other organs. It will turn into a fungus patch unless you digest it with a supplement of digestive enzymes first. Follow the detailed instructions in the 21 Day Program.

Reap The Benefits

Killing *Ascaris* means you have gotten rid of 1,10-phenanthroline. It actually takes a week to 10 days of iron supplementation, in the form of ferrous gluconate, to combine with all your phenanthroline so it can leave your body. You then find it in the urine as ferroin. Without phenanthroline in your vital organs, you are no longer attracting and chelating your precious iron and copper; more will be left for you instead. Without this interference, your bone marrow, liver, and spleen can begin to regulate your most vital functions again. It begins

immediately. So *Ascaris* annihilation is supremely important in a life-saving venture. Without the mutagens made by *Ascaris*, your list of mutations is shortened. Without *Mycobacterium* and *Rhizobium* you will feel much better.

Killing tapeworm larvae means you have gotten rid of phorbol and dibenzanthracene from your vital organs, malonic and maleic acids as well as other powerful mutagens. And without streptomyces bacteria, RNA and protein formation can start again. Without both parasites, p53 mutations are all but gone, only waiting for vanadium (fungus and dental) to be removed.

Killing rabbit flukes means you are no longer bringing *Clostridium* nor *Streptococcus* into your body for distribution to teeth, colon, or tumors. Nor the c-MYC oncogene.

Most important now is not reinfecting.

While clostridia are our tumor-causing bacteria, streptococci are our pain-producers. Streptococci produce *phenol*, which not only causes pains of many kinds, but also ages us. Phenol, although considered a reducer in regular chemistry, oxidizes our vitamin C into toxic "oxidation products" that cause wrinkling of skin, cataract formation and other aspects of aging! Perhaps health and youth would stay much longer in humans if we didn't regard *Clostridium* and *Streptococcus* as being "normal" colon flora!

Stay Clean

In all cases, where I have seen that a cancer victim did not get good results after using the parasite program and zapper described in *The Cure For All Cancers*, I found remaining parasites! Was the program ineffective? Or did the person get reinfected? I find when the program is administered again it is effective. So I conclude that the biggest problem for a cancer sufferer is the ease with which they can become reinfected from food and their own tumors!

The sources of reinfection with *Ascaris*, tapeworm, and rabbit fluke eggs are so pervasive, you may reinfect faster than you can eliminate them! A glass of milk, a cheese sandwich or a green salad will reinfect you in five minutes if they are not sterilized first. Cancer victims have no ability to kill these parasites—their immune powers are gone!

A person without cancer can eliminate them. There are no “safety islands” in them, namely tumors. And stomach acid kills them or the immune system takes over for them.

For a cancer patient, swallowing a few *Ascaris* eggs is equivalent to swallowing a few cholera bacteria or the Ebola virus. Even a few will speed up the terminal process.

Where would you find *Ascaris*, tapeworm and rabbit fluke eggs? On your vegetables! And in your dairy products!

Agribusiness uses, and must use fertilizer. Fertilizer is cow, pig, and horse manure. All animals have parasites. The eggs pass with the manure. Manure does not simply wash off lettuce and strawberries as you “clean” them under the kitchen faucet. They stick tightly to the cabbage (even inner leaves), beans, and spinach that have been splashed with manure or are simply dusty with dirt that has manure in it![58]

The other source of reinfection with *Ascaris* is a pet. All pets have *Ascaris*. The carpet has *Ascaris* eggs trapped between the fibers. They fly up with the dust that settles everyday on the table and dishes. In the bedroom you inhale them all night.

Remove the bedroom carpet, get a new mattress, dry clean the blankets and small rugs (laundering does not kill *Ascaris* eggs). Sterilize other carpets with a special stain-free iodine solution added to the carpet shampoo mixture (see *Recipes*). Give away your pet until you have recovered.

Cleaner Cooking

You can not change the way milk and produce are handled or grown. But you can protect yourself. You must kill parasites yourself.

There are three ways to kill parasite eggs: chemicals or heat or full spectrum light.

Sanitizing your unpeeled **vegetables and fruit** is quite easy. You can use Lugol’s iodine or hydrochloric acid (HCl). Do not use chlorine bleach. It is a good disinfectant, but supermarket bleach is itself polluted with heavy metals,

solvents and dyes; besides, you would get too much chlorine.

A one minute dip in very dilute Lugol's solution or hydrochloric acid kills everything it reaches. But they do not reach into crevices without a lot of agitation. Sanitized foods keep much longer. Specific instructions are in Recipes.

Our traditional methods of food preparation have never tried to make food sterile. Even cooked and baked food is not sterile. Some pathogens require higher temperatures to be killed. That is why hospitals heat surgical instruments to 250F in a special pressurized oven called an *autoclave* instead of simply boiling at 212°F.

Dairy food is fairly easy to sterilize but often contains traces of azo dyes. For that reason, dairy products are omitted from the 21 Day Program.

Meat is best sterilized by heat, but a higher heat than you are used to using. Rabbit fluke stages and *Ascaris* eggs survive boiling temperature (212°F/100°C). Even baking seldom raises the internal temperature of meats or other foods higher than 180°F even if the temperature is set to 400°! (Meat pop-up temperature devices go to 160°F.) This is far from the boiling point. So to cook your meat safely, I recommend microwaving or "cooking twice." Microwaving has other disadvantages, such as destroying good germanium. The details on food sterilization are given in the chapter *Food Rules*.

If you neglect sterilizing your fruits and vegetables, you can assume you have *Ascaris*, tapeworm eggs, and rabbit fluke eggs again—immediately repeat the parasite program.

Full Spectrum Light

A new way to kill parasite eggs, bacteria, fungus and even oncogenic viruses is simple sunlight. More powerful than boiling temperature or chemicals. But the exact intensity and length of time needed has not been worked out. So an artificial fluorescent tube marked Full Spectrum will be used instead. Certain wave lengths, evidently, can penetrate food for many inches. It even changes azo dyes. Since dairy foods do not contain asbestos, you can now use heavy whipping cream and butter. Other dairy products must be tested for lanthanides first. Place the dairy product within 2 inches of the bulb. Place the bulb on 2 stacks of books on your kitchen counter to give you lots of working space or see sources.

Kosher Foods to the Rescue

During my testing, foods labeled with a kosher symbol were found to be far superior in cleanliness and purity. Canned foods did not have rabbit fluke. Sweetened foods did not have asbestos. Processed foods did not have azo dye pollution. Even meats did not have rabbit fluke or *Ascaris* eggs. But dairy foods, while free of parasite eggs, often had azo dyes. For this reason, the ban on dairy foods for the 21 Day Program must stand. Read more about kosher foods in *Recipes*.

Clearing Toxins

The next task is to remove inorganic copper, cobalt, vanadium, lanthanide metals, germanium, malonic acid, azo dye, asbestos, urethane, silicone, acrylic acid, and acrolein from your body.

These come from three places. The first, your dentalware, will be cleaned up with the same dentalwork used to eliminate *Clostridium*. The second, your food, will be discussed in more detail in the Tumor Shrinking Diet chapter. The third, your environment, is the subject of the Safe Surroundings chapter.

After your body has been cleared of pathogens and toxins, your tumors must shrink. They always do, in case after case after case. In fact, we must be careful not to shrink them too fast! The contents must be detoxified and cleared slowly, in order not to overburden your vital organs. But before going on to the detailed instructions, we must pay attention to *pain*.

Painkilling

Reducing pain is the first and most important need for any cancer sufferer. It is a patient's right to have pain relief. You may be in excruciating pain, and on morphine because no other painkiller "touches it." Or you may be stoically "putting up" with it, not sleeping, barely able to get up from your chair to get to the bathroom. Pain is the true master of us all. It even takes away our initiative to get well. If a cancer sufferer has decided to give up the battle, this wish should be understood and respected. But removing pain can change all that! And initiative and determination to conquer this disease can return.

We have been told that pain in cancer is due to the cancer. This is not true. The pain is caused mainly by bacteria. There is very little contribution from other causes. The simple act of pulling infected teeth can reduce the pain to half within hours even though the pain is at the hip or abdomen, far away from the teeth. The Dental Aftercare program reduces it further.

Streptococcus bacteria play the major role in producing pain. They reside in numerous little pockets all over our bodies, even if we consider ourselves "well," making *phenol*. When the phenol can no longer be detoxified at some location, it builds up to produce pain. All our painful locations have streptococcus bacteria living there!

Streptococcus bacteria killers include cayenne pepper, inositol, ozonated water, sage oil and chamomile, and zapping. None of these work decisively in the body. Yet in a week you could be in a lot less pain by taking inositol and the two oils before meals plus cayenne capsules and HCl with meals.

Take ½ tsp. inositol in ¼ cup water; it is sweetish. Sage oil may be taken as 6 drops placed in an empty capsule for moderate pain; chamomile oil as 10 drops in a capsule, followed by bread. Repeat everything 3 times a day if on morphine. The cayenne dose must be worked up gradually to get to a dosage of six capsules three times a day for three days in a row.

Once you make progress killing streptococcus, you must hold onto those gains. The underlying reason for having streptococcus colonies must be found. It is often due to the presence of asbestos or lanthanide metals, namely, local lack

of immune power.

I believe our major source of asbestos is food that has rolled along old asbestos-containing conveyor belts. Sticky foods like sugar pick it up and spread it to all sweetened foods in the marketplace. Wherever a minuscule tuft of asbestos lands in your body, there is a location of low immunity because the local white blood cells (our immune "soldiers") become coated with ferritin. *Streptococcus* can then grow unchallenged.

Lanthanide metals ride along with fruit and vegetable dyes used to intensify their color, and with pesticide. The most polluted dye, Fast Green (also called Food Green 3), penetrates entire bananas, grapefruit, eggplants, etc., bringing you thulium, lanthanum, and gadolinium in large quantities.

Streptococcus infects us by riding along with the common parasite, rabbit fluke, in the same way as *Clostridium*. This fluke is smaller than a pinhead and the eggs are everywhere in dirt. We have been taught since primeval times to wash our food for the very purpose of removing dirt—even dust. We wash our hands for the same reason. And plain washing does get off most of it. But tiny amounts remain. The small amount that is stuck in crevices or remains glued to the food we eat is important to us now, although it does not make ordinary people sick or feel pain. Unfortunately as we age, we lose the very hydrochloric acid that can kill this parasite and its bacteria in our stomachs. In this way our immunity sinks and we acquire more and more colonies of streptococcus—and more and more aches and pains. A newborn baby is very susceptible too, due to immature immunity and is fed only sterilized food for its safety. The cancer patient is most susceptible of all, and with every mouthful of non-sterile food, receives another dose of rabbit fluke.

Streptococcus does not have special needs, such as *Clostridium* does—it colonizes wherever there is the slightest opportunity: in traumatized joints, in organs with asbestos lodged in them, in ears after infections, in hearts that are parasitized, and in tumorous organs.

As soon as you stop reinfecting with rabbit fluke, and zap your streptococcus, or kill them with the items mentioned, pain will stop, whether it is in the bones, abdomen, chest or head, or any other location. Soon your body is cleared of them except for those that are marooned in your tumors. After the tumors are drained and shrunk, all pain stays away <u>until</u> you reinfect. If you are in pain, this

is the most compelling reason to sterilize your food as you would for a baby.

Who Comes To Dinner?

The Syncrometer® detects many other varieties of bacteria, too, at a tumor site or a location of pain, but these are more easily banished. Many are common food bacteria:

Shigella sonnei, food origin

Shigella flexneri, food origin

Shigella dysenteriae, food origin

Salmonella paratyphi, food origin

Salmonella typhimurium, food origin

Salmonella enteriditis, food origin

E. coli, food origin

Staphylococcus aureus, dental origin

Rhizobium meliloti, food origin

Rhizobium leguminosarum, only with *Ascaris*

Lactobacillus casei, food origin

Lactobacillus acidophilus, food origin

Streptomyces griseus, only with tapeworm larvae

Streptomyces albus, only with tapeworm larvae

Streptomyces venezuelae, only with tapeworm larvae

Mycobacterium avium/*cellulare*, only with *Ascaris*

A glance at the list shows that common food bacteria eaten at mealtime can find their way to your tumors and to your joints or muscles, wherever you have pain! Immune protection by your white blood cells is lacking there.

Normally, even harmful food bacteria simply pass along and out of the digestive tract. Yet, for a cancer patient they can escape from the digestive tract and enter the body. The protective lymph nodes and white blood cells in the lining of the intestinal tract have lost their immune power. You will get it back as you recover.

Until then the bacteria, besides the parasites, found in common dirt must not be allowed to enter with food and invade you. They make amines that remove the "brakes" on cell division. They also make ammonia. Ammonia is extremely toxic to living cells, giving you fatigue and illness besides. Some bacteria make growth factors and "cancer antigens" as seen by Syncrometer®. For a list see *The Cure For All Cancers*.

1. Eat sterilized food to stop reinfection.

2. Kill those bacteria already present with a daily regimen, called the Bowel Program.

If you have extreme pain, or even moderate pain, this is your clue that bacteria are <u>still arriving</u>. You can assume you are eating them! Fight back with a two pronged approach:

Divide And Conquer

- *Salmonellas* are eradicated with Lugol's iodine solution, three times a day. In severe pain, a fourth dose is given at bedtime. It clears up in a day - unless your food is contaminated with it (throw out all leftovers immediately).

- *E. coli* and *Shigellas* will be eradicated by a combination of turmeric and fennel herbs.

- *Streptococcus* will be eradicated with oregano oil and by killing the rabbit fluke and zapping. You should, of course, stop eating asbestos and

lanthanide metals. You must remove the ferritin coating from your white blood cells and any lanthanide metals coming from metal teeth, as well, to restore your immunity. We will discuss them later.

- *Staphylococcus* varieties will be eradicated as dental work is completed. Extraction sites must be kept free of food particles, of course, so they can heal. This is accomplished in the Dental Aftercare program.

How do you know which bacteria you have? You can assume that you have all of them. That is why the parasite program, Lugol's solution, turmeric, fennel, and oregano oil are part of the 21 Day Program. Food Sterilization, and dental work take care of the rest. Ferritin plus lanthanide removal, the mainstay of immune recovery, is also easily accomplished.

Fight Phenol Too

Although *Streptococcus* and rabbit flukes are instantly killed by the parasite program, the pain causing part, the phenol, is not instantly gone. There are several ways to destroy phenol:

1. Inositol, 1-3 tsp. Before each meal.

2. Raw beet juice, 2 tbs. With added vinegar, 1 teaspoon to tablespoon before meals

3. Rhodizonate, 133 mg (available in Mexico)

4. Magnesium oxide, 300 mg with each meal

A single dose of any of these treatments destroys all phenol quickly, but you may still not feel pain relief for several reasons. You may already be reinfected because your tumors themselves release bacteria. Also, we find it takes about a week of practice to learn to make sterile food. Another reason is that you may still have benzene accumulations in your tumors or fatty tissues. Benzene is detoxified into phenol. It takes three to five days before benzene can be cleared with vitamin B2 doses (these are part of the 21 Day Program). So, although pain reduction will begin immediately, it typically takes the first week of the 21 Day Program dosages for substantial relief.

Minimize Morphine

Try to switch from morphine to codeine and then to non-prescription painkillers—even if you must quadruple the number of tablets. It is often difficult to move from the addictive drugs (morphine and codeine) to the non-addictive varieties. Morphine and codeine are more powerful. But remind yourself why you were put on them—your "case" was considered hopeless. The side effect of morphine, inability to thrive, was not considered important anymore. Doctors routinely do not tell the patient or family when they have given up on them. A prescription of morphine is your clue! Switch as soon as you can to regular painkillers. Try to mix several painkillers so less of any one is required. Also, try these alternative painkillers:

- Castor oil packs (see *Recipes*).
- One aspirin plus 50 mg niacin (not when bleeding or very low RBC are problems).
- Benzoquinone, 1-2 mcg by injection (provided clinically only; available in Mexico).
- Colloidal silver, homemade (commercial varieties were polluted with lanthanides). Try one tablespoon first. After 10 minutes take another tablespoon. Increase this way till you get pain relief. Stop at ½ cup. Repeat as needed.

Coffee enemas are no longer recommended due to pollution with asbestos, fungus, and several solvents.

Safer Painkillers

Both nonprescription and prescription painkillers are heavily polluted with antiseptic (isopropyl alcohol), petroleum residue (benzene), and traces of azo dyes. These will go straight to your tumors; some will be stored in your body fat.

If you cannot test your pills for these, try to make them safer. First, wash off any color coating under the cold water faucet. Then roll in a bit of B_2 powder. Then allow to dry. Pills that are white and capsules containing powders need the same treatment because dyes contaminate them also.

Alternatively, put pills under the full-spectrum light. Treat the whole bottle at once for 20 minutes with lid removed.

What If Pain Comes Back

Pain can come back with a vengeance even after it has left. If it does, you already know the causes—the same bacteria as before! Since you cleared it up once before, repeat everything, being very meticulous. Just assume that you picked up *Ascaris*, tapeworm stages, the rabbit fluke, or dental and food bacteria. Kill them all again. Take black walnut tincture extra strength, cloves, wormwood, Lugol's, turmeric, fennel, and oregano drops all at 10 minute intervals and finally wash it down with 10 drops hydrochloric acid (5%) in water. You may need to repeat everything later in the day. Reinfection is so easy and immunity so low.

Coincidental Pain

Another contributor to pain is spasms from the gallbladder and bile ducts. Although this has nothing to do with cancer, it is often a part of the total pain picture.

Gallstone pain may be directly over the gallbladder (right side, lower chest) or radiating through to your upper back! It may be especially intense in shoulders, upper arms, behind or between shoulder blades. The only solution is to do a liver cleanse (see *Recipes*). Fortunately, this serves extra purposes: it will make your digestion stronger, you will be able to gain weight, and you will feel better. And fortunately, sick people, even terminally ill people, tolerate it very well. In about one thousand cases there have been no emergencies resulting from a liver cleanse. Follow it exactly including the suggestion to use some ozonated olive oil. The ozonation will reach into the bile ducts, penetrating many stones and killing bacteria and viruses there. Four to six liver cleanses with ozonated oil will make a big difference to your health. Follow each cleanse with vitamin E (100 u, see *Sources*) the following day to minimize over-oxidation. Also zap and take the usual parasite-killing dosage the following day. Of course, if you are in great pain and your ozonator has not arrived, do the liver cleanse anyway, with plain olive oil.

How can you know with certainty, whether some or all of your pain is due to

gallstones, and is therefore easy to correct? You can do a simple test: the Epsom salts test. Spasms from the bile ducts (the excruciating pain) are relieved by Epsom salts. If you have not taken any food or beverage (besides water) for four hours you may try this test. If you have eaten, this test will make you sick because Epsom salts mixed with food will cause nausea. Wait until your stomach has not had food for four hours. If the pain level allows you to wait until six PM, it will be a better test.

Give yourself a rounded tablespoon of Epsom salts in ¾ cup water. If you sense some relief—it need not be total relief—spasms from the bile ducts are contributors to your pain. At this point, you could decide to continue with the liver cleanse since you have already done part of it. Even if you had food containing fat in the morning, even if you had painkillers in the morning (both of which are normally not allowed), there is little to lose, except gallstones, or an *Ascaris* worm, or a commode full of flukes (be sure to look).

In advanced cancer the rule of waiting two weeks between liver cleanses can be set aside. The time interval can be decided by how you feel. Especially if you are in great pain, you can repeat the liver cleanse every third or fourth day. You may get slightly more pain relief each time. As soon as pain is tolerable, rest your body; delay the next liver cleanse until pain is intolerable again or for two weeks.

Another coincidental pain could be from a fracture in hip, vertebra, or rib. Such pain can be excruciating, and a fracture should be searched for by x-ray. Nevertheless, it is extremely painful only if infected with bacteria. Do your dental work as soon as you are able to sit in the dentist's chair. Start the Dental Aftercare program the same day.

Wearing a supportive brace may help with pain, but gives you the risk of "overdoing" by sitting up too much or walking too much. There could be sudden collapse of vertebrae or a perforation of pelvis by leg bone. These "accidents" will keep you flat on your back for six months while healing occurs! So I don't recommend wearing a brace; you should stay fully aware of your limitations, real improvement, or worsening.

To heal a fracture, you need calcium, magnesium, and the bone hardeners: manganese and boron. We also use a special herbal tea (see Bone Healer tea in *Recipes*).

Pain from friction of a lung sac (pleura) against the chest can be excruciating, too. Purchase a rib brace to immobilize your chest as you heal; a rib brace is not conducive to over exertion.

Headache can also be severe, especially in brain cancer. If it returns after clearing up, suspect a new tooth infection. Go back to the dentist and be extra meticulous with your dental aftercare. Repeat the program and zap continuously. Be extra careful to sterilize your food.

Remember, your body is eager to heal and be pain-free.

Be sure to zap daily. Keep bowel functioning well (do a daily enema, see *Recipes*).

Finally, if things don’t go exactly as planned, and you must use stronger painkillers, don’t punish yourself with remorseful thoughts. It is not a moral issue. When pain is lessened, you will automatically be able to reduce them. Not sooner.

Dental Work

There are two purposes for doing the dental clean-up:

to clear up *Clostridium* infection

to remove mutagens and carcinogens from your mouth.

Clearing up *Clostridium* infection requires removing abscessed teeth, teeth with micro leakage (infections in crevices under fillings), and eliminating infections in the jawbone itself where teeth once were, called **cavitations**.

Removing mutagens and carcinogens means all metals and plastic materials in your mouth. You may believe you have only “gold” or “silver” in your teeth. But these are really gold or silver alloys, containing many metals, including carcinogenic ones.[59]

The Syncrometer® detects about 30 metals in any “gold” or “silver” filling. These include nickel, copper, cobalt, vanadium, thallium, germanium, cadmium, mercury, platinum, titanium, and even uranium! In my Syncrometer® studies, I have found copper, cobalt, and vanadium to be present in every tumor. Seeping from both metal and plastic teeth, these metals are common denominators in advanced cancer cases. I have also found inorganic “bad” germanium in enough cases to consider it another common denominator. These begin to build up in your tissues in the early, tumor-forming stage. I am not sure whether these toxins play a role in actual tumor growth, but eventually they cause the anemia, liver failure, kidney failure, mutations, hypercalcemia, and immunity failure that cause death. So I want to emphasize again, that even if a magic wand shrank your tumors, you are still in mortal danger unless you get your dental work done!

If you have plastic materials in your dentalware, I find they will seep urethane, maleic acid, malonic acid, and various azo dyes. Methacrylate dentures even seep acrylic acid. Urethane and azo dyes have had decades of research in the past; they were found to be highly carcinogenic. Maleic and malonic acids were found to be respiratory inhibitors, which in turn, cause tumors to form. And acrylic acid, another carcinogen, is the same chemical that is made by frying foods in unsaturated fats. With so many well-studied carcinogens in dental

materials, we should ask a child's question: Have filling materials ever been tested for carcinogenicity? If so, what were the results?

Is it impossible to make plastics that don't have all these carcinogens? Not at all. The Syncrometer® detected more dental ingredients that were free of them than those that had them. But if each dental material (such as composite, ceramic, glass ionomer) requires the use of ten ingredients, then the chance of finding the final restoration free of carcinogens is essentially zero. Using a Syncrometer®, each ingredient could be tested separately for one dozen of the most harmful chemicals–not impossible–but quite impractical.

So to accomplish the two purposes of eliminating *Clostridium* infection and seeping carcinogens, you must extract teeth with large metal or plastic fillings, root canals, crowns or caps. They once were infected—before you had them "repaired". Now they are infected again and must be removed.

Why Is There Metal In Plastic?

Metal is not an essential ingredient of plastic manufacture. How can plastic material become polluted with it? I can speculate on several ways, but the fact is I am not the only one finding it.[60]

Perhaps the use of inferior "practical" grade chemicals to make plastics with, or recycled ingredients, causes wholesale pollution of dental materials with toxic metals, dyes, or solvents.

A method for hardening (curing) your own dentures and partials is given in Recipes. Unfortunately, no way of hardening fillings and glues has yet been found.

I also find that insufficient hardening of plastic in your mouth allows seepage of plasticizers, dyes, and other ingredients from the soft tooth filling.

Another possibility involves the chemical antiseptics used in manufacturing plastics. Although important, they are themselves polluted with metals, solvents and dyes. Pollution that stems from antiseptics spreads further and further. It is like having a wet kitchen sponge that drops to the ground; after that, dirt will be spread wherever the sponge is used to "clean" a surface. Ultimately, there is nothing left unpolluted with the antiseptics themselves and the toxins found in

them. Look at the assortment of antiseptics legal for use in manufacturing processes, including the dental and plastic industries.[61]

Learning to manufacture pure and safe dentalware should not be difficult for an industry with a research budget. Hopefully, it will soon develop. Learning to harden it adequately should be the second goal.

The Syncrometer® detects the same pollutants in many manufactured products as in these antiseptics. Coincidence?

Fig. 18 Only two of these antiseptics had no pollutants

Be Your Own Dentist

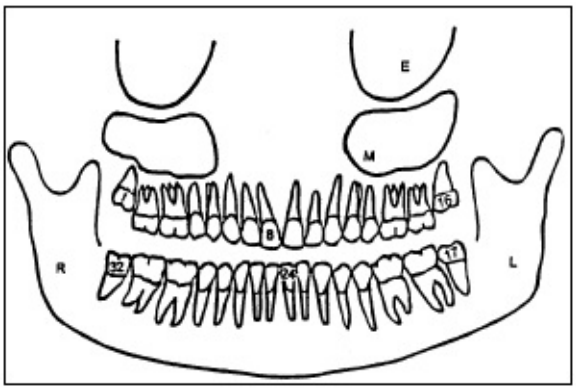
Meanwhile, you must try to be your own dentist. Your teeth are too important not to understand the issues. If your dentist is willing to assist you, you are most fortunate. You may otherwise learn the basics from the following sample x-rays. Use this diagram to orient yourself.

First, obtain a good quality *panoramic* x-ray of your mouth, in duplicate if possible. A panoramic views the entire mouth, including jaw and sinuses, allowing you to see much more than single teeth. Take one negative home to study.

On your panoramic you can identify metal, plastic, root canals, crowns, abscesses along roots, cavitations (hollow spaces or mushy bone at old extraction sites), and other suspicious things. Circle whatever your dentist or radiologist identifies as suspect for future reference. Make notes.

Here is a sample of a panoramic x-ray that has been printed. Remember that a print of an x-ray negative reverses the light and dark areas. Since you will be

comparing this print with your own x-ray, you must compare light areas on the print shown here to dark areas on your x-ray.



R is right side; L is left side; M is maxillary sinus; E is ethmoid sinus; and the teeth are numbered from 1 to 32, with 1 being the upper right wisdom tooth

Fig. 19 Diagram of a panoramic x-ray

To read your panoramic X-ray, tape it up on a window. First find the angles of your jawbone, noting top and bottom, left and right side. Keep the right side (R) on <u>your</u> left, as if facing yourself. Use a hand magnifying glass to study it.

You Be The Judge

It doesn’t take an advanced degree in dentistry to judge whether it is a good or bad x-ray. Are all the root tips visible? If not, you wasted your money; you got the panoramic so you could see the root tips and beyond! Since the x-ray can be viewed right at the time it is made you can request a retake (it costs very little extra and supplies the duplicate you wanted anyway).

Fig. 20 A print of a medium quality panoramic x-ray

This particular x-ray should have been done over, because, looking at the upper teeth, no root tips are visible. The mouth was not correctly positioned for the x-ray. Also, the teeth at the ends are a solid black, so nothing can be deduced about them. The intensity setting on the x-ray machine was not correct for them.

Next, look at the lower teeth. The root tips are on the print, but not very clear. The x-ray machine produced two dark vertical lines at the centers, obscuring the roots further (a good reason to get it redone on the spot). Under each end-tooth is a roundish white spot. On the x-ray film, which you would be examining, these would be dark spots. These are the holes in the jawbone that allow the nerve and blood vessels to pass through.

Locate the center. You have four small flat teeth in front on the lower side. The center is between them so two are on the left side and two on the right. The center on the upper side is easier to find; see the arrow.

The fifth tooth from the center at upper left (L) has a black cloud emerging upward from the root tip like a swarm of gnats above it. This is an infection; the bacteria are parading up towards the brain. Brain tumors are made of such events. Trying to save such a tooth would be a bad mistake, even though it “looks good and was giving no trouble.” Plastic (black edges) can be seen on the inner edge of the top center teeth; this was done for cosmetic purposes. A few more bits of plastic are seen here and there. No cavitations (dark areas) are seen in the bottom half where the visibility is good.

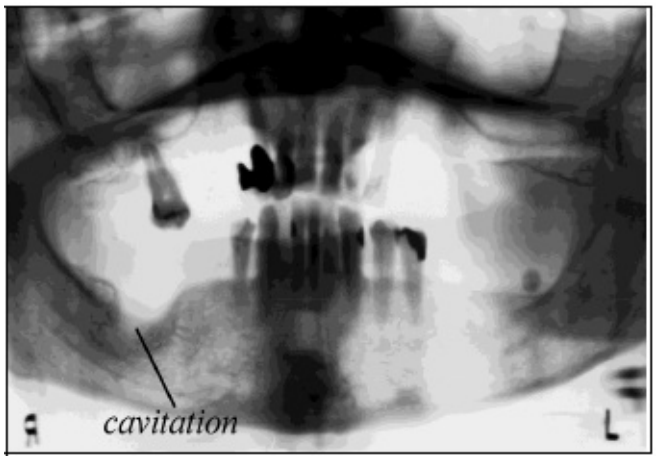


Fig. 21 Panoramic showing large cavitation at lower right.

A large tattoo (spattered amalgam) did not show up on this x-ray although the

dentist spotted it easily just by searching, visually, some time later, while working on the mouth. Tattoos can be notoriously difficult to find, either way.

The second panoramic, although poor quality, shows a large cavitation at the lower right. One or two teeth extracted there long ago left a large hole with infection (dark area) along the sides. Thorough cleaning will allow it to fill in with bone again and stop the chronic illnesses this patient suffered from.

At the upper right, a solitary tooth is sitting in a bed of infection. The dark black areas are metal. Syncrometer® tests of this patient showed that the tooth bacteria, *Staphylococcus* and *Clostridium*, were both traveling to the breast. Staph was producing growth factors and *Clostridium* was turning RNA into DNA to spur the tumor there.

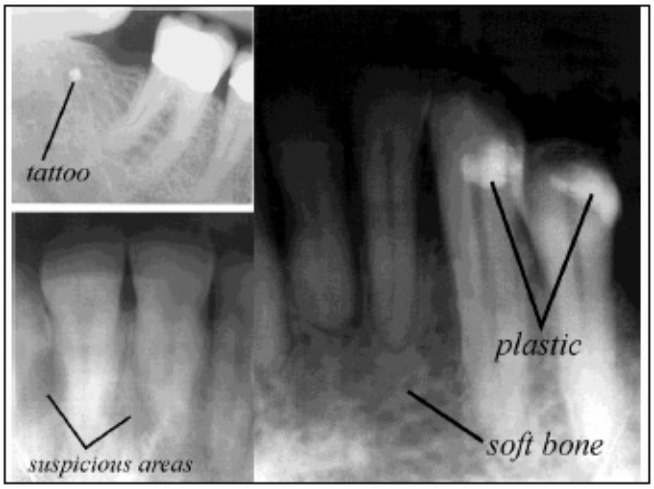

Fig. 22 Digital x-rays give superior view

If you notice a suspicious tooth or location, but can't quite make a determination, repeat the x-ray at the tooth location; it is called a *periapical* x-ray. **But not the regular kind.** Newer digital x-ray equipment is much superior. Compare these digital x-ray frames with your panoramic.

After examining your x-rays, make your decisions—do not ask the dentist to make them for you—and mark the teeth for extraction. The dentist may not agree with you because his/her job is to save teeth. Your job is to save your life. Your dentist can't be expected to know or believe that your life depends on this.

Another option is to go to a foreign country to find a sympathetic dentist (see *Sources*).

What You Can Salvage

How can you decide what is a large and not-so-large filling? Since this is to some extent a subjective decision, you should consider the options. If you mark for extraction a number of bad teeth, but leave single teeth behind that are marginally good, you will get a partial denture that must fit around the single stragglers. These will constantly get food clogged around them, giving you discomfort. You will need to take out the partial for cleaning much more often than if you had a simpler partial that included all the molars and premolars in any one quarter (quadrant) of your mouth.

The same thinking applies to front teeth. If you have only two or three good front teeth, you should consider the need to remove partials for cleaning more frequently than you would need to remove a full denture.

Fillings that could be replaced with an inlay or onlay may simply be removed, leaving the hole open. Later, when your tumors are gone you may have them filled using zinc oxide and phosphate paste as the glue. But this does leave you with a grave risk—the risk that the dentist "didn't get it all." And this could hardly be considered the dentist's fault, since he/she must work blindly. Plastic is almost invisible and undetectable by any means. Even a digital x-ray could not detect a tiny bit left behind. A reliable plastic identifier has not yet been found. If you are terminally ill, the tiniest remnant of plastic could tip the scales to failure. Your spleen, bone marrow and liver are already full of plastic toxins, as a cup of water is "full" to the brim. Your spare storage tissue, fat, is full, too. Even a tiny plastic remnant is too much. Extraction is safer.

When the open tooth is brushed daily with oregano oil and colloidal silver, and occasionally with bleach (USP, more on this below), it does not decay further. I have not seen these teeth undergo further decay in one year's time. Remember that the purpose of the original filling was to stop decay. You can now do that without the filling so no harm is done for about one year, enough time for you to get well first. You will be able to monitor your teeth yourself by watching for discoloration. Any beginning infection can be quickly eliminated by yourself.

The Visit To The Dentist

Find an oral surgeon willing to clean up your mouth for you. It is more than "just pulling teeth." They must be willing to let you examine your own x-ray, participate in decisions, and use your homemade antiseptics.

Make two appointments (if you have time), one for x-rays and one for dental work. That way you will be able to study the x-ray. Dentists often want to get started right away, but you may need more time than that for these important decisions.

Arrange for a friend to accompany you to the dental office. All professional persons pay more attention to a party of two than a single person. Ask for permission to have your friend nearby. Your friend can hand you your antiseptics. Your friend should sit quietly near you, not wasting the dentist's time with talk or questions.

Treat yourself to a good meal before going for dental work. You will be on liquids for a while afterward.

If you have "dentist-phobia", take a strong dose of painkiller (not aspirin) one half hour before your appointment time.

Your Antiseptic Is Best

Make and bring your own antiseptic. Even though the surgeon and dental assistant wear gloves, a cancer patient can't help picking up bacteria. This is not the dentists or surgeons fault. They are coming from your own mouth. Sterility for the mouth is impossible. While blood vessels are broken (bleeding), bacteria can enter your circulation.

By far the best antiseptic to use during dentalwork is plain bleach.

> Bunyan [in *The Use of Hypochlorite For The Control of Bleeding*, Oral Surgery, v. 13, 1960, pp. 1026-1032] reported that rinsing with 0.2% hypochlorite solution stops postoperative bleeding within 1 minute after a tooth extraction or other oral operation. The hypochlorite solution functions also to contract and harden the blood clots and make them more resistant to infection. In addition to the effective hemostasis and the change in the character of the clot, the author reported a reduction of swelling of traumatized gingival tissues and diminution of the postoperative pain.[62]

Bleach (5%) is very caustic.
You must not use it at full strength.

You must dilute it.

Don't use household bleach because it is not safe for internal use! Obtain food

grade (USP) bleach from *Sources*. Purchase the same strength (5%, not stronger) as regular household bleach so you can handle it safely. If bleach is not available bring Lugol's iodine solution or a colloidal silver solution with you to the office.

We will name your new, diluted bleach, Dental Bleach. Take a half cup of Dental Bleach with you in a convenient jar. Rinse your mouth with it before you sit down in the dental chair. Never swallow it! Hold the jar in your lap. Later, when the dentist signals you to rinse your mouth, use your solution again. Also rinse one last time before leaving the office. The dentist will appreciate this extra care because she/he is less likely to see post-dental infection in you.

Second best would be Lugol's iodine solution (six drops of actual Lugol's iodine in a half cup of water). Use up the entire amount before leaving the dental office.

Third best is colloidal silver. Make your own colloidal silver solution since the commercially available ones I tested had the familiar pollutants associated with antiseptics. The same instructions apply to colloidal silver; use ½ cup.

As soon as the extractions are completed the sockets left behind must be cleaned by the surgeon to remove bits of adhering tissue together with a few millimeters of bone. This will prevent leaving a residue for bacteria to thrive on later. Then it is squirted with a dropper full of diluted Lugol's iodine solution, or straight white iodine (see *Recipes*). If you are allergic to iodine use colloidal silver instead. You must supply these.

Commercial antiseptic made for the dental profession is not satisfactory. It invariably contains isopropyl alcohol besides other chemicals. On the positive side, though, is that they are not trapped in your teeth, they do dissipate and get detoxified.

Save The Pieces

Tell the dentist before sitting down in the chair that you would like to keep the extracted teeth, root canals, and fillings, but they can all be tossed into a bag together. If the dentist tells you this is not allowed due to Public Health regulations, agree to fill out the appropriate application forms. They may need to be sterilized first (in 50% bleach water—don't autoclave because that would put mercury vapor into the air). It is amazing that your own teeth may be considered

too dangerous—too bacteria-laden and full of mercury (a hazardous waste!)—to be handled, even by you, the owner! (Were they safer in your mouth?) But they do belong to you. You may be curious in the future about what they contain, and could have been leaching.

You can preserve them in a few days, when you are up to it. Cover them with Dental Bleach or Lugol's to sterilize them again. If the strong odor does not leave, you may understand how the internal infection of these teeth was poisoning your body! Finally, you may wish to look for the Clostridium infection, which would be a darkened area under fillings or in crevices. After drying, store them in a paper bag (plastic traps moisture).

Save loose pieces of metal and plastic because you may wish to have them analyzed at a later date, too. Or you may simply wish to gloat over the retrieved "treasure" as you identify corrosion and gross infection.

When extractions are done, congratulate yourself for the achievement. Start the Dental Aftercare program at once. Do not eat or drink, (besides water) for the rest of the day after an extraction.

All root canals and dead teeth must be extracted, as well as teeth with large fillings. Teeth with implants have not been studied sufficiently to know which metals they shed or if *Clostridium* infections start in their vicinity. For this reason, you must use your own judgment on implants.

After extracting rotten or filled teeth, the dentist or surgeon needs to do two things before stitching up the wound: cavitation cleansing and amalgam cleanup.

Huggins Cavitation Cleaning

The tooth was held in the socket by soft tissues like tiny ligaments. Unless these are removed, too, they will decay and provide opportunity for bacteria to reside there. The sockets left behind should be carefully cleaned with special tools for this purpose.

Dr. Hal Huggins has taught this procedure in the past and many dentists are familiar with it. It is called cavitation cleaning. It prevents future infection and inability to heal at that site. In spite of such superior treatment of the socket, you may occasionally expect a bone fragment to reveal itself later. As it loosens and works its way out, infection and pain accompany it. Go back to the dentist. This

could be a source of your pain elsewhere in your body if it is not removed.

While the new sockets are being cleaned, any old infected sockets (cavitations) should be cleaned out as well. The dentist can spot the obvious cavitations on the panoramic x-ray. Afterwards, each cavitation site also gets squirted with diluted Lugol's solution or straight white iodine or straight colloidal silver. Hidden cavitations (those that don't show up on the x-ray) can be cleared without surgery; we will discuss this soon.

Arechiga Gum Cleaning

The second task after extracting your teeth, and cleaning cavitations is to remove imbedded amalgam. This procedure has been developed by Dr. Benjamin Arechiga of Mexico. Each quadrant of your mouth needs an amalgam cleanup. The top of the gum line will be gray from absorbed mercury. It is easiest for you to have this done while extractions are being done. The dentist begins by cutting a straight line on top of the bony ridge of the jaw where teeth once were.

Next, he/she snips away $^{1}/_{8}$ inch (3 mm) of the gum on each side of the incision. A ribbon, $^{1}/_{8}$ inch wide and extending from the wisdom teeth to the closest front tooth is discarded. The remaining gum tissue stretches over the top easily and is sutured over. Surprisingly, the new gum tissue heals much faster than the old, mercury-saturated gums. You can count on your gums being healed in two to three days. The new gum tissue produces a strong even union, without small holes where food can get trapped. We call it the Arechiga technique, after the oral surgeon who invented it. While the dentist is cutting out mercury-drenched gum tissue, the exposed bone can be cleaned of amalgam bits that are easy to spot now.

Dental Aftercare

One of the purposes of doing this dental clean-up is to kill all *Clostridium* bacteria that have invaded the deeper regions of the jaw bone after being spawned in the decaying teeth and crevices under tooth fillings. From here they colonize your tumors as well as the bowel.

Antibiotics are not to be relied upon by a cancer patient undergoing dental work because antibiotics only inhibit the bacteria until they die or your immune

system takes over. In a cancer patient, this immune response may never happen. And as soon as the antibiotic is stopped a new, more serious, bacterium can surface to bewilder and defy everybody.

Antibiotics cannot stop tooth decay. They do not reach the crevices in teeth because there is no blood circulation there. For the same reason, antibiotics do not reach cavitations.

Antibiotics are merely an adjunct to good Dental Aftercare. So a very vigorous program is needed to clear up infection even after the infected teeth are pulled because deep wounds such as the base of the socket where the bacteria used to be is precisely the preferred location for more *Clostridia*. They refuse to leave. Just removing the tooth does not automatically clear up an abscess that was at the tip of a root. Other bacteria may leave but not *Clostridium*. Even cleaning the socket thoroughly may remove *Staphylococcus* but does not remove *Clostridium* bacteria.

This Dental Aftercare program is successful in killing *Clostridium*. You will need:

- a water pick
- hot water, towels
- empty syringe (barrel only, purchase at pharmacy)
- pure salt or sterilized salt water
- Dental Bleach

Acquire these before your dental appointment. Practice using the water pick. Practice using the syringe to squirt water (do not attach needle).

The first day of dental work is critical.

If you miss this, a massive spread of infection can occur because the mouth is always a “den of bacteria”, and your own tooth infection is itself the source.

The immune power of your arterial blood is much greater than in your veins. How can you bring arterial blood into the jaw area to heal it faster after dental work? Simply by hot-packing it from the start!

Remember, even before leaving the dentist’s office, just as soon as you are out

of the chair, rinse with Dental Bleach. Then, again, as soon as you get home from the dentist. Next, swish your mouth gently with a cup of warm water. The heat brings in arterial blood. Keep the cotton plug in place for you to bite down on and reduce bleeding, even while swishing. Don't suction the water forcefully around your mouth, you could dislodge the blood clot that needs to form in the socket. Slowly move the warm water about your mouth.

At the same time apply a hot towel to the outside of your face where the dental work was done. Wring a washcloth out of the hottest water you can endure, trying it out on an unanesthetized location first. Or fill a plastic baggie halfway with hot water, zipping it shut securely. Do this for thirty minutes, four times a day, for a few days. Then three times a day for a week—even when there is no pain.

Don't suck liquids through a straw for twenty-four hours; the sucking force is too risky. Don't allow your tongue to suck the wound site, either; and don't put fingers in your mouth.

As the anesthetic wears off there will be very little pain if the bacteria in the tooth sites have been killed. But you could introduce the bacteria yourself, by eating, or by putting fingers into your mouth. Consider your mouth a surgery site. Anywhere else on your body, the surgery site would have been scrubbed first, then painted with iodine or other strong bacteria killers, and later sprayed again with antiseptic and bandaged to keep everything out—certainly food particles and fingers!

But the mouth cannot be bandaged and you must eat! To be successful, eat a big meal just before your dental appointment. Then eat nothing with particles in it that could lodge in your wound sites for two days! In fact, on the day of surgery, drink only water afterward. You may need a painkiller on the first night; choose a non-aspirin variety to minimize bleeding.

Bleeding should have reduced considerably by bedtime. The cotton plug put in your mouth by the dentist may be thrown away. Rinse with Dental Bleach once more before bed.

Dental Day Two

The next day you need to be well fed, yet eat no solids, nor liquids with

particles in them. The particles easily lodge in your wound. Your choices are:

1. Chicken broth, (actually Cornish hen or turkey) filtered.
2. Herb teas, sweetened, filtered.
3. Fruit juice, using undyed, pesticide-free fruit, filtered.
4. Vegetable juice, filtered (including raw beet juice).
5. Puddings made of cornstarch or flour.
6. Complete "feed"

Filter through a coffee filter placed in a strainer. These liquid foods must also be sterilized before drinking (see *Recipes*).

Immediately after eating, rinse your mouth with a cup of very hot water to which you have added ½ tsp salt. Fill syringe with hot salt water and squirt each extraction site several times. Do not be afraid to start some bleeding; this could be expected and is even desirable if an infection has already started; bleeding washes bacteria outward. Water squirting and swishing never dislodges the healing clot. Only strong suction or infection dislodges it. If pain increases instead of decreases on the second day, you are already infected. Continue swishing and hot packing for one hour. Devote the whole day to fighting infection. If the pain subsides, the infection has been cleared. If not, you will need a more forceful stream of water. Begin using the water pick at its lowest speed setting. Water pick repeatedly until it clears. (It could take four hours!)

Hot pack the outside of your face just as on the first day. If pain is subsiding on the second day, you are being successful. But the gums are not healed; you cannot take chances yet on eating food. Nearly all infections come from eating solid food on the second day.

Floss the front teeth with homemade floss being extra gentle. For floss, cut strips of plastic shopping bags ½ inch by 4 inches. Regular floss and toothbrush are too harsh for the nearby sensitive tissues. After flossing, clean these teeth by hand rubbing, using paper towel dampened with water and ½ drop of oregano oil (one half drop only).

Also rinse your mouth with Dental Bleach several times during the day and bedtime.

Dental Day Three

On the third day, you may drink blended solid food; do not try to chew solids.

Use your water pick now after each meal. Fill the tank with hot water to which you have added a few drops of Lugol's iodine, or 1 tsp. colloidal silver, or salt. Set it at the gentlest level, at first, squirting each site carefully. Floss the front teeth and brush them with Dental Bleach (other antiseptics are not strong enough).

Notice how difficult it is to squirt out any trapped food. Swishing is not sufficient! Continue hot packing the face. If pain returns and water picking has not succeeded in clearing it, you must hurry back to the dentist to search for the food particle. The wound will be opened and cleaned out for you.

Bleeding

A moderate amount of bleeding is normal, even days later. Bleeding caused by water picking is not too serious. But if you sense an emergency, apply ice cubes wrapped in a paper towel or cheesecloth. Bite down on them till bleeding stops. Continue ice-packing for 4 hours. As soon as it is safe, return to hot-packing. If ice packing does not stop the bleeding, go back to the dentist or emergency room.

Cancer sufferers may have a low platelet count or be on a large amount of "blood thinners" which promote bleeding. Yet, oral surgery is a very skilled profession. Dental work is safe in the surgeon's hands. Platelets can be given just beforehand; blood thinners can be temporarily stopped; and a transfusion can be given before or immediately afterward. These same patients often state that they feel better, immediately after the dental extraction, than they can remember in months! It was the dental problem that was poisoning their platelets and their blood! It may be the last transfusion that will be needed even though there is some unavoidable blood loss with dental extractions.

Stitches should be removed earlier for cancer patients than others because they will get infected by the third day! Do not use self-digesting sutures; you need the extra dental visit to let the dentist observe your mouth.

Be Vigilant The Next Week

Continue water picking, hot packing, and rinsing your mouth with Dental Bleach after each meal until the gums are healed over. This may take five to seven days, longer for some sites. Floss and brush your front teeth once a day. If pain stays away you can take credit for killing your mouth-bacteria. You may reduce the treatments to three times a day, then twice.

Clostridium can return even after a week of steady recovery. Remember that its true source is the rabbit fluke, a tiny parasite that we eat accidentally with filth on unsterilized food. If you detect an odor from your mouth, at any time, it is *Clostridium* making a comeback, even without pain. A crumb has lodged in the wound and is decaying. Try bleaching, squirting, swishing, and water picking for half a day; then hurry back to the dentist if the odor persists.

If you got through the whole ordeal without needing more than one nights' painkiller and without needing to return to the dentist for extra clean-up, give yourself excellent grades. And if you got through, in any way, still give yourself very good grades!

It is common for dentists to recommend cold packing to reduce swelling after dental work. I recommend hot packing because I consider swelling less important than infection or pain. It is also common for dentists to rely on antibiotics to clear up infection. I find this is not sufficient.

Small Fillings

Again, you must search for a special dentist. The dentist must let you bring your own sealer. All sealers and desensitizers that are available from dental supply sources are typically polluted with the customary tumorigens and solvents: copper, cobalt, vanadium, malonates, urethane, azo dyes, germanium, isopropyl alcohol, and benzene. Do not risk any brand. But a sealer made of only calcium hydroxide (lime water) is safe and pure, if prepared by a pharmacist, or yourself, or the dentist. A saturated solution is easily made and applied from a small dropper bottle. Purchase from a chemical supply company (see *Sources*).

Small fillings of plastic can be spotted on the digital x-ray that could not be seen on the panoramic. They must be drilled out meticulously.

The dentist should be very careful to notice any left over amalgam at the edges or the bottom of the plastic fillings left over from previous amalgam.

Amalgams are routinely not cleaned out carefully when they are replaced by plastic. Furthermore, crevices may be found to be filled with amalgam that simply cannot be cleaned out. The dentist cannot go into a discussion of this while your mouth is stuck in open position! You should be familiar with this possibility. The dentist with a video system can show you the deep-seated metal bits. If the old amalgam cannot be removed without reaching the nerve, extract the tooth instead. Arrange for this with the dentist or surgeon beforehand.

Removing small amalgam fillings should be done very carefully, using a rubber dam, in order not to produce "dust" that spatters the entire mouth. Drilling out amalgam is a special skill. Find an experienced dentist. Only after your tumors are gone should you refill these cavities.

The cavity is then filled with a paste of zinc phosphate or zinc oxide and eugenol. These compounds will be pure if purchased from a chemical supply company or if purchased separately from a dental supply company. (No premixed variety has ever tested pure by the Syncrometer®.)

The cavity may also be filled with an inlay of *Sculpture* or *Targis*. Inlays are already hardened in the dental lab and did not seep in my experiments. A glue of zinc phosphate paste, purchased as two separate bottles, will be safe. If removing a filling kills the tooth so it can now feel nothing, extract it. If filling removal got so close to the nerve that you are now in pain, extract it also. Only shallow fillings are candidates for salvaging.

Jerome Tattoo Removal

While the amalgam was being put into your teeth or taken out—tiny bits got away or flew away with great force into your cheek folds, into neighboring gums, into exposed bone nearby and down to the bottom of newly made sockets. Nobody will ever see these again, or so it was thought. (And guilt can never be laid.)

Larger bits of amalgam, called tattoos, can be seen on the panoramic or digital x-ray. Your dentist has already spotted them no doubt. But smaller particles do not show up. You must ask the dentist to search visually, with a magnifier and remove them all regardless how painstaking the job is. This and many more facts of dentistry are discussed by Frank Jerome, D.D.S. in his book, Tooth Truth. Each quadrant of your mouth needs a careful examination for mercury, and

treatment by prying out tiny pieces stuck in your cheek folds, plus any pieces buried in your jawbone. In addition, the ¼ inch ribbon of mercury-soaked gum on top of the jaw ridge must be removed as previously discussed.

Hidden Cavitations

These are more than the customary infected bone sites. They are primarily bioaccumulation sites. The Syncrometer® detects them easily by searching for mercury and other amalgam-related metals in the jawbone (meaning a bone slide is in the circuit). Here the Syncrometer® also finds plastic-related chemicals from fillings and silicones from toothpaste! *Streptococcus* is also there. The real reason for this bioaccumulation site is probably the presence of lanthanide elements. Wherever the lanthanides occur, the white blood cells become "choked" with iron and calcium deposits. After this they stop "eating" any more toxins, destroying your immunity at this location. Hidden cavitations still contain their mercury even 20 years after amalgam was changed to plastic!

Only digital x-rays can picture these hidden bioaccumulation sites, and even here their identification can be difficult. Fortunately, they can be cleared without surgery. A magnet of about 100 gauss can attract the iron and lanthanide deposits in them. It takes about one week. After these have left, remaining metals, plastics, and bacteria leave also, and are seen in the white blood cells for a few days, showing that immunity has returned suddenly and swiftly. Thereafter, the jaw bone is cleared.

Another way to clean out these hidden cavitations is with a DMSO mouthwash (see *Recipes*), although less reliable. In three to five days the entire toxic team of carcinogens (and *Streptococcus*) are seen to leave the jawbone.

Home Dentistry

Although dentists and dental surgeons alike have done their utmost to clean metal, plastic and infection from your mouth, there are still minute traces left behind. They continue to arrive in your tumors and fat reservoirs. Syncrometer® testing reveals that half of the remaining teeth may still have traces of plastic. Only a final tooth polishing can make them truly safe. On this hangs your fate if the LDH, liver enzymes, or alkaline phosphatase are much too high.

Ask the dentist for several “finishing strips.” If these are not available you may use the finest grade emery cloth (such as 400 grit), by cutting strips out of it (approximately four inches long and one eighth inch wide). Put a few drops of Lugol’s into a large glass of water, big enough to dip your hands into to sterilize them before the final polishing and “finishing” of your teeth.

First, you must brush your teeth very thoroughly with Dental Bleach. The easiest way is to be seated in a recliner chair facing into a bright light or sunshine and have a friend do the polishing. Otherwise you must do it yourself, standing in front of a mirror. Individually sterilize each of your hands and a finishing strip. Notice the clear plastic in the middle of a finishing strip. Slide it between the first two teeth. Saw back and forth as much as the teeth allow. Repeat between all other teeth. The heaviest work is at the ends—the sides of the last tooth in the row. Saw with a long sweep of the strip. Saw at least 20 times. Use the strip as ingeniously as you can to polish the top surface, too. Keep dipping your hands in Lugol’s before each time you work in the mouth. When the polishing is complete, brush teeth again, and rinse with Dental Bleach.

Ideally, each newly polished tooth is now tested with the Syncrometer® for remaining plastic, amalgam, or Clostridium bacteria. Resonance with urethane and DAB dye or bisphenol implicates leftover plastic. Resonance with platinum, palladium, thallium, or nickel implicates amalgam. After finding which teeth are still contaminated, test the tooth surfaces individually to identify its exact location. Then repeat the polishing on that surface. Test each tooth for *Clostridium*, too. Note that even the tiniest brown spot tests Positive for *Clostridium*. Try to polish it away. If you can’t, go back to your dentist for assistance. Do not have these tiny cavities filled afterward. But brush with oregano oil and colloidal silver in turns after meals, and Dental Bleach at bedtime.

This beginning Home Dentistry is a creative innovation of huge significance. Being able to do simple dentistry using the Syncrometer® to guide you may pave the way to caries prevention that has eluded us so long. You can find a tooth infection long before it becomes a cavity.

You are finally metal-free, plastic-free, dye-free, and *Clostridium-free*. All that will be needed is to draw these out of your storage sites—fat tissue and tumors themselves—to begin tumor shrinkage.

Making Your Dentures and Partials

There are different opinions among dentists about when to make an impression of your mouth: before tooth extraction or later after your mouth has healed. There are advantages and disadvantages to either choice. The life-saving process is extraction—so don't delay a single day with this, even if the denture-making schedule is postponed.

For "instant teeth" the impressions are made before extraction. Ideally, the fitting is done immediately after extraction while still under anesthesia, so a very good fit can be made. But, of course, the mouth often changes its shape as it heals. Major adjustments will be necessary a month or so later.

Methylmethacrylate and **polyurethane** can be hardened by yourself at home and are therefore safe from seeping, even if a pink color is chosen for your dentures or partials. Other materials hold promise but need more research. See *Hardening Dentures* in *Recipes*.

Congratulations

You have completed the hardest task required to shrink your tumors: you have evicted *Clostridium* from its fortress.

A glance in the mirror shows you a beautiful set of teeth, sweet-smelling breath at all times and chewing better than before. You have enabled your body to survive.

On The Road To Recovery

Of course you have done a lot more than just eradicated *Clostridium*! You have also removed heavy metals, mutagens, dyes, and other toxins that were seeping from your fillings. Before this you killed *Ascaris*, tapeworm larvae, and rabbit fluke. The next step is to remove these same pathogens and pollutants from your diet and environment. And the final step is to drain them from your tumors so the tumors collapse and dissolve.

You might be wondering how much it will cost for this very specialized dental clean-up. Although the dental work may seem straightforward (extractions and

filling removal being very common procedures) the way you need them done is not at all common. Using homemade antiseptics, requesting cavitation cleaning and tattoo removal, and finding a dentist with digital x-ray equipment are all non-traditional. In Mexico, in 2000 the rate, including the cleanups, was about $80.00 per extracted tooth.

How To Make A Million Dollars In Your Spare Time, At Home: Sue!

Pollution problems should be solved by people themselves, not industry or government; the responsibility is too great. Family health is at stake. Only people's groups would not be influenced by other priorities. What I am suggesting is that people form their own groups, find labs willing to do analysis of dental supplies, form collaborations with dentists willing to use tested materials, and follow-up on the job done with analysis of saliva (also by lab testing).

I was joking about making a million dollars, but maybe suing the American Dental Association is the last resort solution it takes to bring the problem to the attention of the American People, and provoke change.

That is another reason for saving what was removed from your mouth (besides curiosity). Any extracted teeth with fillings could be analyzed. They could be set to soak in water overnight and the water analyzed for seeped ingredients. These ingredients were seeping into you. The real object is not to point out guilt but to find a developing problem before your entire family has been damaged, generation after generation. Before your family must spend half its generated income on health restoration.

Bad health underlies mental illness, addictions, and criminal behavior besides the customary diseases. Even reproductive disturbance is a state of bad health. It makes no sense to place a piece of estrogen (as in bisphenol-A, used in dental plastic) in the mouths of children, to be sucked on day and night. Both girls and boys are likely to be affected, especially before puberty. Again, a people's group would not let this happen, if it were known, whereas a professional or governmental group is bound by laws to have other priorities even when they know it is happening.

A list of labs doing analyses for metals, solvents, and other chemicals is given in *Sources*. Many others can be found in the yellow pages of telephone directories. Be sure you understand the sensitivity of the testing each lab can do. Obviously, the ability to test to parts per trillion is better (more sensitive) than parts per billion.

Despite what I feel is the uninformed state of the dental profession, the average dentist is devoted to human welfare, besides just his or her own. This is apparent in the movements, within the dental profession, to outlaw mercury, to outlaw all metal, and to advocate better nutrition. Not all agree. But that is my point. Progress is made from discussion, and trying to achieve higher standards. If you find a dentist knowledgeable about microleakage and cavitations, willing to support your strange, new agenda, then you have truly found a treasure.

Tumor Shrinking Diet

To shrink your tumors your diet should be:

1. free of malonic acid
2. free of carcinogenic dyes and metals, isopropyl alcohol and benzene, asbestos and thulium
3. free of parasite eggs and harmful bacteria
4. free of mold

   because these are the things that made your tumors grow and drastically lowered your immunity.

This means that safe food is more important than nutritious food for you at this time.

Avoiding malonic acid in your food is the first rule in curing tumor disease. Malonic acid accumulates in tumors. No tumor has been found without it in over 1000 cases. This shows that malonic acid is a common denominator of tumors. What is it doing there?

Cancer researchers for one hundred years or more have been searching for the direct cause of our tumor growths. They suspected a chemical. They used mice and other animals to test chemicals by injecting them, putting them in the feed, or rubbing them into the skin. Chemicals were tested one by one, in the belief that there was one, and only one, responsible for it all. Many chemicals looked promising at first, but one by one, they were discarded—because they failed to always produce a tumor at the same place, in the same time, in all animals tested. It could not be imagined that a combination of chemicals was responsible. And that some might be supplied by the body itself. This degree of complexity could not be researched with traditional chemistry; even now it cannot be realistically pursued. Only Syncrometer® biochemistry, which is electronic, has the speed and accuracy to allow a return to the fundamental questions that were already asked one hundred years ago: What is different about tumors? What is unique about them? What do they have in common? Is the problem chemical, biological, or a matter of physics? The answers to these questions would surely lead to tumor

prevention and cure. Now that Syncrometer® technology has arrived, the involvement of malonic acid is clearly seen. To understand the role of malonic acid and the harm that it does, we must understand the basics of metabolism.

Your Metabolism

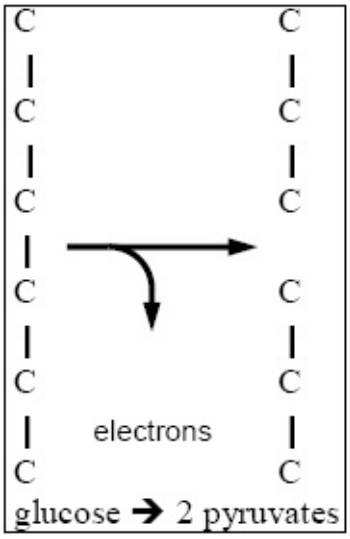

Fig. 23 Glycolysis, the first part of food metabolism

We get energy from food we eat by **oxidizing** it. This is the same way we get energy from fuel; we call it "burning." Burning fuel uses up oxygen and releases energy in the form of heat; it happens quickly, in a burst; we try to slow it down by controlling the draft in order to be less wasteful. Living cells burn food very, very slowly, controlled by enzymes, so that heat trickles out very slowly too (to keep us warm) and most of the energy can be saved as stand-by fuel—called ATP.

Getting energy from a food molecule means that an electron has been taken away from it; a nearby oxygen atom will soon grab it up. Intense heat causes this to happen in the case of burning fuel. But in a living cell enzymes cause electrons to be pulled away.

The first part of food metabolism in our cells is called *glycolysis*. Several enzymes approach a molecule of food, such as glucose (sugar), removing its electrons and finally snipping it in half. Removing electrons is called oxidation, even when no oxygen atoms are involved. **Pyruvic acid** (pyruvate) is produced.

In this way the food has been prepared for the second part of metabolism,

called the **Krebs cycle**. Note that acetyl CoA is the hub that links glycolysis to the Krebs cycle.

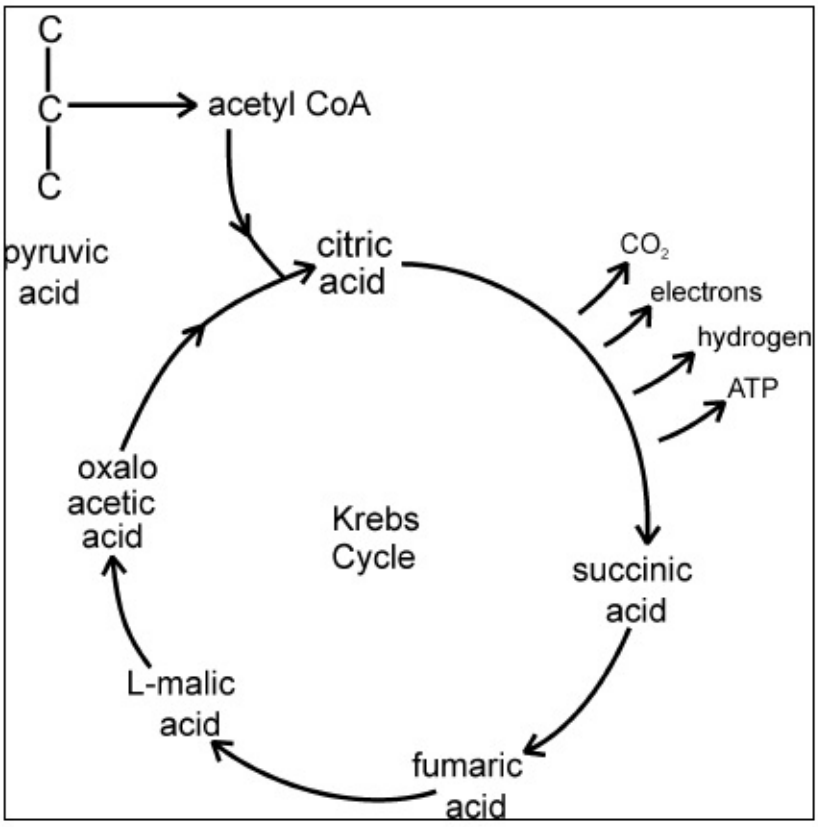

Fig. 24 The Krebs cycle, the second part of food metabolism

Now pyruvate (after turning into acetyl CoA) is joined by oxaloacetate to make citric acid (the same as in lemon juice). This gets oxidized to succinic acid, then to fumaric, then L-malic (as in apple juice) and back to oxaloacetate. Throughout the Krebs cycle oxygen is being used, electrons and hydrogen are being freed, and carbon dioxide (CO_2) and ATP are being formed. In addition each electron, along with its partner hydrogen, will combine with oxygen to make water, H_2O.

Meanwhile the path taken by electrons will be carefully supervised. It is called the "electron chain," the links of which operate with familiar molecules known as vitamins much like a hot-potato game. More on this later.

Very tiny chemical steps must be taken to get the most energy out of the food. That is the secret of energy conservation and that is why the Krebs cycle has so many "intermediates" and corresponding links to the electron chain.

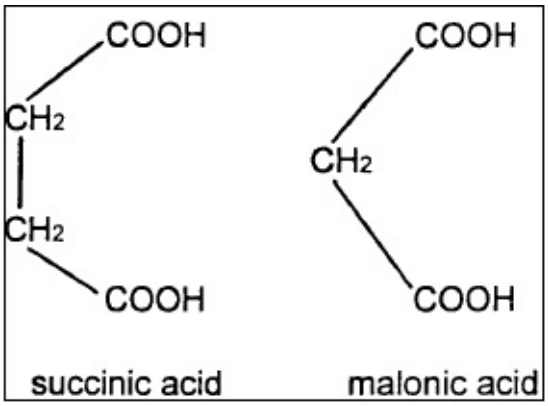
Now the pyruvate molecule is completely oxidized to CO_2 and H_2O and a great deal of energy is produced in the form of ATP to be used later; although a tiny bit is let out now for immediate use. The second part of our food metabolism, the Krebs cycle, produces much more energy than the first part, glycolysis. It provides the "lion's share" of our energy.

The primitive part, glycolysis, may date back to the time before the earth had oxygen. Lots of bacteria, such as *Clostridium*, and some lower animals can survive quite well on glycolysis alone. Yeast is another example; when we want it to grow we give it sugar and cover it, to keep out oxygen.

The primitive and advanced parts of food metabolism together are called *respiration*. It is the reason we breathe (respire); we must take in the necessary oxygen for the Krebs cycle. Many of the enzymes involved in respiration need to be attached—not loose in the cytoplasm (water portion) of our cells. These stationary enzymes are housed in special factories, the mitochondria, which have many shelf-like surfaces inside for enzyme attachment.

Malonic Acid

When our cells are accidentally fed the respiration inhibitor (poison) **malonic acid**, they mistake it for succinic acid because the molecules are "look-alikes." But, of course, the enzyme that is trying to pull away one of its electrons is rudely surprised. The electrons are not in the right place. The Krebs cycle stalls. And because every step is dependent on the previous step the entire chain of metabolism, called respiration, stalls. It was known by 1909 that malonic acid is a severe respiratory inhibitor.[63]



Malonic acid deceives our enzymes who think it is succinic acid

Fig. 25 Malonate and succinate

By 1920, Otto Warburg, a scientist in Germany, had invented a new device that could measure how much oxygen was actually used by a bit of living tissue, the "Warburg apparatus". It was fun to measure the oxygen consumption of leaves, seeds, insects, frogs, pieces of different tissues, embryos, young and old tissues, and calculate their respiration rates. But Warburg measured the respiration of a tumor and found it hardly used oxygen at all,[64] that respiration was somehow inhibited! He devoted his scientific career to exploring this phenomenon. Never was it guessed that our tumors—human tumors—actually contained malonic acid! That we were eating it! Or somehow producing it! It could not be guessed because malonic acid was known as an industrial chemical. It would not be logical to suspect it in foods or in the animal body.

After a lifetime of work Warburg finally concluded that **any substance that damaged respiration would cause tumors**; he had proved it many times, in many animals, with many respiratory inhibitors (including urethane, which seeps from plastic teeth). But exceptions could be found, showing there were additional "common denominators" he could not guess at that time. After giving his life to this work, he grew disappointed that damaged respiration was not the one and only cause of tumors. He, too, believed that a single cause must somehow be the only and sufficient cause of tumors. We now know that nothing is that simple in biology. His legacy, the discovery that tumor cells have inadequate respiration, is monumental. His book, *The Metabolism of Tumours*, can be found at university libraries.

When the Krebs cycle is blocked by a respiratory inhibitor, cells are immediately in a crisis, like when computers crash. The cells can still do glycolysis to make energy, but, of course, must do it many times faster than before. Like a car that has slipped out of high gear into first gear, but must still keep up the 55 mph speed—much more fuel will be used for the miles traveled. The tumor cell consumes everything in its vicinity for fuel: the blood sugar drops, blood fat level drops, muscle protein is used up. The patient becomes emaciated. And, in spite of all this activity, there is no energy and little enough body heat.

Numerous other respiratory inhibitors besides malonic acid and urethane were found in the next decades. Exotic things, like antimycin A, made by *Streptomyces griseus*, a most unlikely bacterium as it seemed then! Rotenone was found (a fish poison and now a common pesticide) and maleic acid, another

non-biological substance. It could not be guessed—only the Syncrometer® technology has revealed—that we are inundated in malonic and maleic acids, urethane, rotenone, and antimycin A, not one, but all of them!

Inundated in malonic acid because it is made by our 2 largest fluke parasites, Fasciolopsis and Fasciola, and by tapeworm larvae. We all have these in abundance. And it is in our food. We are probably eating much more malonic acid now than we did in the past.

Produce that is sprayed tests positive for malonic acid. Nearly all the produce in the supermarket is sprayed with something and therefore delivers its respiratory inhibitor to its hapless consumer.

Although it can be washed off most produce with 2 very hot washes, some produce requires more. Foods placed in the malonic list require 3 or 4 very hot water washes – each one minute long. And in spite of this break through, advanced cancer patients are not allowed to eat these foods; the risk of inadequate washing is too great.

Scientists studied malonic acid, also called *malonate*, intensely for decades though never suspecting its true significance for humans. A lengthy and excellent review of malonate research has been published in *Enzyme And Metabolic Inhibitors Vol. II* (see previous footnote). Here is a partial list of topics reviewed.

- ◊ Malonate inhibits uptake of glycine and alanine.
- ◊ Malonate may chelate iron so it can't be incorporated into hemoglobin.
- ◊ Malonate inhibits healing.
- ◊ Motility of sperm is reduced by malonate.
- ◊ Bacterial phagocytosis by human neutrophils is depressed by malonate.
- ◊ Malonate chelates calcium.
- ◊ Malonate drops the resting potential of muscle.
- ◊ Malonate causes air hunger (dyspnea).
- ◊ Methyl malonate is toxic to the kidney.
- ◊ Acetoacetyl Co A can transfer its Co A to malonic acid to make malonyl Co A. This could lead to acetoacetate buildup, namely ketonuria and possibly a block in fat utilization of even numbered carbon atoms, leaving odd numbered carbons to predominate.

- ◊ Malonic acid reacts with aldehydes
- ◊ Thallium is chelated by malonic acid into a stable compound. (This could explain accumulation effect in a tumor.)
- ◊ A color test for malonates is tetra hydroquinoline-N-propinal to form blue-violet compounds. It is sensitive to 0.01 mg malonate.
- ◊ Malonate complexes with zinc and magnesium.
- ◊ A fall in malate concentration due to malonate causes depletion of NADP.
- ◊ Malonate induces ketonemia.
- ◊ Malonate reduces oxygen uptake. Coenzyme Q10 is required to make ATP.
- ◊ Malonate raises cholesterol.
- ◊ D-malic acid complexes with malic dehydrogenase and NADH, but is enzymatically inactive.
- ◊ Maleic acid is competitive inhibitor of succinic dehydrogenase.
- ◊ Synergism between rotenone and malonate occurs in mitochondria.
- ◊ Malonate causes oxidation of NADH and cytochromes.
- ◊ Rats can convert malonate to acetate in the presence of malonyl Co A.
- ◊ Malonate reduces survival of infected animals.
- ◊ Malonate fed to dogs is recovered as methyl malonate in urine.
- ◊ Malonate can pick up an amino group from glutamine.
- ◊ Hemolysis of red blood cells may be caused by malonyl dialdehyde (MDA), a derivative of malonic acid.
- ◊ Malonate catalyses renal glutaminase; with less glutamine uric acid levels fall.
- ◊ Malic acid (apple juice) is the best antidote to malonic acid. (But commercial sources contain patulin which depletes cellular glutathione.)
- ◊ Malonic acid is present in urine.
- ◊ Malonate depresses the reduction of GSSG to glutathione.
- ◊ Malonate inhibits protoporphyrin formation 32%.
- ◊ Malonate inhibits insulin stimulation of muscle respiration.
- ◊ Malonate inhibits acetylcholine synthesis.
- ◊ *Mycobacterium phlei* respiration is stimulated by malonate. (All schizophrenia cases I see test positive to this bacterium in the brain!)
- ◊ Malonate is put into soy sauce in Japan.
- ◊ Malonate stimulates *Entamoeba histolytica* growth.

- ◊ Malonate inhibits phosphate entry into cells.
- ◊ Potassium transport into cells is inhibited by malonate.
- ◊ Malonate causes systemic acidosis.
- ◊ Calcium and iron transport by rat duodenum is severely reduced by malonate.
- ◊ Malonate inhibits pyruvate oxidation.
- ◊ Malonate causes increased utilization of glucose due to the Pasteur effect of a blocked Krebs cycle.
- ◊ Lactic acid formation is increased with malonate inhibition of respiration.
- ◊ Glycolysis is stimulated by malonate.
- ◊ Malonate has different effects on different tissues.
- ◊ Much less glucose goes to form amino acids and proteins in the presence of malonate.
- ◊ Malonate induces the appearance of the pentose phosphate shunt.
- ◊ Malonate diverts fatty acid metabolism to acetoacetate.
- ◊ Malonate increases the formation of fatty acids up to 10-fold.
- ◊ Maleic acid is a potent inhibitor of urinary acidification.
- ◊ Malonate inhibits oxidation of fatty acids.
- ◊ Malonate fed to dogs produces acetoacetate, acetone and alcohol.
- ◊ Malonate can reduce the concentration of magnesium and calcium to 25% or 50%.
- ◊ The methyl derivative of malonate depresses renal function.
- ◊ Malonic acid can form malonyl coenzyme A, which is very stable, thereby depleting the system of coenzyme A. (Coenzyme A has a nucleic acid base, adenine, plus pantothenic acid and sulfur in its makeup. You will have an increased need for these nutrients.)
- ◊ Malonate inhibits urea formation by reducing the supply of oxaloacetate.
- ◊ Malonate inhibits cell cleavage (the formation of a wall between 2 dividing cells).
- ◊ Benzaldehyde reacts with malonic acid.

With this much harm coming from malonic acid, why have we not noticed this as we eat malonate-containing food? Shouldn’t we drop dead or at least get sick? Perhaps we don’t detect it because we are already so debilitated by malonate coming from our flukes parasites.

Obviously, the cancer patient must stop consuming any malonic acid-containing food; it inhibits respiration, the very stuff that Warburg found would cause tumors to grow.

Fortunately, the list of malonate-tainted foods is quite short. This list is off-limits to the cancer patient.

Malonate-Free Foods

There is an extra benefit for persons who switch to a malonate-free diet. You may notice less sleepiness after eating and a higher body temperature after a few weeks, which brings with it a rosier complexion. This is just what is needed now.

Remember, that a food may be malonate-free and still not be good for you for other reasons. Remember, too, that this is a plant list, since animals do not make it. But milk from the supermarket (not including goat milk) is an exception; it has traces. Yet, cows' milk (based on 2 samples) directly from the cow did not have malonic acid, either. Nor did several human milk samples. Evidently, malonic acid is part of processing pollution. So dairy foods are listed as safe, but only with special treatment. Your 21 Day Program does not allow any dairy foods, though, not even with treatment.

Eat Only These

Acorn squash (with peel)
allspice
almonds (including brown skin)
aloe vera
amaranth
apples (red delicious, golden delicious, green)
apricot kernels
artichokes
avocados
bananas
banana squash (without peel)
bean sprouts
beans, adzuki
beans, pinto
bee pollen

beet tops
beets, red
bell peppers (red, green)
black pepper
black-eyed peas
blueberries
bok choy
brazil nuts
broccoli (organic, in plastic bag)
brewers' yeast
Brussels sprouts
buckwheat
butter (soften, add HCl and vit. C)
butternut squash (without peel)
cabbage (purpose, white)
cactus (nopalitos)
cantaloupe (and seeds)
carrots (organic in plastic bag)
capers
cardamom
carob powder
cauliflower
cayenne pepper
chayote squash (with peel)
cheese (melt, add HCl and vit. C)
cherries (Bing)
chili peppers (California, jalapeno, pasilla, serrano, yellow)
chili peppers – red (dried)
cilantro
cinnamon
coconut (without the milk)
collards
corn (yellow & white)
cornmeal
cranberries
cream (add HCl and vit. C)
cucumbers
cumin
currants

dairy
products (add HCl and vit. C)
dandelion (greens)
dill (fresh)
dulse (sea vegetable)
eggplant
eggs
extract of wintergreen
eyebright herb (dried)
fenugreek
figs (dried)
flax
seed
flour (unbleached white)
garbanzo beans
garlic cloves
ginger capsules
ginger root (inside only)
goldenseal
grains and legumes from India (see *Sources*), chana dal, split urad chilka, split moong chilka, whole urad, moth, whole moong USA green with skins, masoor, chori, kabu fee chana, whole val, moong zib, whole moong dal, toor dal, yellow peas, split val, oily toor (the dals are legume-like)
grapefruits (and seeds)
grapes (green, red & purple)
green bean thread
green beans
green olives (in jar)
grits
hazel nuts
Helleborushominy (white canned)
hydrangea root
jicama
kale
Kamut (grain)
kiwi
kumquats
leeks
lemon grass tea

lemons (also sweet lemon)
lentils
lettuce (iceberg, green leaf and red leaf)
lingon berries
loquats
maple flavoring
maple syrup
masala (spice)
millet
mint leaves
miso (sweet)
mullein flowers
macadamia nuts
mushrooms (common white)
nectarines
nutmeg
oats
olive leaves (for tea, see *Sources*)
onions (white, yellow, green)
paprika
parsley
Pau D'Arco
peaches
peanut butter
peanuts (without red skin)
pears (Bartlett, Bosc)
peas (green)
peas (split green)
peas, black-eyed
peas, green (in shell)
peas, snow
peppermint
pimentos
pineapple
plums (red and blue)
pomegranate
potatoes (russet, red, sweet)
psyllium seed husks
pumpkin

pumpkin seeds quassia
quince with seeds
quinoa
radishes (red)
raspberries
rhubarb
rice (white, cooked in pressure cooker)
salsa picante hot sauce
sesame seed
shave grass
soy lecithin
soybean (whole)
spearmint (dried)
spinach
strawberries
sunflower seeds
sweet basil
sweet lemon
Swiss chard
tahini
tapioca (pearl)
thyme
tomatillo turnip greens
Uva Ursi capsules
Viscum album
walnuts
watermelon (ripe inside portion only, excluding seed)
wheat berries, flour
yellow split peas
zucchini squash (yellow, pale green, mottled, with peel)
zucchini squash blossoms

The presence of malonic acid in plants was reported as early as 1925.[65] Its relationship to food spray may not have been guessed or considered important. It was certainly not suspected to be a tumor-causer in humans.

Foods That Contain Malonic Acid

Be aware that in packaged foods, the processing could contribute the malonic

acid. Pesticide absorption by plants could also be responsible.

alfalfa sprouts
apricots
araica (dried)
beans (black, great northern, lima mung, navy, red kidney)
black olives (canned)
broccoli
butternut squash peel
carrots
chaparral (dried)
chocolate
ginger root skin
grape jam, commercial
green zucchini (dark)
Kombo (seaweed)
limes
mangos (large, small yellow)
Nori sea weed, packaged
onions (purple)
oranges, all kinds
papaya (Mexican)
parsnips
passion fruit
persimmons (Fuji, regular)
radish (Daikon)
red skin of peanuts
Tamari soy sauce
tomatoes
turnips, rutabaga
wheat grass

In normal tissue malonic and maleic acids do not accumulate. They only accumulate in tumors, this is the source, since this is where flukes and tapeworm larvae are located.

I believe there is a normal route for your body to metabolize malonic acid, because when malonic acid-containing foods are eaten, I observe the immediate appearance of *malonyl-Coenzyme A* ("malonyl CoA").

Malonyl CoA has been well studied by scientists and found to be the beginning of fat formation. So my conclusion is that the body can use up some malonic acid by making fat. But most malonyl CoA is produced from other food components besides malonic acid. So this alternate fat-making mechanism that uses up malonic acid seems to me like a "favor" evolution is trying to do for us.

It is not a perfect solution. In the process of making fat with malonate, biotin and coenzyme A are quickly used up, too, so this route doesn't work very long. A tumorous organ never has biotin or coenzyme A in detectable amounts. Its normal ability to metabolize malonic acid is lost, so it must try the next route, detoxification.

Detoxifying Malonate

A popular detoxification method used by the body is to pin a *methyl* group onto the offending molecule. In this case that means:

malonic acid + methyl group ⇨ methyl malonate

The organ under siege is becoming vitamin deficient and malnourished, and so is the rest of your body that is trying to support it by sending more supplies to it.

But transferring methyl groups requires **vitamin $B_{12,}$ folic acid,** and **SAM** (S-adenosyl methionine). That uses up the organ's supply of vitamin B_{12} and folic acid, but at least the malonic acid is gone. Of course we must still get rid of the methyl malonate, which is toxic, but that's another story. Another drawback of pinning a methyl group is that it uses up your methyl supply, which means methionine, choline and betaine. This, in turn, depletes other metabolites, including glycine, taurine, cysteine, lecithin, hormones, and neurotransmitters. Keeping SAM supplied also means keeping S (sulfur) and A (adenosyl) supplied, which depends on adenosine triphosphate (ATP), which is exactly what is not being made when respiration is inhibited.

Your tumorous organ will be free of malonic acid as soon as you dose it with vitamin B_{12}, folic acid, methyl groups (methionine, betaine), sulfur (cysteine), and vitamin C. But not the tumor itself. If it has a tough, thick wall around it, these supplements cannot enter. Nor can parasite-killing herbs or zapping. So we must wait for the second week of the 21 Day Program when your immunity has

returned to help us.

Now that we can detoxify malonic acid into methyl malonate, what's next? There are three more steps:

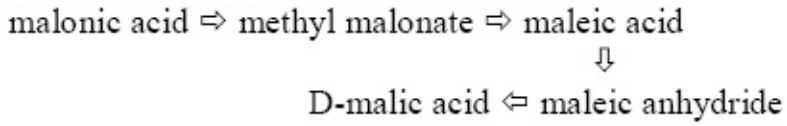


Fig. 26 Detoxification route of malonic acid as seen by the Syncrometer®

Because these compounds all begin with M, I call them the "M-family." Fortunately just vitamin C is needed to detoxify the remainder.

Tumor cells have lost the ability to do the detoxifying chemistry on their own, but if you supply the ingredients, they can still carry out the detoxification routine.

Couldn't we simply stay on these supplements and not be deprived of the malonate-containing foods? Unfortunately, we would have to stay drenched in supplements, even taking them in the night.

Other Malonic Acid Sources

Once I identified malonic acid as a common denominator in all tumors I searched everywhere for it. First, I found malonic acid to be present wherever a tapeworm stage was located. Then it was found in food. Then I found malonic acid was seeping from the plastic of dental restorations. (All varieties seeped: the composites, ceramics, glass ionomers, and porcelain. Possibly because they all contained some acrylate[66]). I learned recently that acrylic acid gets changed into malonic acid by our metabolism. Acrylate is also produced by heating unsaturated oils. This, again, becomes malonate. Another source was simply as a pollutant. Malonate is so ubiquitous a pollutant, present in processed food, medicines, antiseptics, and body products, it is detected constantly by the Syncrometer®. And most recently malonate was found to be near our two largest flukes while maleic acid is always found near Paragonimus flukes.

As pervasive as malonate is, you may have already removed it all. You have killed flukes and tapeworms, removed dental plastic, and are in the process of excluding it from your diet.

Some Expected Benefits

The most surprising benefit from the malonate-free diet and malonate-free mouth is stopping the production of *effusates*. Effusates are caused by seepage of body fluid into places where it does not belong. The lung is a favorite tissue for "water accumulation" of this type, but the abdomen is another common site. Legs, groin, lower abdomen are less common sites.

The actual culprit is maleic anhydride a substance that is formed from malonic acid in your body. It could also be formed from maleic acid trickling from plastic teeth and Paragonimus flukes! This may seem to be a small source, but when all of it travels to your tumor, and none gets excreted, it amounts to a great deal of damage, similar to a water drip—just one drop—dripping on your floor day and night, on the same spot.

Maleic anhydride as a cause of tissue edema has been known a very long time, but only when inhaled.[67] It was never guessed that cancer sufferers with effusions actually had this chemical in them. Effusates are life threatening for a cancer patient. The effusion stops the day after all malonate-related chemicals are gone. Small effusates can often be reabsorbed but large ones must be drained. It may be your last drainage! When an effusate is not drained bacteria find these fluids. And the pressure of this fluid against heart and lungs, against liver and intestine, or against lymph nodes in the groin can produce severe pain and breathlessness. If you "fill up" again, you are still getting malonic or maleic acid!

Another surprising benefit of removing all malonate from your body is improved kidney function. Methyl malonate is a serious kidney toxin. Stopping use of malonic acid foods and getting every vestige of plastic out of your mouth can start your *creatinine* level (indicative of kidney health) dropping to more normal levels in a few days. *Polycystic* kidneys are greatly benefited. But eating the tiniest bit of an ordinary malonate-containing dairy product (not allowed in this program) can ruin your progress in days! You must have no methyl malonate. Methyl malonate is detoxified with vitamin C.

No amount of the detoxifiers, vitamins B_{12}, C and folic acid could stop effusates from occurring or creatinine levels from rising when malonates were still arriving in the body from any source. We were forced to conclude that detoxifying malonic acid after consuming it did not prevent the damage done by it. It should not be consumed at all.

The supplements needed to detoxify all the malonates in your body are included in the 21 Day Program.

In a few days, with your new malonate-free diet and reinforcing supplements, your tumor cells will no longer have to put up with Krebs cycle blockage. And a daily dose of thyroid will help your mitochondria to divide so fresh young mitochondria are born to handle the improved Krebs cycle activity. They will soon be larger, more numerous, more capable. The tumor cells will begin to do their own work. Soon they will look like neighboring healthy tissue on the scan.

Damaging Dyes

Your anti-tumor (tumor-shrinking) diet should also be free of carcinogenic dyes.

This is as logical as coming out of the rain in order to stay dry. Of course, we have believed that our diet is free of cancer-causing dyes, since laws were passed outlawing them decades ago. Actually, the Syncrometer® detects the most notorious of all carcinogenic dyes, 4-dimethylaminoazobenzene (**DAB**) in foods as varied as jello, cool-aid, candy, and milk. **Sudan Black B**, **Fast Green**, and **Sudan IV** are also common pollutant dyes. The Syncrometer® finds them in many hair dyes, too; dyes penetrate the scalp to load up the body, especially the spleen and body fat. Cheese, butter, cream, which state that annatto seed or riboflavin (natural dyes) have been added, also have traces of these dyes! Not only these, but a host of *azo* dyes, a finding as unbelievable as it is revealing. Azo dyes have a special chemical structure that involves two nitrogen atoms (–N=N–). They have been implicated in cancer induction for decades.[68]

How can this be? Is it the result of an error in identifying it to the manufacturer using other food dyes? Is it the result of cross-contamination? A manufacturer using unsafe dye for some legitimate purpose and safe food dye nearby cannot keep them totally apart? One cannot expect the work force in a factory to understand the issues—the terrible seriousness of keeping them apart—the system must be made fool proof. Or is it due to confusion in naming of dyes? (Both Sudan IV and DAB have over 40 names each![69] Their popular names are "Scarlet Red" and "Butter Yellow.") Could there be a loophole in the legislation banning carcinogenic dyes to be used in food? Have hair dyes completely escaped legislative attention? Why is it legal to use carcinogenic ingredients in them?[70] Just because you are not eating them? With over

20,000,000 people (mostly women) dying their hair in the United States alone, should it not be made safe? Could there be simple negligence, in spite of safeguards such as required testing of each batch of synthetic dye to be used? There is one glaring defect in this "safeguard." The testing done is for the presence of the stated dye, a legitimate one, to make sure it comes up to the percentage (usually 85%) on the label. Testing is not for possible illegal contaminants in the remaining 15%. The components and quality of this remainder is left up to GMP (good manufacturing practice)! Neither the FDA nor private laboratories do testing for illegal azo dyes.

Certainly, this is a loophole in the regulation of dyed foods. Dyed food should be spot-tested constantly. This would probably uncover the mysterious "transmissible factor" that pollutes nearly all (over 90%) of the processed food in the U.S. marketplace.

Sudan IV

The dye industry of Germany was an early industrial development—already thriving in the 1880s. During WWI, surgeons used Sudan IV to rub into soldiers' wounds because it had been seen to speed wound-healing. Soon these boys grew tumors from within and around the wound site. It did not take long to make the connection. Use of Sudan IV to heal wounds was stopped by the war's end. It was a cruel hoax to perpetrate on young war heroes and their families, but incredibly, researchers are still experimenting with its use![71]

Just how carcinogenic is Sudan IV? The Syncrometer® detects it as soon as you have eaten dyed food, in the lung, tongue, salivary glands, esophagus and stomach. It is also seen in the bone marrow, liver and spleen. The next day, Sudan IV lines the whole intestinal tract including the colon, and is present in adrenals and kidneys, too. It is not easily detoxified by your body and therefore, cannot be quickly eliminated. It accumulates in the body's fat—both organ fat and skin fat.

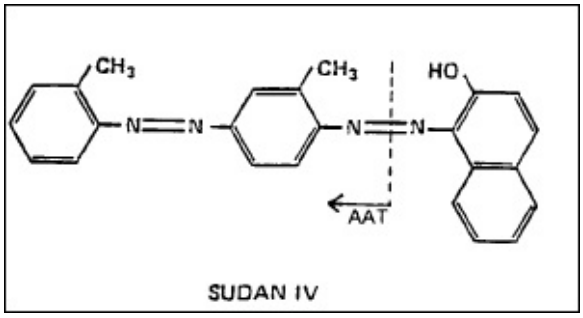

Fig. 27 AAT in Sudan IV

Scientists had done the necessary research on Sudan IV and many other carcinogenic dyes by the 1960s. They had taken the molecule apart. The left hand portion of the molecule is responsible for the carcinogenic action. By itself, this portion is called o-aminoazotoluene or **AAT**, not easy to recognize or pronounce. It forms the heart of numerous azo dyes. When a single dose of AAT is given to mice or rats, it combines with both DNA and RNA and stays stuck for 84 days.[72] It produces mainly tumors of the liver, gallbladder, lung, and urinary bladder (particularly papillomas here). A single dose causes cancer in newborn mice.[73] Most azo dyes were taken out of the food market because of their carcinogenicity but now are present everywhere in trace amounts, detected by the Syncrometer®.

A Little DAB Can Do You In

p-dimethylaminoazobenzene (**DAB**) is even more carcinogenic than Sudan IV or AAT. One researcher stated "For efficient tumor induction DAB has generally been fed to rats in the diet at a level of about 0.06%…"[74] This led to as much as 100% tumor induction in as little as six months!

At one time it was allowed as a butter colorant (for people!), hence its popular name Butter Yellow. I find every patient blood test that shows an elevated alkaline phosphatase has an accumulation of DAB in the vital organs and in their fat reservoir.

Sudan Black B

Sudan Black B accumulates in any organ, penetrating the nucleus of many cells, making it the most difficult of dyes to remove. It has three azo portions in the molecule, making it the most difficult of dyes to detoxify, too. While it is concentrated inside the tumor, it slowly leaks out, being taken up by the liver

and other vital organs. It causes part of the LDH rise so commonly seen in advanced cancer patients. Did Sudan Black B cause a mutation that overproduces LDH or lactic acid? LDH and alkaline phosphatase are often seen to be linked on the blood test. The dyes, Sudan Black B and DAB, are both present when both enzymes are elevated. When only one test is elevated, only one dye is found present.

It requires large doses of coenzyme Q10, vitamin B_2 and glutathione (this is part of the 21 Day Program) to detoxify our azo dye collection. When we track carcinogenic dyes with the Syncrometer®, we see them appear in the kidneys and bladder afterward. It still takes a special effort to dislodge them here.

Hair dye and food dye are considered to be far apart in terms of danger to the body by our government agencies. It is assumed that the hair, being external to the body, does not transmit its dye or other chemicals to the body. Nothing could be further from the truth. Hair dye is immediately absorbed by the scalp and remains there in a large reservoir to be slowly absorbed for six weeks! By then, a new batch of dye is applied. For this reason, hair dye should be non-carcinogenic and easily excreted by the body. If you have used hair dye you must begin to detoxify it and use only all-herbal dye in the future (see Sources).

Additional note: never, never get your skin tattooed. Long ago, when vegetable dyes were used, it may have been safe. But now, tattoos seep synthetic dye at a steady rate.

Fast Green FCF

Fast Green FCF is also known as Food Green 3. It is not an azo dye, it is a legal food color. I find fruits and vegetables that are dyed to give them extra appeal in the supermarket are saturated with Fast Green. Even eggplants and bananas are "colored", suggesting a combination of pesticide and dye was used. Fast Green brings with it the lanthanide metals (thulium, gadolinium, lanthanum, etc.). Both dye and lanthanides are very tightly stuck to the food. Two hot water washes are needed to clean the surface enough to risk cutting the fruit. Remember, wherever the lanthanides arrive in your body, immunity is immediately dropped. This allows parasite eggs to survive, as well as *Streptococcus* bacteria, the pain causers. If you can not get pain relief, it would be wise to avoid all fruits and vegetables for a few days, except watermelon, cantaloupe, honeydew melons, and the thick-skinned squashes or pumpkin.

More Dastardly Dye Deeds

The Syncrometer® detects a major disturbance in vitamin A metabolism in whatever organ Sudan IV and the other azo dyes are found. The bone marrow is particularly affected. We have genes for vitamin A receptors and binding proteins. A mutation at these genes could result from a translocation similar to "The Philadelphia Chromosome," characteristic of leukemia, a bone marrow cancer. At the bone marrow the Syncrometer® detects abnormal vitamin A products like 13-cis-retinoic acid instead of the normal 9-cis. While at the bladder 9-cis is present but 13-cis is normal for this organ. Such exchanges could result from mutations induced by dyes. Meanwhile, the proper vitamin A members, like *all-t-retinoic acid* and the retinoic acid receptor *RAR*α, are missing, as is *retinol binding protein*.

These vitamin A members are probably important in the growth regulation for which vitamin A is known. This could also explain why vitamin A, given to cancer patients, was found to inhibit tumor formation many times in the past. Here are just five examples from the research literature:

- Antitumor Action of Vitamin A in Mice Inoculated With Adenocarcinoma Cells[75]
- Concentration-dependent effects of 9-*cis* retinoic acid on neuroblastoma differentiation and proliferation in vitro[76]
- An Inhibitory Effect of Vitamin A on the Induction of Tumors of Forestomach and Cervix in the Syrian Hamster by Carcinogenic Polycyclic Hydrocarbons[77]
- Inhibition of the Growth and Development of a Transplantable Murine Melanoma by Vitamin A[78]
- Prevention of chemical carcinogenesis by vitamin A and its synthetic analogs (retinoids)[79]

Azo dyes are responsible for missing oxidizers![80] Remember that azo dyes are also responsible for an elevated alkaline phosphatase[81] and LDH on the blood tests. If yours are elevated, let this galvanize you into action. These dyes accidentally contaminate the safe dyes: annatto seed and riboflavin. Avoid <u>all</u> dyes. Children consume more dairy products, jello, and cool-aid than older persons. Is this why leukemia is commonly seen in children? (Seventy-five percent of all leukemia is in children.) Do children get more azo dyes, causing

more vitamin A mutations, causing more leukemia?

Avoiding dyes will not pose a new restriction on your diet. It was already restricted to unprocessed (undyed) food. Now you must pay closer attention to natural food to be sure it has not been dyed. Which dye is used is irrelevant, since it is nearly all contaminated with Sudan IV, Sudan Black, DAB, and other azo dyes as detected by the Syncrometer®. By avoiding all dairy products besides processed foods and washing natural foods twice in hot water, this risk from carcinogenic dyes will be gone. This is the main reason for removing dairy products from the diet during the 21 Day Program. After your tumors are gone and health has returned, you can begin to detoxify food dyes by adding vitamin B_2 to the food itself.

Full spectrum light can change azo dyes. Are they then detoxified? This is not known with certainty. So advanced cancer patients must wait till their tumors are definitely shrinking before consuming light-treated dairy products. Place butter, cheese or other items within an inch of the bulb for at least 5 minutes.

Don’t Eat Carcinogenic Metals

Even though our bodies need copper, cobalt, germanium and perhaps even vanadium, it is needed in organic form. The inorganic form is toxic. The toxicity is subtle. It builds up slowly. Certainly, the body has detoxification mechanisms, but these use up your glutathione and precious metabolites. As you age, we have less ability to detoxify.

Although the body can often make the organic form out of inorganic metal that you eat, this does not justify eating it. Eat only the organic forms of germanium (aloe, garlic, hydrangea root), chromium (thyme, chromium-yeast and other minerals). Ultratrace minerals can be found in fish, eggs and whole seeds.

- Cook in glass or ceramic pots, not stainless steel, which releases chromium and nickel, two of the most carcinogenic metals.
- Change copper or galvanized (source of cadmium) water pipes to PVC plastic. Perhaps the practice of grounding the house electricity is partly to blame for so much corrosion.
- Change glasses frames to plastic. Wear a plastic watch.

- Switch to non-metal jewelry. Wear no metal that touches the skin. (For solid jade rings, see *Sources*.)
- Use no metal tooth repairs

No Isopropyl Alcohol or Benzene

The FDA requires, and rightly so, that processed food, extracts, supplements, in fact everything that is put into a bottle or a package, must be essentially free of bacteria. This is very difficult to achieve, since even dust carries bacteria and fungal spores. Even plain water develops bacteria in a bottle. A manufacturer is very tempted to overdo the antiseptic, for your protection and their legal protection. The antiseptics used are not required to be disclosed. Nor is rinsing or drying required. In fact, what is required is a thorough drenching of bins without rinsing or drying.[82]

The cancer patient must have no isopropyl alcohol, which is the most common antiseptic. For this supremely compelling reason the cancer patient must not eat bottled, canned, or packaged food (with a few exceptions as noted in this book).

Benzene comes into the food supply in huge amounts. It is part of petroleum residue. Wherever pesticide is used, the Syncrometer® detects benzene. Although the pesticide has a specific chemical that is the active ingredient, this is usually just a few percent. The bulk of the pesticide is a petroleum-derived "vehicle" or base. This is the source of the benzene. Over half of all the greens (lettuce, spinach, parsley) on supermarket shelves that I tested were positive for benzene, implicating pesticide. Organic produce was only slightly better, testing negative only if in its original plastic package.

That is why I do not emphasize greens in the diet. It is sad for the vegetarian especially, and those health-minded individuals who promote juice-making, raw vegetables, and a natural diet. And for the cancer victim.

Although I have found an antidote to benzene, vitamin B_2, effective both in your body and outside it, this is far from satisfactory. The toxic compounds formed (phenol and others) have not been studied. How to detoxify all your foods is given in *Food Rules*.

Even after avoiding benzene to the best of your ability, detoxifying food with B_2 is essential for the cancer patient.

Don’t Eat Asbestos

We are familiar with airborne asbestos, and the whole nation has made great efforts to remove it from our buildings. But this source of exposure is minor compared to the huge amounts we are eating daily! The Syncrometer® detects it on apples, plums, pears, rolled oats, rice, and many other foods. It can be washed off some foods, but not off others. There are large amounts in sugar, which explains its presence in all sweetened foods. It can be filtered out of a light syrup made from sugar, using a coffee filter. Coffee, too, is contaminated with asbestos.

What these foods have in common is rolling along conveyor belts. I suspect many conveyor belts, especially old ones, contain asbestos. Avoiding asbestos and learning to remove it are part of the instructions given in *Food Rules*.

Asbestos does special harm to us. Our white blood cells quickly eat it up themselves to protect our vital organs. But once the white blood cells are filled up, their lysosomes are speared and damaged, letting out their ferritin and the iron metal contained within. Ferritin reaches the surface somehow, where it coats the white blood cell all over the outside, covering up its precious receptor sites. Now it no longer recognizes bacteria, viruses, toxins or even its friendly neighbors. It can’t even unload its toxic cargo to get it on its way for excretion. The immunity in this tissue (our white blood cells) is fatally reduced.

Another immune function is lost when white blood cells are coated with ferritin. Beta glucans cannot find their normal attachment sites. Without beta glucans attached, the white blood cells cannot display viruses on their surface. Unless displayed other white bloods cells can’t become natural killer (NK) cells.

And even after the asbestos is removed from the tissues, by restoring immunity, the cells are left with the remains: a large pile of useless oxidized iron, the "ferric" form. It will take gigantic amounts of vitamin C to reduce it and remove it.

Unsaturated Fat Risks

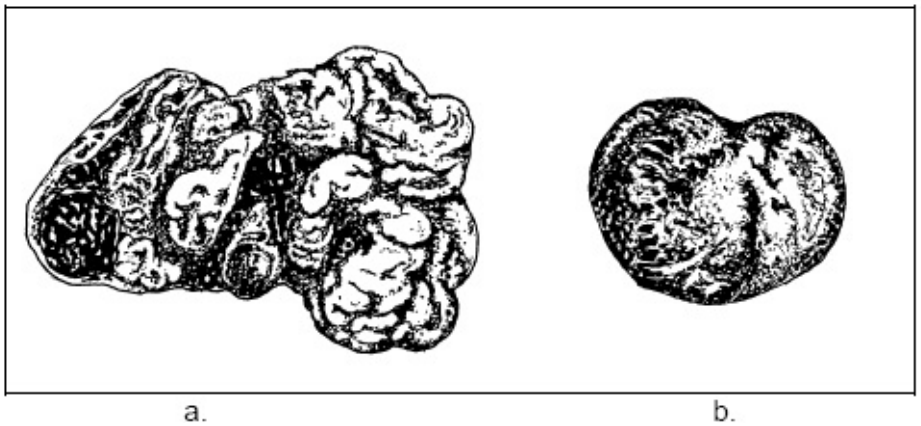
Acrylic acid is a small bit of unsaturated fat. It is also a bit of polymer prepared by industry. Unsaturated fats have several double bonds in their

molecular structure. We have been told they are good for us nutritionally. Consequently, we have been frying our foods in corn oil, canola oil, safflower and a host of new oils, instead of the old-fashioned butter, lard, chicken fat and olive oil. We were not told that heat could disintegrate the unsaturated oils, leaving bits of acrylic acid that our bodies do not digest but instead escape from the intestine to enter our tissues and disturb DNA production.

In fact, the corn oil, canola oil, cottonseed oil on the grocery shelves, even before they are used to fry, contained acrylate molecules, according to the Syncrometer®. This included the "cold pressed" varieties. Only olive oil and coconut oil, both fairly saturated, did not. Frying food to near-blackness with butter, lard, olive oil or coconut oil did not produce acrylates either. But microwaving coconut oil did, whereas microwaving did not make acrylate out of butter, lard or olive oil.

The more unsaturated the oil, the more easily it is broken up into acrylate bits, it seems.

Acrylic acid is detoxified in the body by adding methyl groups. The Syncrometer® detects methylmethacrylate (the same as your denture plastic!) at the same locations as acrylic acid is found. Some acrylic acid is metabolized to malonic acid! Acrylates are dangerous molecules. Even the *IARC* concluded there is "sufficient" evidence for the carcinogenicity of ethylacrylate (similar to methacrylate) in animals.



(a) Enlarged tumor-filled liver of rats fed aflatoxin. (Drawn from photo.[83]) (b) The liver returns toward normal after giving glutathione (100mg/day). But this is equivalent to 25 gm/day for a human!

Fig. 28 Glutathione combats aflatoxin liver damage

Quick and easy Rules for baking and frying without making acrylic acid are

given in *Food Rules*.

Don’t Eat Moldy Food

In the earlier books, three mycotoxins were mentioned, that were always seen in tumors: aflatoxin from nuts and bread, patulin from apples and zearalenone from Russet potatoes. It was easy to assume the patient had eaten these. It was profoundly shocking to find the patient had not. In fact, the fungus that produced the mycotoxins was actually right there in the tumor. And, in fact, there are numerous tufts of fungus growing in us. Our food is our fungus source.

Fungus Fighting Round 1

Our pickles, cheeses, grains, syrups, peanut butter, tea, coffee, cereals, are laden with fungus spores. And they germinate and grow in us at a special location: wherever a large fluke has been killed. Eventually it all gets cleaned up, provided the white blood cells are not ferritin coated or made immobile with lanthanide deposits. But in a cancer patient’s tumors, immunity is gone, so a tangled mass of several fungus varieties grows together. Perhaps they grow right into the human cells with finger like extensions, similar to Candida, because when the fungus is zapped, tumor tissue collapses.

A large part of the tumor is fungus since tumor reduction is fastest just by zapping fungus. A marble-sized tumor can disappear completely in 24 hours. A coleslaw lover may have tumors of cabbage black fungus, while a potato lover may have tumors of potato-ring rot. But when flukes are first killed it is always the same 2 fungi that move in first: common Baker’s yeast and sorghum mold.

The yeast brings with it RAS, a powerful prevalent oncogenic virus! Sorghum mold produces a mycotoxin that causes bleeding.

The Rascal RAS

Not all yeast carries this virus, but most of the samples I tested did. It was hidden inside the chromosomes beside the legitimate genes, like a cuckoo in a bluebird’s nest. When the yeast was started growing the RAS multiplied and could be detected everywhere. When the yeast was stopped by bringing it to a boil, the virus disappeared everywhere EXCEPT in the chromosomes. Only after

boiling for about 20 minutes could RAS be eliminated. Twenty minutes under full spectrum light could also eliminate it (30 minutes for dry yeast). After this, the yeast could be grown again, this time without RAS appearing. Nearly all the bread on supermarket shelves has live yeast and RAS. Is our daily bread a significant source of a tumorigenie virus? You can kill your own RAS viruses, even those latent in your chromosomes with 3 closely spaced doses of Frankincense. But a single slice of under baked bread gives it back to you. Bake your own bread with a bread maker, and light treat the yeast cakes first.

In fact, all live fungus will grow in us wherever our white blood cells are disabled. A cancer patient must kill the fungus in fungus-foods. But this is easily accomplished by light-treating. Lugol's also kills all fungus. Pau D'Arco herb kills most fungus varieties, and Echinacea kills many.

But when yeast and sorghum mold are killed, by whatever means, 2 new varieties promptly take their place and a large quantity of elemental cobalt is left behind.

Fungus Fighting, Round 2

Elemental cobalt is extremely toxic. Now coenzyme A cannot be used. The body must stop making malonyl coA and acetyl coA, which stops the metabolism of malonic acid and stops the Krebs cycle. Malonic acid builds up and pyruvate builds up, giving rise to lactic acid. We see the high lactic acid level on the blood test as high LDH.

The two new fungi are Aspergillus and Penicilluim varieties. They make aflatoxin! The liver is especially sensitive to aflatoxin. When it can no longer be detoxified, the bilirubin begins to rise. This becomes a terminal process very quickly. We give glutathione to help detoxify it. Most important is killing these 2 fungal growths and eating no more aflatoxin on food.

Cobalt does not go away by itself; it lingers for weeks, unless a special chelator, 1P6 is given. Cobalt interferes with vitamin B12 somehow, so B12 shots are given too.

The new aflatoxin producing fungi can be killed, too… with a single zap. But now Chaetomium takes over, or your "personal fungus" – the kind you have been eating in the live state! And elemental copper is left behind.

Fungus Fighting, Round 3

Elemental copper seems to poison our zinc enzymes and our blood making ability. Brain tumors, leukemias and nervous system diseases show especially high levels of copper. It can be chelated out with EDTA but, of course, more will be formed until all fungus is killed and removed.

Chaetomium and "personal fungus" can be killed, the same way as before, this time leaving oxidized vanadium and oxidized germanium behind.

These 4 metals, copper, cobalt, vanadium and germanium are the true cause of death for all our cancer patients! In the meantime, though, flukes that are killed, release harmful bacteria and viruses. Immediately upon the death of Fasciolopsis and Fasciola we see emerge, the influenza (Flu) viruses A and B, and Salmonella bacteria. They invade the rest of the body but you don't feel sick unless they reach high levels in the brain. When Paragonimus fluke is killed (another very common fluke) we see Pneumocystis, another tiny parasite released, and when this is killed, Staphs and Streps are released in droves. The killing of Ascaris releases Coxsackie viruses that invade the brain too. When all of these occur together, as they do in a terminally ill patient, it seems to the doctors the end is near. The patient can't eat, vomits everything, can take no medication, needs morphine as a painkiller, and is sweating or shaking with either a temperature or chills, or both together.

No clinical treatment or powerful new antibiotic can save this patient. But five simple treatments can turn it all around in an afternoon. Lugol's for Salmonella, digestive enzymes to consume the dead flukes, Frankincense to kill viruses, Oscillococcinum for the flue (all within an hour) and continuous zapping to kill bacteria. In a few well chosen strokes, your patient is saved from coma; she/he may now be hungry. Make sure the food is not moldy, has been light-treated and is sterilized. Soon he/she will be willing to take the 1P6, EDTA and MSM by mouth to remove the toxic metals. They would also benefit from an IV dose of 25 grams of vitamin C. Make sure it has been filtered.

Fungus is the final undertaker...unless we fight back with the Syncrometer® as our secret weapon.

Help From The Health Department

Perhaps we should not expect produce that is pulled from the earth after fertilizing with manure to be free of parasite eggs. It is the consumer's responsibility. We can learn to sterilize food quickly and easily in the kitchen. But the Health Department could help in crucial ways. Food could be tested for asbestos, azo dye and lanthanide contamination.

Most of all, milk should be sterilized, not just pasteurized. A few salmonella and E. coli bacteria do not make a healthy person sick, not in glass after glass. And swallowing tapeworm eggs, which will never mature into a tapeworm (only into a very small "bladder cyst" larva) has never been seen to cause anything. Nobody drops dead or even gets sick. Yet here is the mysterious beginning of our tumors. Perhaps they will stay benign and never become aggressive. But without them, we would not even have to think about it.

Kosher is cleaner. Milk, cheese and butter purchased at kosher grocery stores usually did not have tapeworm eggs, *Ascaris* eggs, Rabbit fluke, or filth-bacteria. Nor were they sterilized! Evidently, cleanliness is possible in the dairy industry. Amish-made products were similarly much safer. Yet, the cancer patient can not take chances. When dairy foods are finally allowed in your program, they must still be sterilized.

We can, of course, sterilize all our milk ourselves—and must do so. But if it were done as part of the regular sanitation procedure for milk, we would automatically have safe cheese, ice cream, yogurt, etc. Presently these are all slightly contaminated with parasite eggs, bacteria, and carcinogenic dyes, and off limits to the cancer sufferer.

The Health Department should increase compliance in restaurants. We should feel secure that gloves were used to handle food. And hands washed after bathroom use. The security system should include an electronic message if the sink is not used between door openings. Better yet, the Health Department should develop and require testing sticks for Salmonella and *E. coli* for restaurant use.

Best is to choose homemade food. If you must eat in a restaurant you must take extra precautions. After your food arrives, pile it all on one plate and ask to have it heated in the microwave uncovered for three more minutes. Also dot it with 15 drops of hydrochloric acid, mixing as well as possible. Accompany with a beverage that has another three drops hydrochloric acid added. Do not eat raw

salads unless you can dunk them in Lugol's while dining. Take Lugol's iodine drops with you when eating out. Put 1 drop in a glass of water to sterilize raw food during the meal. (This advice is only for cancer patients, and only in restaurants, until they are well. Others would risk oxidizing too many food elements.)

Whenever one of our patients became bloated or gassy, we routinely identified the bacteria that were eaten. Then we located the source. It wasn't the dust in their room, their water, their fingers, nor was it a "bug that was going around." It came from the food they had recently eaten! Most of our patients' "mysterious" setbacks, like headaches, fever, abdominal pain, nausea, diarrhea, and pain in general turned out to be caused by food bacteria. So don't be too discouraged if you suffer a setback. Before you blame it on the cancer, go through the bacteria-killing recipe stop eating suspect food and throw out those leftovers!

Can The Government Protect Us?

Certainly the United States Government tries. An independent group of chemists was formed about 1969: the International Agency for Research on Cancer (IARC) Working Group on the Evaluation of the Carcinogenic Risk of Chemicals to Man (an embarrassing term for this non-sexist age). They have met regularly. They have assessed chemical risks in great detail, establishing criteria in the best scientific manner. But are these criteria the best for you?

For instance, suppose you are the Food And Drug Administration (FDA) and "The Big Corporation" wants you to allow their new additive, saccharin, in food. It's a miracle substance, says The Big Corporation, a substance that sweetens without calories! Millions of people will benefit! So being a conscientious FDA policy maker, you diligently check the IARC Evaluations and find that saccharin is classified in "Group 2B." This means that it is "possibly carcinogenic to humans."[84] So impartial scientists have no proof saccharin is carcinogenic, points out The Big Corporation, so it wouldn't be legal for you to deny approval. As an FDA official, you decide the "fair" decision is to allow saccharin to be used (as actually occurred). But as the parent of a six month old baby, would you let her eat food sweetened with saccharin?

Agencies and committees like the FDA, IARC, and others, can be expected to be very, very conservative; certainly not biased against any particular chemical. But where safety is the issue, an evaluation committee should be biased (in favor

of safety). This bias would change the language used by the committee. For instance, an unbiased committee would consider carbon tetrachloride as possibly carcinogenic (because not enough human experiments were done, although animal experiments definitely showed cancer induction[85]) whereas the safety-biased committee would consider it probably or undoubtedly carcinogenic (because some human experiments were done and these showed cancer induction besides the results from animals).

I think the IARC working group has failed. Despite their distinguished personnel, they have made a classification system that confuses and demoralizes the public that relies upon it. Their Group 1 category, which lists agents that "are carcinogenic to humans," has both benzene (indisputably carcinogenic) and nickel (used in our coinage and stainless steel cookware and tooth fillings)[86]. It contains mineral oil, which is legally allowed in food! And estrogen replacement therapy, prescribed to millions of women! How can a lawmaker trust such a list? I am suggesting that **lay people** (excluding all professionals) staff committees and set their own standards. And give food their' own stamp of approval. They could devise categories that make sense. And advise lawmakers what they feel comfortable letting their children eat. We might never see saccharin, azo dyes, mineral oil and lots of other chemicals even near our food and body products again.

Although finding what is carcinogenic for people is important for all of society, finding what carcinogens are in your tumors is most important to you. If you have a tumor removed, ask the surgeon to give it to you, it's yours, after all. If this is not allowed, agree to fill out the necessary paperwork to make it legal. It should be given to you, not as a biopsy slide, but as a specimen, preserved and safe for anyone to handle. New labs are springing up with the capability of testing for toxins. Find laboratories willing to analyze it for copper, cobalt, vanadium, lanthanum, gadolinium, thulium, asbestos, benzene, silicone, zearalenone, patulin, aflatoxin and azo dyes. After finding some of these common denominators in your tumor, search for them in your foods, dental fillings (those you saved!) and vitamins, using the same lab. Laboratory costs are about $30.00 to $50.00 per test. Eliminate the culprits permanently from your life.

Now you are eating safe food!

- There is no malonic acid in it because you avoid the "contaminated" list.
- There are no azo dyes in it because you check the label for all dyes, and are not eating dairy products, for now.
- There is no asbestos or mold or Fast Green dye because you wash and peel fruits and vegetables according to the Food Rules. There are no parasite eggs because all food is sterilized.
- There are no solvents because you don’t buy canned or processed food except occasional kosher varieties.

  You look forward to mealtime because it reminds you of how your grandmother cooked!

With your new expertise in toxins and where they come from, you will be more qualified to sit on a standards committee than most people, even scientists!

Safe Surroundings

Your own home brought you cancer! Any place else will be safer. The easiest and fastest way to make a complete environment change is to leave home.

The pets brought you *Ascaris* worms; *Ascaris* eggs and tapeworm eggs are in the carpet. The carpet must be sterilized, or removed. The bedroom carpet is most important, because you breathe the polluted dust for one third of the time! Throw rugs and bed blankets can be dry cleaned. Laundering does not kill parasite eggs. If pets have been on the bed, throw away the mattress.

The water pipes brought you copper. The refrigerator brought you Freon. Freon is known to enhance the mutagenic action of PAHs.[87] New furniture and bedding brought you formaldehyde. The laundry room, besides food, brought you asbestos. Gas fixtures, besides plastic teeth, brought you vanadium. Concern for ants and roaches brought you arsenic-containing pesticides.

If you are the caregiver, take your precious patient anywhere but home. Even a hospital is safer, if it weren't for the treatments given.

Find a motel with plastic water pipes, ask for a non-smoking room and move in for one month. If you are better after one month, stay another month. Stay until your toxic home has been cleaned up. Choose a ground floor room for convenience. Heaters must be electric. Do not use the air conditioner. Sit outside as much as weather allows. Remove the linens and bring your own borax-washed replacements or immediately take motel linens out to launder in borax and bleach. Rent a small, non-Freon refrigerator for your room, available at office supply stores. Bring home-cooked food to the motel. Take copper-free water from the motel to do cooking. The motel is your temporary spa. If friends and family do the shopping, you can do the cooking. Do not accept offers of cooked or prepared food. You must see the food being sterilized and know what is in it. Only a weight gain is a sure sign of success with cancer. Until you have gained ten pounds you cannot be sure that you are on the road to health. Weight gain is the mysterious indicator that all is well with the body. Use scales twice a week. (If you are overweight, consider yourself lucky—do not lose a single pound.)

When searching for the safest haven, also emphasize linoleum floors, no gas heaters, no wallpaper or paneling, no refrigerator (except your new one), and no recent paint (fumes have vanadium). Do your own housekeeping with borax and dust with plain water. Bathroom fixtures are sterilized with ethyl alcohol (the 750 ml or 1 liter size bottle only). The toilet is sterilized with regular bleach by someone else while you are out of the room. No pesticide is used. Arrange this with the motel beforehand.

No visitors may smoke. And no pets may visit. Keep extra warm: wear socks, long pants, long sleeves, and turtleneck top until your body temperature is normal, above 98.5. Take your temperature in the morning, upon waking, several times a week. Take showers and shampoos at bedtime to conserve body heat.

Your home should be made ready while you are in the motel "spa." It should be completely overhauled.

- Bedroom carpet pulled up, floor cleaned, throw rugs purchased (washed first). Don’t put down a fresh coat of paint or polyurethane.
- Pets given away.
- Plastic water pipe run to the kitchen, bathroom, laundry facility. (A temporary line can be hooked up at an exterior valve). You may check into plastic-coating of metal pipes (*Sources*).
- No hair dryers used.
- Clothes dryer covered with large plastic bag to put it out of use. Use a Laundromat.
- Refrigerator changed to non-Freon variety.
- Gas appliances changed to electric.
- Dishwasher and laundry routines changed to borax and white vinegar.
- Chemicals removed from bedroom, basement and kitchen.
- All body care items replaced with homemade substitutes. (See *Recipes*.)
- Read *The Cure For All Cancers* for replacement recipes.

If all this seems needless and excessive to your family, you must stay at the safe motel. But if your family did the job so you can return home, give them a big hug and thank you!

Personal Products

Although they are not part of your home, clothing and body products are part of your surroundings, too. They will be sources for cancer-specific toxins until you correct them.

All clothing, even whites, have dyes stuck to them that are eagerly absorbed by your body. Washing them in borax removes most dyes, but not DAB or Sudan Black B. These are the very toxins that spell ultimate doom for the cancer patient by raising alkaline phosphatase, and LDH. Clothing constantly rubs these two toxins into our skin, day and night. Our skin fat absorbs them. The liver, in its constant vigilance over toxins, pulls them inward for detoxification in its microsomes. When it can't keep up with the barrage from food, hair dye, and clothing, they begin to accumulate in other organs, causing more and more mutations.

Chlorine bleach, even though it is itself polluted with these dyes, can remove them from your clothing.

As soon as you read this, wash all your clothing, including wig, turbans, hats, shoes, jackets, bedding, and towels. Use ½ cup bleach per washer-load of whites, like sheets, jackets, underwear, socks, shoes, scarves, outerwear. Everything else, like colored clothing, silk, leather, rayon, can be given ¼ cup bleach per cold washer-load. Don't mix white and colored items. Leather goods should be removed after five minutes bleaching, rinsed and dried by stuffing with paper to avoid shrinking.

Your own hair, if dyed, can be detoxified with dental bleach, applied to the dry hair for 5 minutes. Then rinse out. Wigs can be similarly treated.

Now that you have clean, safe food, air, water, bedding, clothes, and body products, you may rest briefly. Your achievement is great. If you are now in less pain or feel better, your reward is already there.

So far, all your efforts have gone into **removing** things, not **taking** things. Because **removing** things gives back your body its lost immunity and missing metabolism. **Taking** things only covers up the problem, like adding more and more fuel to a furnace that has no draft and is broken. Vitamins, herbs, medicines, and chemotherapy all belong to the category of **things to take**. They are not totally useless. But if your goal is regaining your full life-expectancy (not just 5 years) you must **remove** harmful things first and **take** things second.

We will next discuss supplements, but in my discussion notice the difference between those that are given to **remove** things and those that represent **taking** things.

Supplements

I hope you have already started the 21 Day Program. You may have noticed that the first thing we do is kill parasites so they can not take advantage of the nutritional supplements that follow. Parasites are dead in hours and it is now safe, and necessary, to feed the recovering body tissues. I have not done many experiments where we fed large amounts of supplements before killing parasites and bacteria. But feeding the "bad guys" may explain why the research literature has conflicting results on the benefits of giving vitamins to cancer patients. Our instructions are safe.

Here is the comprehensive list of supplements, most of which you will use. No others should be used since purity from pollutants and antiseptic is a life-and-death issue now. Corporations selling supplements cannot vouch for, nor even identify the antiseptics used in their own products. Nor colorants, fillers, pump sterilizers, valve lubricants, moisture absorbers, capsule sealers, release agents, etc. Each of these leaves a trace behind, in the finished product. We are accustomed to thinking that a trace is "negligible." But even ultra-traces are not negligible when they are uranium, Sudan Black B or thulium! The Syncrometer® detects them in crucial organs of sick people, so they could not be negligible. For this reason, untested supplements are off-limits to cancer patients. You could, of course, have your supplements tested by a testing lab (see *Sources*).

Not all of these supplements are available in all countries. Where possible, I have given alternatives.

Supplement List

Sulfur-Supplying Compounds (remove heavy metals)

- glutathione
- methionine
- cysteine
- taurine
- vitamin B_1
- thioctic acid
- pantothenic acid (as calcium pantothenate)

Urea Synthesis Cycle Expanders(remove ammonia)

- ornithine
- arginine

Respiration Supporters

- thyroid
- niacin
- niacinamide
- thioctic acid
- biotin
- vitamin B_2
- coenzyme Q10
- potassium gluconate

Oxidizers (remove bacterial and industrial toxins)

- inositol
- Lugol's iodine solution
- rhodizonate, sodium or p
- tassium (in Mexico)
- benzoquinone (clinical treatment only)
- ozonated oil
- ozonated water
- iron (ferrous gluconate)

Reducers(remove toxins)

- cysteine
- glutathione
- vitamin C (L-ascorbic acid, only)

Enzyme Cofactors(repair metabolism)

- vitamin A and beta carotene
- vitamin B_1
- vitamin B_2
- vitamin B_{12} and folic acid
- vitamin B_6

Methyl Group Donors(repair metabolism)

- methionine
- glycine
- betaine hydrochloride (remove *Clostridium*)

Major Minerals (repair metabolism)

- calcium (as powdered calcium carbonate)
- magnesium (as powdered magnesium oxide)
- potassium (as potassium gluconate)

Trace Minerals (repair metabolism)

- boron
- manganese (only as yeast complex)
- selenium (as sodium selenite and coconut)
- germanium (only herbal forms)

Detoxifiers (remove harmful chemicals)

- glutathione (reduced)
- glycine
- L-cysteine
- D-glucuronic acid
- L-ascorbic acid (vitamin C)
- taurine
- vitamin B_2
- coenzyme Q10
- Dimethysulfoxide (DMSO)

RNAse Inhibitors(remove RNAse)

- coconut oil
- chicken broth
- shark cartilage
- raw red beets

Immune Stimulants(remove immune blocks)

- hydrangea root
- papain
- a very weak magnet
- bromelain
- methyl sulfonyl methane (MSM)

Tumor and Parasite Digesters

- pancreatin and lipase
- mixed digestive enzymes
- prepared horseradish (peroxidase and catalase)

Miscellaneous

- essential amino acids
- non-essential amino acids
- high strength magnet
- oregano oil
- hydrochloric acid
- inositol phosphate
- EDTA
- vitamin D_3
- wintergreen oil, crude (not distilled or synthetic)

The supplements are numerous and the tumor-ridden body has no appetite for even the best of real food, let alone supplements. But you must find a way to conquer your own resistance: it is essential for survival. Although many of the supplements are available as injectables, bypassing the need to eat them, this is not advised. Intravenous solutions and injectables are often contaminated with bacteria or polluted with solvents, heavy metals and dyes. They are not worth the risk unless there are only days remaining for you or the blood test shows clinical failure of some vital organ.

Additional Supplements Used For Special Purposes

Bloating and Gassiness

This is caused by food bacteria, *E. coli, Shigella, and Salmonella*. Take:

- Turmeric, six capsules, (one teaspoon), three times a day.
- Fennel, six capsules, (one teaspoon), three times a day.

These herbs can be purchased in bulk. Mix with water and a little vinegar or water and a little honey to make a cocktail.

- Lugol's iodine 6 drops in ½ glass water taken after meals and bedtime. **Not if allergic to iodine.**

If there is no relief in 24 hours, you are continuing to reinfect from food. Sterilize all food.

Intestinal Blockage or Bleeding

- Moose elm (also called slippery elm), one to two tablespoons a day, made into "cocoa" (see *Recipes*).
- Sodium alginate, two teaspoons powder a day added to one pint boiling water (see *Recipes*) or simply blended in cold water.

These two can heal the intestinal wall where tumorous growths have caused bleeding, ulceration and pain. They may be combined with any food or each other. Use both.

Bleeding

- Chinese Herb, Yunnan Paiyao, (see *Sources*) ¼ teaspoon, three times a day, up to one teaspoon, three times a day, if bleeding is severe. This is outstanding in effectiveness for chronic bleeding, but not to be solely relied on for hemorrhage.

Fig. 29 Yunnan Paiyao, Chinese herb to stop bleeding

- Ice cubes, emergency treatment for stomach hemorrhage. Swallow a dozen cubes quickly en route to the hospital's emergency room.
- Cayenne, swallow 20 capsules as quickly as stomach allows, in event of any hemorrhage. Follow with bread to reduce heat sensation en route to the hospital's emergency room.
- Hydrogen peroxide (17 ½ %) for external hemorrhage; apply as drops and spread with plastic spoon.

Clinical help must be found in an emergency.

Poor Digestion

- Multiple digestive enzymes, two to three with each meal. Helps food leave the stomach to relieve "full" feeling. Relieves heartburn and hiatal hernia.
- Hydrochloric acid (5%), 15 drops distributed in food and beverages at mealtime. Stir while adding. Never put drops straight in mouth because it dissolves tooth enamel! Check blood chloride levels after six weeks. Do not exceed 45 drops a day (not including cooking routines).

Diarrhea and Constipation

Both are caused by the toxins produced by bacteria (the wrong bacteria) in the intestine. Killing them is the fastest way to relief.

Start with the antibacterial program: Lugol's (6 drops in ½ glass water). Ten minutes later turmeric (1 tsp. or 6 caps stirred into water), plus fennel (1 tsp. or 6 caps stirred into water). Later: 10 drops HCl (5%, USP) in a glass of water. Zap continuously for hours daily.

At the same time start taking sodium alginate (2 tsp. blended in 1 cup cold water). Sip it during the day.

Do not use anti-diarrhea drugs except as a last resort, since the bacterial problem will worsen while peristalsis is slowed.

If constipation continues, use Cascara Sagrada capsules (as directed). Also try Epsom salts (as directed on package). Also try *lactulose* available at pharmacies. Since you will be giving yourself an enema at bedtime, the constipation will do little harm.

Anemia

"Building" blood can be the single most important task for you. If you have already begun getting transfusions, you know there is something terribly wrong with your blood-building organ—your bone marrow. It all hinges on iron.

Iron is necessary for your body in many ways, besides making hemoglobin for your red blood cells. Muscle activity depends on myoglobin—much like hemoglobin; it contains iron. Detoxification of cholesterol, hormones, assorted

amines, even industrial chemicals that have entered the body is done by enzymes called cytochrome P-450s. They require iron. Nearly half the enzymes in the Krebs cycle need iron. The enzymes catalase, peroxidase and various dehydrogenases also contain iron.

Iron must not be in competition with copper, either. Copper water pipes and copper seeping from metal or plastic dentalware or from killed fungus keep blood iron levels too low.

Lanthanide metals block the availability of iron even when large stock-piles of iron exist. I believe the lanthanides simply stick to them magnetically since the Syncrometer® detects them in the same place and both are removed together by wearing a weak magnet.

To be useful, iron must be in its special state, called ferrous. There is no benefit in having a large pile of iron in the ferric state. ("Ferrous" has an "o" like "good," to help you remember.) This is why the correct form of an iron supplement is ferrous, as in ferrous gluconate. Even this cannot be given in large amounts safely, because of its propensity to change into ferric form. Our dosage is 10mg with each meal. This amount does not increase ferritin levels, or change to ferric iron.

Iron may be secretly stolen by a silent chelator of iron: 1,10-phenanthroline. This is a very large molecule, similar to other PAHs that are made by *Ascaris*. Phenanthroline travels throughout the body attracting iron to itself, which turns it into *ferroin*. The Syncrometer® detects ferroin and 1,10-phenanthroline whenever *Ascaris* is present—even as far away as the bone marrow! But what if all the iron is used up? Then phenanthroline stays in your tissues, never to be excreted. It will not appear in the urine except in the form of ferroin. So iron must be given to the patient in sufficient amounts to turn all the phenanthroline into ferroin before your body gets any! Since this could take a week, it is important to start taking ferrous glucanate as soon as possible.

And considering that 1,10-phenanthroline is powerful enough to suck the iron right out of the center of enzyme molecules, it can probably suck up our "good" copper the same way. Double harm is being done. Simply killing Ascaris and taking iron gets rid of the ferroin and phenanthroline.

With parasites and other toxins gone, the iron level promptly rises and may

reach forty from a value below 35 in the first five days, getting to a more normal level of 50 to 60 in three weeks.

All anemic persons should:

- Remove metal dental materials from your mouth.
- Never drink water from copper plumbing.
- Make your food safe from asbestos, according to the Food Rules.
- Take MSM to reduce ferric iron into good ferrous iron.
- Kill *Ascaris* to eliminate 1,10-phenanthroline, which robs iron.

The low iron level in cancer has been known a very long time and is referred to as "anemia of chronic disease," which includes "anemia of malignancy." It is, more accurately, "anemia from *Ascaris*, copper, lanthanide and asbestos toxicity." It is the unavailability of iron in the midst of plenty (of ferric iron) that strangles the cancer patient's metabolism and ultimately causes fatality in roughly half the failing cases I see, not the tumors themselves. Fortunately when you kill Ascaris and take iron, this anemia clears up.

As you can see, iron has a very complex story. It's like a million dollars. Once in the bank vault (ferritin), you must keep safecrackers (asbestos) away. If a customer withdraws some cash, your teller must not rip (oxidize) the bills; otherwise they are no good (ferric iron). When that happens, the teller should fix them with tape (reducers) so they are usable again (ferrous iron). Once out of the bank, the customer must protect his money from pickpockets (like 1,10-phenanthroline). Then the money can be spent wisely (on hemoglobin to carry oxygen in your bloodstream)! Cancer sufferers are especially prone to iron thefts because the same high "crime" neighborhood that makes tumors also causes anemia. Fortunately they both clean up together, too.

Insomnia

All insomnia I have seen is due to bacteria in the brain. The supplements given here do not correct the problem (only killing bacteria at their source does), they only give relief. Make sure you are correcting the problem at the same time as getting relief. Do not take vitamins or supplements at bedtime (except Lugol's, calcium, magnesium) because they tend to energize you. A hot shower is helpful, too, as is chamomile tea.

- Ornithine 500 mg, take six or eight for a strong effect.
- Melatonin 2 mg, take two for a strong effect.

They may be taken together.

Lymphoma

In the lymphomas, butyrates are absent in the lymph nodes. They represent the oil of butter. They are present in healthy people. It is known that the enzyme, tributyrinase, is very low (10%) after feeding the azo dye DAB.[88] This could account for low levels of butyrate. The Syncrometer® detects the absence of butyrates in the lymph nodes if toxic germanium is present or isopropyl compounds (isopropylidene nucleic acids) are present. This suggests that the absence of good germanium allows isopropyl-caused mutations to occur preferentially at a butyrate-related gene such as the tributyrinase enzyme. Giving a supplement of butyrate to lymphoma patients was already advanced in 1982.[89] The dose is 3 gm daily (see Sources).

Liver Cancer

These are commonly used by alternative cancer doctors. Try some or all or milk thistle powder, 2 heaping tsp. daily.

- Silymarin (milk thistle concentrate, see *Sources*), take 2 three times a day.
- Cesium chloride, 3 to 6 gm a day after meals (provided clinically only). May give side effects like nausea. Intended to push excess sodium out of cells to rehabilitate them.
- Urea powder (provided clinically only), 3 to 6 tsp. a day, dissolved in beverages.
- Raw beef liver juice, sterilized with hydrochloric acid, 1 oz. daily. (See *Recipes*.)
- Raw bitters (foraged greens), sterilized with hydrochloric acid. (See *Recipes*.) Use raw peeled aloe vera if other herbs not available.
- Glycyrrhizin (licorice extract), 2 capsules three times a day.

Bone Cancer

To heal bone, you need calcium, magnesium, and bone hardeners: manganese and boron.

- Calcium carbonate, 500 mg, take one a day. Do not take calcium if blood test shows calcium level is over 9.6. Take with meals. Capsules are preferred, so you can dissolve more of it. Be sure your brand is lead-free. (Ask for a lead analysis.)
- Magnesium oxide, 300 mg, take one 3 times a day at beginning of meals. Capsules are preferred.
- Boron, 1 mg, take one with each meal, twice as much if in pain.
- Manganese, 10 mg, take one a day for one month. Then stop.
- By prescription *Clodronate* (or equivalent), two tablets, three times a day. This is sodium diphosphonate; it stops further dissolving of bones.
- Vitamin D, 25,000 IU per day for 10 days, then 25,000 IU twice a week only. Do not use vitamin D if blood test shows calcium level is over 9.6. Vitamin D is a differentiator, meaning it causes cells to return to their normal work. It causes inositol phosphate to appear in tumor cells and remove calcium deposits so the digestion-flag can be raised. Excess (over 50,000 IU per day) is toxic!

A Reason For Everything

This book is empirical in approach, not medical or clinical, which is based on protocol. Empirical means, whatever works will be accepted. How it works, why it works, and when it works are interesting aspects, that can ultimately lead to a real understanding, but not necessary at first. Like the person with a sore toe, I tried many solutions, keeping those that worked for our cancer patients. Consequently, nothing is used in our 21-Day Program without a basis, not merely because it has a history of use, not because it is touted as having value, not simply as a generalized application of "good nutrition". The actual experiments supporting the use of each supplement are too voluminous to be included here. But some are described in my *Syncrometer® Science Laboratory Manual*.

When a lot of variables, such as these supplements, are in use, the scientific aspect of the design is very complex. The human brain cannot cope with many variables and see results that can be attributed to one combination and not another. For this reason, science, including medical science, phrases its questions

one variable at a time. For example, a lab rat may be given asbestos or carcinogenic dye or methyl cholanthrene or urethane or copper and so forth, but never more than one of these. The results may be minimally tumor inducing. Anti-tumor treatments are given one by one, too. But the human counterpart gets hundreds of tumor-inducing substances at the same time—quite a different situation. Experimental animals are not eating asbestos-laden dyed food, nor getting metal and plastic tooth restorations nor thulium-polluted vitamin C. This is how medical science missed finding the causes and cures of our tumor growths. Any single entity does not work alone, not in causation, nor in cure. Only a specific set is the correct set.

In the 21 Day Program a selection is made to provide the most effective set of these supplements. Their effectiveness was monitored by the Syncrometer®, blood tests, scans and assessing the general well-being of patients. As our research advances this set will change, becoming more effective and more manageable.

Here are the explanations.

Pry Out Oncogenes

Viruses are known to cause tumors in chickens and mice. But what about humans? There is no agreement amongst scientists.

The Syncrometer® detects a number (not just one) of the most tumor-causing viruses known in nearly every tumor. People without cancer carry several of these, too. This means the viruses don't act alone to cause tumors. Where do they come from and how do they invade us? We simply eat them. But instead of being killed in our stomachs, they hurry into our tissues, burrowing right into the nucleus of each cell and settling itself in a chromosome between 2 genes. It automatically gets multiplied as our DNA multiplies, which saves the virus a lot of energy.

When a mutation occurs in this virus, affecting a particular gene, the whole cell is induced to multiply. The mutated gene is now called an oncogene. There are quite a few causes of mutations: azo dyes, vanadium, PAH's, metals. As long as the viral genes are in the human chromosomes, they are considered latent. But they can be triggered into action, so that they multiply, by a variety of things. For instance, peanuts, cold and heat can trigger Herpes virus.

And nothing is known clinically that can kill these viruses once they are in our chromosomes. But 2 things have been found by Syncrometer® testing that can pluck them right out of our chromosomes: ozonated oil and Frankincense. A third item, plain sunlight or full-spectrum artificial light can pull RAS out of yeast chromosomes. How they work is completely unknown.

Since we eat the oncogenic viruses in our daily food, we can immediately become reinfected. Note these sources:

- RAS: (Bakers' yeast, bread!, rice)
- c-fos
- c-myc: (chicken)
- EBV:
- CMV:
- papilloma 16

Full spectrum light at very close range, applied to food for 20 if minutes, if wet, and 30 minutes, if dry, kills them. I believe that no human being has ever been free of latent viruses.

Stoke The Stomach With Acid

Every cancer patient without exception was seriously lacking hydrochloric acid and pepsin in the stomach. Acetyl choline, coming from the vagus nerve to stimulate the stomach into making these things was also missing. It was undoubtedly the work of elemental cobalt, which was plentiful.

Persons without cancer often have a similar problem. Now the Ascaris eggs, bacteria, viruses and fungus spores all survive and escape through the stomach walls to distant tissues. It happens in 5 minutes after eating anything non-sterile.

Especially, streptococcus bacteria spread this way, bringing pain to new places when the old places are used up. Taking HCL drops only helps for minutes. The strongest stimulus we know of to trigger the stomach to make all 3 secretions is a set of 3 supplements: ferrous gluconate, magnesium and vitamin B2. But they must be taken 5 minutes before eating your meal so enough acid is produced to kill all bacteria before you eat. Otherwise the bacteria multiply by eating your food, faster than you can kill them later.

Treat your problem religiously until you have removed the real causes: cobalt and phenanthroline accumulation in the stomach wall.

Clean The Cobalt

The seeds of fruit are often bitter due to cyanogens in them. In this way the plants protect themselves, it is thought from predators like caterpillars and cattle. So many plants have these cyanogens, including the whole cabbage family, that a special enzyme in all our cells is devoted to detoxifying them, rhodanese. Eating these foods actually triggers us to make rhodanese, according to the Syncrometer®.

The old cancer treatment, laetrile, was a 3-gram dose of amygdalin, a cyanogen. People felt better immediately after getting 2 such doses by IV. What did it do? We found that it very quickly removed cobalt from vital organs in addition to destroying malonic acid. A pamphlet, describing the laetrile-cancer treatment can still be obtained. *

There are no side effects to IV use of laetrile but it must be professionally administered.

One or two apricot kernels, 10 or 12 apple seeds well chewed, *Reference To B17 Therapy, and a glass of cabbage water (raw or cooked) will begin to take out your cobalt stockpiles. It takes 10 to 14 days by this route. But will you continue to make toxic inorganic cobalt?

Stop Sorghum Mold

This fungus seems to be the real culprit behind the release of inorganic cobalt. This simple plant can shut down the entire metabolism of a huge animal like a human. Cobalt poisons the hub, the lynch pin of metabolism, on which life itself depends. Without the ability to make ATP or fat, we must get thinner and thinner…a condition called cachexia. It is the last downhill slide for a cancer patient.

Yet one thing has been known to miraculously save the patient from a cachexia death: Hydrazine sulfate.

In just 1 to 2 days appetite is stimulated, the patient complains of hunger(!)

and real eating begins. When we explored with the Syncrometer®, we could see that fungus of every variety was being killed. And cobalt removed. What is Sorghum mold living on in our bodies? It appears suddenly wherever flukes have been killed.

Hydrazine sulfate is given in these dosages:

For an emaciated person: 30 mg once a day with breakfast for 3 days in a row. Then twice a day, breakfast and lunch for 3 days. Then three times a day with meals to the end of a month. Stop for a month.

For a moderately cachexic person: 60 mg capsules instead of 30 mg capsules.

Without hydrazine sulfate, the emaciated person must, of course, be fed by IV solutions.

We have found that Pau D'Arco is an efficient fungus killer. Echinacea, too, kills fungus. But zapping is superior to all herbs in one respect. No free metal toxins are left behind. So when time is short we use only zapping. For this purpose the zapper current must be concentrated in an area of about 6 square inches, moving from location to location.

Full Spectrum Light

Light is powerful. It consists of electromagnetic energy coming in waves from the sun. The frequencies of these waves do different things. Since all electromagnetic energy travels at the same speed, 300 million meters per second, it is easy to calculate the wavelength of any specific frequency by the formula

$\lambda f = 300{,}000{,}000$ m/s where λ is the wavelength

Plants use the frequencies near the red end of the sunlight spectrum. With this energy source they manufacture starch, fat, protein which animals greedily eat.

But animals let light enter through eyes. Different frequencies can be discerned as different colors. Is that all?

The Syncrometer® has shown that different colors affect the timing of our body's metabolism (see the *Syncrometer® Science Laboratory Manual* by this author). Light seems to interact with the earths' magnetic field, which also

regulates timing of cellular events, such as DNA production.

Light bulbs rely on very hot wire to produce light, but the frequencies of this radiation are not the same as sunlight. In fact incandescent light bulbs yield mostly the yellow-orange-red and infrared (beyond red) frequencies. The Syncrometer® detects that thiourea is overproduced in such light. In fact, although pyruvic aldehyde (the brakes on cell division) is produced in every minute, continuously. The body's scavenging mechanism is relied on to destroy the extra thiourea.

Certainly this is a sinister factor affecting cancer patients.

When the blue frequencies are added to the light, thiourea and pyruvic aldehyde alternate normally. It seems advisable to use full-spectrum light in our homes, and especially for cancer patients.

Full spectrum light is powerful enough to kill bacteria, viruses, and parasite eggs, even to the depth of an 8-oz glass. Perhaps sunlight was meant to be nature's sterilizer.

Full-spectrum light can destroy ago dyes when placed near the bulb.

Most astounding is the ability of full spectrum light to remove ferritin from white blood cells that have become coated with it after "eating" asbestos.

It takes only 10 minutes to clean an organ of this immune defect by placing the full-spectrum bulb within inches of the skin closest to that organ.

The strength of the light energy is important. Merely replacing ceiling light-fixtures, important as this is for the eyes, is not strong enough to remove ferritin.

For all these purposes, a full-spectrum fluorescent tube can be purchased to fit a fixture 18", 24" or longer. It can be placed on the kitchen counter, being held up at both ends by a stack of books.

Place all food, beverages and supplements as close as possible to the bulb (within 2 inches). Supplements can be removed after 2 minutes. Wet food can be removed after 5 minutes. But hard dry foods need 10 minutes at very close range to kill all. Foods containing Baker's yeast harbor the dangerous RAS oncogene and must be left for 20 minutes to kill them inside the yeast chromosomes. If this

is not done, they emerge as the yeast reaches moisture (in us) and begins to grow.

Cooked foods can be light-treated instead of being cooked twice.

The effectiveness of light in killing fungus spores has not yet been researched. So the food rules regarding peeling must be observed. And HCL must still be added.

And the double hot-water wash must be observed, since wax and asbestos are not destroyed by light.

Besides treating all food, treat your body by sitting close to the bulb with clothing removed, for at least 4 one-half hour sessions daily.

Do not look directly into the light with open eyes. Do not use sunglasses.

Evidently, the specific benefits of sunlight had already been noticed millennia ago (in Pharaohs' times)!

Treating diseases with specific light frequencies (colors) is one of the older natural therapies and needs reinvestigation.

It took thousands of years for society to acquire such information. Why do we, in our "scientific" mode of thought, brush it aside? Surely, professionalism is at fault. We need a lay group, without links to commerce that will evaluate and above all save such ancient knowledge. Much cannot be evaluated, but by saving it, a library of knowledge is created where investigators might browse and learn.

Make Mitochondria

Thyroid. Since all cancer sufferers need thyroid hormone supplementation for a number of purposes, it is advisable to start this immediately, as soon as it can be obtained. Remember, the Syncrometer® detects no thyroxine in tumors, thereby crippling recovery until it is obtained.

Thyroid hormones come in natural form as desiccated (dried) thyroid gland, or as synthetic L-thyroxine (T_4) or other synthetic varieties. The natural form is easy to regulate without a doctor's assistance. For this reason I recommend obtaining desiccated thyroid (see *Sources*). But it should be treated by dusting

with vitamin B_2 to detoxify any dyes or solvents present. Dip in water that has two drops of HCl per cup added to provide sterilization. Pills come in various sizes from one grain to three grains. Begin with a dose of one grain the first morning upon rising. This lets you know if it will agree with you—that you are not allergic to it. On the next day take two grains upon rising. It is not too much, so that it disables your own gland, but enough to reach the tumor cells with a significant impact.

The main purpose of taking thyroid is to stimulate the mitochondria of the tumor cells to divide and grow larger. These will be more capable of taking up oxygen so respiration can intensify to produce ATP energy. ATP energy will help make the enzymes and other cell chemicals needed to differentiate (do their kind of work). You can expect to feel an energy increase and a need to breathe faster. But this may take several weeks.

Another purpose for taking a thyroid supplement is to raise your body temperature. You may begin to feel warmer, even hot and sweating. The heart will beat faster to carry the extra oxygen all over your body. All these signs are good—unless overdone. If the pulse goes higher than one hundred, cut back on the thyroid to half the dose. This protects you from overdosing, although the results are not life-threatening. It takes about three weeks for the mitochondria to respond to the thyroid stimulation, so the sooner you can begin, the better your chance of early success. The use of thyroid was advised by early cancer researchers[90] and is still in use by some alternative therapists. Much higher doses were documented by Loeser, up to 25 grains daily for four to six weeks. They are no doubt beneficial when tolerated but should only be taken under the watchful eye of a physician.

A thyroid test of the blood can not show a deficit that is specifically present in the tumorous organ. It is, therefore, wasteful and even misleading to do the test. That is why it is not included in our blood tests. How long should you stay on thyroid supplementation? Until your tumors are gone. This may be three weeks or three months. Be patient with your body. It is working miracles for you.

Lugol's iodine solution is more than an antiseptic that kills *Salmonella*. It stimulates the thyroid to make more thyroxine, a vital part of every patient's recovery. The dose is six drops in ½ glass of water (not beverages) after each meal. Taken this way it serves both purposes at once. Do not take Lugol's solution if you are allergic to iodine.

Bust Malonic Acid

Vitamin B_{12} and Folic Acid. After seeing the sudden appearance of malonic acid in a tumor within minutes after eating some, I first tried doses of vitamin C to detoxify it. Nothing happened. I gave individual amino acids and a long list of other supplements. There were no changes. I gave vitamin B_{12} alone or folic acid alone. Nothing happened. But when I gave B_{12} and folic acid together in large amounts the malonate disappeared and methyl malonate was in its place within ten minutes. We could begin to mend the metabolism of the tumorous organ by giving 6 mg vitamin B_{12} and 25 mg folic acid. Anything less would allow malonic acid to persist.

Vitamin B_{12} is needed in amounts much larger than was thought necessary in the past. In fact, cancer patients have a serious deficit. Some of the body's deficit is due to constant malonate detoxification. But some may be due to Ascaris parasites. They eat it—even turning pink from it! After eating it, the organic cobalt in the B_{12} molecule is turned into toxic inorganic cobalt. A flood of cobalt in the liver causes globulin levels to rise (leading to multiple myeloma). For this reason B_{12} is not given until your Ascaris parasites have been killed—on Day 1. The Syncrometer® detects no B_{12} in the tumorous organ until 6 to 12 mg have been given for several days. A new sense of well-being is often noticed by the patient after taking B_{12}. It has been believed that B_{12} will not be absorbed if given by mouth. This may be true for certain "pernicious anemia" cases, but cancer patients make good use of it. The injectable variety is too often polluted with antiseptic to risk.

Vitamin B_{12} and folic acid have been extensively researched in connection with cancer. Deficiencies are conducive to tumor formation[91] according to most researchers. Since both vitamins are essential for cell health and cell division, a popular clinical approach to cancer treatment is to withhold them until tumor cells die. This works as long as the body is strong enough to recover from the systemic effects. But at the "terminal" or "hopeless" stages this no longer makes sense. It is wiser now to turn around at lightning speed and supply all the nutrients in massive amounts. Survival should come first.

Rapid Rescue

Glutathione (GSH), single-handedly can improve a semi-comatose condition.

The powerful chemistry in this molecule can be seen when the terminal event has already begun. It can be compared to water. The power in the simple water molecule can only be seen in a severely dehydrated person, someone who has collapsed on the desert without water to drink. Only water cures and the amount must be large. The amount of glutathione must also be large.

When a dying patient cannot be fed by intubation or IV and only one supplement can realistically be given, glutathione is the choice. Thirty capsules, 500 mg each, can be quickly snipped with scissors and dumped into straight honey to make a goop or honey-water to be drunk. This is 15 gm. Given daily, it can salvage a loved one more quickly than any other non-clinical treatment.

The molecule is just a simple tripeptide, meaning only three amino acids are linked together to form it (glutamic acid, cysteine, glycine). It is known that the body makes it readily; therefore, there should be no need to supplement. Yet, for the extremely ill cancer patient, glutathione is a necessary supplement, and in very large amounts.

Glutathione detoxifies metal, somehow raises immunity, and supplies sulfur.

Supply More Sulfur

Cysteine and Methionine. Text books teach that methionine can be converted to cysteine and only methionine would really be needed. Yet, in a very ill cancer patient, I find giving methionine does not produce cysteine. Both must be given. It takes rather large amounts, not skimpy amounts as in regular supplementation. The criterion of effectiveness used is when the Syncrometer® detects its presence—and its staying power—in the sick organ. Cysteine gives a quick diuretic effect, too, very good for any sick person. Cysteine can trigger the liver to quickly regenerate, so new normal liver is made to tide over the liver cancer patient while tumors are being shrunk. We typically see a lot of regenerated liver on a scan after three weeks of this supplement. A liver full of tumors is not lethal as long as some good liver is present to do the body's manufacturing. Cysteine was researched by scientists decades ago and found beneficial in certain cancers.[92] We use it to supply reducing power, detoxifying power, a sulfur source, an iron mobilizer, and as a parasite killer! It kills parasites and bacteria whether inside the body or outside, provided a correct dose is taken. Methionine supplies methyl groups. A shortage of these was found to be particularly severe when weight loss had set in, a fact also noted in recent

research.[93]

Taurine is thought to be made from cysteine. But in the cancer patient, taurine is deficient even after giving cysteine. The body needs taurine—at least to detoxify cholesterol and steroids. It is even possible that a deficiency of taurine allows the mis-biochemistry of *Ascaris* parasites to occur, so mutagens are formed. Perhaps if there were plentiful taurine, cholesterol would be detoxified properly. Taurine is especially helpful in lung cancer when formaldehyde has been one of the toxins in the home.

Crank The Krebs Cycle

Pantothenic acid, or pantothenate, is another sulfur compound. It is used by the body to make coenzyme A. Without coenzyme A many links to the Krebs cycle are missing. Coenzyme A is regularly missing in tumors, according to the Syncrometer®. It is probably being siphoned off as malonyl CoA, oxidized by phenol to a useless oxidation product, or disabled by cobalt toxicity. To make more coenzyme A–much more–pantothenate is given in teaspoon doses.

Coenzyme Q10 and thioctic acid are part of the oxidation chain (respiration) in our cells. This means they can accept an electron that has been pulled away from a food molecule, hold it for a moment and pass it to another molecule willing to accept it. The electron is being passed along like a hot potato and with each change of hands, more energy is released to our advantage. A large dose of Q10 (three to four grams) can also kill tapeworm stages and detoxify dyes! When dyes have accumulated in our fatty tissues such as the skin, it must be taken in a large dose daily.

Biotin is a factor needed to make certain enzymes work. It is necessary to make fat and to use stored fat. It is missing in tumorous organs. It must be taken in large amounts before it becomes detectable here by the Syncrometer®, though it is present in all other organs. By large amounts I mean several milligrams (mg), whereas most biotin supplements are in micrograms (mcg, which is one thousandth of a mg).

Niacin and Niacinamide. Both forms can be used by the body to make the NADs. NADs work with enzymes that do oxidizing and reducing, and are essential. The NADs actually handle the electrons, pulling them away from some compounds and giving them to the next oxidizer in the chain. We have two

major NAD systems: NAD and NADP (NAD-phosphate). The N stands for niacin. The A stands for adenine, a purine base. After an electron (plus its partner, hydrogen, H) has been picked up, it is written NADH or NADPH (which are reduced NADs).

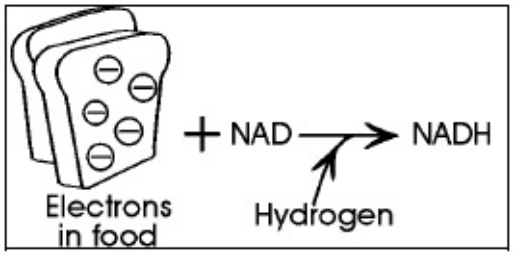


Fig. 30 Food electrons captured by oxidized NAD

The Syncrometer® never detects NADH or NADPH in a healthy organ in the morning. Evidently, the electron (and hydrogen) are passed on to the next recipient so fast that it is never in the reduced state long enough to be detected. But in a tumor, the reduced forms are always present. Obviously, there is a serious slowdown of oxidation. Late in the day, after 5 PM, even healthy organs in elderly people can build up some NADH and NADPH showing, perhaps, the effect of age on our metabolism.

Often a tumorous tissue shows neither the oxidized NADs nor the reduced NADHs. This suggests an absolute shortage. Low NAD levels were the result of feeding the dye, DAB, to animals in 1940.[94] Although our 21 Day Program removes all synthetic dyes, perhaps the damage is done and the parts are now missing that are needed to make the NADs. Fortunately the N-portion is easy to provide.

The N-portion can be provided by a supplement of either niacin or niacinamide. The problem with taking niacin is the "niacin flush." Some people flush with a dose as small as 25 mg. The face feels hot and turns red. Neck and arms may turn red and itch also. All this lasts five to ten minutes, sometimes followed by chills. It is harmless and perhaps even beneficial. But for this reason, only a small dose is given, a pinch, three times a day, with food. Niacinamide does not cause flushing and can also increase NAD levels. So a larger dose of niacinamide is given, 500 mg, twice a day. The problem with niacinamide is that it is a methyl acceptor. It seems wise to minimize supplements that use up methyl groups since there is a general shortage of these.

These doses of niacin and niacinamide lead to prompt replenishment of both

NAD and NADP levels. Of course, this does not correct the oxidation flaw.

Raise Reducing Power

Vitamin C detoxifies methyl malonate, restores ferrous iron, and adds reducing power to your body's chemistry. But it should be balanced with the use of oxidizers (which we do).

Vitamin C is known to prevent scurvy in humans by making strong connective tissues like bone and skin. About a dozen more functions have been studied by scientists.

Vitamin C is probably the most popular and frequent supplement used. So I want to discuss safety for a moment. Any supplement used daily should be as safe as food and water. Even the smallest amount of pollutant becomes more important due to daily accumulation of whatever toxins are present. Food and water have a safety feature built into them—they are both changed in source and variety during the day. A vitamin or mineral tablet, on the other hand, stays the same, bringing with it the same processing pollutants day after day after day.

Processing must introduce pollutants. It is in the very nature of processing, even when so simple a process as just mixing is done. The bins and vats must all be cleaned and sterilized. The sterilizing solutions themselves are not safe and pollute the product in trace amounts. No one should be given supplements that have not had a final analysis for heavy metals (particularly lanthanides), solvents, and synthetic dyes. Cancer patients, especially, suffer from the least amount of toxicity; it's a matter of life and death for them.

There are a lot of vitamin C varieties on the market, but I can only recommend L-ascorbic acid (straight vitamin C) because it has the least amount of processing. I don't even recommend the tablet form of plain vitamin C because the extra ingredients that must be added to make tablets may inadvertently pollute the product.

Vitamin C is often marketed for children. Be particularly cautious of those. Is that flavored, chewable, or "better than regular vitamin C" really worth taking a risk?

Thulium pollution, especially, concerns me. Both the Syncrometer® and independent laboratories have detected it in some vitamin C varieties. Thulium is

a rare earth (lanthanide) metal. Lanthanides have recently been shown to cause extensive mutations, with thulium in the lead.[95]

There is yet another reason for sticking to plain vitamin C. As soon as you do any kind of chemistry with it, like "buffer" it with calcium, you create oxidation products. These are sometimes called ascorbic acid "metabolites," and have not been well researched. But excessive oxidation products of vitamin C have been found in the blood of diabetics, in the lens during cataract formation, and in aging in general.[96] Adrenal and kidney tumors have been implicated, too. You take vitamin C for its reducing power. Why ingest a form that is partly oxidized?

Oxidize the Bad Guys!

Although the current emphasis is on reducing chemistry, (antioxidants), at least one early researcher thought the problem in cancer was a missing Mystery-oxidizer. Dr. William E. Koch thought that older persons lacked certain oxidizers that children had in abundance. This allowed toxic amines to interfere with regulation of cell division. So he designed three "super oxidizers" that could be taken safely in microgram (homeopathically small) amounts: benzoquinone (BQ), rhodizonic acid, and glyoxilide. I have seen that a single dose of BQ can kill fluke, *Ascaris* and tapeworm stages, all bacteria, and can destroy mycotoxins, as well as oxidize metals, truly a magic bullet. Unfortunately, the cancer patient is not strong enough to survive such a "blitz"—a serious crisis might follow. I prefer rhodizonic acid which is less powerful and without after-effects. A 10 mg dose in 1/8 cup water is held in the mouth for 5 minutes before swallowing. Six doses a day is typical.

The Syncrometer® does indeed detect BQ and rhodizonic acid in children and healthy tissues of adults, but never in the presence of *Ascaris*.

Busy B's

Vitamin B_1 is thiamin. Since slow oxidation of food limits the availability of ATP energy, helping food oxidize in any way is important. Cancer patients become emaciated as the disease becomes terminal. Part of this is due to not eating. There is no appetite. In fact, there may be revulsion toward food. The patient shoves everything away except water. The liver dictates this behavior. Perhaps it knows it can't digest. It takes a large amount of thiamin and other digestive "help" to persuade the liver it can digest food. It takes 500 mg taken

with each meal to increase appetite.

Vitamin B_2 is riboflavin. Besides being part of the oxidation chain that metabolizes food, B_2 has a number of other activities. It is a detoxifier of azo dyes[97] and benzene. The Syncrometer® detects the disappearance of benzene within minutes after taking a large enough dose of B_2. But it is only changed to phenol, halfway to complete detoxification. So vitamin B_2 is taken with magnesium to detoxify phenol as well. Phenol is extremely destructive, oxidizing our vitamin C, our sulfur-based enzymes, and even vitamins.

Vitamin B_6 helps enzymes that transform amino acids, called transaminases. It is a vital function of the liver. In fact, if transaminase levels in the blood are high, it shows these enzymes were dumped by the liver—due to dying liver cells. Unfortunately, bacteria also make much use of B_6, so we have kept this supplement low, only 250 mg, twice a day.

Assist P450s

Glucuronic acid: This is used by the body as a detoxifier, especially for the hemoglobin salvaged from old worn out red blood cells called bilirubin. It helps the liver detoxify bilirubin and avoid jaundice. It is said to be present in the popular Kambucha tea. Such tea if used should be prepared very carefully, to prevent bad molds from growing. Glucuronic acid also assists the P450 system of detoxification inside cells.

Kill Bacteria

With the immune system down, a cancer patient is as helpless as an infant in a burning building. So food and fingers must be sterilized before eating. Use these five systems to kill the truly harmful parasites and bacteria.

Lugol's iodine. This is curative for *Salmonella* infection, the most common cause of stomach discomfort or bloating. Do not take if allergic to iodine. Also use Lugol's as mouthwash, hand wash and general disinfectant, diluting 1 drop in a cup of water.

Colloidal silver, homemade (see *Sources*). Six drops on tooth brush after meals. One tablespoon as mouthwash, gargle. Swallow. Is particularly effective

against *Clostridium*. Use one to four tbs. for pain, up to ½ cup in acute situations.

Oregano oil, of the variety *Oreganum vulgare* specifically kills *Clostridium*. To penetrate a tumor, though, you must use 20 drops three times a day for several days. To avoid burning your tongue, put them in an empty capsule and swallow. Any drops on the outside should be washed off. You may have bread and a beverage with it.

Cysteine.1/8 teaspoon per quart clear liquid kills parasites and bacteria. Use twice as much if liquid has particulate matter. This will not kill *Toxoplasma* or *Leishmania*, though, which are also found in plain dirt. To kill these an equal amount of salt must be added. Cysteine and salt is particularly compatible with buttermilk, yogurt, blended cottage cheese, and eggs. One tsp. cysteine (4000 mg) by mouth kills many parasites and bacteria internally; consume within ½ hour, may cause temporary side effects at this dosage. Eat solid food afterward to reduce side effects.

Hydrochloric acid (HCl 5%), 3 drops in a glass of water three times a day kills bacteria in the stomach, but also reaches the gall bladder to help the liver kill its bacteria. Do not take straight in mouth—it dissolves teeth.

Kill Leftover Pathogens

Betaine hydrochloride. This is the only supplement we know that can clear the intestinal tract of Clostridium bacteria; therefore it is essential to your recovery. Betaine will not clear Clostridium from your teeth. It is also a methyl group supplier.

Ozonated oil can distribute itself to locations where ozone as a gas or ozonated water cannot reach. It can detoxify benzene in the body (changing it to phenol) similar to the action of vitamin B_2. We have seen it kill various bacteria and viruses when monitoring with the Syncrometer®. Even *Leishmania* and malaria parasites have disappeared after several weeks' use but more research is needed to confirm this, and also to establish a mechanism of its action, as well as a level of safety.

I have found that it does not oxidize vitamin C into breakdown products in the body. But it does oxidize some vitamin E. For this reason a supplement of

vitamin E should be taken 5 hours after taking ozonated oil. If it is taken sooner than this, the ozonated oil is neutralized before it has completed its action. Until more is known, caution is advised; use only with the mop-up program and liver cleanse (not as an ongoing supplement).

It must be sterilized, preferably before ozonating (2 drops HCl per cup, shaken), since most oils on the market are contaminated with *Ascaris* eggs and larvae.

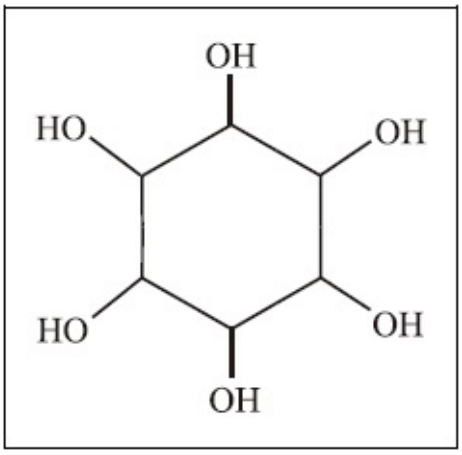

Fig. 31 An inositol molecule, pretty as a snowflake!

Inositol is a sugar-like compound with unique features. It is ultra-oxidized in having six molecules of oxygen attached to itself. It is missing in organs that are infected with bacteria. But when inositol is eaten, it is immediately transformed into two new molecules. The Syncrometer® now detects rhodizonic acid and L-ascorbic acid!

Could eating inositol regularly provide this "mystery oxidizer" that seems to be lacking in adults, just as Dr. Koch imagined? And would it keep us deparasitized and detoxified automatically?

It is also baffling in a second, more obvious way. We have been taught that humans cannot make their own ascorbic acid. Yet here we see it appear from a precursor compound. It is as if internal oxidation-reduction occurred in the inositol molecule, producing rhodizonic acid, an oxidizer and ascorbic acid, a reducer. More research is needed to confirm this.

Inositol Phosphate is formed after six phosphate molecules have combined with inositol, one at each OH. This makes the new molecule (popularly called IP6) quite acid and able to combine with the calcium deposits created by

lanthanides. Remember, calcium deposits prevent the digestion flag to appear. Tumor cells do not have IP6, although others do. Although removing lanthanides is most important, we can speed up removal of calcium deposits by giving IP6, also called phytic acid. Take 10 drops of a 50% solution, three times a day, in ½ cup plain water before meals or water with inositol added.

Wintergreen oil (natural only, not distilled or synthetic) is another mysterious helper that needs more research. I believe it seeks out tumors, turning them into cysts with liquid centers, as seen on a scan. Take three drops, three times a day (excess is toxic). It is also a traditional tumor shrinker.[98]

Restore Major Minerals

Calcium. There is a serious deficit of calcium in all cancer patients even when tumors themselves have too much and blood levels are much too high! But we cannot give more while blood levels are too high, called hypercalcemia. The problem in this case is in the thyroid gland. As soon as the thyroid problem, itself due to toxins and bacteria from teeth, is corrected, the calcium level may plummet, revealing the true shortage. Only repeated blood tests would show you this sudden change, in time to treat the hypocalcaemia (low levels) that suddenly develops. The amounts we recommend are in the 21 Day Program. Don't exceed the program because taking too much calcium could precipitate it in the wrong places. Excess calcium could even trigger cell division in some settings. Be sure yours is lead-free (ask for an analysis).

Magnesium (oxide) should be taken as a powder, like calcium, to help it dissolve in the stomach. Taken as a powder, it does not cause diarrhea. It is a major enzyme activator. There is a severe deficit in cancer patients. Magnesium helps to detoxify phenol. Phenol is produced by *Streptococcus* bacteria, and also comes from benzene. Phenol is even produced during digestion by the liver. High doses of magnesium are needed during the time when benzene, dyes, and plasticizers are being mobilized from the body tissues and newly opened tumors. After this, a lower dose may be taken. Take at the beginning of meals. Magnesium also reduces anxiety, relieves pain, protects the heart, and stops spasms of many kinds.

Potassium gluconate. There is a severe deficiency of potassium in the tissues of a cancer patient. Even ½ teaspoon of potassium gluconate powder, which contains 240 mg potassium, taken three times a day does not bring up the level

to its correct value for several weeks. The level should be 4.6 or 4.7. But no higher. For this reason, you should not exceed ½ teaspoon three times a day, and must monitor your blood at least every three weeks.

All cancer patients need supplementation with potassium even when the blood level is not seriously low, for example, 4.1. The blood level does not tell the whole story—that cellular levels are really much too low. But when the blood level is above 4, a lower dose of ¼ teaspoon, taken three times a day with food (it has a slightly salty taste) is more suitable.

Potassium is a respiration stimulant, causing increased uptake of oxygen, exactly what is wanted to restore health to the tumorous organ. After a blood level of 4.7 is reached, stop. Never take potassium gluconate for more than 3 weeks without getting a new blood test.

Always use a measuring spoon to portion out powdered supplements.

To find the equivalent dose in capsules, empty capsules into a measuring spoon and record the number used.

Get the Ammonia Out

Ornithine and Arginine. When an organ is besieged by bacteria it is overwhelmed by the ammonia they make. Ammonia is the same fume that comes from a diaper pail. Our livers can detoxify it very quickly, but not other organs because they can't do the chemistry called the *urea synthesis cycle*. Other organs must ship any ammonia made in them to the liver.

In the urea synthesis cycle two molecules of ammonia are pinned together with a carbon dioxide molecule to make a single urea molecule. Urea is odorless, tasteless, and harmless. Urea can be excreted easily into the bladder, but it is useful in several ways before it is excreted. It helps to keep the osmotic strength of the blood up so liquid cannot seep out and cause edema. Urea in pure crystalline form (28 grams in a liter of water in one day) is often given by mouth to cancer patients in alternative treatment centers, especially for liver cancer (provided the blood level of BUN is not already too high). It is well tolerated and does not raise the BUN for several weeks, after which it can be stopped.

Ornithine and arginine both play a role in the urea synthesis cycle probably

expanding it and speeding it up and thereby helping the liver detoxify the whole body from ammonia. It is like supplying more trucks and wagons to do a hauling job. Removing ammonia returns each cell to a less alkaline state, giving strength to the cells' own ability to kill bacteria (lysosomes must keep themselves acidic). Arginine is particularly beneficial in combating Clostridium bacteria. But it takes a lot of arginine to keep up with the ammonia production of a moderate Clostridium infection. Three tablespoons was needed at first to control *Clostridium* in tumors. After finding the real source of *Clostridium* (Rabbit fluke and tooth microleakage) and getting rid of them, we could reduce the dose to one sixth of that!

There may be an actual shortage of ornithine and arginine in the tumorous tissue because these amino acids are consumed in the manufacture of *polyamines*. During cell division large quantities of *diamines* and polyamines are made to somehow satisfy the needs of chromosomes. The enzymes, arginase and ornithine decarboxylase, makers of these polyamines, are always working overtime (remember that cobalt stimulates arginase) in cancer patients and using up arginine and ornithine. This way a shortage of arginine and ornithine could easily develop and stall the urea synthesis cycle. This would worsen the ammonia buildup, ruin cells' immunity, and allow a runaway *Clostridium* infection.

When you begin to feel sleepy by daytime, the ornithine dose can be reduced but not the arginine dose.

Supply Amino Acids

Essential and Nonessential Amino Acids. Amino acids are the building blocks for protein. Essential amino acids are the ones that the body can't make. Non-essential are the ones that it can (when the person is healthy). But cancer patients have a considerable handicap in interconverting (making) amino acids. Often none or just a few are detected in the tumorous organ. This could also be due to lack of ATP energy to operate the transport mechanisms that pull them into the cells. To heal, cells must have amino acids, they cannot wait for health to improve first. So don't be deceived, even the "non-essential" ones are essential to you right now.

The recipe for a "mix". There are 19 ingredients altogether. It takes large doses before they are detectable by Syncrometer®. And they will not stay present

unless taken daily for a few weeks.

Instead of chicken broth, we now use the broth of Rock Cornish hen or turkey. All chicken samples we tested carried the c-MYC oncogene as well as another virus that we dubbed.

Raw Chicken Virus All cancer patients tested carried both of these. Rock Cornish hen and turkey did not carry them. Cooking did not kill them. Cooking plus 10 minutes full-spectrum light did kill them. It seems much too risky to eat chicken.

It is, of course, not the fault of chickens. They would prefer to be well too. Their feed, if made of animal refuse, could bring them these oncogenic viruses.

Both shark cartilage and chicken broth help cells replenish their amino acids in days, not weeks; perhaps this is due to the RNAse inhibitor they contain.

Shark Cartilage helps replenish RNAse inhibitor and amino acids as well as providing other factors. But it must be sterilized with cysteine-salt water ($^{1}/_{16}$ teaspoon each per cup liquid) or by adding HCl drops (see *Recipes*). Not many brands have RNAse inhibitor present. It must be a casualty of processing. For this reason we always add chicken broth to the cancer program besides shark cartilage.

Glutamic acid is a very versatile amino acid and can be transformed into other amino acids. By picking up ammonia it changes to glutamine, which has further uses. One use is making purines, which in turn makes uric acid. So when your blood uric acid level is low it indicates a need for glutamic acid. I recommend taking glutamic acid separately from the "mix" because so much more is needed. A large dose, 1 tbs. three times a day, often brings a sense of well being immediately.

Glycine is the simplest of all amino acids and for this reason can be made from others, and it should therefore never be low according to classical textbooks. But I find cancer patients don't have it! Glycine is used to make creatine, which in turn makes creatinine. So when your blood creatinine is low, I believe there is a shortage of glycine. In addition to the "mix," take ½ tsp. three times a day if creatinine levels are below 0.8.

Stop p53 Mutations

Organic germanium (not inorganic) can stop p53 mutations. **Hydrangea root** is one, but not the only, source of organic germanium. Garlic and ginseng are said to have a lot. Most plants have a tiny bit. And we should not need a lot. The Syncrometer® finds it also prevents hCG from appearing even in the presence of isopropyl alcohol, suggesting that this, too, is the result of a mutation. So it is wise to supplement. Remember, good germanium can be turned to bad just by getting a dose of benzene or asbestos. And the bad germanium may be cooperating with dyes to cause enzyme mutations—raising LDH and alkaline phosphatase while lowering tributyrinase and blood iron. So it is wise not to supplement too much. Commercial varieties of organic germanium were found to be impure and are not recommended.

Organic germanium is known to reduce T-suppresser cells and elevate T-helper cells. It also produces interferon. The Syncrometer® detects that it controls viral integrase, the enzyme that can lock out viruses from your DNA.

You may make the hydrangea root into a tea, as in the kidney herb recipe, doubling the amount of hydrangea. Or use as powder for three weeks.

Return Immunity

Papain and bromelain are plant enzymes often used to help digestion. I use them because they can digest the ferritin off white blood cells (at least papain has been studied in this regard,[99] bromelain was discovered by Syncrometer®). Previously when we discussed ferritin, it was the hero that sacrificed itself to surround the villain asbestos. Why are we now trying to digest it? Because there is a drawback to using ferritin. Ferritin as it coats and smears the outside surface of white blood cells inadvertently "blinds" them.[100] Their surface has the receptors, which sense enemy molecules, acting as their "eyes and ears." Digesting ferritin lets the white blood cells regain their "sight." They can now find other white blood cells to pass their toxic cargo to,[101] which is the normal method.

Now tissues can be cleared of asbestos much more quickly. And excess damaged ferritin is no longer present, exposing its ferric iron, which was oxidizing good germanium. Immunity has returned.

We give 1 tsp. papain twice a day in a beverage before meals. (Be careful not to inhale it, you could start an allergic reaction.) Bromelain is much more palatable, though less effective. You can use 1 tsp. (4000 mg) two times a day instead of papain. But in serious illness use both.

Selenium can be detected by the Syncrometer® as sodium selenite in healthy organs, never as selenate (so I assume that is the beneficial form). But in the presence of ferritin coated white blood cells or phenol or Ascaris produced chemicals, only the selenate form is detected. It switches back to selenite as soon as the above abnormal oxidizers are gone. Lack of selenite stalls the unloading from White Blood Cells. They seem to be bursting with high bacteria and toxin levels soon after ferritin and lanthanides are gone, yet unable to dispatch and unload these until large amounts of selenite are consumed. It typically requires 3,000 to 4,000 mcg daily for 3 weeks. Fresh coconut is a good source after that, when much smaller amounts are needed. Selenite can be detected now when one half coconut is eaten for three days straight. If raw coconut is not available, continue taking sodium selenite, but at a reduced level, 1000 mcg a day, for several months after all tumors are gone.

Bring Back Iron

Methyl sulfonyl methane (MSM) is a powerful substance that can return your ferric iron and bad germanium to ferrous iron and good germanium! Even while asbestos is still present and ferritin has coated the white blood cells! Use ½ tsp. twice a day for 3 weeks. Double this dose if severely ill. This will not remove asbestos or dyes.

Supply Missing Growth Regulator

Vitamin A is a growth regulator. The gene that allows it to be transported and absorbed is always mutated when azo dyes are present, according to the Syncrometer®. Vitamin A, *retinol binding protein* and *retinoic acid receptor* are all absent in the tumor.

The truly effective dose is 100,000 I.U. a day. It forces open the cells' lysosomes so powerful enzymes are released, your oxidizers. Palmitate and acetate forms are usable. You will certainly get hypervitaminosis A (scalded looking skin or peeling) from this dose taken daily; it is the result of so many opened lysosomes, not truly serious. But you can also get good results from

taking this dose intermittently, such as 3 days ON, 3 days OFF. Do not exceed this dosage without a doctor's assistance.

Beta carotene is the precursor to vitamin A. Phenol produced by streptococcus bacteria oxidizes it so no vitamin A can be made. Correcting the phenol problem allows instant return of both beta carotene and vitamin A. This conversion does require zinc, so a zinc supplement is part of our program. Vitamin A is easily destroyed even after supplying it as a supplement, so it seems wise to give beta carotene as well.

Lick the Lanthanides

Although heavy metals will leave by themselves after using ozonated water and many sulfur-containing supplements, lanthanides will not. The lanthanides are a group of 15 elements listed in the periodic table beginning with lanthanum: lanthanum, neodymium, praseodymium, samarium, gadolinium, cerium, terbium, europium, dysprosium, holmium, erbium, thulium, ytterbium, lutetium, promethium. They have special properties: their magnetic nature,[102] their high molecular weight, their similar chemistry (so similar they can hardly be separated from each other), and their affinity for tumors.[103] Their magnetic properties are why lanthanides are used to make "ceramic" magnets, much more powerful than iron and steel magnets of the same size. That is also why they are used as "contrast" materials for MRI and CT scans, especially gadolinium. Surprisingly, the Syncrometer® detects not only gadolinium, but all the lanthanides together in contrast materials. Were they never truly separated in the production process? Each cancer patient is getting dose after dose of all the lanthanides by injection!

Lanthanides do special damage.[104] They cause calcium to deposit in cells. This triggers the enzyme, protein kinase. And this signals cells to divide! At the same time, white blood cells that begin to eat up the lanthanides are disabled by the very same calcium buildup and must stop eating them. So lanthanides accumulate. Cells that are filled with calcium deposits get stiff—too stiff to move about. And too stiff to put up the acute distress signal. The signal, a molecule of *phosphatidyl serine*, should be sticking out of the cell surface to attract pancreatin. Normally, pancreatin would digest such a cell and no tumor could form. We never detect pancreatin in lanthanide-loaded cells, although it is present in all other tissues, especially high after eating. So neither white blood cells nor pancreatin is capable of removing a tumor! Not without special help.

Yet the Syncrometer® has found what helps.

- a very tiny patch of low strength magnetic material (see *Sources*), and
- a high strength magnet.

The small patch should not be too strong (not over 100 gauss, which is the unit of measurement for magnetic field strength). It should be ½ inch wide and about 1 inch long. It should be placed lengthwise over the centerline that you can draw along your spine. The back of your neck is convenient. The North side of your patch is placed against your skin. Tape it down securely with cellophane tape. Patches as small as a few gauss need recharging by a high strength magnet after several days. Patches as high as 100 gauss might last a year before needing a charge.

The high strength magnet should be a ceramic block with a strength between 1000 and 4000 gauss. Keep it away from delicate instruments since they could be instantly ruined.

Determine which is the North side of your magnets even if they come already labeled. This means the side that attracts the end of a compass needle pointing North. You must be certain of this; place the compass on a table; it will soon settle down and point northward. Identify the tip that points North. Now bring your magnet, slowly, toward the compass, with one side of your magnet facing the compass. Find which side of your magnet pulls the compass needle tip pointing northward. Label this side of your magnet North. The opposite side is South. (These instructions are using the "biological convention" in labeling.)

The main purpose of the small magnet is to pull iron and lanthanides out of your tissues; this includes excess ferritin that coats your white blood cells. These two effects raise your immune power. Soon bacteria can be devoured again and the white blood cells fill up with asbestos, lanthanides and bacteria, evidence for their ability to devour them again.

The high strength magnet has more purposes. It will stop DNA production by *Clostridium* without disturbing your own. To achieve this you must sit on the N pole for ½ hour daily (not more).

Do not position the magnet over the heart. Do not use the high strength magnet if you have a pacemaker.

Remove Calcium Deposits

Vitamin D can induce inositol phosphates IP6, IP2 and IP3 to appear in the correct ratios even when none were there before. This results in disappearance of calcium deposits much faster than if using only the magnet. A hard bony tumor may begin to soften in a few days. Use 25,000 units of cholecalciferol daily for 21 days. No more. It can be toxic. Use only if calcium levels are below 9.7. Vitamin D is a known differentiator, causing cells to "get to work" making the right proteins.

Digest the Tumor

Enzymes, including pancreatin, lipase, DNAse, peroxidase, and catalase are produced by the body in large amounts. The Syncrometer® detects all these in every organ. But not in the tumor or its white blood cells.

We have been taught that digestive enzymes stay in the digestive tract. And that eating them would do no good since they would be themselves digested. This may be partly true, but only partly. The tumor can be deluged with pancreatin and lipase by taking 1 tsp. of each between meals 3 times a day. "Enzyme therapy" was discovered long ago by cancer therapists and was built into several alternative programs. But will the flood of enzymes digest the tumor? Only if lanthanides and the calcium deposits they cause are gone, so the cell "flag" may be raised, saying "I am ready for digestion…come and get me." The flag, phosphatidyl serine appears on the cell surface when calcium deposits, particularly calcium triphosphate, are gone. At this point the enzymes are exceedingly swift. In one week a large bite can be missing from the tumor.

We use horseradish sauce (Heinz brand) to supply peroxidase and catalase since the dried herb is missing catalase. Use three tsp. daily on food.

Intravenous (IV) Supplements

If you are a caregiver, you might notice that in spite of all the good intentions your patient has to eat and take supplements, day after day passes and it simply does not happen. There are reasons beyond anyone's control for not eating. If your patient continues to lose weight, they are not eating enough. Provide the richest, highest calorie food you can. Prepare it in the most appealing way you can. But if they have not eaten food for two days, you must give IV feedings.

The IV feedings should include fat and protein, not merely sugar. It is common practice to give terminal cancer patients dextrose-water (glucose/sugar) alone as nourishment. Perhaps it seems justified to clinical personnel since better nutrition would only delay the final event. I recommend an intensive feeding program including a liquid amino acid mixture and a fat emulsion (see *Sources*). If blood albumin levels are low (below three), a bottle of albumin should be given daily as well (alternate days as condition improves). Along with these nutritional IVs, hefty doses of vitamins and minerals should be given (see IV *Recipes*).

Fig. 32 Good IV bottle and filter

Unfortunately, I find that the IV bags and bottles of injectable supplements are often polluted with antiseptics, heavy metals, bacteria and even *Ascaris* eggs and larvae! The bags themselves seep plastic because the Syncrometer® finds polyvinyl chloride inside (a carcinogen!). For this reason we use only glass IV bottles. Since you cannot test easily for bacteria, you should give each 500 ml IV bottle one ml of ethyl alcohol (either 76% or 95%) to kill Coxsackie viruses that

are often present. To eliminate bacteria and parasites, run the IV tube through a five micron (5µ) syringe filter placed "in line." As for isopropyl alcohol or benzene, you are taking a chance—it is simply a gamble. But it is better than doing nothing.

This is our "minimum nutrition" list for IVs.

- Fat emulsion (1,000 ml, Intralipid™ 10% see *Sources*) Use ½ or whole bottle a day.
- Magnesium (10 gm/20ml) use 2 gm in a day. Gives pain relief. Stops spasms.
- Potassium chloride (149 mg/ml) use 2 to 4 ml a day.
- Vitamin B-100 complex, use 5 ml a day.
- Amino acid solution (1,000 ml, with electrolytes). Give ½ or whole bottle in a day.
- Vitamin C (L-ascorbic acid, 500 mg/ml), 25 gm up to 100 gm in critical cases. Use calcium and magnesium injectables to neutralize acidity.
- Calcium gluconate 10% (50 ml) use 25 ml when blood level is below the normal range. Use together with vitamin C to help neutralize the acidity.

Note: if you do not sterilize the vitamin C, amino acids, B-complex, and fat emulsion, and filter them, you will be introducing the very pathogens you are trying to clear!

These supplements are added to IV bottles of saline (salt) or dextrose (sugar) depending on which is lowest on the blood test. If both are low, glucose (50%) is added to a saline IV bottle to give both at once.

Note that no oxidizers are included in this regimen, nor sulfur compounds. It is quite inadequate, but may tide your patient over the first few days, when a small improvement makes the critical difference. As soon as your patient is willing to drink chicken broth instead of water, you have gained ground.

Additional IV treatments may be used in other situations.

- Procaine, use 5 to 10 cc of 2% solution (the preferred painkiller).
- EDTA, single dose, (3 gm) to remove heavy metals.
- Laetrile (also called amygdalin, 3 gm/ampoule) use 2 to 3 ampoules a day.

Available in Mexico.

- Vitamin K, 5-10 mg a day to reduce bleeding.
- Vitamin A (25,000 to 100,000 IU/day).
- Albumin (use a one dose bottle, 12.5 gm in a day).
- Rhodakem, 2 to 6 vials a day (can also be taken by mouth) (product includes rhodizonate). Available in Mexico.
- Glycyrrhizin, 30 ml, especially good for liver cancer.
- DMSO, 5 ml (100%) increases penetration of other supplements. Differentiates (normalizes) tumor tissue.[105]
- Cesium chloride, 3 gm a day at first. Then 6 gm daily unless nausea occurs.
- Insulin, rapid acting, 15 to 30 U along with 100 ml of 50% glucose. (Must watch patient for signs of hypoglycemia.)

Each bottle must be tested separately for heavy metals, dyes and solvents.

Fig. 33 Assorted supplements given by IV

IV treatments speed up tumor shrinkage. They are life-saving when the liver can no longer detoxify what is coming out of the tumors as evidenced by rising LDH, alk phos, GGT, etc. If you are very ill, choose IV therapy to help your body survive each opened tumor; it could take 5 weeks!

Many details of good IV therapy are given in the book *Intravenous Nutrient Protocols in Molecular Medicine* by Majid Ali, MD, Denville, NJ, USA, 1994.

How To Take Your Supplements

Taking some supplements out of the capsule reduces the queasiness and discomfort from dozens of capsules bouncing around in your stomach. Capsules can be cut in half with scissors and dumped into foods or mixed with straight honey or maple syrup to make "candy". Always add spices (natural herbs only, commercial varieties may have added dyes!) to such a concoction. But you need to be warned which supplements taste like burning rubber tires or worse so you can leave these in their capsules. Here is my assessment of taste.

Supplements that taste terrible: glutathione, methionine, thioctic, amino acids, niacinamide, papain.

Supplements that taste quite bad: taurine, B vitamins, ozonated oil, vitamin C, shark cartilage, MSM.

Supplements that taste okay: cysteine if dissolved in broth or grapefruit juice, pantothenate, ornithine, arginine, coenzyme Q10, potassium gluconate (salty), beta carotene, vitamin A, wintergreen, folic acid, Chinese herb (Yunnan Paiyao), biotin, niacin, betaine, calcium, magnesium.

Supplements that taste good: inositol (sweetish), fennel, turmeric, moose elm.

More do's and don'ts about supplements:

- Always wash a color-coated tablet under the kitchen faucet to remove the dye. (Close sink first). Dunk in vitamin B_2 powder and set to dry on paper towel.
- Take coenzyme Q10 in the morning upon rising, before or after thyroid.
- Lugol's must be taken by itself with water at end of meals to avoid oxidizing your vitamins and food.

Supplements can be mixed together, stirred into cereal, mashed potatoes, pudding, or rice and gulped down at beginning of meal.

Always keep bread nearby when taking supplements. If one should stick in your throat eat a bit of bread.

If nausea threatens, eat bits of bread, not liquid. Take two drops of mint oil (see *Sources*).

If a stomachache threatens, sip hot water.

For spasms of intestine, sip hot water or take one niacinamide.

Don't take supplements at bedtime, especially B vitamins, because they are too energizing. But calcium and magnesium with hot moose elm are soporific.

The actual amounts of supplements to take are given in the next chapter.

Choose IV therapy if supplements "won't go down." But remember, IV therapy does not take the place of green black walnut hull, cysteine, ozonated oil, and all the rest.

21 Day Cancer Curing Program

Your supplements have been divided into manageable "packages"; every day some new ones are added to those you are already taking. You will be on the full program in about a week. By then your body will be sufficiently cleared of toxins to begin "tumor drainage." This takes up the second week. In the third week, the body is cleaned up again to start the actual shrinkage. Tumors that can be seen or felt are given a topical treatment, too.

You may want to quickly check the section on special problems to see if there are any extra supplements you wish to add.

Check the *Recipes* or *Sources* chapters for many of the items used below.

> **Caution**: The dosages recommended here are for cancer patients only, and then only for 3 weeks. DO NOT use this cancer curing program to PREVENT cancer or for other diseases. I have not evaluated these dosages when taken for a prolonged period of time.

Many persons can consume these dosages easily. But if your frame is small, your appetite poor and there is no rooms for supplements, just do **the best you can**.

Day 1

1. Kill all your parasites in a single day. This includes mopping-up after tapeworm stages, flukes, and *Ascaris* worms. Take:

- 2 tsp. green black walnut hull tincture extra strength
- 9 capsules cloves (500 mg each)
- 9 capsules wormwood (200 to 300 mg each)

Mix the tincture with fruit juice (hand squeezed) or tap water and spoon it down carefully or sip slowly. You may add sweetening and cinnamon. Don't let it stand after mixing; it begins to lose its potency after twenty minutes. Keep the stock bottle refrigerated. Take the capsules afterward, one at a time. You may take these later in the day if you wish. Keep a bit of bread nearby, to swallow if a capsule sticks. If you have stomach cancer or liver cancer, the alcohol could be harmful. There are some powdered black walnut hull capsules on the market, but beware! Some have no potency, while others are extremely potent. Ones I have tested are listed in *Sources* along with the number of capsules to be taken.

Later in the day, when you are comfortable, mop up after shielded parasites and viruses that still survive. Use cysteine and ozonated olive oil.

- L-cysteine 500 mg, take two capsules, twice within ½ hour. You may snip open and empty capsules into broth or other tart beverage (like lemonade). This avoids tummy twinges from the undissolved crystals. Stay seated until side effects wear off (a half hour). Do not drive a car.
- Add 4 drops HCl (5%) to a cup of olive oil. Ozonate for 25 minutes, using a ceramic or wooden aerator. Then cap tightly and store in freezer until used. If it will be used the same day, store in refrigerator. Take 1 tbs. at least 5 hours after the cysteine. If you take it sooner, it will undo some of the benefit of cysteine. It is quite palatable mixed with mashed potatoes or pasta. Do not gulp it straight since this could give you nausea.

If you do not have cysteine yet, take the ozonated oil anyway. If you do not have an ozonator to make ozonated oil, take the cysteine anyway. Catch up as missing ingredients arrive.

Repeat the whole parasite program daily.

The amount of black walnut tincture extra strength may be increased to 10 tsp. if there are only days remaining, especially for brain and bone marrow cancers which are hard to reach. You may take it in 2 tsp. doses five times in a half hour or all at once. Another effective schedule is 8 tsp. followed by a one hour rest, then another 8 tsp. Choose what is easiest for you. Only 9 capsules of cloves and wormwood are needed, though. Try to avoid nausea by eating bits of bread

afterward, with a drop or two of sterilized mint oil. You might wonder why there is a need for repeat treatments at all if these doses are truly effective. The explanation is that parasites tightly encased inside a tumor with little circulation are very hard to reach. They continually emerge to reinfect the body and must be promptly killed.

2. Zap every day . This will gradually remove ferritin from your white blood cells. It also brings North pole magnetic fields into your body which removes lanthanide metals, besides outright killing of parasites and bacteria. Zap more often if extremely ill.

3. Start your dental work. If you have only weeks left, but can sit in a dentist's chair, take the first appointment available and have all your teeth with metal or plastic fillings extracted. You do not have time to wait for the tedious task of cleaning up teeth that have small fillings. Do not waste a day deliberating over any teeth! You may request general anesthesia if the dental surgeon agrees.

Be sure to clean out cavitations that can be seen on x-rays. Hidden cavitations can be cleaned up later.

[Note: If your red blood cell count is 3.2 or less, you should request a transfusion first, to make up for the minor blood loss during extraction. You should also be off any blood thinner and not use aspirin for pain the day before and during dental work. If your platelet count is below 10,000, you should request a dose of platelets first to protect you.]

If you have more than three weeks remaining, take the first appointment available to extract all teeth with large metal or plastic fillings, and teeth that are capped, or have root canals. After healing for five days to let the gums close, get a digital x-ray exam of the front teeth. Plastic fillings can be identified and drilled out. Your recovery now depends on perfection practiced by your dentist; the tiniest speck of plastic remaining will still show its poisonous effect on your next blood test and will prevent recovery (high LDH, alkaline phosphatase, globulin, low iron). Leave the fresh cavities open until the blood test results have become normal. Keep them sanitary by brushing after eating with colloidal silver and oregano oil.

Rinse your mouth at bedtime with dental bleach, for one month. Start the Dental Aftercare program carefully and meticulously, on the same day as the

dental work.

4. Treat all your essential medications as if they were contaminated by dyes, benzene, and isopropyl alcohol. Treat them as described in the Safer Painkillers section.

5. Start your tumor shrinking diet. Choose malonate-free foods. Remove asbestos, dyes, lanthanides all together with 2 hot water soaks separated by a 10-minute cooling. Sterilize everything afterward except water. Every food is given a few drops of hydrochloric acid (5%, USP) after serving on your plate; stir in well. Total drops of hydrochloric acid added not to exceed 45 drops daily, not counting those used in kitchen preparation.

6. Throw away all your cosmetics, lotions, salves, deodorant, shaving supplies, shampoos, hair dyes, eye liner, soap, mouthwash, toothpaste, nail polish, absolutely everything that goes on or in your body. Switch to our recipes. More are given in *The Cure For All Cancers*. Take a shower and shampoo the chemicals out of your hair with borax and citric acid. Do not use a hair blower and keep very warm by dressing in extra clothes. You may use a henna variety of hair dye purchased in bulk (see *Sources*). If your hair is already dyed, wash in dental bleach for 5 minutes. This will not affect color. Rinse with citric acid. Launder clothing in straight borax. Bleach all clothing once to get out azo dyes and the metal germanium. Toxins, except for hair dye, will leave your body in the first week. But toxins inside your tumors are marooned and require a special seven day program which begins in the second week.

7. Start glutathione, 500 mg; take two, three times a day, to be completed before supper time to avoid having too much energy at bed time. Take them before meals so it can act on the tumorous organ as a reducer. If you are bedridden, double this dose. If only days remain, take thirty capsules daily. Take all at once stirred into honey or maple syrup (each treated with HCl first to sterilize). If this causes diarrhea, take with food in several doses.

8. Start Lugol's iodine. Take six drops in ½ glass of water at the end of each meal (three times a day). Take it at bedtime, too, if bloating is present. No HCl needed.

9. Start thyroid: one grain in the morning upon rising. Increase to two grains in the morning after that. If you were on a thyroid medication previously, be sure

to come up to at least that dosage. (A pharmacist can help you convert your brand to grains). Remember to treat tablets with vitamin B_2.

10. Schedule blood test (SMAC 24: must include serum iron) and scan (see the Reading Your x-rays chapter for advice on scans).

11. Set kidney herbs to soak overnight per recipe.

12. Do the same for liver herbs.

End of Day 1

You have accomplished a lot. You will probably feel better tomorrow. If you had to omit some instructions, catch up on them as soon as the supplies arrive. Day one instructions have the highest priority.

On each day more supplements will be added. Do not stop taking those that were scheduled on previous days.

Day 1 At A Glance

Before breakfast	2 tsp. black walnut tincture extra strength, 9 wormwood cap-sules, 9 clove capsules, 2 glutathione (500 mg each), thyroid (one grain).
Breakfast	follow guidelines so it is malonate-free, sterilized, dye-free, as-bestos-free, etc. Finish with Lugol's (six drops) in 1/2 cup water. (No HCl.)
Midmorning	make dental appointment. Schedule blood tests. Zap when convenient. "Clean" up all essential medications. Throw out all commercial body products.
Before lunch	2 glutathione (500 mg each)
After lunch	Finish with Lugol's (six drops) in 1/2 cup water.
Afternoon	4 cysteine (500 mg each). Ozonate some sterilized olive oil 25 minutes to take later. Launder with borax and bleach all your clothes and bedclothes.
Before	

supper	2 glutathione (500 mg each)
After supper	Finish with Lugol's (six drops) in 1/2 cup water. Set to soak kidney herbs and liver herbs.
Bedtime	1 tbs. ozonated olive oil with food

Day 2

Capsules of supplements may be emptied, mixing all together in a closeable container; then taking one third with each meal. We will call such a mixture "vitamix." Supplements that are particularly bad tasting should be flavored. It is important not to feel revulsion toward your supplements. You may use the spice-like supplements (fennel, turmeric, beet cocktail, oregano oil, wintergreen oil) to mask the bad tasting ones (shark cartilage, MSM, papain, DMSO and others).

1. Start kidney herb recipe (1¼ cups a day) and liver herbs (2 cups a day). This will improve kidney and liver function so toxins can be detoxified and flushed out rapidly. Leave out the magnesium because there are separate instructions below. Stir two drops hydrochloric acid into each cup at time of drinking.

2. Coenzyme Q10, 400 mg, take ten in the morning, upon rising, before or after the thyroid pill. Repeat this high dose on Day 7 through Day 14, and on Day 19. On other days take one capsule daily. This will begin to destroy the azo dyes accumulated in the spleen and body fat, particularly Sudan IV, DAB, and Sudan Black B. You may snip open the capsules and mix powder with straight honey or put powder directly in mouth. Take it 5 hours away from the reducers cysteine, glutathione, and vitamin C; that is why early morning is best.

3. Start vitamin B2 and magnesium. Take two B2 (300 mg each) capsules and one magnesium oxide capsule (300 mg) three times a day. This will destroy the benzene and phenol that has accumulated in your spleen and body fat as well as helping to detoxify azo dyes there.

4. Betaine hydrochloride (about 300 mg), take three, three times a day with meals. This kills *Clostridium* in the colon.

5. Start vitamin B12, 1000 mcg, take two, three times a day, at mealtime. This

vitamin hatches *Ascaris* eggs; make sure you have already taken cysteine and ozonated oil previously, have zapped and are adding HCl to each food. If not, postpone this.

6. Vitamin C, 2000 mg (same as 2 gm, or ½ teaspoon), three times a day. No "mineral ascorbates" or other vitamin C like products due to toxic oxidation by-products. You may take more.

7. Chicken broth, one pint a day (see *Recipes*) alternating with shark cartilage, two tablespoons or more a day. Each beverage will receive two drops of hydrochloric acid before consuming.

8. Start bromelain or papain, four 1000 mg capsules, twice a day. If extremely ill use both. This will digest and clear the ferritin coating on your white blood cells to recover immunity. Take well before meals (at least 15 minutes).

9. Turmeric and fennel. Take six capsules (or one teaspoon) of each, three times a day. Don’t mix with food like I recommend for other supplements because these are so flavorful they will overpower your food. You may mix them with sweetened water if you wish. Sterilize with 2 drops HCl for each.

10. If you have tumors you can see or feel, use the Topical Tumor Shrinker.

Day 2 At A Glance

Before breakfast	Ten coenzyme Q10 (400 mg). Repeat parasite program, 2 tsp. black walnut tincture extra strength, 9 wormwood capsules, 9 clove capsules. Thyroid (two grains). Open six glutathione capsules, six 300 mg B2 capsules, three 300 mg magnesium oxide capsules, nine 300 mg (approximately) betaine hy-drochloride capsules, and six 1000 mcg vitamin B12 capsules to make today's vitamix. (You could leave this all in capsules or tablets and take separately, but we find this is a lot easier, even though a few bites of your meal won't taste as good.) Take 1 tsp. bromelain or 1 tsp. papain stirred into a beverage to make a "cocktail" (they may also be encapsu-lated). Use both if very ill. Sterilize all concoctions as well as food.
	Take 2 gm vitamin C. Mix a third of your vitamix with part of your break-fast and gulp down. Distribute 15 drops of

Breakfast	hydrochloric acid in your foods and beverages. Take six fennel capsules and six turmeric cap-sules. Finish meal with Lugol's (six drops).
Midmorning	Make kidney herb recipe (sip 1 1/4; cups throughout day). Make liver herbs (sip 2 cups throughout day). Add 2 drops hydrochloric acid to each cup. Zap when convenient.
Lunch	Take 2 gm vitamin C, another third of your vitamix, 15 drops of hydroch-loric acid in your food. Take 6 fennel and 6 turmeric capsules. Take six drops Lugol's after meal.
Afternoon	Repeat mop-up, 4 cysteine (500 mg each). Make a big pot of chicken broth and freeze all except today's portion. 1 tsp. bromelain or papain or both if very ill.
Supper	Supper should include chicken soup, at least one pint. Take 2 gm vita-min C and the final third of your vitamix, 15 drops of hydrochloric acid in your food. Take six fennel capsules and six turmeric capsules. Take six drops Lugol's after meal.
Bedtime	Finish mop-up, 1 tbs. ozonated sterilized olive oil. Apply topical tumor shrinker if you have tumors you can see or feel.

Critical Blood Tests

If you got your blood tested on the first day, you can expect your results on day two or three, because laboratories only take 24 hours. If you haven’t been notified of your results by now, call your doctor and ask that they be read or faxed to you. You may be feeling quite well but any result outside the normal range should get immediate attention.

As soon as they arrive, review them yourself. It is the custom in the American medical community not to share these results, not to explain them, and in fact, to minimize testing. I believe all this is intended to avoid embarrassing questions by the patient such as, "Why didn’t I improve?" or "Why is my LDH so high?" With this attitude, liver enzymes, serum iron and even the LDH are often omitted completely by physicians (make sure to request them).

As soon as you have results, find the ones that are too high or too low, and take appropriate action as described in the chapter Reading Your Blood Test Results.

Day 3

1. Start folic acid, 25 mg per day (that is 25 one milligram or 0.9 mg capsules). You may have been on chemotherapy that used anti-folate compounds. Their purpose was to kill your cancer cells. If you are now considered a terminally ill cancer patient, you may agree that such clinical treatments failed for you and are not worth pursuing at this point. My approach is the opposite—we will shrink the tumors and rehabilitate the nearby tumor-like tissue, letting the body select those cells it will digest. You should decide to cease anti-folate chemotherapy if you plan to use folic acid.

2. Raw beet juice, 2 Tbs. before each meal. Add 1 teaspoon to 1 tablespoon vinegar as desired. This reduces phenol formation during digestion. Sweeten and dilute to taste. You may add other supplements.

3. Niacin, a pinch, three times a day, with meals. (If you take too much, you may experience the "niacin flush", a sensation of heat and red itchy skin followed by chills. It lasts about 20 minutes and is harmless.)

4. Vitamin A (retinyl palmitate or retinyl acetate) comes as tablets and liquids, in various strengths. You need 100,000 units daily. This will cause a mild hypervitaminosis A (too much vitamin A) in three weeks even if accompanied by vitamin E. Expect a rash, headache, itchy skin, peeling or flaking, loss of numerous skin blemishes and warts. If symptoms appear, go off for 3 days, resume again and repeat. Put drops directly in mouth, tablets may be crushed for the vitamix if that is more convenient. Do not exceed this dose or length of time without a doctor’s supervision.

5. Vitamin E. Take about 100 IU if not already included with vitamin A.

6. Start powdered hydrangea root, 1 tsp. two times a day to supply good germanium.

7. Measure your daily urine output. Get a gallon jug, fill with 2½ quarts or liters of water, mark the outside, and empty it again. You may also need a plastic funnel, and a pint container for collection. Catch all urine for 24 hours. If it doesn’t reach the 2½ quart/liter mark, start over and drink more liquids. High volumes are needed to expel asbestos and Freon. Check urinary pH upon rising in the morning. Keep notes.

8. Begin daily enemas (alternate Lugol’s and black walnut tincture extra strength). If you have pain, you may use a coffee enema (filtered coffee only). These reduce bacteria levels in the bowel. Take one a day (two if very ill) using 1 pint liquid each time. See instructions.

Day 3 At A Glance

Before breakfast	One coenzyme Q10 (400 mg). Repeat parasite program, 2 tsp. black walnut tincture extra strength, 9 wormwood capsules, 9 clove capsules. Take thyroid (two grains), vitamin A (100,000 units), and vitamin E (100 IU). Open six glutathione capsules, six B2 capsules, three magnesium oxide capsules, nine betaine hydrochloride capsules, six vitamin B12 capsules, 25 1 mg folic acid capsules, and 3/16 tsp. of niacin to make today's vita-mix. Mix 1 tsp. bromelain or papain and 1 tsp. powdered hydrangea root and 1 Tbs. shark cartilage and 1 fennel capsule with 1/2 cup water, pinch of B2, 4 drops HCl and sweetening. Drink promptly.
Breakfast	Take 2 gm vitamin C. Mix a third of your vitamix with part of your break-fast and gulp down. Add 15 drops of hydrochloric acid to your food, putting 3 drops in each food and beverage, except water and Lugol's. Take 5 fennel capsules and 6 turmeric capsules. Finish with Lugol's (six drops).
Midmorning	Prepare the kidney herb concoction (1 1/4 cups) to sip throughout the day. Pour 2 cups of liver herbs to sip, too (can be combined with kidney herbs for convenience). Make a pint or more of beet juice from the reci-pe. Zap when convenient. Start collecting urine.
Lunch	Take 2 gm vitamin C. Mix a third of your vitamix, 15 drops of hydroch-loric acid in your food, 2 Tbs. beet juice, six fennel capsules, six turmer-ic capsules, six drops Lugol's afterward.
Afternoon	Repeat mop-up, 4 cysteine (500 mg each). Mix 1 tsp. bromelain or papain and 1 tsp. powdered hydrangea root and 1 Tbs. shark cartilage and 1 fennel capsule with 1/2 cup water, pinch of B2, 4 drops HCl and sweetening. Drink promptly.
	Take 2 gm vitamin C. Add the final third of your vitamix, 15 drops of hydrochloric acid to your food, 2 Tbs. beet juice, six

Supper	fennel capsules, six turmeric capsules, six drops Lugol's after meal.
Bedtime	Finish mop-up, 1 tbs. ozonated olive oil. Do an enema.

Day 4

1. Calcium, 500 mg per day. It should be taken with an acid beverage. (Your beverages are already acidified with either vitamin C, vinegar, or hydrochloric acid.) Do not take calcium supplements if your blood value is over 9.6.

2. Methionine, 500 mg, take two, three times a day.

3. Methylsulfonylmethane (MSM), 4 capsules (800 mg each) twice daily to reduce bad germanium and ferric iron to good germanium and ferrous iron.

4. Ozonated water, 2 glasses a day. This detoxifies heavy metals as they are mobilized from body fat and tissues, and kills streptococcus bacteria. It also removes acrylic acid and acrolein.

5. Vitamin B1, 500 mg, take one, three times a day (if appetite is good, take one a day).

6. Vitamin B6, 250 mg, take two a day.

7. Potassium gluconate, ½ teaspoon (this is 240 mg potassium), three times a day until blood potassium reaches 4.7. Then stop. Use as salt on food. Blood potassium must be monitored at least every 3 weeks.

Day 4 At A Glance

Before breakfast	One coenzyme Q10 (400 mg). Repeat parasite program, 2 tsp. black walnut tincture extra strength, 9 wormwood capsules, 9 clove capsules. Take thyroid (two grains), and vitamin A (100,000 units) plus vitamin E, 100 units. Open six glutathione capsules, six B2 capsules, three mag-nesium oxide capsules, nine betaine hydrochloride capsules, six vita-min B12 capsules, 25 folic acid capsules, 3/16 tsp. niacin, one 500 mg calcium capsule, six 500

	mg methionine capsules, three (or one) 500 mg vitamin B1 capsules, and two 250 mg vitamin B6 capsules to make today's vitamix. Combine bromelain or papain and powdered hydran-gea and four 800 mg MSM capsules and fennel or spice and sweeten-ing in 1/2 cup water. Drink.
Breakfast	Take 2 gm vitamin C. Mix a third of your vitamix with part of your break-fast and gulp down. Add 15 drops of hydrochloric acid to your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. Potassium gluconate has a slightly salty taste, so "salt" your breakfast with 1/2 tsp. if your blood test potassium is below 4.7.
Midmorning	Prepare the kidney (1 1/4 cups) & liver (2 cups) herb concoctions to sip throughout the day. Zap when convenient. Empty the urine jug. If you had less than the mark, drink more liquids today and continue collect-ing. If you had more than the mark, continue to drink as much liquids & you can stop collecting urine. Ozonate a glass quart jar of water for about ten minutes. Drink a glass now (no need to add HCl).
Lunch	A pint of chicken soup, 2 gm vitamin C, another third of your vitamix, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel cap-sules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potassium gluconate if your blood test is below 4.7.
Afternoon	Repeat mop-up, 4 cysteine (500 mg each). Combine papain, etc.
Supper	Take 2 gm vitamin C. Add the final third of your vitamix, 15 drops hy-drochloric acid to your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potas-sium gluconate if your blood test is below 4.7.
Bedtime	Finish mop-up, 1 tbs. ozonated olive oil. Do an enema.

Day 5

1. Arginine, 500 mg, take two, three times a day.

2. Inositol, 500 mg, take two, three times a day.

3. Ornithine, 500 mg, take two, three times a day.

4. Glutamic acid, one teaspoon, three times a day (increase to heaping tsp. for liver cancer).

5. Schedule blood test five days after first one if a previous result was critical, ten days if poor, three weeks later if initial results were good.

6. Pantothenate, one teaspoon, three times a day.

7. Taurine, 500 mg, take one, three times a day.

8. Set small magnet, about 100 gauss on a ½ x 1 inch (1 x 2 cm) square of magnet cloth (see *Sources*); apply North side over the center of your spine, at base of neck. Tape on. Apply another one over the center of your spine just above the waist. Sit on N pole of strong magnet (1000 to 5000 gauss) for 30 minutes daily.

Day 5 At A Glance

Before breakfast	One coenzyme Q10 (400 mg). Repeat parasite program, 2 tsp. black walnut tincture extra strength, 9 wormwood capsules, 9 clove capsules. Take thyroid (two grains), and vitamin A (100,000 units) plus vitamin E, 100 units. Open six glutathione capsules, six B2 capsules, three magnesium oxide capsules, nine betaine hydrochloride capsules, six vitamin B12 capsules, 25 folic acid capsules, 3/16 tsp. niacin, one calcium capsule, six methio-nine capsules, three (or one) vitamin B1 capsules, two vitamin B6 cap-sules, six 500 mg arginine capsules, six 500 mg inositol capsules, six 500 mg ornithine capsules, 3 tsp. glutamic acid, three tsp. pantothe-nate, three 500 mg taurine capsules to make today's vitamix. Combine papain or bromelain, MSM, and hydrangea powder and shark cartilage. Drink at once. Assemble magnets and apply with tape. Sit on N side of big magnet for 1/2 hour; may zap at same time.
Breakfast	Take 2 gm vitamin C. Mix a third of your vitamix with part of your break-fast and gulp down. Distribute 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's after meal. Use 1/2 tsp.

	potassium gluconate as salt.
Midmorning	Prepare the kidney (1 1/4 cups) and liver (2 cups) herb concoctions to sip throughout the day. Zap when convenient. Ozonate a glass quart jar of water for about ten minutes. Drink a glassful now (no need to add hy-drochloric acid).
Lunch	Take 2 gm vitamin C. Take another third of your vitamix, 15 drops HCl on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric cap-sules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potassium gluco-nate.
Afternoon	Repeat mop-up, 4 cysteine (500 mg each). Drink another glass of ozo-nated water. Combine papain or bromelain, powdered hydrangea, MSM, and shark cartilage. Drink at once.
Supper	Take 2 gm vitamin C. Add the final third of your vitamix, 15 drops hy-drochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potas-sium gluconate.
Bedtime	Finish mop-up, 1 tbs. ozonated olive oil. Do an enema.

Day 6

1. Amino acids, both essential and nonessential (see *Sources*), two teaspoons total (6 size 00 capsules), three times a day.

2. Glucuronic acid, 250 mg, take one, two times a day.

3. Wintergreen oil (natural only), three drops, three times a day. (Placed in empty capsule or on bread is the easiest way we have found to take it.) Do not exceed dosage; it can be toxic.

4. Biotin, 1 mg, take one a day.

5. Selenium, as raw coconut, ¼ of a coconut daily (see *Recipes*) or as sodium selenite, 500 mcg (micrograms), take six a day.

6. Niacinamide, 500 mg, take one, two times a day.

7. Oregano oil, 20 drops placed in an empty capsule, three times a day. Eat

bread with it. Brush teeth with one half drop.

Day 6 At A Glance

Before breakfast	One coenzyme Q10 (400 mg each). Repeat parasite program, 2 tsp. black walnut tincture extra strength, 9 wormwood capsules, 9 clove capsules. Take thyroid (two grains), and vitamin A (100,000 units) plus vitamin E, 100 units. Open six glutathione capsules, six B2 capsules, three magnesium oxide capsules, nine betaine hydrochloride capsules, six vitamin B12 capsules, 25 folic acid capsules, 3/16 tsp. niacin, one calcium capsule, six methio-nine capsules, three (or one) vitamin B1 capsules, two vitamin B6 cap-sules, six arginine capsules, six inositol capsules, six ornithine cap-sules, 3 tsp. of glutamic acid, three tsp. pantothenate, three taurine capsules, two 500 mg niacinamide capsules, six tsp. amino acids, two 250 mg glucuronic acid capsules, and one 1 mg biotin capsule to make today's vitamix. Combine papain or bromelain, powdered hydrangea, MSM, and drink. Drink coconut beverage or add 6 500 mcg sodium selenite capsules to vitamix. Take 20 drops oregano oil.
Breakfast	Take 2 gm vitamin C. Mix a third of your vitamix with part of your break-fast and gulp down. Sprinkle 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. Use 1/2 tsp. potassium gluconate as salt. Have a piece of bread or empty capsule with three drops wintergreen oil. Sit on magnet.
Midmorning	Prepare the kidney (1 1/4 cups) and liver (2 cups) herb concoctions to sip throughout the day. Zap when convenient. Ozonate a glass quart jar of water for about ten minutes. Drink a glassful now.
Lunch	Take 20 drops oregano oil. A pint of chicken soup with 2 gm vitamin C, another third of your vitamix, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potassium gluconate. Have a piece of bread or empty capsule with three drops wintergreen oil.

Afternoon	Repeat mop-up, 4 cysteine (500 mg each). Drink another glass of ozo-nated water. Combine papain, etc.
Supper	Take 20 drops oregano oil. Take 2 gm vitamin C. Add the final third of your vitamix, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potassium gluconate. Have a piece of bread or empty capsule with three drops wintergreen oil.
Bedtime	Finish mop-up, 1 tbs. ozonated olive oil. Do an enema.

Day 7

1. Beta carotene, 15 mg (2400 units), once a day.
2. Thioctic acid, 500 mg, one a day. I think this tastes too bad too put in the vitamix. I suggest taking it separately.
3. Phytic acid (inositol phosphate, "IP6"), 50% solution, take 10 drops in a cup of water, three times a day before meals.

For prostate cancer add linseed (flax seed), 1 tablespoon daily. Rinse in bleach water (dental bleach is fine) to destroy aflatoxin and zearalenone. Then add a pinch of vitamin B_2 to remove benzene. Soak them in a beverage for 10 minutes; then stir into cereal or casserole dish. Or you may blend them in a blender. Do not use purchased linseed oil. Sterilize final serving. Also take zinc gluconate 10 to 30 mg daily.

For bone cancer add boron, 3 to 6 mg daily.

For liver cancer add silymarin, a milk thistle product. Take two, three times a day. Also drink green bitters and raw liver cocktail (see *Recipes*) once a day.

For lung cancer add "lung tea", a mixture of comfrey and mullein. Also eat one small clove of raw garlic with each meal.

Day 7 At A Glance

	Ten coenzyme Q10 (400 mg). Repeat parasite program, 2 tsp. black walnut tincture extra strength, 9 wormwood capsules, 9

Before breakfast	clove capsules. Take thyroid (two grains), and vitamin A (100,000 units), plus vitamin E, 100 units. Open six glutathione capsules, six B2 capsules, three magnesium oxide capsules, nine betaine hydrochloride capsules, six vitamin B12 capsules, 25 folic acid capsules, 3/16 tsp. niacin, one calcium capsule, six methio-nine capsules, three (or one) vitamin B1 capsules, two vitamin B6 cap-sules, six arginine capsules, six inositol capsules, six ornithine cap-sules, 3 tsp. glutamic acid, three tsp. pantothenate, three taurine cap-sules, two niacinamide capsules, six tsp. amino acids, two glucuronic acid capsules, one biotin capsule, one 15 mg beta carotene to make today's vitamix (bone cancer add 3-6 mg boron), (liver cancer add sily-marin). Combine papain or bromelain, powdered hydrangea, MSM, shark carti-lage, and drink. Make coconut beverage or add six sodium selenite (500 mcg) to vitamix. Check magnets for snug fit against skin. Sit on big magnet.
Breakfast	Take 10 drops phytic acid in cup of water. Then take 20 drops oregano oil in capsule with bread; then take 2 gm vitamin C. Mix a third of your vitamix with part of your breakfast and gulp down. Sprinkle 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" your breakfast with 1/2 tsp. potassium gluconate. Have a piece of bread or empty cap-sule with three drops wintergreen oil. Take one 500 mg capsule of thioctic acid.
Midmorning	Prepare the kidney (1 1/4 cups) and liver (2 cups) herb concoctions to sip throughout the day. Zap when convenient. Ozonate a glass quart jar of water for about ten minutes. Drink a glassful now. (Liver cancer make some green bitters and raw liver cocktail and drink as soon as made.)
Lunch	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil; then take 2 gm vitamin C. Take a third of your vitamix, 15 drops hy-drochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potas-sium gluconate. Have a piece of bread or empty capsule with three drops wintergreen oil.
	Repeat mop-up, 4 cysteine (500 mg each). Drink another glass of ozo-nated water. For prostate cancer soak one tbs. linseed to eat with sup-per and take zinc gluconate. Combine papain or

Afternoon	bromelain, powdered hydrangea, MSM, shark cartilage, and drink.
Supper	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil; then take 2 gm vitamin C. Add the final third of your vitamix, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potassium gluconate. Have a piece of bread or empty capsule with three drops wintergreen oil.
Bedtime	Finish mop-up, 1 tbs. ozonated olive oil. Do an enema.

Done With The First Week

You have now cleared your body tissues and body fat of parasites, bacteria, metals and carcinogens. Many tumors—those with thin walls around them—have been cleaned up, too. If you have been using the Topical Tumor Shrinker (for tumors close to the surface) you may have seen these shrink already. (If you are experiencing hypervitaminosis A symptoms, like rash, headache, redness, itchiness, flaky skin, you may wish to take a break from the topical treatments, and also oral vitamin A, for at least three days.)

> We will next begin to drain the tumors, killing and detoxifying everything that emerges.

But tumors that are hard to reach, in brain or bone marrow, or with tough coats around them have not even begun to spill their contents. This is fortunate since the vital organs need special protection from the tumor contents. It will be like opening the cages of lions and tigers at a zoo. Your special protectors will be glutathione, ozonated water, oregano oil, ozonated oil, and the parasite program. Because within the tumors, and only within them, *Fasciolopsis*, *Ascaris*, Rabbit fluke, and *Clostridium* are still alive!

We will start with a high dose, 12 gm, of riboflavin (vitamin B_2) which will saturate the tissue around the tumor. Lower doses cannot do this. (A dose of DMSO will help the B_2 penetrate and toxins get out but is not essential.) Suddenly all the toxins break free and flow out of the tumor—into your body!

Aflatoxin, zearalenone and benzene are set free; asbestos and heavy metals are set free; carcinogenic plasticizers and dyes are now free; silicone from old toothpaste and duster spray is set free; acrylic acid and acrolein are set free; the malonates are now free; flukes and *Ascaris* are set free. We will also use a magnet to set the lanthanide metals and iron free.

The flood gates have been opened. There must be enough B_2 now to combine with all the dyes, benzene, and acrylic acid, enough glutathione to protect the liver from all the aflatoxin, enough magnesium to detoxify all the phenol. There must be enough ozonated water to combine with all the metals and enough ozonated oil to kill whatever viruses escape. And, of course, all escaping parasites and bacteria must be promptly killed. Finally, there must be enough magnetic power to attract the lanthanides and the iron. After this the calcium deposits can be dissolved again with the help of phytic acid and vitamin D, letting the "digest me" flag, phosphatidyl serine, go up. Pancreatin and lipase arrive to digest both the protein portion and the acrolein fat residue remaining. Peroxidase and catalase appear, too. This tumor has now been drained and is busy being digested. Soon it cannot be distinguished from normal tissue.

Meanwhile, the more urine is produced, the faster asbestos, silicone and urethane leave the body.

If no more asbestos or dyes are eaten, you can unload one tumor-full in two to three days. During the toxic flood, vanadium will cause a globulin elevation, dyes will cause vitamin A mutations and dyes will also cause enzyme mutations that raise LDH and alk phos. Released copper, phenanthroline, and toxic germanium will lower blood iron so not enough can reach the bone marrow. So the benefit of shrinking a tumor turns into a disadvantage to your white blood cells, liver, and other vital organs that must carry the burden. We must proceed slowly. And if the LDH or alk phos rise too high, you should use IVs to help with detoxifying. Fortunately the white blood cells are regaining their power to help by "eating" everything again. This way, much less needs to be detoxified.

The liver herbs will help to send the entire toxic team on to the kidneys. And the kidney herbs will send them to the bladder. That is why you stay on these herbs as well as all the supplements.

Yet the bladder will keep them tightly stuck, allowing them to circulate back into the body unless a large amount of urine is produced. The next week you

must drink enough beverages to produce one gallon of urine in 24 hours.

Day 8

To make it easier to take these special high doses this week you may reduce your Day 7 vitamix to $^{1}/_{3}$ (or one meal only). Each vitamix now lasts three days.

1. Glutathione, 40 capsules (20 gm) in a single dose, stirred into honey. This protects the liver from the coming aflatoxin flood which then avoids a bilirubin rise.
2. DMSO, 25% in water (optional). Take one tsp. as a mouthwash, twice daily. Swish slowly over gums. Hold several minutes. Swallow for maximum effectiveness. This "pushes" your supplements into your tissues. It also helps to draw toxins out of cavitations. You may add your wintergreen drops to this mouthwash. (50% DMSO is preferred, if available.) Must be edible quality.
3. EDTA, 1/8 tsp. (750 mg) three times a day in 1 cup hot water. This chelates the heavy metals for excretion, before they can get stuck in another tissue.
4. Vitamin C, 12 gm. Take 2 gm with each meal and also between meals.
5. Vitamin B2, 40 capsules (12 gm) stirred into honey or maple syrup (sterilized) and taken in a single dose. Take these about one hour after the glutathione. **This opens the tumors, even without DMSO or EDTA.**
6. Ozonated oil, 1 tbs. (sterilized), taken 5 hours or more after B2. This kills viruses.
7. Black walnut tincture extra strength, 10 tsp. (or 2 freeze dried capsules four times daily, see *Sources*). 9 capsules cloves and 9 capsules wormwood once a day. Also take mop up cysteine and ozonated oil. This kills shielded parasites and emerging viruses.
8. Magnesium, 1 three times a day with meals. This detoxifies phenol produced from liberated benzene.
9. Exchange bromelain or papain for pancreatin (1 tsp.) plus lipase (1 tsp.). This will begin to digest (shrink) the tumors. Take twice a day.
10. Levamisole, 50 mg, take one three times a day. Kills *Ascaris* and keeps ferritin off white blood cells.
11. Vitamin D3 (cholecalciferol) 25,000 units daily, to soften tumors by removing their calcium deposits.

Each high-dose day will be followed by a lower-dose day.

Day 8 At A Glance

Before breakfast	Ten coenzyme Q10 (400 mg each). (One Q10 capsule on Days 16, 18 and 20.) Take thyroid (two grains), and vitamin A (100,000 units) plus vitamin E, 100 units. Kill parasites with 10 tsp. black walnut tincture extra strength (or 2 capsules freeze dried), 9 wormwood and 9 cloves today. Take 2 gm vitamin C. Do DMSO mouthwash. Take 1/8 tsp. EDTA in water. Take one Levamisole, 50 mg. Open three magnesium oxide capsules, nine betaine hydrochloride cap-sules, six vitamin B12 capsules, 25 folic acid capsules, 3/16 tsp. niacin, one calcium capsule, six methionine capsules, three (or one) vitamin B1 cap-sules, two vitamin B6 capsules, six arginine capsules, six inositol capsules, six ornithine capsules, 3 tsp. of glutamic acid, three tsp. pantothenate, three taurine capsules, two niacinamide capsules, six tsp. amino acids, two glucuronic acid capsules, one biotin capsule, one beta carotene to make today's vitamix (bone cancer add 3-6 mg boron), (liver cancer add silymarin). Combine six 500 mg pancreatin, six 500 mg lipase, powdered hydrangea, MSM, and drink. Make coconut beverage and drink or take sodium selenite, 500 mcg. Take one drop vitamin D (25,000 units). Take 40 500 mg capsules of glutathione (only 20 capsules on days 15-21) stirred into a beverage.
Breakfast	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil, then take 2 gm vitamin C. Mix a third of your vitamix with part of your breakfast and gulp down. Sprinkle 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" your breakfast with 1/2 tsp. potassium glu-conate. Have three drops wintergreen oil. Take one 500 mg capsule of thioctic acid.
Midmorning	Take 40 300 mg capsules of vitamin B2, stirred into honey or sterilized maple syrup (only 20 capsules on days 15-21). Prepare the kidney (1 1/4 cups) and liver (2 cups) herb concoctions to sip throughout the day. Take another 2 gm vitamin C. Zap when convenient. Empty the urine jug and start collecting

	again. Drink more liquids today because your goal is one gallon! Ozonate a glass quart jar of water for about ten minutes. Drink a glassful now. (Liver cancer make some green bitters and raw liver cocktail and drink promptly.) Take 1/8 tsp. EDTA in a cup of hot water. Take one Levamisole, 50 mg.
Lunch	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil, then a pint of chicken soup with 2 gm vitamin C, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potassium gluconate. Have three drops wintergreen oil.
Afternoon	Take 4 cysteine (500 mg each). Drink another glass of ozonated water. For prostate cancer treat and soak one tbs. linseed to eat with supper, also take zinc gluconate. If you are getting low on chicken soup, make some more. Combine pancreatin, lipase, powdered hydrangea root and MSM and drink with another 2 gm vitamin C. Take 1/8 tsp. EDTA. Take one Levamisole, 50 mg.
Supper	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil, then take 2 gm vitamin C, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's afterward. "Salt" with 1/2 tsp. potassium gluconate. Have three drops win-tergreen oil. Do DMSO mouthwash.
Bedtime	Take 1 tbs. ozonated olive oil. Do enema. Sit on magnet.

Day 9

Clear the toxins that emerged from your tumors yesterday using a "low dose" of glutathione and vitamin B_2. Coenzyme Q10 remains at a high dose to continue catching dyes and other toxins being released from tumors.

1. Coenzyme Q10, 10 capsules (4 gm).
2. Glutathione, 10 capsules (5 gm).
3. Vitamin C, 12 gm a day.
4. Vitamin B2, 10 capsules (3 gm).
5. Magnesium, 1 three times a day.

6. Ozonated water, 2 glasses a day.
7. Ozonated oil, 1 tbs. a day.
8. Parasite program.

Day 9 At A Glance

Before breakfast	Ten coenzyme Q10 (400 mg each). (Only one Q10 capsule on Days 15, 17 and 21.) Take thyroid (two grains), and vitamin A (100,000 units) plus vitamin E, 100 units. Kill parasites with 10 tsp. black walnut tincture extra strength (or 2 capsules freeze dried), 9 wormwood and 9 cloves. Take 2 gm vitamin C. DO DMSO mouthwash. Take 1/8 tsp. EDTA. You have 2 days of vitamix leftover from Day 8, so no need to make any. Take one 50 mg Levamisole and 1 drop vitamin D. Combine pancreatin, lipase, powdered hydrangea, MSM, shark cartilage, and drink. Make coconut beverage and drink or take six 500 mcg sodium selenite. Take 10 500 mg capsules of glutathione stirred into honey (20 capsules on days 15-21).
Breakfast	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil, then 2 gm vitamin C. Mix a third of your vitamix with part of your breakfast and gulp down. Sprinkle 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's after meal. "Salt" your breakfast with 1/2 tsp. potassium gluconate. Have a piece of banana or bread with three drops wintergreen oil. Take one 500 mg capsule of thioctic acid. (Liver cancer add silymarin.)
Midmorning	Take 10 300 mg capsules of vitamin B2, stirred into honey or sterilized maple syrup (20 capsules on days 15-21). Prepare the kidney (1 1/4 cups) and liver (2 cups) herb concoctions to sip throughout the day. Take another 2 gm vitamin C. Zap when convenient. Empty the urine jug. If you had less than one gallon, drink more liquids today and continue collecting. If you had more than one gallon, continue to drink as much liquids and you can stop collecting urine. Ozonate a glass quart jar of water for about ten minutes. Drink a glassful now. (Liver cancer make some green bitters and raw liver cocktail and drink promptly.) Take 1/8 tsp. EDTA. Take one 50 mg Levamisole.

Lunch	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil, then 2 gm vitamin C, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's after-ward. "Salt" with 1/2 tsp. potassium gluconate. Have three drops winter-green oil.
Afternoon	Take 4 cysteine (500 mg each). Drink another glass of ozonated water. For prostate cancer, soak one tbs. treated linseed to eat with supper. Combine pancreatin, lipase, powdered hydrangea, MSM, shark cartilage, and drink with another 2 gm vitamin C. Do DMSO mouthwash. Take 1/8 tsp. EDTA. Take one 50 mg Levamisole.
Supper	Take 10 drops phytic acid in cup water, then take 20 drops oregano oil, then 2 gm vitamin C, 15 drops hydrochloric acid on your food, 2 Tbs. beet juice, six fennel capsules, six turmeric capsules, six drops Lugol's after-ward. "Salt" with 1/2 tsp. potassium gluconate. Have three drops winter-green oil.
Bedtime	Take 1 tbs. ozonated olive oil. Do an enema. Sit on magnet.

Day 10, 12, 14

Repeat day 8.

Continue to alternate high dose and low dose vitamin B_2 and glutathione treatments.

Make a quadruple batch of vitamix (12 days’ worth) for convenience.

Don’t forget to go for your blood tests. Continue wearing the magnets and sitting on the big magnet.

Day 11, 13

Repeat day 9.

Day 15 To 21

Continue repeating Day 8 on even days (16, 18, 20) and Day 9 on odd days (15, 17, 19, 21), except change glutathione to 10 gm (twenty 500 mg capsules), and vitamin B_2 to 6 gm (twenty 300 mg capsules) every day. This is a compromise between high and low doses in order to accomplish some of each. Also reduce coenzyme Q10 to one capsule (400 mg) except Day 19.

If you were using the Topical Tumor Shrinkers, and you took last week off (because of hypervitaminosis A) you may be ready to resume (including oral vitamin A).

How Well Did You Do?

How do you know you have opened and detoxified all your tumors? Each high dose day drains one tumor, so five tumors require about 10 days. Numerous small ones occasionally open together. If you have 4 or 5 large tumors, chances are they will open one at a time; this is an advantage. You should wait till the liver and kidney have recovered somewhat as seen on a blood test (steady transaminases, GGT, and bilirubin) before opening the next one. The proof that tumors are gone is only seen on a scan. The proof that toxicity is gone is only seen on the blood test (LDH, alkaline phosphatase, globulin and iron are completely normal). This will not happen unless even small leftover bits of dyes, asbestos, inorganic germanium and lanthanides have left the body. They may be stuck in the lysosomes or nucleus of the liver cells or tumor cells, still causing mutations and still keeping the blood levels abnormal. Continue the program until these tests are normal. The chance is quite good that it will happen by the 21st day!

It is time to assess the results.

1. Review your latest blood test.
2. Review a new scan.
3. Compare pain level.
4. Compare functional level, appetite, and energy.

All these results should show beginning improvement. If they did not, you reinfected too frequently with parasites or bacteria. If dental work is not complete, this could explain the bacterial reinfection. You should also assume you are reinfecting with parasites from raw unsterilized food. If you are not in

absolute control of this, stop eating raw food. Start over again. Repeat the parasite-killing program, plus mop-up on the same schedule as before. Assume you still have a tooth infection even if the pain is somewhere else. Find a dentist using digital x-rays to be sure there is no leftover plastic or a tattoo. If you see a suspicious site, use DMSO again as mouthwash, plus EDTA and vitamin C as before to draw out the toxins. Be sure to include the magnet therapy. If your mouth has the odor of decay, water pick for a whole day, one half hour on and one half hour off. Stop taking any supplement that is not listed. Stop using any herb or spice or supplement from a can or bottle unless it is treated with vitamin B_2 and hydrochloric acid. Stop using a cosmetic or hair dye for which you did not find a substitute. Wear no unwashed, unbleached clothing. Of course, you have been reinfecting from your own draining tumors, too, which is unavoidable. Continue the high-dose, low-dose alternating regimen for vitamin B_2 and glutathione during the third week if the scan still shows the original tumors. If diarrhea occurs, reduce glutathione to half and take with meals.

Continued Care

If symptoms have subsided and the scan and blood test show improvement, continue the supplements at a reduced level of your own choosing. Half doses are suitable for a second three week period. But vitamin B_2, glutathione, vitamin C, and coenzyme Q10 should be continued as in the third week, until the blood test is perfect.

Occasionally, the blood test does <u>not</u> become normal due to an unforeseen toxin. Lead from polluted supplements is responsible for high transaminases. Vanadium, lanthanides and dyes from dental plastic will keep globulin, LDH and alkaline phosphatase high. Reinfection with *Ascaris* will keep iron low. Search teeth for remaining plastic using digital x-rays. Then use DMSO and EDTA again along with magnet therapy. It is now time to focus on gaining weight. Weigh yourself twice a week.

Gaining weight is the single mysterious event your body can accomplish if it is <u>well</u>. Only the body knows what this means. We must try to listen and hear our bodies' requests.

Your body may crave sugar now. Your liver is not yet able to make and store sugar or change stored sugar to blood sugar. You must eat often, plenty of

simple starches and fats. This means potatoes, sweet potatoes, home made bread, pasta, fruits, and vegetables, and their juices. 4000 calories per day is a proper goal! Adding dairy foods (kosher only, properly sterilized), will help you reach this.

Getting your appetite back is a very good sign. Hopefully, this happened in the first week. If not, be sure to stay on the B vitamins.

Eat to gain weight. Even one pound of weight gain indicates a return of health. Digestive enzymes (see *Sources*) can help greatly in relieving an over-full feeling, especially when supplements take up so much "room". Take 3 or 4 with each meal. Take them between meals, too. But hydrochloric acid helps digestion most. Do not stop using this to sterilize your food (even kosher food). Often you must force yourself to eat, if you plan to become healthy. Use whatever tricks and entreaties work for you. Aim to gain two pounds a week after the first three week program is completed.

Congratulations!

You have accomplished what few others have. Throw yourself a party when the last tumor is gone! And buy a truly exceptional gift for your caregiver.

What if it fails? What if LDH and alkaline phosphatase keep rising? What if liver enzymes keep rising? Or any other blood value keeps worsening? This can happen if detoxification can’t keep up with tumor drainage. In spite of taking "bushels" of supplements to detoxify, it may not succeed. In this case, seek out IV therapy. Use the entire set of IVs (filtered) listed every day. Keep urine flow high. Do more enemas. It may take three weeks of daily IVs to catch up on opening tumors, but it <u>will</u> happen.

If you were bedridden, in acute pain in all your bones and joints, blood oozing from your mouth from gums too swollen to allow you to speak, you might wish to die as others had in your family. Suppose the diagnosis of <u>scurry</u> was made. This changes things. A <u>crash program</u> of many, many grams of vitamin C carefully dribbled into your mouth could alleviate your symptoms in days and save your life in a few weeks.

But a clinical doctor could not provide this treatment. He/she must abide by the protocol designated for scurvy: a low amount, such as 750 mg or even 75 mg. Nothing more would be scientific. Certainly, being in the care of an enthusiastic family member or friend would be much safer.

Cancer, too, can be treated with a crash program administered by enthusiastic friends or family members. This does not exclude clinic help as you will see. It is my hope that lay people can attack the problem of cancer as no professional group can — with determination and enthusiasm.

Reading Your Blood Test Results

You can help your doctor or health professional immensely by learning to understand your own blood test results. You might also wish to remain discreetly silent about it in order not to offend him/her. There is an element of mystique created around test results in order to keep them off-limits to patients and hold them hostage. I believe this practice is archaic. Not only can you learn to interpret blood test results, you can learn not to panic or take up doctors' time needlessly. Sharpen this new talent on all the blood test results given for the case histories, and then apply it to yourself. Remember, though, not to add your state of psychological distress over reading your own blood test to your doctor's burden. Find solace in the fact that you are going to learn to solve most problems yourself, right now!

Your blood test results are easy to understand, although the form looks complicated. In one column, your results are given. In another column the expected "normal" results are given. The normal results will be given as a range because healthy people can be expected to vary to some extent. Your first step is to fit your result into the normal range given on your printout to see whether it is above, below, or in the middle of it.

The Perfect Blood Test

Photocopy the next page and use it as a bookmark and reference while reading this chapter and the case histories (*True Stories*) that follow.

Fold in half twice lengthwise then across middle

Test	Healthy range by our clinic standard	Units	**Our lab range** for comparison
WBC	5.5 - 7.5	thous/uL	4.0 - 10.0
RBC	4.4 - 4.7	MIL/mm3	4.5-6.5
platelet count	200- 300	thous/uL	150-450
eosinophils	<3	%	
blasts	0	%	0
glucose (fasting)	85-95	mg/dL	65-115
BUN	15 - 16	mg/dL	5.0-26.0

creatinine	0.9 - 1.0	mg/dL	0.6-1.4
AST or SGOT	12	U/L	0-55
ALT or SGPT	12	U/L	0-55
GGT	12	U/L	0-57
Total bilirubin	1.0	mg/dL	0.1-1.8
uric acid	3.0 - 4.0	mg/dL	2.2-7.7
cholesterol	200 plus your age	mg/dL	130-200*
triglycerides	100 - 200	mg/dL	30-180
sodium	138 -142	m Eq/L	133-145
potassium	4.5 - 4.7	m Eq/L	3.3-5.6
chloride	98 - 104	m Eq/L	95-111
calcium	9.1 - 9.6	mg/dL	8.5-10.4
phosphorus	3.0 - 4.0	mg/dL	2.2 - 5.6
Total protein (T.p.)	7.0 - 7.4	gm/dL	6.3-8.3
albumin	4 - 4.6	gm/dL	3.9-5.1
globulin	2.5 - 2.8	gm/dL	2.0-5.0
LDH	125 - 160	U/L	91-250
alkaline phosphatase (alk phos)	75 - 85	U/L	39-117
total iron (serum)	75 - 105	ug/dL	30-170
HGB	gm/dL	13.5-18.0	
carbon dioxide	m Eq/L	12.0-33.0	

*Cholesterol range not statistically set, see text.

Common abbreviations

alk phos	alkaline phosphatase	HGB	hemoglobin
ALT	alanine amino transferase	K	potassium
AST	aspartate aminotransferase	LD or LDH	lactic dehydroge-nase
BUN	blood urea nitrogen	Na	sodium
Ca	calcium	P	phosphorus
chol	cholesterol	plt	platelet
Cl	chloride	RBC	red blood corpuscles

CO2	carbon dioxide	T.b.	total bilirubin
creat	creatinine	T.p.	total protein
FBS	fasting blood sugar or glucose	trig	triglycerides
GGT	gamma glutamyl transpeptidase	WBC	white blood cells

Blood Sugar

Take *glucose* (blood sugar), for example. The range given by our lab was usually 65 to 115 mg/dL. If your value was 95, using this range, it is exceptionally good. To understand the meaning of a result using a different range, you should know how the range was decided.

One of the very large testing labs analyses the blood sugar results for, say, the last 10,000 patients it has tested. It is assumed that they represent the healthy population (which is, of course, not true, since illness brought them to the lab for testing to begin with). The average blood sugar level is found. Then ninety-five percent of all these patients' results are clustered around this average to make a "normal curve". Five percent are thrown away as representing abnormal levels. The lowest and highest levels for these 95% are used to give the range.[106]

This is far from a true standard of good health. It assumes that 95% of the population is healthy. If, in reality, only 80% are healthy, very many people are not being attended and consequently not being alerted to the need for improvement because they are assigned to the "normal" group. Preventive health care is not being served.

A concept of "sick" or "not sick" depending on whether you fit into the values seen for 95% of the patient population is misleading. It is like defining overweight as over 500 pounds (200 kg)! A wrong concept such as this does a disservice to society. Don't let a physician's reassurance that "everything is normal" fool you into thinking you are normal (meaning healthy). Your standard should be higher than "statistically normal," your standard should be "healthy."

In this book, the true, healthy values will be given **as I perceive them**, together with their correct meaning, so you can take steps to help any organ that is weak. I determined them by observing at least two thousand patients closely, most with a series of tests that spanned a period from the time they arrived with illness to a later time when they were well again. It is based on judgment, not

statistics, and it wouldn't surprise me if others disagree with me. However the body stays surprisingly constant when it is healthy, making the task of identifying healthy values fairly easy.

Sometimes your laboratory will have a wildly different range for a particular test than the ranges I have listed, even though the units are identical! That is because there are different types of tests for the same substance. You should scale your result, then, before comparing it to the ranges in my chart. For example if your lab's range goes from 240 to 380 but our lab's range goes from 120 to 200, you can assume that your lab's procedures roughly double the results. Therefore you must divide your result in half before comparing it to our lab's range.

Let us return to the blood sugar, glucose. It should never be lower than 80 mg/DL whether you have fasted before the test or not. The liver should always be able to make blood sugar for you, even if you have not eaten recently. The liver stores a reserve of blood sugar for this purpose. If yours is below eighty, the liver is not able to keep your level up, either because its stores are empty, or for other reasons.

Cancer patients have a special disability in that part of their liver metabolism that makes and stores blood sugar. At the same time, cancer patients use up more blood sugar than normal, healthy persons, so the blood sugar drops as cancer advances. As you recover, the liver will regain this function. If your blood sugar is already below seventy, you must eat throughout the day to re-nourish your body. Your body must be nourished to heal. You should eat the richest, most nourishing (but safe) foods you can find. If your blood sugar is over 90, you are still in good condition. You must work hard to eat enough high calorie, nutritious food to keep this figure from dropping.

There are only three categories of foods: carbohydrate, fat, and protein. All your carbohydrate foods, potatoes, rice, grains, pasta, vegetables, and fruit, are turned into blood sugar by the body's chief factory, the liver.

Why couldn't we simply eat glucose (also called dextrose, or confectioner's sugar) to supply it all? Because there are many food-factors packed into ordinary foods that you would miss by eating plain sugar. Nevertheless, if no food can be digested, a beverage of honey water or maple syrup in water will sustain you for several days, until you are able to eat. If vitamins, minerals, amino acids, fats,

and a few extra nutrient factors are added, you can be sustained for six weeks, plenty of time for tumors pressing on the liver or intestine to shrink enough to let regular food pass again. If you are a caregiver and your patient refuses all food, make a "complete food" in beverage form (see *Recipes*).

If your blood sugar is much too high, due to diabetes, in addition to cancer, consider yourself lucky, especially if somewhat obese. This means you have not gone through your reserves yet. Do not try to lose weight even if you are overweight. Your diabetes will improve while on this program; it may even be cured. It is most important not to eat artificial sugar or calorie-reduced food. You must nourish your body better than ever before to heal from your cancer. You must eat three regular meals and three snacks a day to help your body heal itself. As your diabetes improves, your weight might drop drastically, effortlessly.

CBC

CBC stands for **complete blood count**. A small amount of blood is dispensed into the automatic counter to determine how many of each kind of blood cell you have.

There are three kinds, **white blood cells**, **red blood corpuscles**, and **platelets**, but they are all made from the same original "baby cells" in the bone marrow, called *stem cells*. Stem cells are constantly multiplying to provide us with these three kinds of blood cells.

White Blood Cells (WBC)

These cells are our defense team. One type has the ability to crawl (by means of pseudopodia!), squeeze through tiny spaces, respond to something dead or toxic far away by moving toward it, and simply eat it to destroy it. These are called **granulocytes** (and also called "segs" or "polymorphs" or "neutrophils") and should constitute about seventy percent of your total WBC. About twenty percent are smaller, rounder, and capable of destroying viruses; those are the **lymphocytes**. The lymphocytes are further divided into T and B lymphocytes, named after the thymus or the bone marrow. Lymphocytes get their "final training" at one of these two organs. The last 10% of your WBCs are other varieties.

Your total WBC count should not be below 5,000/mm^3 (same as 5,000/uL).

Any amount below this implies a toxin in the bone marrow. Toxins abound. Heavy metals and azo dyes are especially attracted to your bone marrow probably because of its high fat content. (Metals and dyes are fat-soluble.) Lead, mercury, thallium, nickel, germanium, copper, cobalt and vanadium are commonplace. These consume your sulfur supply, especially glutathione. Then bacteria and even parasites are allowed in. Many of these metals and dyes were found to be carcinogens decades ago.

Carcinogens have a special affinity for the stem cell line in the bone marrow that makes white blood cells, probably because they are constantly in mitosis. Scarlet Red dye (Sudan IV), Sudan Black B, DAB, and other dyes are commonly found here by the Syncrometer®. Hydroxyurea is found here too if *Ascaris* is present. Hydroxyurea specifically kills stem cells. Copper[107] and lanthanide metals[108] [109] cause very large mutations, breaking the chromosomes at characteristic places. This is, no doubt, how the "Philadelphia chromosome" and other translocations are induced. We have found that this mutation disappears when synthetic dyes are removed from food, teeth, hair and clothing, vanadium is removed from teeth, and copper water pipes are changed.

When the WBC count is much too high, over 15,000, it may represent leukemia. The simple step of changing copper water pipes often corrects the problem in its early stages. But when the WBC is over 30,000, much more must be done quickly. Removing all plastic and metal from teeth, killing parasites and bacteria can reduce the count to 20,000 in ten days. Removing all dyes brings it down further. At this point it is important to provide selenium and vitamin A. Your WBCs need these to battle pathogens.

Special caution to avoid benzene is essential to get back your normal WBC count, whether too high or too low. Benzene goes preferentially to the bone marrow and thymus where WBCs are "nesting". A list of benzene polluted foods and products is given in *The Cure For All Cancers*, however an easy rule of thumb is not to eat or use processed products, or ones that involve petroleum (as in pesticide residue and waxed fruit), nor to drink bottled water.

There should never be any **blasts** in your CBC. These are baby white cells, allowed out into the circulation before they are mature enough. It always signals overproduction (namely leukemia) in the bone marrow.

The healthy level of WBCs is 5.5 to 7.5 thousand per mm^3. (A mm^3, also

written as uL, is about the size of a poppy seed.) While levels below five reflect a toxin in the bone marrow, levels above this range reflect overproduction. This could be due to stimulation by bacteria. This alerts you to an infection somewhere.

The **eosinophil** count should be ≤ (less than) 3%; higher values imply the presence of parasites, particularly *Ascaris* and your body's "allergic" response to them.

When the WBC is extremely low (below four) immunity is much too low. You are susceptible to any invader. Levels below three are life threatening. But even levels as low as 1.5 have been quickly doubled (in six weeks) by avoiding benzene, doing dental work and killing parasites.

Red Blood Corpuscles (RBC)

The healthy level of red blood cells is 4.4 to 4.6 million per mm^3 for both men and women. We have been taught that 5 million is the perfect result, especially for men. This is not correct. All levels higher than 4.6 are the result of cobalt and/or vanadium toxicity! These toxicities are very common. The Syncrometer® detects the element vanadium in the bone marrow, liver and other vital organs when fossil fuel is breathed chronically, as with gas or oil heat. Of course, the cleaner the furnace burns, the cleaner the air remains. A dust sample taken off the kitchen table in the morning can be tested for vanadium with the Syncrometer®. Vanadium could come from the gas stove or leaking refrigerant. Humans should not be inhaling vanadium mist constantly. Although there is plenty of vanadium in the dust and dirt outdoors, it does not accumulate in us to a detectable level from this exposure. Even worse than fossil fuel pollution, is sucking on objects day and night that release vanadium, namely tooth prostheses (fillings, caps, root canals, crowns).

Cobalt causes the same deceptive elevation in the RBC level.

The RBC count is a masked value. Certain toxins elevate it, while other toxins lower it. If they occur together, a middle value is reached which appears to be in mid-range, and is, therefore, considered normal and "healthy." Carcinogenic food dyes target the bone marrow. Anemia (low RBC) results. The *anemia* is not noticed when the RBC count is artificially elevated by cobalt and vanadium. Are we a nation of anemic people, lulled into complacency by falsely high RBC

levels?

The RBC level can rise to normal or drop to normal in five days, after removing cobalt and vanadium! We have been trained to believe that it moves very slowly, taking months to achieve a significant change. This is true when iron is being supplemented to force a rise in RBC level. When so many toxic forces are acting, the RBC level can only move very slowly. But when toxins and parasites are removed the RBC moves toward normal very swiftly.

When hydroxyurea and carcinogenic azo dyes are no longer bathing the bone marrow (after the parasite treatment and dental cleanup) an “anemia of long-standing” or “anemia of chronic disease” or “anemia of unknown origin”, (such as an RBC of 3.4) frequently rises 0.5 units in five days! These “anemia” labels are given to indicate “mysterious” diseases but are simply caused by toxicities.

If the RBC falls below 3.0 a transfusion must be obtained promptly (the same day). Some hematologists focus on the hemoglobin level rather than the RBC to assess the need for transfusion. This might result in waiting too long. I recommend giving transfusions a bit too early rather than a bit too late.

When the RBC or hemoglobin drops too low, not enough oxygen is delivered to your tissues. If not enough oxygen reaches the heart, it can be permanently damaged. Heart failure is not far away. It is best to get two units of blood together and raise the RBC to a comfortable level for your body, rather than to skimp along on one unit received more often. To heal, your body needs lots of oxygen, not a survival amount. Use your transfusion time wisely; it is “borrowed”. Hurry to clear parasites, bacteria, artificial teeth, and environmental toxins out of your body. You may request *erythropoietin* from your clinical physician to help build blood temporarily.

If your religion does not allow you to accept a blood transfusion, find a hospital that has experience with your circumstances—the Chamber of Commerce is always willing to help. If your bone marrow has been killed by radiation, a transplant may be necessary. Often your own marrow can still grow back if you make every effort.

Take vitamin E (400 units, see *Sources*) and calcium (1000 mg) daily if you are getting blood transfusions. It seems a wise policy to toughen the RBC walls and to support clotting. Be patient with your bone marrow. We have seen a

patient recover after getting fifty transfusions.

Although we use “blood builders,” they are not effective if the toxins still remain so all effort should be focused on removing toxins.

Platelet Count

You should have 200,000 to 300,000 platelets in a mm^3 (uL) of blood. A count below this implies a toxin in the bone marrow where they are made, or a destruction process going on after they arrive in your blood. An allergic response may cause platelets to burst and be suddenly gone, too. When platelets are sparse, not enough clotting action is present in blood. Surprisingly, our blood vessels spring leaks all the time, and must be patched by platelets. Numerous small bleeds do not get patched, and are allowed to develop, when the platelet count drops below 100,000. If dental work is necessary and platelets are below 100,000, a dose of platelets should be given just a few hours before the appointment (not sooner).

Platelets should be given before the mouth and gums are bleeding. Removing copper, cobalt, vanadium and azo dyes restores the bone marrow’s ability to make platelets again.

As the platelet count drops below 10,000, emergency care is needed. Extra precaution against copper toxicity is now most important. Every food, every supplement, all water, every drug must be tested for copper before it is given to the patient as a double precaution against pollution. Large doses of magnesium (magnesium oxide, 300 mg, three a day) will slow platelet destruction.

Of course, dental extractions to remove the copper, cobalt, vanadium, and germanium will trigger the very bleeding that is necessitating platelet transfusions. But time is of the essence—every minute counts now. Without the dental clean-up, death is certain. With the dental work, survival is at least possible. Dental surgery should be done in a hospital where blood and platelets can be immediately given, bleeding stopped by clinical means and other emergencies attended to.

High platelet levels such as over 400,000 results in too much clotting activity; the blood will run sluggishly because it is too viscous and therefore does not deliver enough oxygen and food to the cells. A small amount of niacin ($^1/_{16}$

teaspoon or a pinch) and an equally small dose of aspirin (½ baby aspirin) are given three times a day to thin the blood in this case. Platelet counts of 500,000 to 800,000 tell us there is a small amount of bleeding going on chronically somewhere in your body (the body is trying to stop it by clotting it!) The bleeding should be searched for. However, often the platelet count does not go up, as expected, so bleeding must be guessed at by watching the RBC to see if it is steadily dropping.

BUN and Creatinine

BUN stands for **blood urea nitrogen**—namely, how much urea is in the blood. Since the kidneys excrete urea, we have mistakenly thought that high levels in the blood imply kidney disease and low levels imply extra-good kidney function. Neither concept is correct.

I have found that high urea levels imply a bacterial infection somewhere and low levels mean there is a block in its formation. When your body cannot form urea, there is serious trouble ahead; yet it has routinely been interpreted as "extra-good" kidney function.

The bacteria that raise the BUN most are the exceptionally bad ones, *Clostridium* varieties. Others add their part, too. Bacteria make copious amounts of ammonia, which is extremely toxic to us. (It has the odor of a diaper pail.) So our bodies catch the ammonia and make urea out of it, so it can leave our bodies quickly. Urea is removed from the blood by the kidneys and bladder.

When your BUN is quite near or actually over the top of the range, you must quickly kill bacteria. The main sources, of course, are decaying teeth and your bowel contents. Use the techniques discussed; tooth extraction, betaine supplement, hydrochloric acid, enemas, Lugol's, turmeric, and fennel to quickly reduce your bacterial burden. Double or quadruple the kidney herb recipe until you can produce 1 to 1½ gallons of urine in 24 hours. The BUN should drop in a week.

A BUN that continues to rise becomes life threatening. At higher levels such as over 50, urea begins to damage the tissues, including the kidney itself. If the kidney becomes damaged, BUN will rise still further and dialysis must be used as a stopgap measure until kidney health recovers.

A BUN level over 55 often brings dizziness and delirium, yet some persons can endure a level of 80! There are many ways of clearing up this condition, even at this late stage. Take numerous (four) enemas in a day. Help the kidneys by stopping all malonate consumption—methyl malonate is the kidney toxin. Detoxify it with as much vitamin C as you can tolerate. Cysteine is a specific kidney helper (take two 500 mg capsules three times a day for several weeks). But first of all, kill parasites and start taking the increased amounts of Kidney Cleanse recipe. All the clinical techniques for lowering BUN (hydration, etc.) should be used, too.

BUN levels can be too low for many years without you being aware of it. A test result that is near the bottom of the range or below is too low. There is a block in the urea synthesis cycle somewhere, probably in the liver. Malonic acid can do some blocking; toxins produced by bacteria themselves may contribute; dyes also block urea formation.

In my observation, the ammonia that is blocked from making urea is forced to make pyrimidines—the very nucleic acids that unbalance the ratio of purine to pyrimidine bases.

If the BUN corrects itself, but then goes to an extreme again, search for the same causes as before—they have probably returned!

Creatinine is more truly a test of kidney function than BUN. Yet, creatinine formation can be blocked too, and be extra low. Again, this does not imply extra good kidneys!

Since creatinine is made from creatine, an extra low value could mean too little creatine is being made, or at least left in the body. Too little would be made if the necessary ingredients are in short supply. The ingredients are glycine, arginine and methyl groups donated by SAM. Malonic acid toxicity shortens the supply of these. Without enough creatine turning into creatinine, blood levels must be low.

Creatine is muscle food. Some cancer patients waste a lot of their creatine because the muscles are unable to use it. So it is excreted. Again, there is very little left to turn into creatinine, giving the appearance of “extra-good kidneys.” The amount in your blood should not be less than 0.9. Even this value is “too good,” since it is the level of young healthy persons. If you have cancer and yet

have a creatinine level that is very low, you can guess that you are unable to make enough creatine or are wasting it in the urine. Stop eating malonic acid foods immediately and get the malonate (plastic) out of your dentalware. In the meantime, supplement yourself with shark cartilage and amino acids, both essential and non-essential.

Creatinine levels rise when the kidneys fail to clear it from the blood. A level of 1.4 should not be exceeded. If it goes above this, vigorous help for the kidneys should be obtained at once. The Kidney Cleanse, starting with the usual dose but doubling it (or quadrupling it) after a few days helps most. Lots of water (at least two quarts/liters a day) helps. Cysteine (three grams a day) and lysine (five grams a day) are especially useful supplements. Alkalinizing your body with ½ teaspoon baking soda or sodium/potassium bicarbonate mix (two parts baking soda, to one part potassium bicarbonate) at bedtime helps the kidneys, too. Sometimes a drug is responsible for kidney failure. To test this all drugs should be eliminated or substituted with an equivalent variety for at least a few days to see if the creatinine will fall. If the kidneys respond and creatinine levels drop, do not go back to earlier drugs. Even a creatinine level over 5.0 can be reduced to safe levels again in these simple ways.

But clinical help should be requested before it rises above 3.0. This will buy you a small window of time; use it wisely—to extract rotten teeth or get plastic out of teeth, kill bacteria and parasites, change diet, and find drug replacements.

Liver Enzymes

The liver is the body's main manufacturing plant so its health is reflected in our health. When the liver gets sick, we get sick. That is why nearly half of the blood tests done are actually liver tests, in some form. The liver can regenerate new cells and keep itself repaired! Old worn out cells must die to facilitate this rejuvenation. If the liver is injured chemically, many more cells will die. If they die, they release their enzymes into the blood stream. Three common enzymes are:

AST (aspartate amino transferase), also known as SGOT.

ALT (alanine amino transferase), also known as SGPT.

GGT (gamma glutamyl transpeptidase).

The two transferases go up quite readily when there is any kind of liver disease or when drugs are used, since drugs are toxins to the liver—meaning that liver cells are killed. If your transferases, also called transaminases, are going up, a liver toxin is present and you must search, even amongst your "natural" supplements for a toxin. The Syncrometer® usually detects lead polluting vitamins or herbal concoctions in such cases. For this reason, only tested supplements are recommended for your use. If your transaminases are over 70, and rising, don't wait; try going off all supplements for five days to see if the transaminases will fall. If not, replace all your drugs, too, with substitutes for five days.

Sometimes an essential drug such as a heart drug or anti-seizure drug is responsible for the elevated transaminases. Even if the transaminases merely climb over 70 U/L, replacement prescriptions should be requested from your doctor. Transaminases over 350 can still be brought down to safety, if you act quickly. But if they soar higher, liver failure is in progress. You must make every effort to help the liver. (Seek out IV therapy.)

The GGT reflects a different liver function. I have not yet found the cause of its elevation in cancer patients.

All three enzymes should be below 25 U/L. (It is unrealistic to expect to see the truly healthy level of 12 in a cancer patient. Some damage may be permanent.) If yours are elevated, try to find the cause. You can be pleasantly surprised just by stopping painkillers and substituting other anti-pain measures. Changing painkillers sometimes works. Using two or three different painkillers, each in a small amount, also may work to lower your liver enzymes. Don't give up, even if your GGT is over 1000; it can still be corrected.

Total bilirubin (T.b.)

It is the liver's job to detoxify the hemoglobin that is salvaged from old worn out red blood cells.

Since red blood cells have a life span of only 120 days, about one percent of them die each day, and must be trapped by the spleen in order to salvage certain parts. Their iron must be salvaged. Their hemoglobin must be conjugated (detoxified), and excreted as bilirubin in the bile. If the liver is not capable of conjugation or the bile ducts are blocked, raw (undetoxified) bilirubin builds up

in the circulation. You can detect a yellowish tint first in the whites of the eyes. It is called *jaundice*.

There is no time to lose. If your T.b. is over 1.0, there is a serious problem. The problem can be corrected if the T.b. has not gone too high. Most of the time, the problem is aflatoxin toxicity. Stop at once eating all grains, including rice, bread, pasta, cereals, and popcorn. Only oatmeal and corn on the cob present no danger from aflatoxins. Also eat no food that could be moldy: all nuts and many fruits and anything fermented. Five days of complete relief will get the T.b. moving downwards. You must stay on this restrictive diet until the T.b. is back to 1.0; then return to normal food slowly—watching the T.b.

If your T.b. hovers around 0.9 to 1.0, you are too close to the brink of jaundice. Reduce grains; go off nuts, whole wheat, and brown rice.

The most insidious source of aflatoxins is the inside of your own tumors. From here they leak out slowly to reach your liver where the harm is done. But this ends when the tumor contents are detoxified. Sometimes a high T.b. is due to obstruction of bile ducts by tumors pressing against them. This is a clinical emergency. A bypass (stent) can be put in place to help them drain again. While waiting for this surgery, do the entire tumor-shrinking program. Shrinkage can begin in twenty-four hours. When the bowel movement regains its dark color, you know the bile is draining again. HCl drops may be maximized to stimulate bile secretion. Coffee enemas also stimulate bile formation. Taking glucuronic acid as a supplement may help the liver do its conjugation.

When the T.b. reaches thirty, it can still be filtered out of your blood in a clinical procedure. It is important not to let it get higher, since it may damage your other organs. It also helps to give albumin by IV, one bottle (12.5 gm) daily to absorb some of it. Exposure to direct sunlight for one hour seems to help our patients. Raised levels of glutathione (20 gm per day) and vitamin C (3 tsp. or 15 gm per day) help the liver the most with this severe jaundice (if these levels give you diarrhea, spread them out over the day). Do not give up even if T.b. reaches fifty! You may be improving your situation, namely curing your cancer, and yet not losing your jaundice. The pigment seems tightly stuck in your tissues for some time. Be patient. Do the program meticulously.

Uric Acid

When a cell dies the body wisely recycles it by breaking it down, keeping what can be reused, and getting rid of the rest. When the body breaks down nucleic acids, specifically, their purine bases are turned into uric acid, which must be excreted through your kidneys. Traditionally, a high uric acid level in the blood is thought to be bad (and even causes gout), while a low uric acid level is thought to be good, reflecting efficient kidneys.

But in cancer, the uric acid level is often much too low, and again, this is not due to having superior kidneys. I think it is because there is a lack of purine bases that uric acid comes from. Certainly the Syncrometer® detects no purine bases in tumorous organs.

Why is your body short on purines? The correct answer must wait for more research, but five possible explanations come to mind:

1. 1. Bacteria are eating the purines.
2. Excess ammonia is making too many pyrimidine bases. This in turn is using up an equal number of purines (all of them, in fact) when double strands of nucleic acid are being made.
3. Purines can't be made because they require glutamine, and glutamine is being destroyed by glutaminase, and glutaminase production is being stimulated by malonic acid.
4. A blocked urea synthesis cycle may be related to low uric acid levels. Cancer patients typically reveal low urea levels (BUN), implying cycle blockage, and when urea is fed, the uric acid level rises, too.
5. Maybe some purines exist, but the enzyme, xanthine oxidase, which transforms purine bases into uric acid, is missing.

It's even possible that all of the above are responsible in varying degrees! But if I had to pick a single culprit, it would be *Clostridium*. Every time the uric acid level is too low, the Syncrometer® finds *Clostridium* bacteria present in some tissue. As soon as they are killed, purines and xanthine oxidase are again present, and the uric acid level rises to a more normal value!

Even if you are perfectly healthy, would having low uric acid levels be good? Maybe not. Uric acid is not a useless waste item, merely to be eliminated. In other animals it goes on to make allantoin, a healing agent. We are taught that

this does not occur in humans. Yet, the Syncrometer® routinely detects allantoin; it must surely occur at a low level. With very low levels of uric acid, perhaps we fail to make any of this beneficial and mysterious substance.

Another possible benefit of uric acid is that it is itself a purine, and as such would have solvent action on PAHs. Therefore uric acid may draw PAHs along with it into the intestines or kidneys and out of your body. The ultra low levels of uric acid in cancer patients may have allowed dispersal of PAH-like mutagens throughout the body.

Uric acid levels can be manipulated. Supplementing glutamine raises it by increasing purine synthesis. We prefer to give glutamic acid, though, since this turns into glutamine by picking up a molecule of ammonia, thereby helping to dispose of ammonia at the same time. It takes three to ten grams a day of glutamic acid to raise the uric acid level significantly in five days. Unless bacteria are removed, though, it will fall back down.

Folic acid lowers uric acid levels. If killing bacteria raises uric acid levels from too low to too high (above six), this is evidence for a folic acid deficiency. A daily intake of twenty-five to thirty-five milligrams will reduce uric acid levels to three or four, a value I consider correct. This is the same dose that the 21 Day Program uses to detoxify malonic acid on a daily basis. You are getting a double benefit.

Uric acid levels are another example of a “masked” result, where a folic acid deficiency can mask a glutamine deficiency, leaving uric acid levels looking normal. But it doesn’t mean you are healthy. By the time a huge bacterial infection arrives, forcing low uric acid levels as we see in cancer victims, a lot of help is needed.

Without the disturbances of disease and deficiencies, we might not need a daily intake of twenty-five milligrams of folic acid. Stopping malonate consumption would reduce the need further. The maximum allowable supplement in the United States is one milligram. This is not nearly enough to correct our common health problems. The regulation is important, though, because taking a lot of folic acid can mask a B_{12} deficiency. A better solution would be to make it mandatory to provide B_{12} along with the larger amount of folic acid, all in the same dose.

Triglycerides and Cholesterol

Triglycerides are your blood fats. They are usually much too low in cancer patients. The reason is not yet understood by scientists. But it is easy to see that cancer patients are very malnourished, using up both blood sugar and fat to sustain the body. At the same time the patient feels neither hunger nor appetite, and loses weight steadily.

If your triglycerides are below one hundred, you must eat, eat, eat to catch up on lost calories and nutrition. Even if your triglycerides are above one hundred, you must struggle hard to keep this level up. Your food must be as rich in fat as your digestion allows. Five or six meals a day is the norm. You must force yourself to eat, even without appetite.

Triglycerides that are "too high," such as over 300, are a welcome sight in cancer patients. It shows there is plenty of energy reserve to support the sick body. Do not try to lower your triglyceride level by dieting. Your diet must be extra nutritious now, without regard for calories. As your health improves, especially kidney health, high triglycerides may suddenly drop by one hundred points, putting you on the brink of too low triglycerides!

Cholesterol levels tend to go with triglyceride levels, and are often much too low, as well. Since cholesterol is largely made in the liver, low cholesterol reflects a sick liver. Cholesterol is needed for every cell—it forms the outer coat or membrane. Old cholesterol must constantly be disposed of, and new cholesterol made. A healthy cholesterol level of "two hundred-plus-your-age" was established decades ago for Americans. It is not less true now, despite the current emphasis on cholesterol lowering. Cholesterol levels that are too high (over 300) will come down automatically as liver health is improved, as the thyroid level comes up, and as liver blockages are removed with cleanses.

As soon as you are well enough to do a liver cleanse, you may use this to improve a high cholesterol. Do not eat cholesterol-reduced foods nor take cholesterol-lowering drugs when recovering from cancer. Remember that high cholesterol and triglycerides are evidence that part of your metabolism is still working well. A too-low cholesterol will come up automatically as liver health improves.

The sugar, fat and cholesterol content of your blood tells you the state of your

nutrition. Are you a well-fed specimen or barely getting by? Now, more than ever, you need to supply calories of the highest quality to accomplish the extra task of healing that your body has taken on.

Electrolytes

Sodium, potassium, and chloride are your electrolytes. Sodium and chloride together make up familiar table salt. As you eat it, daily, in foods, you must excrete it in exactly the same amount so that your blood level will stay the same —near the middle of the range. Excreting just the right amount is the job of the kidneys and adrenal glands. When sodium and chloride levels are too low, the kidneys and adrenal glands are letting too much escape into the urine. You must assist these organs in particular.

Five supplements are especially helpful for the adrenals when electrolytes are too low (below the range): vitamin B_6 (500 mg a day), magnesium oxide (600 mg with each meal), folic acid (50 mg a day), pantothenic acid (3 teaspoons a day), vitamin C (10 gm or two teaspoons a day).

Other supplements most useful for the kidneys at this time are lysine (5 gm a day), and cysteine (3 gm a day). Altogether, these can help you avoid the need for IV therapy with steroids, albumin, and saline. But if the problem persists or is even worsening, clinical assistance must be found.

Low levels of sodium and chloride contribute to fatigue. Yet eating salt does not raise these levels and would be quite detrimental. Tumor cells and other sick cells have become “waterlogged” with sodium and chloride. These elements must be coaxed out with potassium.

Potassium chloride is tissue or cell salt. When it is too low, you may feel fatigue, as with low sodium. Your tissues are constantly lapping up the potassium in your blood for the internal use of the cells. This would lower your blood level quickly if you did not replenish it by eating.

The healthy level for potassium as I have observed is 4.5 to 4.7. All cancer patients have a severe deficit of potassium which takes weeks to bring up to normal. The potassium level of your blood does not rise quickly. Most persons, even those who consider themselves healthy, have levels that are too low! The cause is not known, although I suspect vanadium may play a role by substituting

itself for potassium. For cancer patients, it is very important to raise your potassium level to the maximum, 4.7. This is to stimulate respiration, namely, oxygen utilization by the cells. Potassium was one of the first nutrients found to stimulate oxygen utilization by tissues. At the same time it coaxes sodium and chloride to come out of cells and reside in the blood again, raising the electrolyte levels.

Often the chloride level is adequate, while the potassium level is too low. For this reason we do not supplement with potassium chloride but rather with potassium gluconate. This avoids raising the chloride level. If your potassium level is very low (under 3.5), you will need three teaspoons daily of potassium gluconate. Use one teaspoon with each meal, stirring it into food, or as "salt." (One teaspoon potassium gluconate supplies 480 mg potassium.) If your level is 3.6 to 4.0, you will need ½ teaspoon, three times daily. If your level is 4.1 to 4.4, you will need ¼ tsp. three times daily. Your tissues will gradually load up on this precious nutrient. Foods known to be high in potassium, such as bananas are not enough to raise the potassium level.

Whenever you are on a potassium supplement for more than a few weeks you must get a follow-up blood test. When a level of 4.7 is reached, you must stop the supplement, and rely on wholesome foods for further supplies. If you cannot schedule a blood test in this time frame you must stop taking potassium after three weeks just in case it is high enough.

Persons with a potassium level that is too high, such as 4.8 or higher, have a thyroid problem (not caused by taking potassium). Naturally, we would not supplement potassium when it is already high. Without enough thyroid hormones the tissues cannot lap it up; this lets it accumulate in the blood while the tissues are starving for it. Thyroid problems are mainly caused by dental toxins. High potassium levels (over five) can cause symptoms such as slow heart rate.

As you do the dental clean-up the thyroid recovers quickly, and now the tissues eagerly lap up more potassium from the blood stream. This can cause a sudden drop from too high to too low levels. Another blood test is necessary to see if you now need to supplement potassium. You cannot rely on your doctor to be aware of these subtle relationships. You must notice them yourself on follow up blood tests.

Your blood salt content determines your blood pressure to some extent. Salt holds water; it was meant to hold water in your arteries and veins. If your salt level drops too low, you cannot hold the water in your blood vessels. Water will escape into your tissues because the blood vessel walls are porous. As the fluid escapes into your tissues they become water-logged (edematous) and your blood pressure must drop, causing fatigue. Most of this escaped fluid can be drawn back into the blood vessels when the salt level rises again, but the bigger amounts cannot. Extra potassium in the diet helps to absorb edema.

A diuretic is sometimes used to force extra excretion through the kidneys so that an extra pulling force is felt at the location of edema. If you already have edema, help it drain by bandaging it in the morning, elevating it, as well as using supplements for the adrenals and kidneys. Now, more than ever, drink the kidney herb tea, increasing it to three cups a day after a few days. (Be sure to start slowly, though.) Hydrochloric acid drops (taken with meals) and cysteine are both diuretics, as is ozonated water. But you may still need an additional diuretic such as *spironolactone*, our natural diuretic (100 mg, two a day), or a drug variety.

When electrolyte levels are too high, this is nearly always evidence of dehydration. You need to drink more water. Do not confuse water with beverages. To help the kidneys excrete salt and other wastes, they need plain water to dilute all the wastes they must process. One liter/quart a day, plain cold tap water, besides other beverages, is a good rule to follow for rehydration. If rehydration is needed immediately, drinking water does not suffice; it must be given by IV. Prolonged diarrhea can result in such an emergency, and requires clinical help.

Calcium and Phosphate

These are considered together because they make up our bones and are regulated together by the parathyroid and thyroid glands.

Four little parathyroid glands the size of peas are nestled in the thyroid gland; they make *parathyroid hormone* (PTH). The thyroid gland makes thyroid hormones, such as thyroxine (T_4), but also *calcitonin*.

These two glands together control calcium and phosphate levels in the blood and whether your bones will become harder and healthier or will dissolve and

become fragile.

The Syncrometer® easily detects PTH in the parathyroid gland when nothing disturbs it. But when copper, cobalt, vanadium, the malonates, urethane, bacteria, or synthetic dyes are present in the gland, PTH disappears. This causes the calcium level to drop.

The Syncrometer® detects calcitonin in the thyroid gland when it is healthy. But when these same toxins are present, calcitonin disappears and the calcium level rises. All this happens in days, not weeks.

Having two organs that regulate something in the blood and having them situated so close together that they actually touch each other shows us the wisdom of Mother Nature. We see the same principle at work in the kidneys and adrenal glands. They can stay closely coordinated. Toxins usually saturate the smaller organ first; the larger one has more reserves.

The parathyroids, being smaller glands, are injured more easily by dental toxins, so the calcium level drops first; PTH will test negative on the Syncrometer®. As the toxins increase, they begin to affect the thyroid, eventually injuring it substantially. Now calcitonin is negative also and calcium rises too high. Bone is being dissolved as the calcium level rises. Dissolving bones release their phosphates too. Now both calcium and phosphate are too high.

A calcium level over 9.7 is too high even though it is well within the “normal” range. And a phosphorus level over 3.9 is too high also; it reflects bone dissolution. (Growing children are an exception, their phosphate levels should be higher.)

A calcium level below nine indicates a toxin in the parathyroid gland. Cancer patients may have endured ten years of such a low calcium level before serious disease set in. Taking in more calcium in the diet helps a little, but does not correct the problem. Taking vitamin D helps a little, too, but must be carefully limited and frequently has lead pollution.

When the calcium is lowered by a parathyroid problem and at the same time raised by a thyroid problem, both problems together result in a level that may appear perfect, when actually serious disease is in progress. The calcium level in the blood test is therefore another “masked” value.

The disease process is unmasked as you begin to remove the toxins. If the parathyroids are cleaned up first, the calcium level elevates. If the thyroid cleans up first, the calcium level drops. Hurry, to clear both of them from toxins so no extremes result. Your body corrects itself very swiftly. Your calcium level may drop from a life-threatening 16.0 to10.0 in five days as the dental toxins, copper, cobalt, vanadium, germanium, food malonates, urethane from plastics, dyes, and bacteria leave the thyroid. Similarly, a life-threatening low of 6.8 can rise to 7.5 in five days by doing the same clean-ups.

Calcium levels higher than 15.0 may begin to cause mental confusion. Calcium may precipitate (settle) in the kidneys; this could become irreversible damage although the kidney herb recipe may still reverse this.

We have brought down a level as high as 19.0 safely, due to lightning-speed attention. Tooth extractions of all artificially-filled teeth, in a single sweep, on the day of arrival can bring the calcium level down several points the same day, to begin the recovery. Levels below 7.0 must have the same emergency procedure: tooth extraction will gain a few points in twenty-four hours, to bring you back into the extremely low, but surviving, patient group. The correct level is 9.1 to 9.6.

A relatively new class of drugs, the diphosphonates, can be used to block bone dissolution so that calcium levels are forced to drop. This may be life-saving and provide you with the window of time needed to detoxify your thyroid gland. A popular brand, *Clodronate*, is available in Mexico (and *Aredia* in the United States). Giving calcitonin is also useful for short periods. But ultimately neither medication can save you unless the thyroid and parathyroids are helped.

Phosphorus levels that are below three indicate a need for vitamin D. The correct level is 3.0 to 3.9 mg/dl. As your kidney health improves this will improve also.

Besides vitamin D, vitamin C also plays a role in bone health. But when vitamin C is oxidized, it cannot participate, leading to scurvy, in which your bones (notably teeth) soften. Oxidation of vitamin C is common, due to the oxidizing action of phenol made by *Streptococcus* and due to the prevalence of *Ascaris* infection.

Textbooks may point out that calcium levels are tied to total protein levels so

they go up and down together. And correcting one may help the other somewhat. But never wait too long for a textbook prediction to come true. Help both.

Total protein (T.p.)

The liver makes our two main blood proteins, **albumin** and **globulin**. One of their functions is to give your blood osmotic force so water will stay in the blood vessels rather than seep into the tissues (similar to the action of salt). Albumin is more effective and is, therefore, more important. But there is more than one kind of globulin, and they are also your antibodies, so have additional importance. The total of albumin plus all your globulin is called total protein (T.p.). It should reach a value of about seven; 7.5 is better. This assures good osmotic strength.

I have not been able to determine the healthy range or critical levels of albumin and globulin with accuracy. The amount of albumin, in particular, is so essential for life itself, that only an extremely careful study could decide the optimum level or irreversible terminal level. It is best to scramble with utmost haste to raise an albumin level that has fallen below 3.5. Cobalt and vanadium are the chief culprits in disturbing the albumin and globulin levels, and again, emergency dental care to extract toxic teeth is the only life-saving measure. It was reported in 1967 that vanadium can cut the albumin to globulin ratio in half[110] yet that fact seems to have gone unnoticed in Western medicine.

Unfortunately, eating more protein does not significantly raise T.p. You must improve your liver by removing cobalt and vanadium from it.

When albumin goes up, globulin is expected to go down, to keep the T.p. fairly constant. But if globulin goes up due to a mutation, and albumin does not go down, the T.p. can rise too high. Stopping the mutations is a much faster route to lowering T.p. than chemotherapy.

Another force pulling the albumin up or down is the calcium level. Yet all these legitimate forces and relationships can go astray. If albumin is mortally low, you cannot wait. Clinical help is advised. IVs of albumin and calcium are needed.

Albumin, as injectable, in 8.0 or 12.5 gram bottles, should be given without delay. Two bottles are needed if albumin levels are below three. Each albumin bottle should be sterilized to kill bacteria and *Ascaris* eggs by adding ½ cc of

ethyl (grain) alcohol through the stopper, then shaken for ten seconds to prevent precipitation. Filtering alone does not remove the Coxsackie viruses that accompany *Ascaris* eggs. Many bottles also contain traces of benzene, isopropyl alcohol, copper, cobalt, and vanadium and malonic acid (from antiseptic contamination, no doubt). We customarily discard about twenty-five percent of all bottles for such reasons. You must weigh the need for IVs against the risk of these toxins being present.

Getting a few days of injected calcium and albumin can save your life and give you just enough time to do your dental extractions, parasite killing, new diet, new lifestyle, and supplement routine. Encourage your caregiver to use this time wisely for you.

Injections of calcium by IV should also be accompanied by magnesium to keep them in balance. Additionally about 25 grams (one entire bottle) of vitamin C should be given to balance pH and keep everything in solution. (These, too, must be sterilized with ½ ml ethyl alcohol and filtered). Whether the basic IV is chosen to be dextrose or salt (saline) depends on your blood test results. If your sodium and chloride level are also low, choose saline. If not, choose dextrose. If both are low, choose saline and add concentrated glucose. The IV bottle will be automatically sterilized when the injectable is added containing the alcohol. But if none has been added, then ½ ml alcohol should be added to the bottle itself.

Twenty-four hours after teeth are extracted, the relief is felt by the thyroid and parathyroid gland, as well as the liver, allowing albumin, globulin and calcium to correct themselves.

When albumin is too high (greater than 5), the same toxins are responsible, cobalt, vanadium, and dyes. Even when T.p. reaches twelve or higher, you can still recover by doing immediate dental extractions and filling removal. But time now matters to the minute. And there is nothing to lose—but life.

To sum up, cobalt and vanadium are what cause albumin and globulin to be too high or too low. These come from both plastic and metal tooth restorations.

Lactic dehydrogenase (LDH)

Hard exercise causes your muscles to make **lactic acid**, which is what makes you feel stiff next day. Your lactic acid was made from pyruvic acid because

your Krebs cycle in the muscles couldn't keep up with the pyruvate you were making while exercising. The enzyme that can interconvert lactic and pyruvic acid is LDH. Excess lactic acid can be used up by the liver while the muscles recover. Because LDH levels closely parallel lactic acid levels, labs can test for LDH instead of lactic acid. The test for LDH is much simpler, therefore, universally used to infer lactic acid levels.

We are taught that when an organ is metabolizing poorly the Krebs cycle also can't keep up with the pyruvic acid made by glycolysis. Soon the pyruvate is piled up. Again, LDH is produced so that a batch of lactic acid can be made out of the pyruvate—just until your liver or organ can catch up with burning the excess pyruvate again. But if your liver is not functioning well so the "catch up" is never reached, the lactic acid will build up higher and higher; a blood test now shows rising LDH. This is rare in healthy persons, but quite common in cancer sufferers because a tumor plays the part of the crippled organ that metabolizes poorly.

So it is thought that there are two large problems already in existence when the LDH is slightly elevated. A crippled organ (or tumor), and an injured liver. But I don't agree. How a small tumor, often the size of a walnut, or even several of these could fill the bloodstream with lactic acid makes no sense at all. Especially considering how efficient the liver typically is at removing it. Liver enzymes are often not even elevated in liver cancer!

These uncomfortable facts are not discussed openly, ever, by professionals. Although every oncologist has seen the rising LDH in many cancer patients, discussions of it are as scarce as if it were a big secret! As if to say, Why ask questions that can't be answered?

The Syncrometer® has found the correct answer, at last. There are two reasons why the LDH goes up, not just one. A mutation that directly raises the enzyme LDH occurs when the azo dye Sudan Black B is present in the cell. Azo dyes are known to be highly mutagenic.[111] All cancer patients with elevated LDH show this dye in abundance. It has been bioaccumulated because the body could not detoxify it nor could the immune system (WBCs) carry it away. WBCs belonging to the tumorous organ do not carry away the dye due to their inability to "eat" it, an immune dysfunction due to ferritin-coating of their outside surfaces and due to inability to move about properly due to calcium deposits that keep them stiffened up. When we restore their immunity by removing ferritin

and the calcium deposits (caused by lanthanide elements), the WBCs promptly show the presence of Sudan Black B dye. They are now finding it and eating it. But to our dismay, it causes the same mutation in them! Now their LDH levels go way up; it is spewed into the blood stream now, where they are traveling, where it can affect other organs and, of course, where it can be detected in the blood test. Any organ that dares to pick up some of this LDH will have its Krebs cycle suddenly curtailed since the pyruvate is now being changed to lactic acid.

So you can expect the LDH levels to go up at first as immunity improves! Symptoms are worsened. We must hurry. The affected WBCs must be helped with selenite supplementation to unload their toxic cargo in the kidneys and bladder for excretion.

The second cause of LDH elevation is indirect. When cells have lanthanide elements within them, a family of nucleoside analogs appear called dideoxy nucleosides. How this happens is not known, but that nucleoside analogs cause lactic acid elevation is well known.[112] It is the side-effect of drugs used for AIDS patients. Raising lactic acid would inevitably raise LDH. This needs further study.

By removing lanthanides with lightning speed (dental work followed by magnet therapy) as well as excess ferritin, the LDH drops without first rising and can be expected to drop 100 points in just five days, sometimes faster.

Remember that a normal LDH doesn't mean you are cancer free. Not all cancer sufferers have an elevated LDH. But once it begins to rise in a cancer sufferer, it spells doom because other enzymes are mutated too; all body tissues will soon be dysfunctional. Hurry to get the dyes (dental plastic, etc.) out of your body! And avoid eating both dyes and lanthanides, as discussed in *Food Rules*.

When the LDH is very high, over five hundred, all the dye treatments should be maximized. Normally, we reduce dyes with coenzyme Q10 and vitamin B_2. But if the LDH is over one thousand and all your treatments are not bringing it down in the first five day period, you could be given a shot of benzoquinone oxidizer ("BQ", see *Recipes*) a clinical procedure originated by Dr. W. Koch. Even values as high as three thousand can be brought down with a shot of this oxidizer.

BQ treatment can be given several times, on alternate days. More will not

help. It buys a week of precious time to accomplish dental work, deparasitizing, etc.

Thyroid supplementation is increased to maximum tolerated (four grains or more) to accelerate the LDH drop.

We use a cut-off point of 160 U/L for LDH if the laboratory uses a range up to 240. (But remember, not all laboratories use identical procedures, so if the range on your blood test goes up to 480, you would double 160 to get 320 for your acceptable limit.) This limit of 160 is arbitrarily chosen. A value well below 160, such as 120 to 130, may be better.

Occasionally, LDH values are much too low, below 100. This causes intense fatigue. I believe this is due to cobalt inhibition of glycolysis. Large amounts of oxidized cobalt are produced by *Ascaris* as they consume your vitamin B_{12}.

Alkaline Phosphatase (Alk phos)

This is an enzyme that moves calcium in and out of bones. The only time it should be above the normal range is if you are still a young, growing person.

High levels in cancer cases may implicate lungs as well as bones. Yet sometimes neither is involved! And sometimes they are involved without raising the alkaline phosphatase! This enzyme behaves as mysteriously as LDH. And for good reason! Its elevation is also due to an azo dye. When it is elevated, it, too, can be used as a tumor marker, to guide the way to cure. Its healthy level is 75 to 85 u/l.

One common azo dye is known to raise alkaline phosphatase levels, dimethylaminoazobenzene (DAB).[113] [114] DAB is present as a pollutant (or as an intentional colorant) of the most common of all antiseptics, chlorine bleach. Use of this bleach contaminates all manufactured products where bleach is used, so traces of DAB are left in them. Wherever the Syncrometer® detects DAB, it also detects sodium hypochlorite (common bleach). All cases of elevated alkaline phosphatase seen had DAB distributed widely in their tissues and built up in the fat tissues. I believe this dye induces a mutation that causes the alkaline phosphatase to be produced in excess. In fact, DAB and Sudan Black B frequently occur together, in which case both LDH and alk phos are elevated. Because white blood cells (if they are competent), busily eat up this dye, they are

severely affected themselves. Their excess alk phos seeps out into the bloodstream, thus reaching the bones where the greatest harm is done.

Once you have too much alk phos, this calcium enzyme can start dissolving your bones, creating lesions typical of bone cancer. For this reason, I disagree with current thinking that might state “his prostate cancer metastasized to the bone.” I would say “the same dye, DAB, that caused elevated alk phos in his prostate, has reached the bones, and is now causing the same mutation there, so bones are now under attack.”

Even alk phos values as high as one thousand can be reduced by stopping all use of manufactured products and decontaminating your fruits and vegetables according to the Food Rules. But the accumulated dye does not leave the body quickly. It has become “bio-concentrated,” like Sudan Black B, in your body fat and within your tumors. From here it trickles steadily to liver, spleen, and bone. For this reason, the 21 Day Program has large doses of coenzyme Q10, vitamin B_2, and ozonated oil (another dye destroyer), for several weeks.

Total Iron (Serum)

Iron is transported on transferrin in the serum. Serum is the liquid part of the blood (not the blood cells).

The ideal blood level of iron is 100 ug/dL but values as low as seventy-five are acceptable. Even values as low as fifty will allow hemoglobin to be made so red blood cells can be born in the bone marrow. But below this, body systems begin to fail.

A hallmark of advanced cancer is low iron levels so hemoglobin and RBCs cannot be made.

Hemoglobin (HGB)

HGB is the molecule that carries oxygen to your tissues from your lungs. Red blood cells (RBCs) contain hemoglobin, so levels of HGB and RBCs tend to rise and fall together. An HGB level that is too low may need to be rectified with a transfusion *even if RBCs are adequate* and vice versa.

Carbon Dioxide

Low carbon dioxide implies you may be huffing and puffing, even from mere walking, thereby expelling it too fast. It is needed as an acid/base regulator. It might be better to be on oxygen to stop your breathlessness. High carbon dioxide reflects an acid buildup. Reduce sulfur and HCl; and add sodium and potassium. High bicarbonate (trapped carbon dioxide) may indicate too alkaline a blood serum.

How Important Are Blood Tests?

Blood test values are never accepted as "absolute truth." The lab could make a mistake; something unusual could have happened; or a mysterious effect could be at work. Interpreting blood tests is still an art, hardly a science. For this reason blood tests are repeated before they are given great weight. And certain tests are given much more weight than others, for instance, the RBC, T.b, creatinine, albumin. Life depends on these and there is little room for variation.

Still, the time of day, whether you have eaten recently, or exercised, affect some results more than others. It is wise to wait for three or four blood tests before being too alarmed about most other blood test results.

Since labs use different tests and ranges, it is obviously wise to stick to the same lab for easy comparisons.

You Won't Die From Cancer

Rarely does a cancer sufferer die from their tumors. Long before a tumor presses too hard on a critical organ, something else will go amok. This is what cancer sufferers die from, **in my experience:**

Cancer Symptom	Result	Actual Cause of Death	Incidence
Tumor pressing on a vital organ	Tumors can block airways, arteries, bile ducts, put pressure on the brain, and so forth.	Cancer	25%
Anemia	When your red blood corpuscles and hemoglobin become so low that even	Heart failure.	50%

	transfusions can't keep up, your organs become starved for oxygen.		
Uremia	High BUN levels damage kidneys (they can't excrete urea or creatinine). Am-monia levels rise.	The ammonia poisons your body.	20%
Hypercalcemia	Calcium levels over 16 can cause con-fusion, disorientation, and other mental symptoms. Researchers speculate the calcium is precipitating in your organs, particularly your kidneys. Any level over 17 can be fatal.	Kidney failure.	10%
Hypoprotein-emia	Low albumin permits edema (water retention). As it becomes severe, your blood pressure drops, damaging the heart.	Organs don't get oxygen, among other things.	10%
Hyperprotein-emia	High albumin and high globulin (T.p. levels over 10) cause problems, but the mechanism isn't clear.	A level over 16 can be fatal.	10%
Hyponatremia	When sodium and chloride fall too low, your blood pressure falls too low also.	Heart failure.	10%
Liver failure	High liver enzymes (SGOT, SGPT, GGT) reflect dying liver cells.	Coma.	10%
Jaundice	When the bilirubin levels reach 2, you may start to see a yellowish tint in the whites of the eyes. At higher levels the skin becomes yellow and at 30 you need it removed mechanically before you go into a coma.	The bilirubin poisons your body.	5%
Pneumonia	Lung cancer sufferers often accumulate water in their lungs. How tumors could cause this is considered a mystery, but I find maleic anhydride is the culprit.	Asphyxiation.	5%
	If you don't have enough platelets,	Heart failure,	

Hypothrombo-cytemia	you can't stop bleeding internally or exter-nally. Low blood pressure results.	among other things.	1%

The percentages obviously add up to more than 100%. That is because they often overlap.

Of course classical thinking is that cancer is responsible for all the symptoms described above, so the cause of death in all these cases is “cancer.” But that is because oncologists don’t have evidence that cancer can be cured. They feel once a cancer patient, always a cancer patient. My evidence suggests the opposite: there are two separate battles, tumors, and the toxins responsible for them. I have seen many people conquer their tumors, only to succumb to some aspect of toxicity. That doesn’t mean cancer won. That just means cancer toxins are capable of doing a lot of damage to your body. Damage that doesn’t magically go away like your tumors will.

You <u>can</u> win <u>both</u> battles.

Reading Your X-rays

How would you like to be a radiologist? Not for a moment am I suggesting I can give you a medical school course in one chapter, but I want to emphasize that there are many things you can learn from your x-ray that don't need great expertise to understand!

X-rays, computerized tomography (CT or "cat") scans, magnetic resonance images (MRIs), and ultrasounds all come as "negatives" to begin with. For this book those negatives were printed. A print reverses the light and dark areas. For instance, bones on negatives appear light, but on prints appear dark.

I am assuming you can obtain your negatives to take home. Because they are precious, your doctor is justifiably reluctant to give them to you, even on loan. Some radiologists are equipped to make duplicates. Ask your doctor to refer you to one.

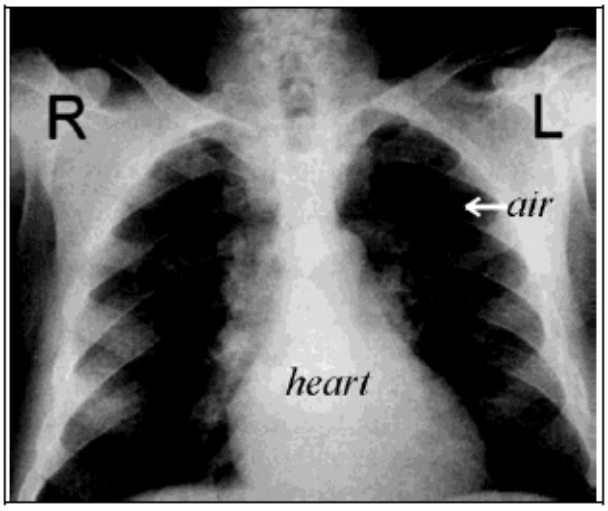

Fig. 34 Chest x-ray, front view

Tape your negatives to a window that lets in bright light to give you good visibility. Get your bearings first: top, bottom, left, right. Some scans include a diagram to show you where in the body the pictures were taken. If you have numerous negatives choose a few that show the problem most clearly; they may have already been marked by the radiologist. Use these markings to help you understand your problem. Most problems are easy to recognize if they are large. Small problems should be pointed out to you by your health provider. It is not

necessary to learn the names of anatomical parts to recognize that they are not normal!

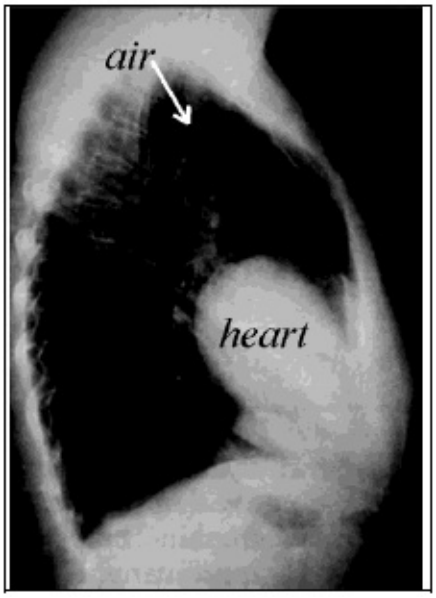

Fig. 35 Profile or side view of lungs

The front view of a chest x-ray shows the lungs as dark areas on the negative. The dark area is actually air. The larger the dark area, the better your lungs are. On the left side, marked L on the negative, a slanting edge marks the heart. It reaches to the middle and upward. A bulge above the heart shows where the aorta arches backward. The trachea, esophagus, aorta, and large abdominal vein all pass along the middle, between the lungs, called the mediastinum. They cannot be distinguished in such a view. Nor could a tumor be seen here. For this reason a side view is taken also. On each side of the midline, bright spots are seen, along finger-like spokes. These are lymph nodes lining the tracheoles. They should not be enlarged or extremely dense (white on the print).

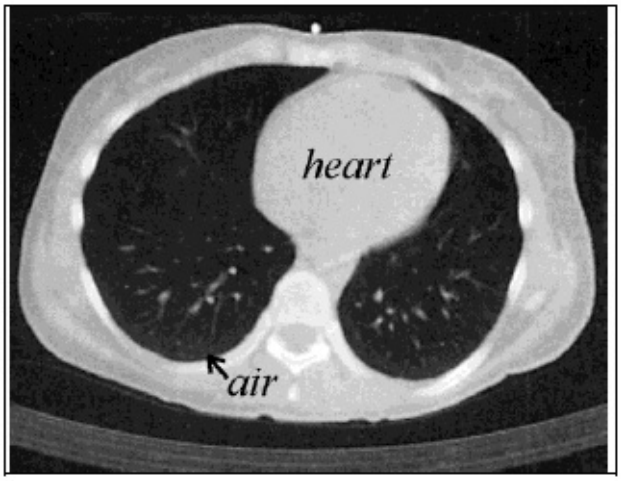

Fig. 36 CT or MRI of lungs

A CT scan of the lungs takes numerous pictures of imaginary “slices” made across the body. Each slice, or cross section, is pictured in a frame. Frames taken very close together (a few millimeters) will be able to spot things that are only a few mm in size. Frames taken far apart will miss things that are smaller than this spacing. The spacing is stated on the negative. The dark areas are the lungs, white specks are the tracheoles with their lymph nodes. The heart is in the middle. Cross sections of ribs surround the lungs.

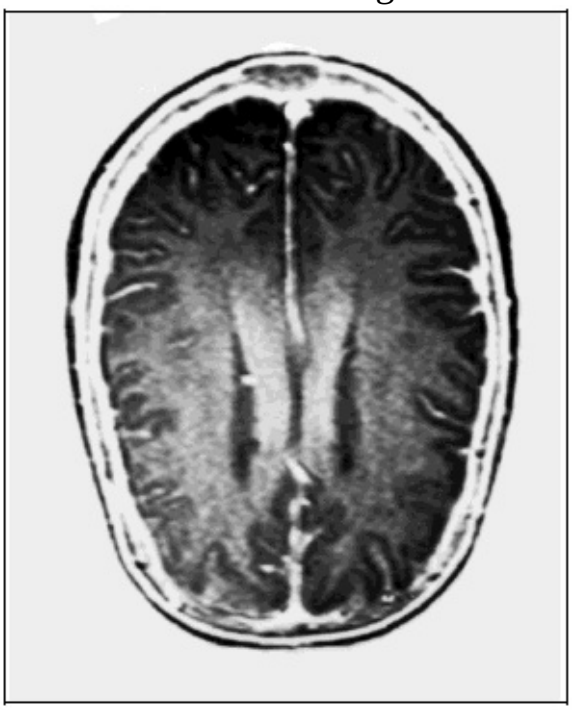

Fig. 37 CT of normal brain

The brain as seen from the top by CT or MRI looks like the meat of a walnut. The two halves are separated by a straight line. The center line should not be pushed to either side. Pressure due to fluid buildup, edema, is the usual cause of displacement of the centerline. The edema could result from an active tumor. The tumor itself is identifiable as an extra dense region that is not shaped as normal brain tissue should be; the shape is compared to the opposite side that is normal and healthy. A plain x-ray, of the skull, not shown, can often show a large brain problem, too, and is much less expensive.

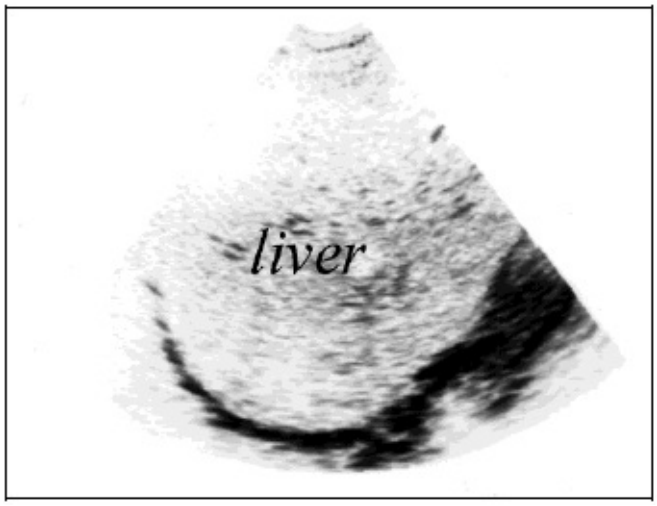

Fig. 38 Liver ultrasound, right lobe

The liver is best viewed by ultrasound. Ultrasound uses sound waves instead of radiation, is also non-invasive, and inexpensive. Like a CT, ultrasound produces a number of frames. The large right lobe should appear smooth in texture (have an even density). There should not be specially dense regions as seen in liver cancer. The gallbladder will be viewed on some frames.

The left lobe of the liver is much smaller. The pancreas and spleen may be viewed on some frames.

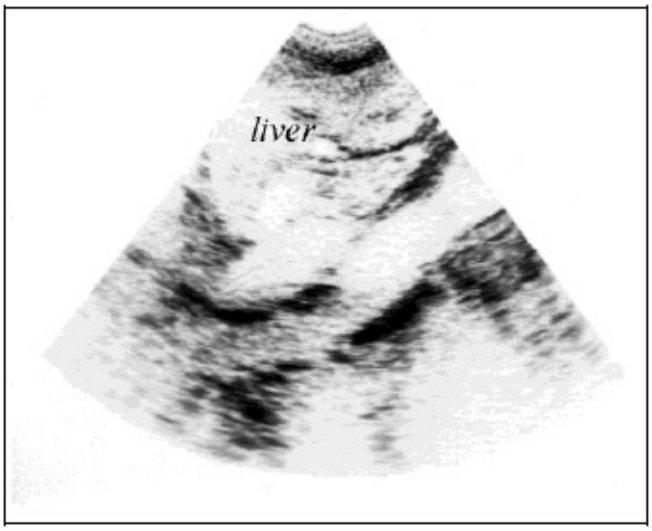

Fig. 39 Liver ultrasound, left lobe

Here is a CT scan of the liver. The texture should be smooth, without granules or dense areas. The dark mushroom shape is the spinal column.

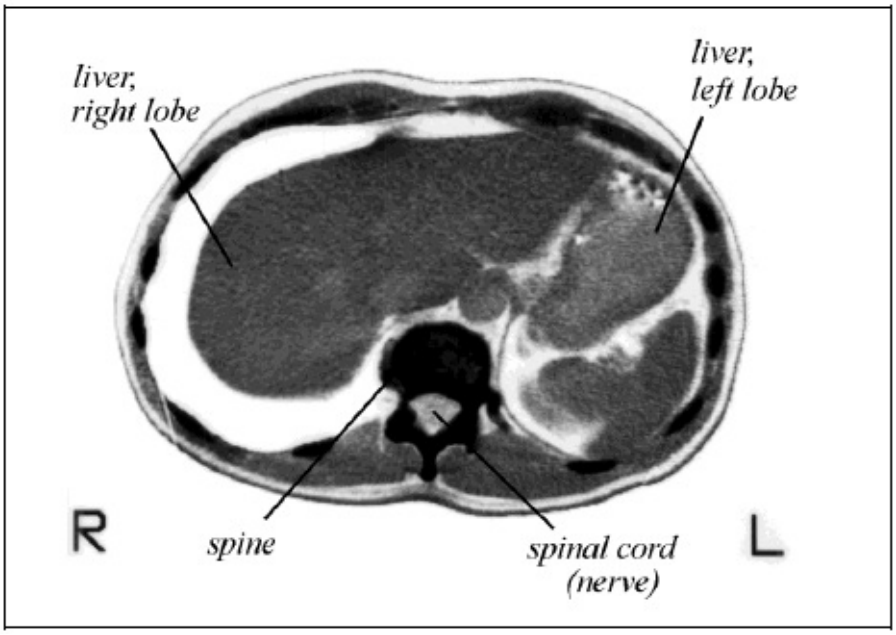

Fig. 40 CT of left liver

A CT scan of the abdomen shows numerous frames in a series of pictures taken between the liver above and the bladder below. Find your backbone, the spine, first. Notice the largest artery in your body, the abdominal aorta, just inside (above) the spinal column. The interior has loops of intestine. On each side are cross sections of the kidneys. Although they may be of equal size in your body, one might be placed higher than the other so a cross section may make them appear dissimilar.

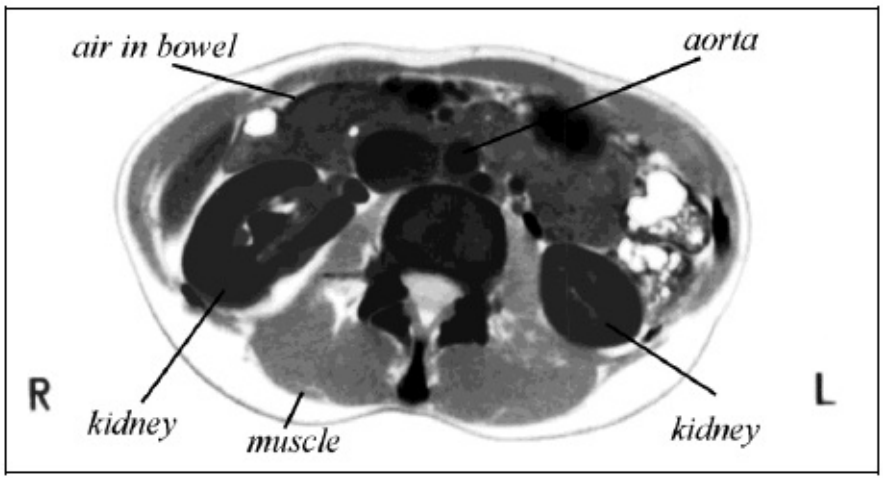

Fig. 41 Typical CT frame of abdomen

Note the CT scan shows the kidneys in relationship to the other organs, whether pushed aside by a tumor or edema fluid. Now compare the CT scan to an ultrasound of a single kidney. The ultrasound shows their typical oblong shape, and ragged internal structure. It is a lot easier to see a mass in the ultrasound than CT. There should be no outlines of masses anywhere.

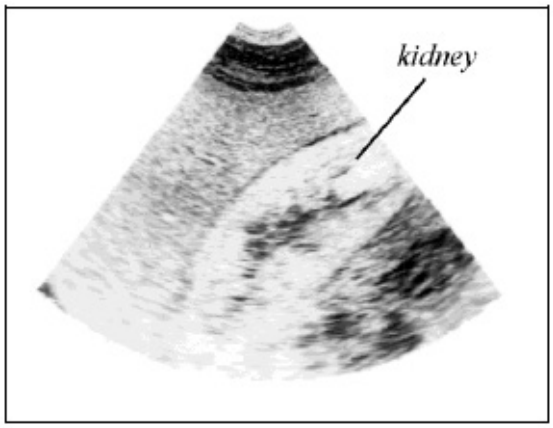

Fig. 42 Ultrasound of normal kidney

The CT scan of breast views cross sections that also show the lungs and rib cage. If the frames are closely spaced, a nodule can be found that may be missed on an ultrasound.

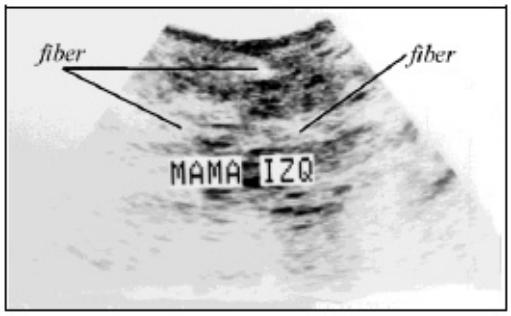

Fig. 43 Ultrasound of left (IZQ) breast

The ultrasound of breast shows typical white patches (dark on negative) where the tissue is more fibrous. The negative should not have intense dark areas of definite shape. A small amount of fibrous tissue is normal. Of course, large masses can also be felt or seen. But small masses may persist, though they can no longer be felt.

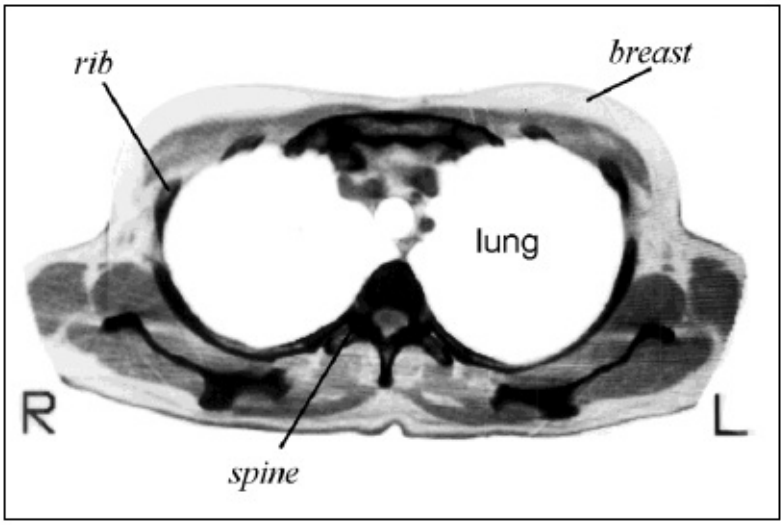

Fig. 44 CT of breast

An ultrasound of the lower abdomen will include both bladder and prostate for men and bladder and uterus plus ovaries for women. The white area is the bladder. Beneath it is the roundish prostate gland. If the prostate becomes enlarged, it pushes against the bladder, indenting it with a “cookie bite” like appearance. The prostate gland should have a smooth external edge and a homogeneous internal appearance. The radiologist calculates its weight from its dimensions, often given on the ultrasound. Pictures taken at different angles will give different lengths and widths; such variations should be taken into consideration.

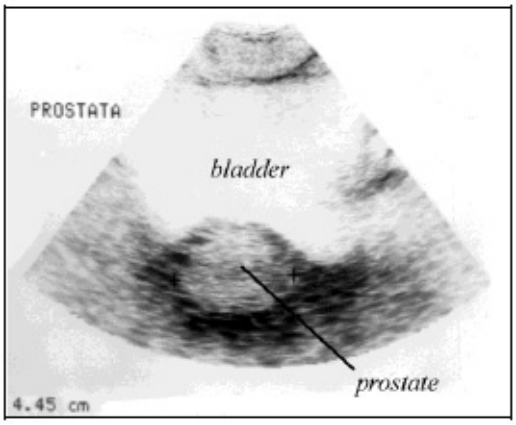

Fig. 45 Ultrasound of bladder and prostate

A bone scan views all the bones in your body, from the skull to your toes in one small picture.

An injection of radioactive technetium (an element) is given first, allowed to

find its way to the bones (three hours) followed by imaging of your radiating bones! The regions where the technetium has accumulated will show up as intensely white “hot spots”. These hot spots are cancerous bone lesions, to be distinguished by the radiologist from mere “inflammatory” or benign lesions.

Fig. 46 Bone scan

You will be able to identify some of the hot spots yourself by matching them with your pain locations. You will also see hot spots that are not yet painful! Pain develops after these lesions become infected with bacteria. Bone lesions of any kind, malignant, benign, or inflammatory are soft areas, showing that calcium is not being deposited as fast as it is being dissolved. Even after you correct the problem, it is nearly impossible to catch up on the bone loss. There will always—or at least for years—be a region of low bone density at these locations. For this reason, a follow up x-ray or bone scan can never be expected

to appear totally normal. But the hot spots will be gone and former lesions that were small can disappear, leaving only the evidence of former severe bone lesions.

Are You Ready For Your First Case?

Use your orientation to understand the scans in the case histories that come next. There will be pointers to help you. The more of these you look at, the easier it is to see things that should or should not be there.

The True Story of...

This is what actually happened to people using the methods taught in this book. They were not selected because they were all successful, indeed, some of the earliest ones were hampered by our lack of understanding. These true stories were selected simply on the basis of having confirming before-and-after evidence of what the treatment did for them. Naturally the names have been changed to ones randomly selected from a telephone book to protect the privacy of the patient. Furthermore, to include all the details in their file, including all the scans taken, would quadruple the size of this chapter, so I have just included relevant details and representative scans.

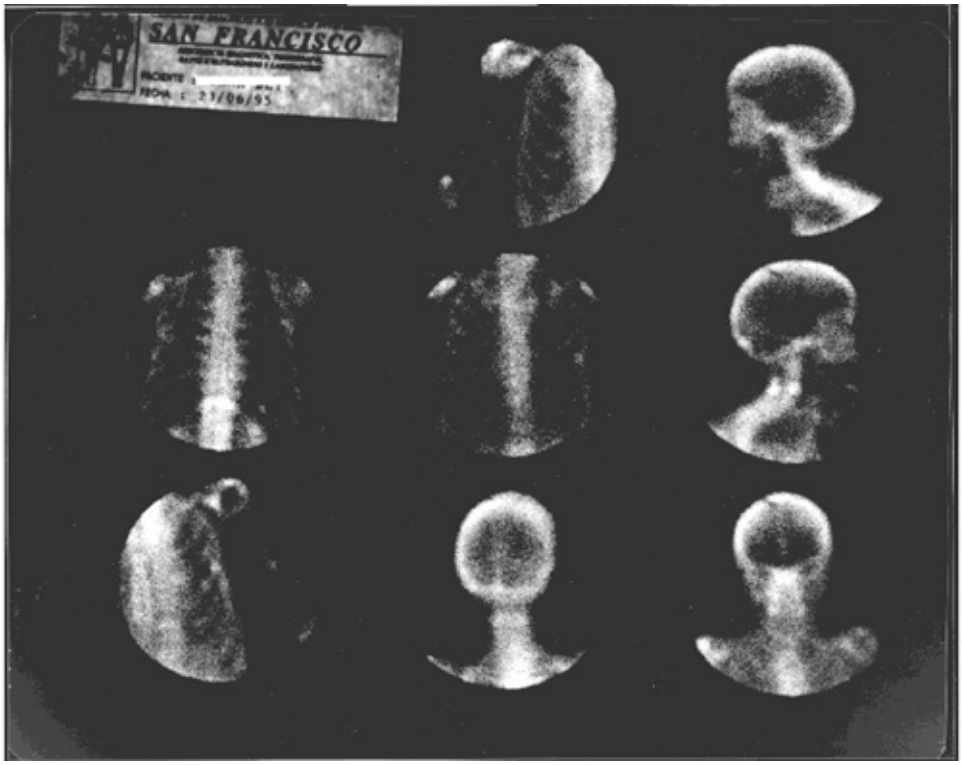
Nearly every case was diagnosed as "terminal." Yet most patients kept joy and hope in their hearts. Many gained a second life. Some did not. But each one taught a new lesson, sometimes at great cost, and for that reason the knowledge in this book is priceless. This is your guide to survival.

1 Katherine Morales Bone Cancer

Katherine Morales, age seventy-eight, came September 21, for her bone cancer that had invaded her whole skeleton. She was in pain from top to toe, especially at the back of her head and neck and the bottom of her spine. She had recently been in poor health otherwise, too. She had shoulder, knee, and hip repaired and replaced, and now her digestion was bad and she coughed a lot. Katherine was on heart medicine (Verapamil). Her daughter, who came with her, could easily see the downward trend; her mother could only sit and had dropped below 90 lb. Katherine was anxious about herself, too. She felt a lump in her abdomen that she could not explain and her bowels had not moved for days.

Syncrometer® testing at the general body level showed ortho-phospho-tyrosine Positive at kidneys and bone, Negative at colon and liver. [*Testing at the general body level selects those problems that are widespread and, therefore, of greater level of toxicity and significance. When a tissue slide is included in the circuit,*

only problems at this tissue are detected.] She not only had bone cancer as found by her doctor at home, but also kidney cancer. We ordered a bone scan and kidney scan, but she wanted to do all scans and tests at home where insurance was certain to cover the cost.



Hot spots on skull, neck, spine, rib, etc. (shoulder is prosthesis).

Part of original bone scan

Other testing we did included isopropyl alcohol (Negative: cancer sufferers always test positive to this, but Katherine had already stopped using all items on the isopropyl alcohol list); lead and vanadium (Negative); asbestos (Positive: she must stop using her dryer); arsenic (Positive: she must clear all pesticide from her home); fiberglass (Negative). She was also clear of the solvents benzene and wood alcohol. Finally, we tested for bacteria: three salmonella varieties, *E. coli*, three shigella varieties, and *Staphylococcus aureus* were all Negative. This was a pleasant surprise. I had usually found Staph responsible for bone pain -which she had! It would originate in a rotten tooth or old jawbone infection (cavitation). But Katherine's situation was different. She wore complete dentures. *Staphylococcus* could certainly be hiding in a cavitation and we would do a careful inspection. But any dental problem would be minimal. Would this give her a special chance to survive? She reminded me of my very special elderly

housemate who had died recently. Both were very frail and bowed with bone loss. Both had thick files in their doctor's offices for broken bones and sprains. But my companion, even at age ninety-seven, was pain-free and pill-free. Could I at least help Katherine out of chronic pain?

Katherine was to start taking the kidney herbs, kill parasites regularly, zap daily, and take two teas she could make herself at home. One was mullein herb for her cough. The other was burdock root to improve her constipation. She would also take 1 tablespoon of moose elm (also called slippery elm) made into a cup of half and half. And sodium alginate made up as ½ teaspoon added to 1 cup of boiling water. This would find its way through the toughest blockage in her intestine. She would be started on IVs and 2 vials containing rhodizonic acid daily.

All this could have overwhelmed Katherine, but her daughter took on the tasks eagerly. Katherine exuded the sweetness of the very elderly as she said goodbye. Did she really believe there would be a "Mexican miracle" for her? I gazed after her with wishful thoughts.

Three days later, not much had been accomplished. Nor had her bowels moved. But her digestion seemed better.

In another three days, much had occurred. She had begun to have bowel action the previous day; the alginate had found its way through. The abdominal scan had been done and revealed no tumors. The bone scan revealed "hot spots" of cancer from top to toe. Hardly a bone was free of lesions. No wonder she had pains everywhere.

Her blood test results are given at the end of her story. They showed the typical low blood sugar (66!) of cancer patients; she would soon be emaciated, not just tiny, frail and thin. Her BUN (4!) and creatinine were much too low, showing there was a block in their formation. She would soon be toxic with ammonia, unable to turn it into urea (BUN). Her LDH was completely normal though, as were all her liver tests showing that hair dye, food dyes, and lanthanides were not the main problem. Only the alk phos was somewhat elevated [*due to the dye, DAB*] though not at all runaway. But albumin, her precious liver protein, was too low and iron was frighteningly low (35!). She must get away from copper water pipes immediately. They promised they would find a new apartment at once. Her potassium was much too low (2.8!), too,

probably causing her extreme fatigue.

Note: instructions in the current 21 Day Program can be different from those given a few years ago.

Her first supplements included one quart milk daily for better nutrition and extra calories, plus magnesium oxide, boron, manganese, and vitamin D. All these were for bone building and bone hardening. The calcium would come from the milk.

"Katherine" in the IV and zapper room

Also included was hawthorn berry, and coenzyme Q10. These two would eventually replace her heart medicine by supplying what the heart really needed.

[*The reader is cautioned not to do this at home without medical supervision.*]

Next was a recipe of herbs to build bones, consisting of burdock, mullein, boneset, comfrey. I reassured her that any toxicity from these was mere hearsay. If she had any side effects, please let us know. There were none.

Her "Rhodakem" (proprietary form of rhodizonic acid; it costs about $3.00 per vial) was raised to 4 vials a day. There was nothing to lose by maximizing every treatment. Time was of the essence for her; while pain was not yet so intense that continuous painkiller was needed.

The following day she had her first IV. She began wheezing and coughing during the IV, which couldn't be stopped. [*With hindsight, she probably got a dose of bacteria in her IV. We were unaware of the bacterial problem at that time and had not learned to sterilize the IVs with ethyl alcohol nor filter them.*]

The next day she arrived in the office, walking unassisted, but with her walker. She was much improved. Her pains were nearly all gone, only the lower back pain and neck pain persisted. Her bowels were functioning very well now. But she was still coughing from the day before. Testing showed she had picked up *E. coli* somehow [*the IV*]. She was given Echinacea and charcoal capsules for it. And "peroxy" water to drink (several drops of food grade hydrogen peroxide in her water).

Four days later, she was still keeping all her gains. She was doing well and could be gone a week now.

It was October 12, a week later. She had moved back to her own home to see if she could take care of herself. She was able to walk a bit <u>without</u> her walker. She was coughing less and could stop the herbs. Her IV series was complete. She was started on 1) hydrochloric acid drops with each meal and 2) Clodronate capsules.

In another week, October 19, she was still in her own home. She was walking in her home without a walker. Her cough was much better, but not gone. She was still on 4 rhodizonate vials daily, hydrochloric acid drops, and Clodronate. Her vitamin D dosage was decreased to one drop (50,000 IU) on alternate days.

The next week, October 26, she arrived with a lot of digestive problems again; nausea, and this time had lost weight. She was down to 82 lb. Her cough was

gone, though, and the lump in her abdomen was gone. The pain at her lower back was gone. But *E. coli* could not be vanquished, it was very positive. She would soon be bedridden at this rate. She was given six vials of rhodizonate to take twice a day, chlorophyll, Lactobacillus culture (tested for other bad bacteria), moose elm, and scheduled again for a daily IV of glucose, vitamin C, and glycyrrhizin. [*At this time we had not yet learned the simpler remedy of turmeric and fennel for E. coli*.]

Three days later, she related that she had felt immediately better after the first six vials (of rhodizonate) and had gone down to four after that. She had gotten nauseous during the IV and had to stop it. We started her on thioctic acid.

The next week, November 2, she had gained weight (1 lb.!). The Clodronate was nauseating her, though, so it was stopped. Instead she was given a calcium carbonate supplement plus magnesium oxide (2 a day), to be taken with meals along with her hydrochloric acid drops. She seemed well enough to do a liver cleanse.

Then she was gone for three weeks, and we were getting quite anxious. Was this long absence good or bad? We were delighted finally to see her arrive. She was "feeling very much better" in her own words. She had done a liver cleanse and gotten about 400 medium to small stones out. She felt stronger, was able to read again. Nausea was much better. Appetite was up. Being able to read again meant a lot to her, she said.

The next three weeks we allowed ourselves to hope for Katherine's recovery. Indeed, she walked in December 14 stating that she felt fine, was doing more and more walking, and getting stronger. She had done her second liver cleanse and got a lot of stones again, including one large one. Her nausea was gone now, and she was eating well. There was no coughing. She was zapping daily. All bacteria tested Negative. The bowel was functioning perfectly. Her pulse was 68; there were no missed heart beats. So she was taken off Verapamil and left only on hawthorn berry capsules, one 3 times a day plus coenzyme Q10. She would have her pulse taken daily to see if this switch was satisfactory.

Three weeks after that, January 9, Katherine came in with purpuric (purple) spots on her arms. Her left hip also showed a "bruise mark" and was painful. She was taken off molasses and syrup sweeteners she was using-they contain sorghum molds that cause blood vessels to break, causing the purpura. She

should make herself marmalade as a sweetener, using honey. This would provide bioflavonoids to strengthen her blood vessels. A supplement of bioflavonoids was added for a month. Otherwise, she was getting stronger. She had gained more weight back. A new blood test was scheduled. Next day we reviewed it together. Her blood sugar level was now much better. She was making urea well (BUN up to 13) though creatinine was still too low. Most significant was the further drop in alk phos, this represented the improvement in her bone cancer.

The entire staff was elated for her, as well as her daughter. Her liver could make enough albumin again so she was not in danger of developing edema followed by kidney and heart failure. Her uric acid was normal, but calcium was too high (10.3). She could go off her calcium supplement and reduce vitamin D drops to one a week. Her iron level was normal.

Katherine had seen her medical doctor recently, who had released her. We could also release her this time, free of pain, free of drugs, but still on a few supplements.

Three months later, she came in for a peculiar head problem. She had pain again, at the back of her neck. Notice how extremely "hot" the bone lesions at the top of her spine were initially. This implicates bacteria-the most likely bacteria were food bacteria since she had full dentures ruling out rotten teeth. Indeed, she tested Positive for *Salmonella* and *Shigella*. She was put on a Bowel Program including Lugol's, four times a day, turmeric, fennel, and digestive enzymes with each meal for one month. In one week she was much better, all bacteria tested Negative and she could stop the program. Only Freon tested Positive now. It had filled her diaphragm. She would start drinking ozonated water and make a recipe of kidney herbs for herself besides changing her refrigerator.

In June she moved to a new apartment. Immediately she began coughing a lot. She was full of fiberglass. Dust tests led to the furnace room, where there was also arsenic. She received a benzoquinone shot (½ dose). Later that month she was well again.

Time passed. We did not see her. We grew anxious and called her daughter. Katherine was doing fine; she was taking care of herself and her husband at home. She was not using a cane or walker and was not in pain. She had purchased a special three-wheel walker for outdoor jaunts. Shark cartilage was

recommended as a maintenance supplement.

The calendar rolled on. It would be three years before we saw her again.

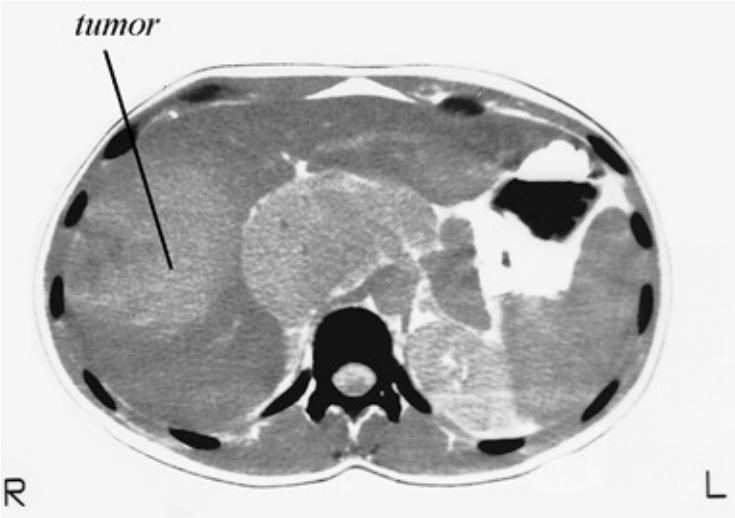
NOTE: ranges shown in parentheses are laboratory "normal" ranges and are included only when they are notably different from laboratory ranges cited earlier (because laboratories differ). **To remind yourself what I consider a "healthy" range, please tear out the chart and use it as a bookmark.** "Verified" means the lab knew the result was at an extreme and repeated the test.

2 Michelle Symanski Liver Cancer

Michelle Symanski came to Mexico after she was told by United States surgeons that she had inoperable liver cancer. She was only twenty-three years old and had two very young children. She was wearing a pain patch (morphine).

One look at her liver scan explains this. She had tumors, including one very large one, making up all of the right side. But the left side (not shown) had a small portion that was uniform and smooth, without granules. This probably was the functioning part that was keeping her alive.

Due to my intense emotional distress over this young mother, I called in a brilliant alternative doctor (Dr. M). He in turn called in a brilliant allopathic doctor (Dr. V). Seldom do we all join forces. Dr. V pronounced that nothing could be done that would not add needless misery to the weeks or months remaining for her. But he would run a special catheter right into her liver so we could conveniently administer any treatment.



Liver scan from August

She was very pale, thin, small framed, but still vivacious.

Our electronic testing showed ortho-phospho-tyrosine, isopropyl alcohol, *Fasciolopsis buski*, asbestos, fiberglass, aluminum were Positive. Mercury, lead, cadmium, arsenic, formaldehyde, and eight common food bacteria were Negative.

She was to stop using her clothes dryer or hair dryer to eliminate asbestos. She would bring in dust samples from home to track down the fiberglass source. She had less than the average number of toxins in her home.

She was to start the parasite-killing program, zap daily, and go off everything on the isopropyl alcohol list. She seemed to be in a panic and agreed eagerly.

She was to start the kidney herb recipe.

Her IVs would be formulated to contain glycyrrhizin, DMSO, B-vitamins, vitamin C, and laetrile beginning at once.

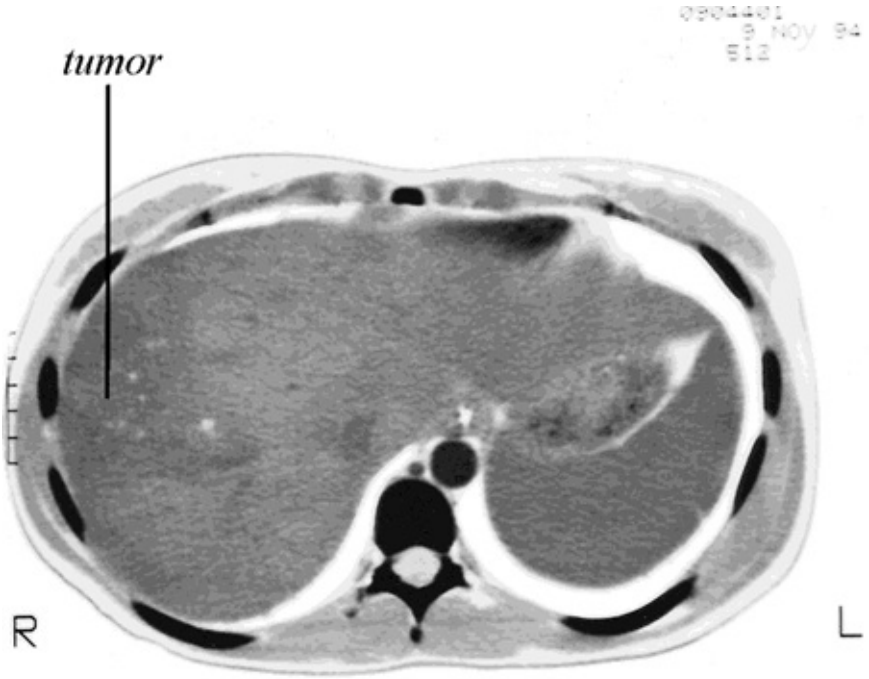
She felt better immediately, the same day, and skipped next day's treatment. The day after, she arrived quite fatigued. Although ortho-phospho-tyrosine and *Fasciolopsis* were now Negative, she was still Positive for isopropyl alcohol. She had gone back to using regular shampoo and drinking bottled water. She was helped to make borax shampoo and persuaded to stop bottled water.

Three days later Michelle was Negative for asbestos, fiberglass, and isopropyl alcohol. She felt well and had brought her children. She was started on Lugol's iodine, though, (6 drops, 4 times a day in water) to eliminate a Salmonella invasion.

Eight days later (she was missing her daily IVs and check ups), she arrived still Negative to toxins. Her swollen liver had gone down along with her abdominal pain.

She missed appointments another two weeks and had been seen shopping with her children. She was coaxed to come back. She had a new pain across the abdomen and was coughing. She only stayed long enough for one IV treatment even though appointments, IVs, and supplements were given free of charge, out of compassion for her tragic circumstances.

Another three weeks went by without communication. Then she arrived very depressed. Yet her energy was up, her health obviously better, and all her pain gone. Her coughing had stopped. A scan was scheduled. But it was skipped.



Nov. liver scan

A month later, November, she had gained 20 lb., and had not yet done her scan. We were overjoyed to see her and quickly helped her get to the radiologist. The scan showed the large liver tumor had mostly disappeared, leaving only fragments. Notice how the texture of the entire liver was much improved, appearing more regular and smooth than her first scan.

She continued to miss treatments for another month, in spite of our anxious calls to her home.

When she appeared she was feeling very bad again. She had received conventional chemotherapy in the meantime. I could hardly persuade her to even come in for testing; she was just visiting somebody.

Michelle Symanski	April
BUN	9
AST (SGOT)	147
AST (SGPT)	96
LDH	771
GGT	18
T.b.	0.4
alk phos	117 (39-117)
albumin	3.8 (3.9-5.1)
globulin	2.9
uric acid	7.5 (2.5-6.8)
calcium	9.6 (8.5-10.4)

iron	35
bands	3.5
other tests	good

Ortho-phospho-tyrosine, isopropyl alcohol, aflatoxin and cobalt were Positive. She had her original problem back. She was crying and angry. She said she stopped zapping, used no parasite herbs, and had been using regular body products again. She had a new boyfriend and didn't want to appear "abnormal" to him. But she promised me personally to zap again and go back to her disciplined life style.

From time to time somebody reported she had been seen with her children. One report sighted her in a bar at night. Christmas passed and we heard she was seemingly well.

Four months later, she arrived extremely ill. She did not come to see me, but I obtained a copy of her blood test results. She was terminal.

Soon after this we got the news, Michelle died.

Summary: If we had a chance to do it all over, losing another $5,000.00 worth of IV supplies, besides supplements, we would gladly do it. She had a right to live life, free of chains. She had a right to appear "normal" to a young man of her choosing, whatever the place and time. We turned our grief inward. Society and government had let her down.

3 Julie Cote Brain Cancer

Kevin and Julie Cote had been told in no uncertain terms by their friends at home that they must seek out our clinic at once.

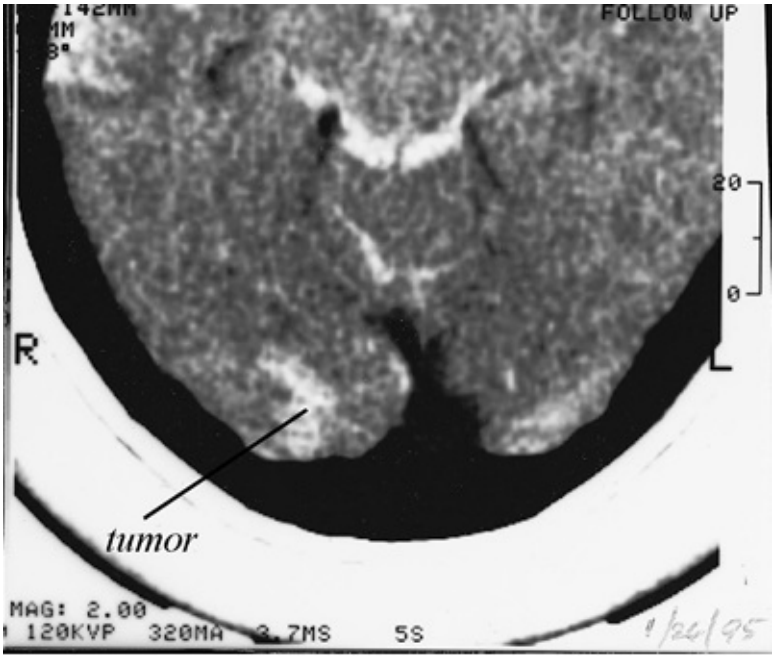
Three weeks ago Julie had a five-day headache for no reason and suddenly lost her memory. She couldn't remember having had guests for supper the previous day.

An MRI of the brain done by her doctor at home showed a mass the size of a nickel in the right occipital lobe. It had an irregular shape, appearing white on the print. Her doctor thought it might represent a newly reactivated cancer since it couldn't all have grown so suddenly.

When she arrived on February 14, her husband did the communicating for her and steadied her along to and from her chair. She had numbness in the tongue, lips, cheek, and left hand. (Remember, the right side of the brain controls the left side of the body.) This made speech difficult; her vision was blurred and she felt dizzy and lost her balance easily. She also had chronic headache. Such symptoms can be a sign of an active tumor.

Her initial test results with the Syncrometer® were Positive for ortho-phospho-tyrosine, *Fasciolopsis*, isopropyl alcohol, aflatoxin, lead, cadmium (from copper and galvanized water pipes), mercury (from amalgam fillings), *Salmonella typhimurium*. This systemic salmonella infection was probably what caused her dizziness; it may even have been responsible for activating her tumor. She was given 6 drops of Lugol's iodine in ½ glass of water before leaving the office, to begin killing *Salmonella*. She was to take the iodine dose 4 times a day, after meals and bedtime. She was instructed in taking the parasite-killing program and avoiding items on the isopropyl alcohol list as given in the book, *The Cure For All Cancers*.

She was shown how to use our zapper, daily. A blood test was done. Her diet was to be free of grocery-store bread and all nuts to get rid



Jan 26 MRI of brain (magnified)

of aflatoxin. She was given capsules of methylene blue (65 mg each) to be taken 3 times a day and told to anticipate having blue urine. Methylene blue is a very old and relatively nontoxic dye. It acts as a reversible oxidizing and reducing agent, picking up electrons from brain cells that need oxidation, then giving them up again to neighboring chemicals. In this way, the brain's metabolism is helped.

They sat quietly absorbing their instructions on diet, changed life style habits, the need for a copper-free water source, and all the supplements to take. They were overwhelmed. I feared they would not accomplish their tasks. I decided to use the intravenous route for supplements instead. Unless we could correct the mental impairment very quickly, the damage would become irreversible. Or at least, take much longer to reverse than the three weeks they had come for. It was a fortunate decision since they did not return the next day. Even the day after that, they had not managed to begin anything. But they had found copper-free lodging.

Julie Cote	2/16	2/24
RBC	4.6	4.85

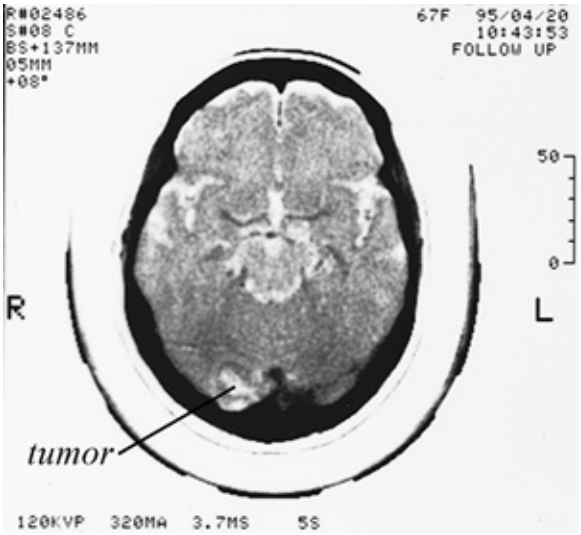
Potassium	4.2	3.7
Chloride	99	102
triglycerides	202	151
cholesterol	364	259

On February 17, we reviewed her blood test results together. They were discouragingly poor. Both BUN and creatinine were too low, showing that the excretion path for ammonia was blocked and her muscles were not being fed with creatine. Her liver enzymes were somewhat high, and the GGT extremely high. This probably reflected aflatoxin damage as also seen in the rising total bilirubin. Unless this could be reversed right now, it would continue to rise beyond our capability to correct it. She would soon be jaundiced. The alk phos was extremely high also, suggesting lung or intestine or bone would soon be involved, besides brain.

The uric acid level was too low, revealing the lack of glutamine; glutamine is especially important to the brain. [*A failing Krebs cycle could explain the lacking glutamine since it is made from glutamic acid. At that time we were not aware that low uric acid also implicates Clostridium bacteria somewhere*.] She was supplemented with glutamine.

Her iron level was much too low (38), revealing a toxic copper [*and germanium*] burden, no doubt in her amalgams. A good sign, though, were her triglycerides and cholesterol. Although they were indicated to be high by the lab, we knew it to be a good prognostic sign. She needed one. The LDH was satisfactorily low [*showing that her liver could still detoxify Sudan Black dye*].

The remainder of the test results were quite good. She announced that her urine was blue, as it should be, but that the liver and kidney herb recipes had not yet been started. Nor had dental work been scheduled-she needed amalgams removed.



April brain scan

I implored them to comply to perfection and let nothing stand in the way. They seemed blithely unaware that disaster was imminent, though perhaps still avoidable, as it is for the camper whose tent is pitched within inches of a cliff.

Her isopropyl test was Negative, showing she was making the right product choices. She had been given three IVs and was scheduled to continue these daily. In fact, I added several items to her IV schedule. (All IV bags and the injectables to be added to them were first tested for pollution with copper, cobalt, vanadium, isopropyl alcohol, benzene, and methyl alcohol.) To no avail. I did not see them for eight days.

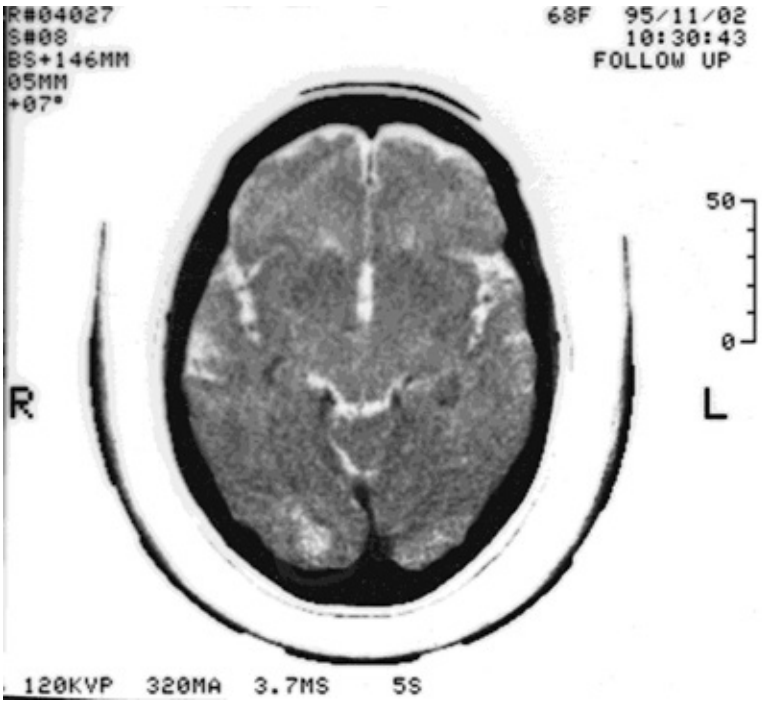
When they arrived, Julie walked briskly, unassisted into the room and took over the communication for herself. She said they had done everything they were told. Eight missed appointments did not seem noteworthy. She was quite aware of her improvements, was sleeping better, and no longer dizzy. She was back to her old self and was doing the housekeeping again. What pleased her most was being able to read again; she had sorely missed this while she was ill.

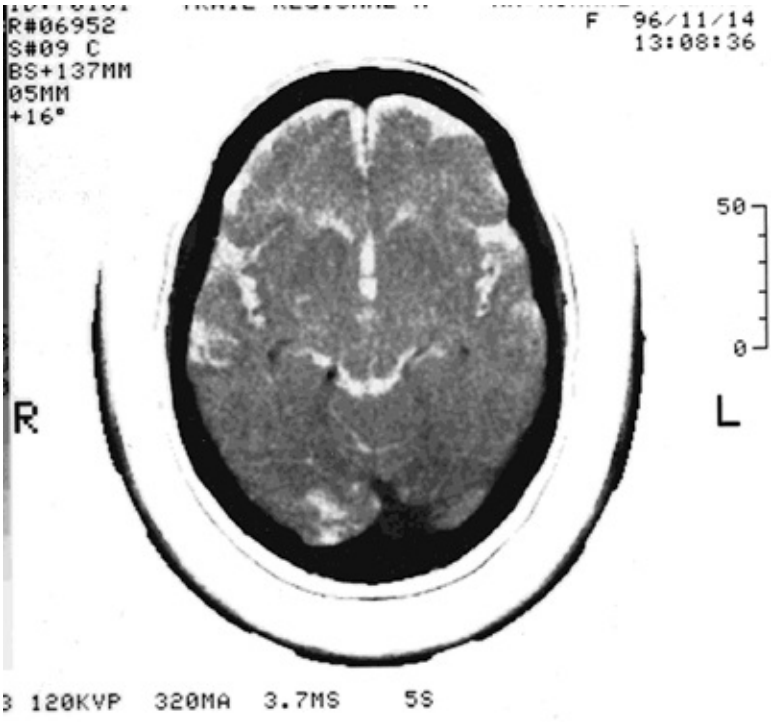
A new blood test was scheduled, February 24. Her BUN and creatinine were now normal. All the liver enzymes were down to normal, the GGT was 20! The T.b. was back down from 2.6 to a healthy 0.3. And the alk phos was perfect at 80. The improvements were phenomenal. But they didn't know this, since, again, they did not return the next day to review it. Day after day, they did not return.

We had a private celebration over her good fortune, even while we scolded

over her missed appointments. We called the area motels and RV parks, trying to locate them. Weeks later we found them...back home in their own country! We gave them the good news about Julie's blood test but they knew it already and were not very interested. They knew it from Julie's return to health! We also wanted to see a follow-up CT scan.

She sent us her follow-up CT done in April. Another was done in November, and then in November of the following year. The mass seemed to have shrunk very slightly, or at least it had not enlarged. The pressure it had been exerting on surrounding brain tissue was evidently relieved. She had no symptoms remaining whatever, although the tumor was not gone. Possibly, more vigorous treatment could have shrunk it, but the cost was prohibitive for them. And they chose to risk stopping and leaving well enough alone. Perhaps it was a wise choice, after all.





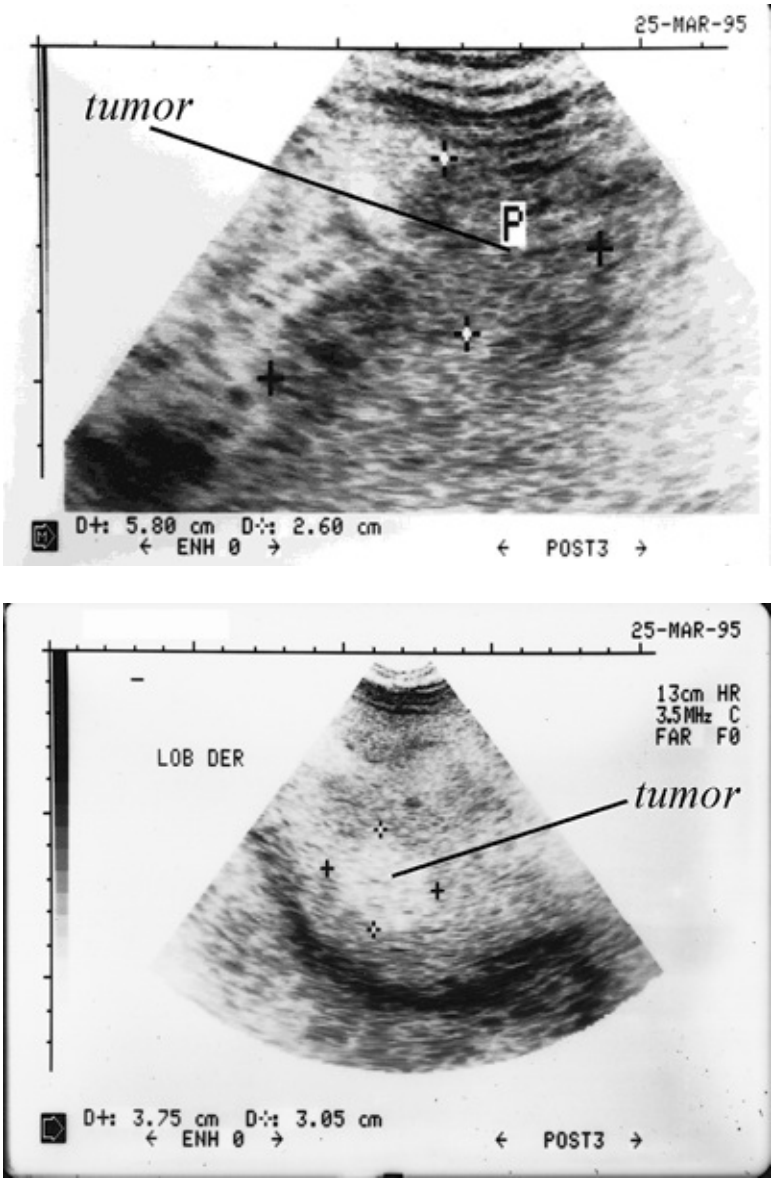
Nov. brain scan, and Nov. next year

Summary: Julie got fantastic improvement in ten days. What had she done? Her file does not state she got amalgams removed, but clearly her copper was gone since her iron level came up. She had taken Lugol's, certain supplements (not listed), methylene blue, and the kidney herbs. She sent us follow-up CT scans for a year and a half; then stopped that, too. Two years after the last scan she was reached by telephone. She was happy and well.

4 Jason McGowan Pancreatic and Liver Cancer

Jason McGowan, a middle-age father of several children, was first diagnosed with irritable bowel syndrome at home. He was on antibiotics for a severe "flu" that wouldn't go away soon after that. A GI series of x-rays showed nothing, but an ultrasound of the liver revealed some spots. Then a CT scan was done. It showed a 5 x 7 cm tumor in the pancreas. This is equivalent to 2 x 3 in., the size of a tangerine. Plus several small masses in the liver, considered to be metastases from the pancreatic tumor. He did not want to biopsy any of them since he knew

this was terminal illness. He refused clinical treatment and headed for Mexico.



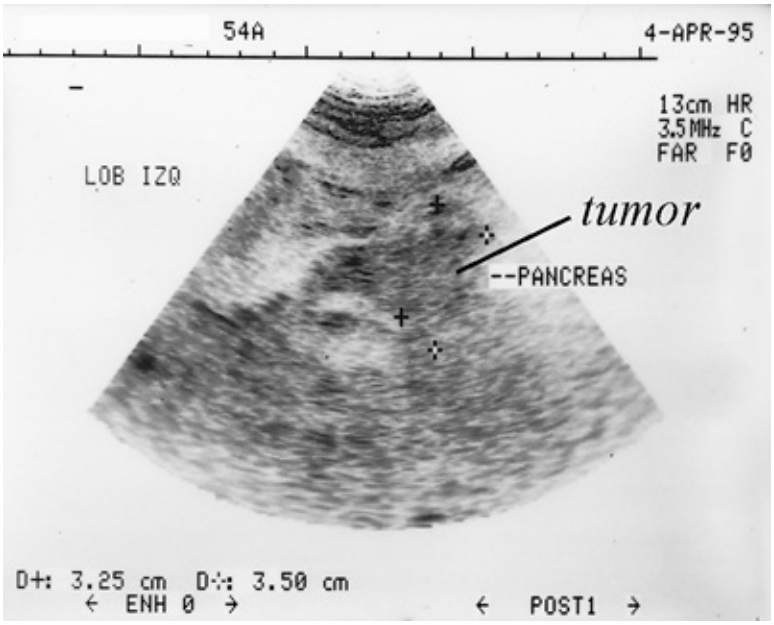
March 25 pancreas and liver ultra-sound

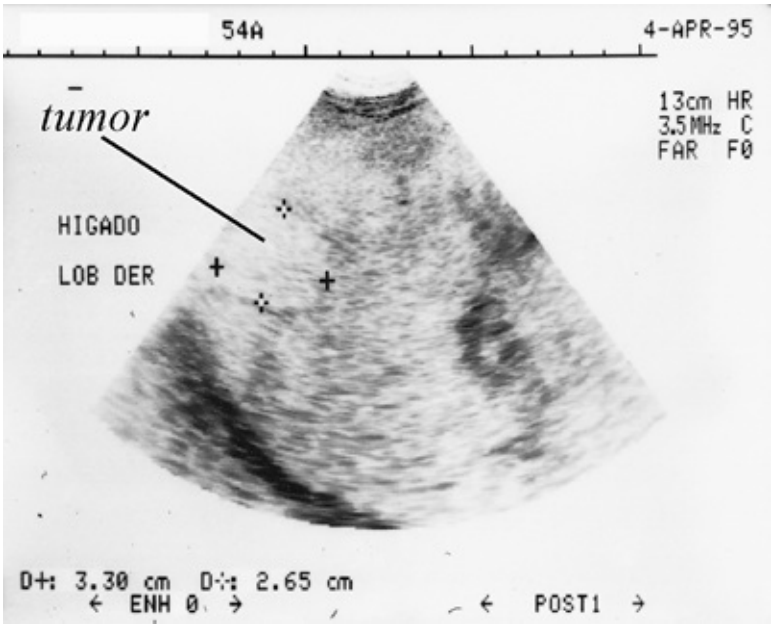
It was March 17. He arrived full of vanadium, gold, Freon, isopropyl alcohol, three varieties of salmonella, one shigella, and *Staphylococcus aureus*. The vanadium came from his oil-heated home; he said you could smell the oil as you entered. The gold came from the crowns in his dental ware; gold has a preference for the pancreas. Salmonella and shigella are filth bacteria, colonizing the bowel of animals and spreading to human food via fertilizer and dirt. Staphylococcus comes from teeth, in the form of an abscess or cavitation.

He was started on Lugol's iodine, the parasite-killing program, and zapping. He was helped to avoid isopropyl alcohol containing products. He was scheduled for dental work to replace metal and started on the kidney herb recipe. A consulting physician was asked to be in charge of the IV program. He would receive daily, vitamin C, vitamin B complex, glycyrrhizin, Wobe Mugos digestive enzymes, and as much painkiller as needed of a non-morphine variety.

A blood test was ordered and it showed that tumor activity was not great; the LDH was only 179. Liver enzymes were very high, especially the GGT, a function of the liver that is also sensitive to aflatoxin and synthetic dyes. His RBC was too high as expected for vanadium toxicity.

By the third day, he was free of isopropyl alcohol, gold buildup, and the malignancy. Only shrinking the tumors and regaining health remained. He was monitored with the Syncrometer® each day for solvents and bacteria. In spite of starting on ozonated water and liver herbs, he still had Freon in his pancreas ten days later.





Apr. 4 pancreas and liver

But on the eighth day, a new ultrasound of liver and pancreas showed a remarkable improvement. The pancreatic tumor that had been 7 x 5 cm was now only 5.8 x 2.6 cm. He was off to a good start. The largest of the various liver tumors was 3.75 x 3.05 cm in the right lobe ("LOB DER").

He was still getting chills every night and pain at both sides, over the right liver and over the pancreas. Coffee enemas to reduce pain were recommended daily.

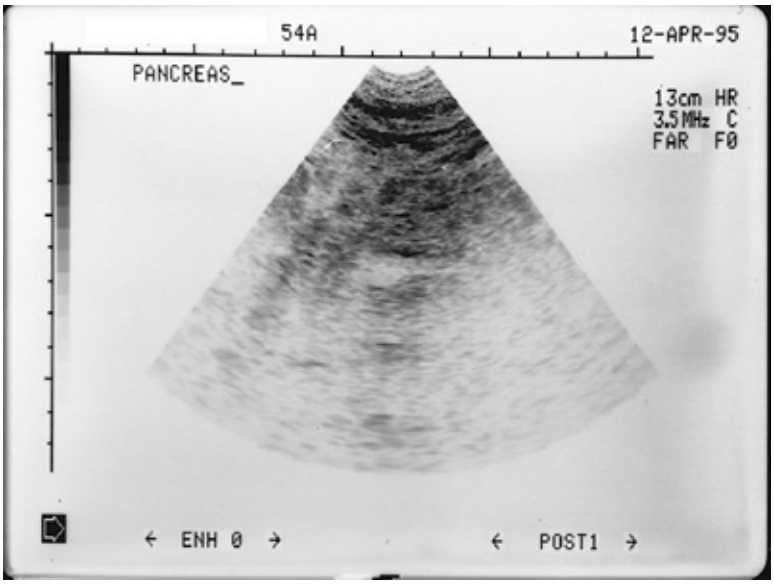
The Freon refused to leave him; it was found to be present in his room so he moved to a room without an air conditioner. On the fourteenth day, he was still feeling very bad, dizzy all the time. He could not shake his systemic salmonella...¦ not until it was found polluting his water pitcher! He was changed to a glass jar instead of the plastic pitcher beside his bed. [*Drinking water from a standing source is never advisable*.]

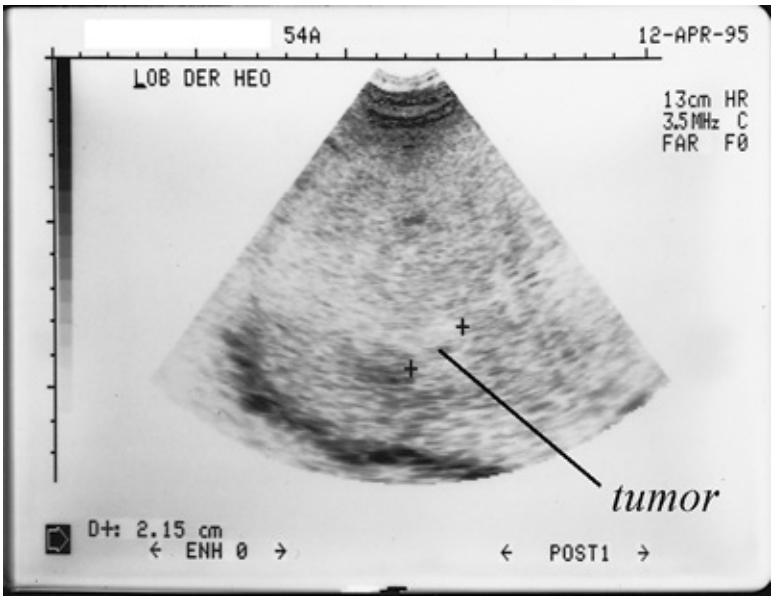
Two days later, after the last metal was out of his teeth, [*we were replacing amalgam with composite at that time*] he was feeling, strangely, much better. The pain over his pancreas was gone, but it remained over the right side (liver). A new blood test and ultrasound were ordered.

In spite of his obvious improvement-he was eating now in the dining room, taking short walks and socializing-his blood test results were worse [to be

expected as tumors drain, but dismaying at that time].

At the time I did not know the relationship between bilirubin and aflatoxin. In our joy at seeing him eat, I could not advise against the pancakes and maple syrup he always had for breakfast. He was somehow getting a lot of aflatoxin or food dye [actually, from his tumors]. All the liver enzymes, especially GGT, were elevated (870). His RBC was not yet correct, due to persisting vanadium in his teeth. [*The dental plastic problem is apparent soon after the amalgam has been changed to composite; it too contains vanadium*.] Creatinine was much too low.





He felt fine, though. His pain-free periods were quite long, although pain still disturbed his sleep. Best of all, his ultrasound of the pancreas showed further shrinkage of his tumor to 3.25 x 3.5 cm. The largest of the liver tumors was now only 3.3 x 2.65 cm.

All this good news led him to one conclusion: that he could go home for Easter with his family. As much as he argued that he could, I argued that he couldn't. He agreed to stay one more week and repeat the blood test and ultrasound. During this time, several toxicities were inexorably at work. He was continuing to eat aflatoxined food (moldy grain), driving his liver enzymes and bilirubin up. Malonate inhibited the Krebs cycle and possibly the urea synthesis cycle. But other things were improving; vanadium was leaving his red blood cells (RBC) and globulin was declining.

His new ultrasounds (April 12) carried the day for him. The largest liver tumor now measured only 2.15 cm long. And no actual tumor was seen in the pancreas; only some irregular morphology, reminiscent of tumor. This was all he needed to board the next plane home. In spite of intensive last minute pleadings by all the doctors: "A successful start deserves a successful ending," "When you've got a good thing going, don't stop," "Don't get in the way of a lucky streak," he didn't hear.

I never expected him back. I expected his oil-filled house to push his liver to exhaustion, land him in the hospital at home from which never to emerge. But I was wrong. He called to say he was in trouble and would hurry back.

Three weeks from the time he left he returned, quite jaundiced now, in pain and with no appetite. He was full of vanadium again (fuel oil). We checked into surgery as a way to relieve obstructions of the bile ducts, even though we knew there would be no obstruction found. The liver was simply failing to conjugate (detoxify) the bilirubin. Bilirubin was saturating his body, turning him yellow.

He was returned to the IVs and supplements that had worked magic for him the first time. Besides this, he got a BQ shot (1 ug) in the hip in anticipation of a higher LDH level. He was sent out for serum cleansing, using a device that pumps out the blood, centrifuges out the bilirubin and lets the cleaned blood return. After this, his complexion was much less yellow and he felt better.

But his blood test revealed the truth; he was in beginning kidney failure, both BUN and creatinine rising.

Presumably the saturating bilirubin [*or the methyl malonate from new plastic teeth*] was halting kidney function. This would allow albumin to escape through the kidney, so that the "total protein" would not be high enough to keep the blood plasma in the blood vessels.

Seepage of plasma into the tissues would let the ankles swell first, then the rest of his body, never to be regained. By now, he was aware of his predicament; he quickly sought out other doctors; he was tried on various drugs and chemotherapies. I could not guess the real culprit was probably his new plastic teeth and the toxins that had drained from his tumors. I suggested calling his wife; she had said earlier she wanted her husband home for his last days.

Weak and yellow and on a handful of pills and continuous IVs, he elected to go to a hospital in another doctor's care. There was no opportunity to say goodbye or let him know that his wife had been calling. I obtained the next set of blood test results from his kind doctor at the new hospital.

It was his last. Final heroic efforts to save him can be seen in the lowered BUN. He did not die of cancer or tumors or pancreatic failure in my estimation. He died of aflatoxin [*from opening tumors*] and dye in dental plastic which blocked conjugation of bilirubin, all made worse by copper, cobalt and malonates. But I did not understand all this until sometime later.

Summary: A lesson can be learned. We do not necessarily die of a tumorous condition. Jason's tumors were nearly gone. As long as the body can carry out its functions it can also put up with these obstructions. We die from <u>toxicities</u> that block these functions.

5 Norman Shirkey Prostate Cancer

Norman Shirkey, age seventy-nine, padded lightly into the office, following his determined caregiver. She was so determined to get him well, we were sure they would manage.

Norman's PSA was 105 (normal is 0.0-4.0 ng/ml), he was on a catheter, and was given six months by his doctor. This merely doubled her determination.

Norman had the following toxins in his prostate: Freon, arsenic (pesticide), cobalt, and patulin (from common moldy fruit). He also had a dental infection: *Staphylococcus aureus*.

He was told to: (1) zap three times a day until well; (2) change his refrigerator to a non-CFC variety and do the Freon-removal program; (3) clean the pesticide out of his house; (4) use no more detergent (to eliminate cobalt); (5) stop eating fruit except bananas and lemons (to eliminate patulin); (6) get his amalgams changed to composite and clean cavitations (to eliminate staphylococcus); (7) take vitamin C, vitamin B-complex, vitamin A, zinc; (8) get a benzoquinone (BQ) shot. But his finances did not allow regular visits or IVs. We begged him to persevere.

Two weeks later his cobalt was gone. He had ordered a new refrigerator. Arsenic was gone; patulin was gone; but salmonellas were now present in the prostate. He was given Lugol's to take for that. Also rhodizonic acid.

It wasn't working. At his next visit another two weeks later, his PSA was up to

130 ng/ml. He had a lot of pain around the ribs and lower back. He was asked to do a bone scan. He had his new refrigerator, and patulin was still Negative, so he could eat a few more fruits. *Rhizopus* (fungus) was growing in his prostate and Peyers patches (the lymph nodes of the intestine). [*We are able to grow fungus right inside our most hallowed organs, the lymph nodes*.] His latest blood test showed a low RBC. He was started on an IV containing potassium, magnesium, cesium, and B complex. He was in the middle of dental replacement. His next blood test showed exceptionally good results in spite of his poor condition. But the protein level was slightly high, and LDH also high. He was given another BQ shot. The outcome looked assured. But why was he worsening?

Another week later he had picked up patulin again. And mercury was still Positive even after amalgam removal. It was traced to his new pink denture; he was to replace it. He was given another IV. He was to continue rhodizonic acid, two a day.

He did not show up for his daily IVs, in spite of entreaties. In fact, he didn't return for two months. His friend gave explanations of a sort. When he arrived this time he was feeling very well. A blood test he brought with him showed: LDH 245 and PSA 167. The tumor was not shrinking. And deep inside, patulin fungus was again growing, as was *Aspergillus mycelium*, *conidia* and three other aspergillus varieties. There was mercury at the prostate; he was using cotton swabs daily. [*We did not understand the importance of leftover amalgam tattoos at that time*.] He was given cloves, cinnamon, L-G (homemade lysine-glutamate as described in *The Cure For HIV/AIDS*), wormwood, and bee pollen. This was our antifungal program at that time. He was given another BQ shot, to bring down the LDH, and two IVs of EDTA plus vitamin C.

Two weeks later, he appeared more bowed and shuffling than ever but still walked unassisted. Patulin was again at the prostate, as was insulin-like growth factor. Both *Fasciolopsis* eggs and *Fasciola* miracidia were thriving there, too. He was reminded to zap, and take the parasite herbs regularly. His caregiver was doing her level best.

Three weeks later, he had pain everywhere around the middle and in his spine. The catheter showed bloody urine. There was staphylococcus everywhere. And fibroblast growth factor in the liver. He was given 4 tsp. black walnut tincture extra strength in a quart of very warm water by enema plus 1 tsp. black walnut tincture extra strength by mouth. His PSA was 169; his LDH 274. His doctor at

home, where the test was done, was calling him urgently for treatment. His RBC was 3.35.

In another three weeks his pain around the mid-abdomen was much worse. He still had not done all his dental work. The bone scan showed widespread bone cancer. Staphylococcus was still everywhere. He was to continue taking enemas.

Six days later he arrived in a wheelchair, just a wispy shadow of his former self. He said he was numb everywhere. His blood test results were RBC 3.74 (an increase!), LDH 268 (slight decrease), uric acid 2.4 for which he was given glutamine. He was given a BQ shot and an oral dose of DMSO (just half a dose). IVs were not helping him so were not recommended. He was given Lugol's again to be taken four times a day for salmonella everywhere. There was also staphylococcus everywhere due to uncompleted dental work. He was now too sick to sit in a dentist's chair. He was given magnesium, plus Cascara Sagrada for constipation. And black walnut tincture extra strength was increased to 2 tsp. on alternate days.

He went home to die and I did not prevail upon him to do more. His whole

treatment program had been "too little, too late." His caregiver quietly pushed him through the front door and we looked our last goodbye.

Eleven months later she reappeared by herself. I wanted to know about Norman's last days. She almost giggled as she spoke; Oh, Norman's fine, she said. He's living on a mountaintop. I thought she meant as an angel in some religious sense. Oh yes! I said and listened on. She related that he wanted to die on a piece of family property-mountainous land-far from his city home. When he left our office he decided to live his last at this mountain retreat. He threw away his pills and potions, all his vitamins, special herbs, etc. But instead of dying he got stronger. He got out of the wheelchair, began to cook for himself, went for walks on trails and enjoyed each sunrise and sunset. He planned to stay there and not return for any more treatments.

Later, as I absorbed this "miracle" I wondered: Was it his toxic home that he was getting away from? Some food dye? A toxic supplement? Was it the enemas that helped? Was it the L-G and bee pollen? Was there magic in the mountain property? We'll never know. The truth still lies carefully hidden.

PS He didn't need his catheter any more either.

Summary: It was tempting, as an author or researcher, to omit this case history. It ridicules all our efforts as therapists. And perhaps other patients will try this and shorten their days. One cancer patient, who knew Norman, did choose Norman's abandon, went to a mountain retreat and lived on coconuts and other natural food. She died a few months later, emaciated and in pain. It is not easy or simple to abandon all civilization's foods and products. She kept her hair dye and eyebrow pencil, perhaps her vitamin C, and a few other select items. These may have been the traitors.

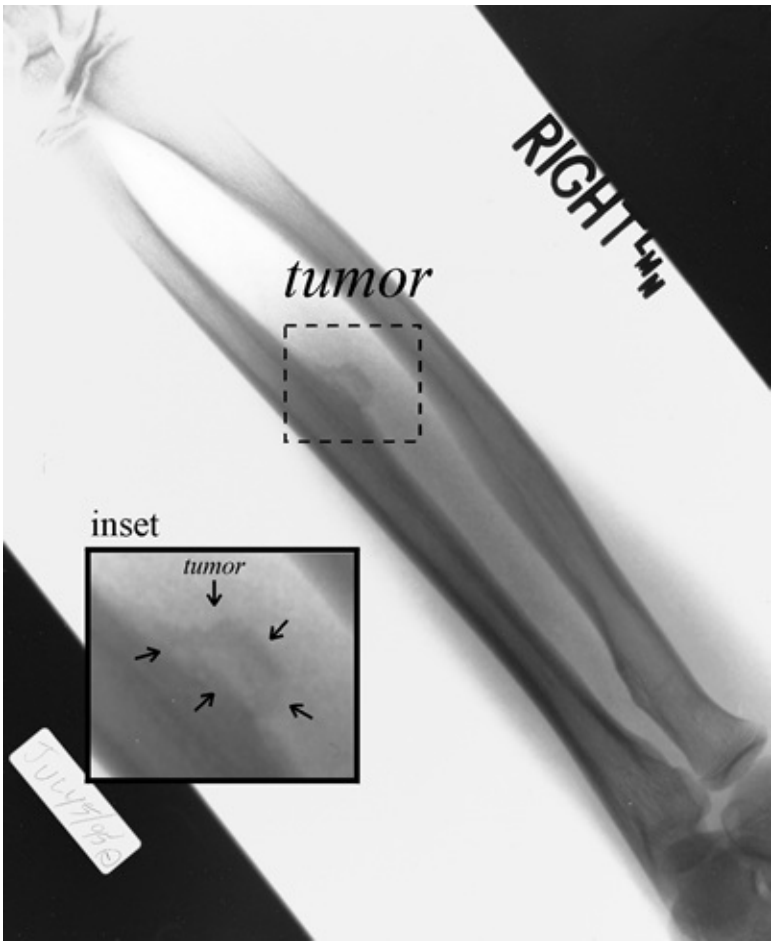
I decided to keep the story. It has more hidden wisdom than we can understand; at the very least, a terminally ill patient should leave the dwelling where the disease was acquired.

6 Brian Castro Bone Cancer

Brian, age seventeen, was a tall, athletic looking teenager, who came with his parents for his bone cancer on July 14. They could stay at the clinic only four days. Three weeks earlier, his right arm began hurting and a bump arose on his forearm about half way up to the elbow. His whole arm and hand were painful

and he couldn't move his thumb back. X-rays showed the bone tumor on the ulna.

Earlier in the Spring (March), Brian had become very tired. He slept most of the time (16-18 hours a day), the rest of the day he was dizzy and felt cold. [*Dizziness is usually due to Salmonella; feeling cold could be due to anything abnormal in the thyroid.*] His blood pressure was low and he was pale. He had a dog. His mouth contained amalgam.



Brian's arm in July

A visit to the doctor at that time, March 9, got him a blood test and a diagnosis of Epstein-Barre virus. There was nothing to do but "outgrow" it. He did not have enough energy to attend school and if he tried to play, he felt as if he would faint. But looking at the blood test of March 9, we see a number of metabolic problems. They could not all have arisen in the previous year. He must have been suffering from certain parasites and pollutants for many years, perhaps from age four when he had Kawasaki disease.

The RBC was too high, showing cobalt and vanadium toxicity. And creatinine, which is muscle-related, was much too low. No wonder he was tired. Creatinine is made from creatine, the muscle energy factor. Creatine is made by the body from arginine and glycine and also requires methionine. Was he not getting enough of these amino acids or was a parasite inhibiting their formation?

Most notable is the high alkaline phosphatase. This is the bone enzyme. It is normal to be high when your bones are growing, and Brian had grown 6 inches during the past year, but still, 378 is too high. (It's more than twice the highest normal value of 150.) Was Brian's growth spurt a causative factor, an effect, or just a coincidence with his bone cancer?

The T4 indicates thyroid function. It's very low, and would contribute to Brian's lethargy.

They had brought an x-ray of Brian's arm. The growing lump was easy to see. The doctor had given an ominous prognosis: it was better to amputate than try to treat; this variety of cancer was lethal in children. The doctor immediately arranged for the surgery-there was to be no waiting. That was July 5. On July 6 his family started him on our parasite-killing recipe, using the book as guide. On July 10, another visit to his doctor brought only dire predictions if the surgery were not carried out quickly. Three days later they flew in to see us.

These were Brian's initial test results using the Syncrometer®: isopropyl alcohol Positive. He was referred to the isopropyl alcohol list in *The Cure For All Cancers*; he agreed to be meticulous about compliance. Wood alcohol Positive. Ortho-phospho-tyrosine Negative. Evidently he had killed the flukes and their stages already with the parasite program.

Copper, mercury, *Mucor* (fungus), Freon were all Positive at bone. Where was it coming from? Household water tests for copper were Positive in the bathroom. A home air test (dust sample) was Positive for Freon in living room and Brian's bedroom.

The parents planned to immediately move the refrigerator outdoors while finding a new non-Freon replacement. They would change the copper water pipes immediately also. Brian's dental amalgams would be changed to plastic. [*At that time we did not know that dental plastic could also be polluted with copper, cobalt, vanadium, malonates, dye, and urethane, all with cancer*

promoting action.]

His instructions were: (1) continue the parasite-killing program according to the book recipe and to zap daily. (2) Drink 2-3 glasses of ozonated water daily to remove Freon, and take ¾ cup kidney cleanse recipe daily (½ dose). (3) Take benzoquinone orally for three days to kill *Mucor* fungus. They would make a homeopathic dilution of it (one part per million) and give Brian ¼ tsp. of the final solution. To make a 1 ppm solution they would first put ¼ tsp. powder into a glass quart jar of solvent-free, copper-free water obtained from a busy laundromat's cold faucet. The jar would be closed and shaken a few times. It dissolves quickly. Then ¼ tsp. of this brown-colored solution would be placed into another quart jar to be filled with water also. The final solution should not be more than 10 minutes old before Brian drank the ¼ tsp. liquid.

Aug. 30

His food supplementation was calcium, from 3 to 4 glasses of 2% milk in a

plastic carton daily, correctly treated, magnesium oxide, manganese, boron, zinc, chromium, selenium, vitamin A, vitamin B complex, and vitamin C.

Three days later, Brian was tested again. His arm was now free of pain, the lump was down. New tests showed solvents Negative; *Mucor* Negative; copper still Positive at bone and parathyroid; mercury Positive at bone and parathyroid; Freon still Positive at bone and parathyroid. Dental work had not been done yet.

The blood test (July 14) showed considerable improvement from the one done in March, especially in alk phos, creatinine level, and thyroid function (T_4). They had accomplished this themselves before arriving.

They left for home, returning a month later. Brian's arm pain had not returned; the lump was visibly smaller, nearly normal-feeling. His new Syncrometer® tests showed: isopropyl and wood alcohol Negative; copper Positive at bone and parathyroid; mercury Positive at bone; *Penicilluim* spores (fungus) Positive at bone; *Mucor* and yeast fungi Negative at bone; Freon Positive at bone and parathyroid.

A dust test from home was negative for Freon; they had moved the refrigerator outdoors (but it takes six weeks before Freon is removed from the body by drinking ozonated water).

His household water continued to be Positive for copper; the plumbing had not yet been done. His new instructions were to take thioctic acid, cysteine, taurine, methionine (I would have liked to give these sooner, but did not have the opportunity), and to continue with his old instructions, taking another single dose of benzoquinone to kill remaining fungus.

By August 25, all his amalgam fillings were replaced with composites. Final Syncrometer® testing showed: *Penicillium* spores Negative at bone, mercury Negative at bone.

A new item was added to his supplement list, L-G (a lysine-glutamate compound). He next appeared on October 23. His arm still showed a slight swelling where the lump had been.

They informed me that a second x-ray had been taken August 30, showing that the top part of the tumor was gone; the base was still there, maybe even larger, according to his doctor. The doctor now advised to "keep doing whatever

it is we are doing, something seems to be working" and scheduled another x-ray for thirty days hence. The third x-ray was taken October 4. The tumor had decreased in size again and texture appeared more bone-like; nevertheless, the doctor referred them to an orthopedic surgeon.

Brian was no longer exhausted all the time. He was sleeping only 9-10 hours a night and did not need naps. He was attending school full-time and kept up with schoolwork. He could attend P.E. without physical limitations. He seemed to be back to his old healthy self.

Their regular doctor appointment had been on October 9, the doctor had compared all three x-rays stating he "didn't usually see tumors do this, didn't usually see them get smaller, they usually get bigger. This is unusual." An MRI had been ordered. It showed that the base was <u>not</u> larger than the first x-ray had shown it to be. Nevertheless, the doctor recommended a total surgical bone biopsy in order to see it himself. The parents decided to "wait and see" instead.

Here they were, now, on October 23, doing their "waiting and seeing." Isopropyl alcohol Positive; *Fasciola* miracidia Positive at bone; *Fasciolopsis* eggs Positive at parathyroids. They had become way too relaxed about all Brian's instructions; he was consuming cold cereals and soda pop (they contain traces of isopropyl alcohol antiseptic).

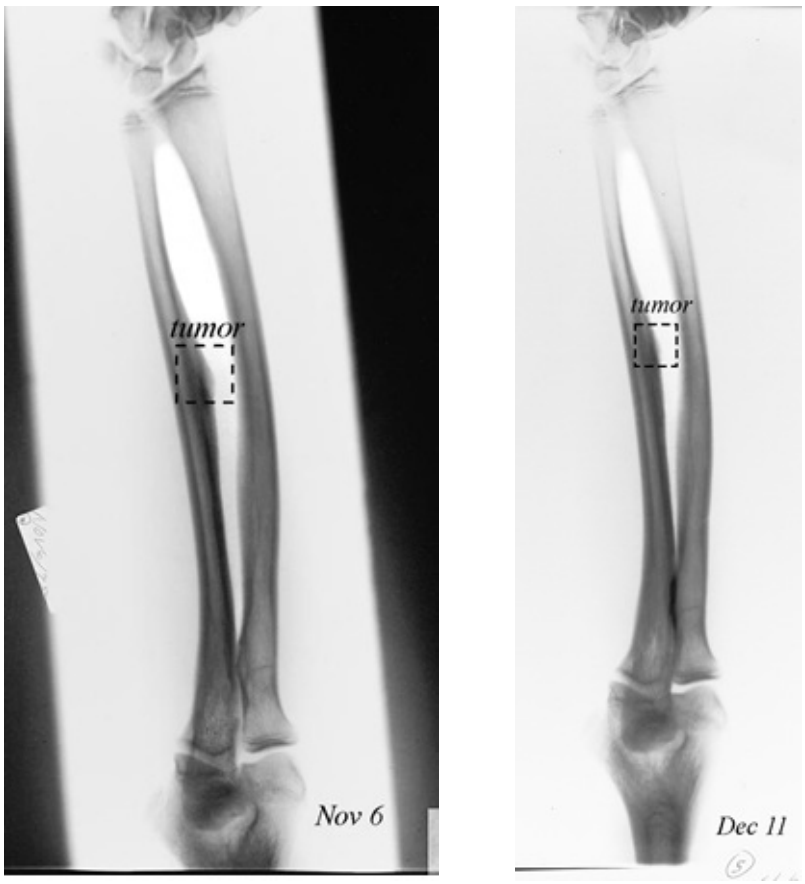
Oct. 4

He was to continue the maintenance parasite program once a week and give away his dog. He was reminded to boil all dairy products, avoid aflatoxins, stay away from salad bars (*Salmonella,* etc.), consume no cold cereal, or bottled water, no soda pop, no corn chips, no popcorn, no nuts, and no raisins (mold) until his ulna was totally normal again.

The next visit to his doctor, in November, brought them his fourth x-ray. This time the doctor said "Well, this is the best x-ray yet. Keep up the good work. The blood work looks real good. Let's do this again in five weeks and see what it looks like then." Gone was the recommendation to do surgery.

The fifth x-ray was taken December 11. The tumor was still present but getting smaller, in fact, almost gone. The doctor was delighted, exclaiming it

was "like a ferocious beast had attacked but then decided to run away. This is hard to understand," he said, "it looks great. I want to see it again in three months." A blood test done by his doctor was dated December 27.



Nov 6 and Dec 11

The RBC is too high, due to cobalt and vanadium from left over tattoos [*or possibly from the recent dental composites installed*]. The WBC is now too low, implicating toxins in the bone marrow. The LDH is correct now; so is the alkaline phosphatase for the first time (note range change for alk phos); this indicates normal bone health. The albumin was normal now, as was iron. Urine tests (not shown) had normalized also.

We didn't actually see Brian and his family again till February 28 of the next year. He had lost 15 lb. and was fatigued a lot. He had malonic acid in the bone, bone marrow and liver. [*At that time we did not suspect a food source, nor the dental plastic source.*] We assumed he had picked up a tapeworm stage again. This time we used coenzyme Q10 in 4 massive doses of 3,000 mg taken four days apart. He was also given glutathione. This should help normalize bone

metabolism after the malonic acid attack.

April 1, next year

Our Syncrometer® tests showed: vanadium Positive; cobalt Positive. [*The sources for these were not suspected to be right in his own mouth. Now we know he must remove the composites as well and even make a dedicated search for tattoos before he can be free of their toxicity.*] The parents were encouraged to learn the Syncrometer® technique so they could follow his progress at home.

His last x-ray was taken on April 1: His doctor had come into the room and said, "Well, it's all gone now. That was a strange thing, but there's nothing to worry about now. He must have injured it or something because it's not there anymore. It looks like normal healthy bone. I don't know what that was. It was sure strange, but you don't need to come back. Whatever that was, it's gone now."

Brian's parents were meticulous about writing down what the doctors said, both now and before, so they were just a tiny bit chagrined. After all, two radiologists knew exactly "what it was," and two other doctors agreed. They

"knew it needed immediate surgery"; amputation, in fact.

But joy outweighed chagrin, as it should.

Summary: Of course, we know that the last quote, "it's gone now", should be changed to "it's gone for now." He will need to remove plastic and leftover metal in his mouth. He will need to clear *Ascaris* and tapeworm parasites from his body repeatedly. He will need to keep his distance from animals (pets). And to lead a health-conscious life. Maybe his early Kawasaki disease should tip him off to his special needs. Maybe he'll grow into a tough, robust athlete in spite of everything. We wish him his heart's desires. In exchange for a little caution! His parents, though, deserve A-1 grades for pulling their teenager through this experience, with arm intact.

7 Jamie Humbert Liver Cancer

Jamie Humbert, only fifty-nine, came with her daughter in high hopes of

becoming cured of her liver cancer. They had already had conventional therapy, followed by alternative therapies in Mexico. But one look at her blood test revealed the ominous fact that her LDH was much too high (3415!).

[*When Jamie arrived I had no reason to doubt the clinical explanation for elevated LDH, which is cancer plus liver failure.*] Why was it so high? I soon found that there is a mysterious lack of information on reducing LDH in the scientific literature. [*Which I now think reflects the hopeless nature of the problem as perceived by scientists.*] Nor was there any conventional medicine or treatment to reduce LDH. [*My unconventional treatment, benzoquinone ("BQ"), was not yet discovered. Jamie would turn out to be the first person to try benzoquinone to see if it would reduce LDH.*] Clearly it <u>was</u> partly due to a failing liver because the other liver enzymes were much too high, also. [*But I had not yet discovered that <u>Sudan Black B</u> and <u>lanthanides</u> cause LDH elevation.*]

Although Jamie was in a wheelchair, nothing else on her blood test was particularly bad, except the creatinine level. It was much too low. Either it was being lost with the urine or its production was blocked. [*At the time, I did not know of the great shortages of amino acids cancer sufferers have, some of which are required to make creatinine*.] But a low level of creatinine or BUN is not considered serious, clinically. What was obvious, clinically, was that she would die of liver failure. But just as obvious was the fact that one <u>need not die</u> of an LDH over 3000! She was in good spirits and eager to begin something. She could eat and digest, was not in much pain though terribly fatigued.

The tumor in her liver was "only" the size of a baseball, but there were ominous signs of brain involvement: her left arm was becoming useless. I ordered a brain scan and ultrasound of liver. There was also a tumor in the pancreas.

She was started on the parasite-killing program, but only a 2 tsp. dose. She was given numerous IVs and zapped, though I knew it would not save her. She was full of mercury, although all amalgam had been replaced at an earlier time. She was full of vanadium [*but its significance as a mutagen was not known then; nor did I suspect the plastic in her dental restorations*]. Vanadium was coming from the refrigerator and gas line to her motel room. There was no environmentally safe room for her yet.

After ten days, though, her nausea and vomiting had stopped and the tumor in her pancreas had shrunk to half its size. But seizures were increasing in spite of medication to block them.

Still, she had gotten through ten unbelievable, unprecedented days. Would she survive? Could she? Her daughter was determined.

Our hopes were dashed at the next blood test. The whole liver picture was worse and the LDH was now an unbelievable 5119 and the GGT over 500. [*Today I know that opening the tumors releases the toxins that cause this.*]

We had transferred Jamie to a hospital ten days before this second blood test, but defeatism was not in our nature, even there. The doctors were encouraged to test and treat up to the very end. The hospital water contained no copper which was the basis of my choice of hospital. Of course, it was still coming from the plastic dentalware [and tumors].

Jamie's daughter was allowed and encouraged to do her mother's cooking, feed her, and do personal chores. She was also getting three IVs a day, containing amino acids, fat emulsion, besides numerous vitamins and minerals. She was not in pain. Each day, her daughter coaxed a cup of "high-calorie food" down her; she did not resist.

Suddenly, May 1, Jamie got better. She talked on the telephone and took a shower-standing by herself! They were both jubilant and Oh! so hopeful. Would the miracle happen? The next day she did a blood test. Hopes were dashed again. LDH had set a new record, 5350. Yet Jamie was definitely better in a number of ways. This could not simply be due to that small drop in the transaminases, SGOT and SGPT.

On May 2, when the blood test showed no improvement, a special preparation of benzoquinone was made for her. The concept was taken from Dr. William Koch. I had been reading his books to the wee hours of the night. Librarians helped locate these long-lost monographs at obscure libraries. Dr. Koch discovered half a dozen highly oxidizing compounds that could safely be given to cancer patients. He cautioned against giving too much or too often. He described one of these as benzoquinone, a familiar compound, which in a minute dose of 1 ml of a 1 ppm solution could miraculously "cure" a bedridden, terminally ill cancer patient. He had pictures of "recoveries" to prove it. I gave it

to myself several times first. After I noticed no ill effects, staff volunteers took the shot. It seemed safe, and was, after all, in a homeopathic dose. We gave it to Jamie.

The next five days she got better and better. She stayed out of bed and wanted food. She stopped vomiting and hiccupping. Her family arrived, too, seemingly to applaud her gains.

But on May 8, Jamie had no insomnia and was sleepy through the day. The next day was no better, in fact, worse. We did a blood test to find the cause, but it was too late. Jamie was slipping away. Her family surrounded her as she lay in a coma in bed. Voices were lifted in song. She left at 6 p.m. on May 10.

The blood test results were available at 8 p.m. LDH was an incredible 338(!) and the other liver statistics showed similar improvement. But if that wasn't the problem, what was? Perhaps you have already spotted it: high calcium levels. Simple hypercalcemia, plus a rising bilirubin.

Neither I nor the other doctors suspected it, and it would have been correctable if we had just ordered the blood tests a day earlier. And what if Jamie had gotten the BQ shot a day earlier? It was not to be. The family was more than kind and gracious and forgiving. She did not die in pain or on morphine. Was it the benzoquinone shot that worked the miracle? Or every*thing else?*

Summary: It is never possible to know the true cause of death. For Jamie, it wasn't heart failure (the test for this, creatine kinase, Ck, was done), nor kidney failure, nor even the expected liver failure. Thank you, Jamie and family, for your truly spiritual contribution to this book. You taught us that LDH over 5000 isn't hopeless. You taught us how to fight it. You taught us not to cower in fear of it. When the next patient handed us a similar challenge, we could begin where Jamie left off. And Jamie got five weeks of extended life when only one was expected.

8 Anthony Stephens Cancer of the Parotid Gland

Anthony Stephens, sixty-nine, had a lump that measured 1½ x 1½ in., outer dimensions, on the right side of his face, at the angle of the jaw just in front of the ear lobe. It was a tumor of the parotid gland, one of our salivary glands. At first it was thought to be a dental abscess. But an oral surgeon thought it was a tumor and referred him back to his doctor. Such tumors are notorious for growing right back after they are removed. His MRI dated September 5, shows it clearly.

He decided not to get it biopsied and surgically removed. So by the time he arrived, he had already been on the parasite killing, isopropyl alcohol-free regimen for seven weeks. He was also on the "macrobiotic diet." And, indeed, when he arrived in Mexico he tested Negative for isopropyl alcohol and ortho-phospho-tyrosine (malignancy). But why didn't the tumor shrink during these weeks? The answer will be clearer as we follow his progress.

Parotid tumor, Sept. 5

He arrived on October 2. His toxin test was done the first day after arrival. Promptness in testing for home toxins is essential because toxins disappear from the body quickly, in days! It showed the following at the "whole body": Negative for isopropyl alcohol, wood alcohol, benzene, xylene, arsenic, aluminum, asbestos, nickel, cobalt, thallium and patulin. Copper was Negative in general, but Positive when I checked the parotid. Toxins present were cadmium, formaldehyde, lead, beryllium, mercury, and CFCs. The pathogen picture was worse. Negative for two species of salmonella, but Positive for *Salmonella typhimurium*, one shigella, staphylococcus, and *E. coli*. In addition he was tested for seven common fungus varieties; he was Positive for five, including *Aspergillus*, in his parotid gland.

He was also Positive for fibroblast growth factor (FGF) and fibronectin at the parotid, made by *Fasciola* stages (not *Fasciolopsis*) and bacteria.

We started with an intensive bacteria killing program in the intestine. He was given Lugol's iodine to take 4 times a day to kill salmonella, as well as the Bowel Program. And, of course, he would continue with the parasite program, both herbal and zapping.

He was given cysteine, taurine, and methionine to detoxify formaldehyde buildup. He was started on the Freon removal program. And instructed to reduce

bacterial and fungal growth in the intestine with a series of daily enemas. It consisted of 1 quart very warm water with 4 tsp. black walnut tincture extra strength added. At the same time, he would take 1 tsp. by mouth in water. This would kill the parasites hidden in the intestinal contents.

His blood test showed very little damage yet, either from the tumor or from the toxins causing the tumor.

His blood sugar was much too low (62), and T.p. was too high. This was the beginning evidence for cobalt and vanadium toxicity. Even tiny amounts of these, not even detected at the initial "whole body" test would, nevertheless, seek out the vital organs.

Tumors of the mouth and throat can be very swift and so disfiguring! It was reassuring to see his triglycerides and cholesterol high enough to see him safely through this ordeal.

Anthony was meticulous with his total program even while away for the next twelve days. Upon his return, the parotid tumor was already shrinking and actually draining on the inside. He had not started dental work yet! Just killing bacteria, parasites, and fungus evidently was enough. He could stop the enema routine and simply take the parasite herbs once a week.

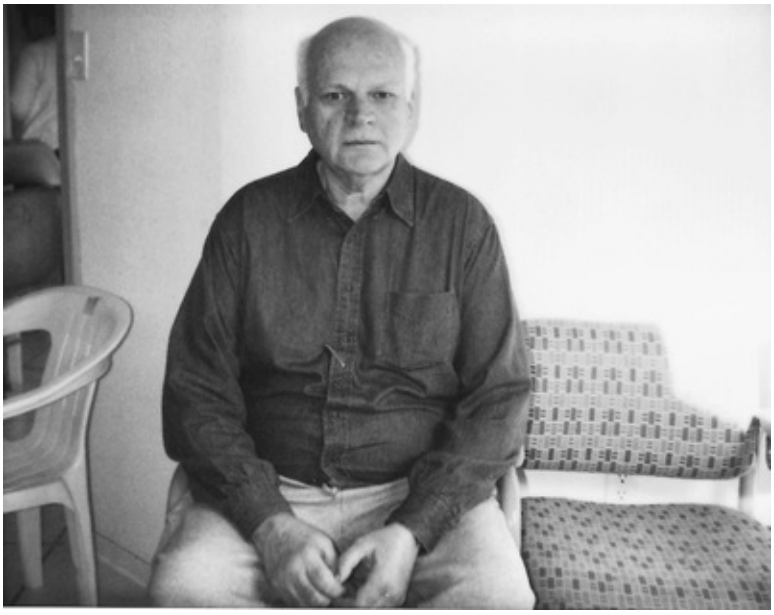
Again he had to leave, this time for four weeks, returning November 15. The parotid tumor could no longer be seen. His cheek was flat. Most of the dental metal was out-but not all of it-and replaced with plastic. He was Negative, now, for *Staphylococcus aureus*, dental bacteria. He tested Negative consistently for isopropyl alcohol, benzene, and wood alcohol. He received no IV therapy or extra supplements. Evidently, getting rid of bacteria in his mouth and reducing them in the intestine had empowered his immune system to clean it all up again.

Three weeks later he returned again to relate how he had passed a tape worm of the long variety common in horses and cattle. It was after taking Rascal, a popular anti-tapeworm herbal mixture. We immediately tried to "mop up" after it with 8 tsp. of black walnut tincture extra strength since the scolex can be very hard to kill. This was followed by 3 niacinamide tablets, (500 mg each) then another dose of 8 tsp. black walnut tincture extra strength followed by zapping. We feared the scolex was still present somewhere. He then left for three months, taking his new lifestyle with him.

On March 6 of the next year he returned for a follow-up. His face looked perfectly normal, but malonic acid was Positive at the parotid gland. By now we were using coenzyme Q10 to kill buried tapeworm stages; he required 5 grams. He was also given glutathione for one week. After this he felt noticeably better, although he had not felt ill before. Malonate was now Negative at the parotid gland. He left for home.

By September, we were aware of the presence of malonic and maleic acids in dental plastic. We let him know he was at risk from his new plastic fillings. He hurried back in October. His toxin test now showed he had not only malonic acid buildup, but benzene, isopropyl alcohol, wood alcohol, *E. coli*, shigella, asbestos, cadmium, cobalt, mercury, vanadium, and aflatoxin! But staphylococcus and Clostridium were missing due to his earlier dental cleanup; this probably saved him from a recurrence of his parotid tumor. He arrived October 10, still with a perfectly smooth contour to his face.

He had 17 plastic fillings in his mouth to be tested. Three of these were Positive for copper, cobalt, vanadium, and malonates. [*We did not suspect carcinogenic dyes yet.*] We determined this by filing each tooth with an emery board, then testing the emery board electronically. His blood test of October 10 reflects the new toxins in his mouth, carried for one year.



Oct. next year. Lump used to stick out 2 cm on R

The red blood cell level is now higher than before switching to plastic,

showing that his body is now deprived of oxygen due to cobalt and vanadium toxicity. He was also making too many white blood cells (11,800). Calcium had begun to drop due to toxins in the parathyroid gland. And the phosphorus level was now too low. The iron level was also dropping.

His 3 toxic plastic fillings were replaced.

Summary: Before leaving this time, he agreed to pose for our camera with his beautifully flat cheeks.

This may still not be the final step to be taken for Anthony, but he understands the power of nature and the feebleness of research or medicine and may act in time. We wish him well.

Post Script from Anthony, December 4.

"The next routine appointment with my regular, allopathic doctor produced this exchange: Dr.: 'Did you have surgery?' Anthony: 'No, I did not want surgery so I went offshore, alternative.' He dropped the subject and we moved on to other matters." We also received a letter a year later, and again almost a year

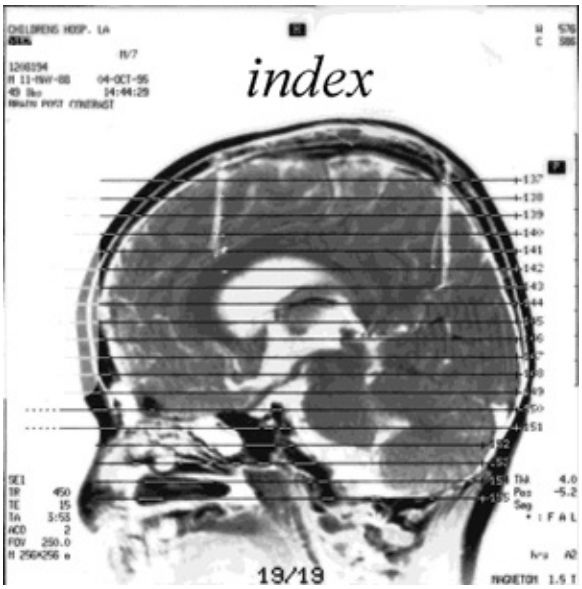
after that reassuring us that there had been no recurrence.

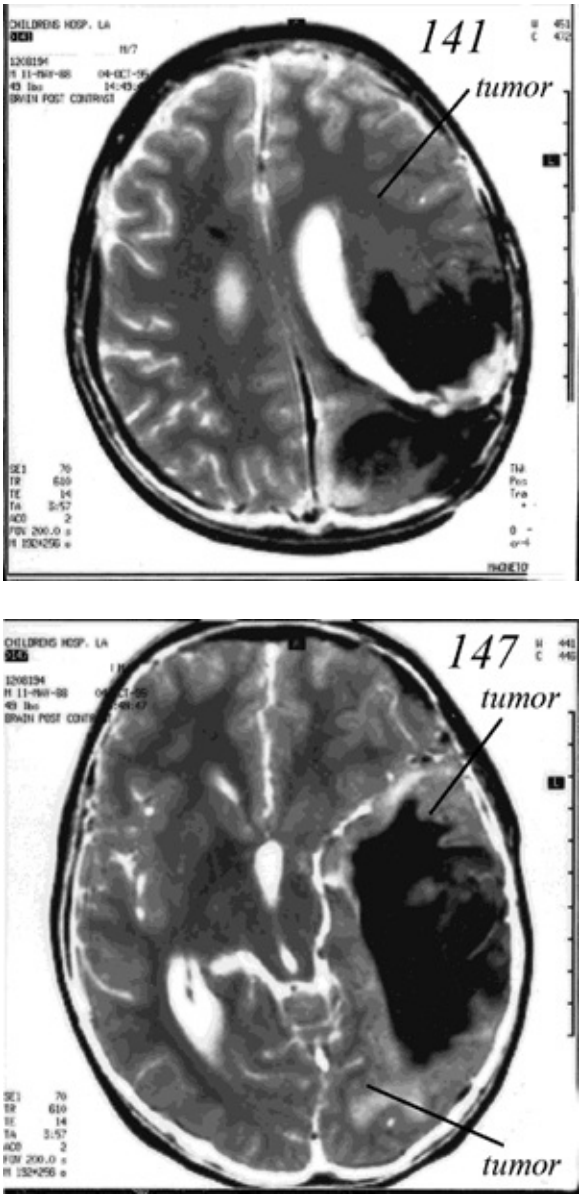
8 Ronald Hartnett Brain Cancer

"Little Ronald's" adventure with brain cancer taught us a lot about the brain.

It began at age eight, diagnosed as glioblastoma multiforme/astrocytoma. We saw him first at age nine. He was now in Stage IV. He had already gone through six surgeries to remove the tumor, but each time it grew back. He also had received intense chemotherapy and six weeks of radiation. The family had decided not to do another surgery this time for the new growth. Ronald was extremely weak; nothing had worked. He was on Decadron, 4 mg a day, to prevent brain swelling. He was also on Tegretol for seizures.

He arrived in a wheelchair, unable to hold his head up or raise his arm. He was not interested in talking or listening or being tested. His face was tearful as were our hearts.





Oct. 4. MRI index. View 141 shows large tumor pushing midline off center. View 147 shows depth of tumor.

His initial toxin test showed isopropyl alcohol, asbestos, copper, cobalt, Freon, formaldehyde, *Salmonella*, *Staphylococcus*, Positive. Mysteriously, mercury was also Positive yet he had no tooth fillings. We traced the mercury to an everyday personal product. This did not surprise us because most paper products like toilet paper, paper towels, Q-tips, sanitary napkins, tampons, paper diapers test Positive to mercury on the Syncrometer®! Perhaps this is due to using mercuric chloride as a sterilizing agent. It may be illegal in the USA to sterilize with mercury for the environment's sake, but it is not illegal in other countries where such products are made. Or perhaps mercury is used in the wood pulp industry because in addition to paper products, toothpicks often test

Positive to mercury. Ronald was to avoid all use of paper sanitary products. Next, the copper plumbing had to go. They agreed at once. This was probably the decisive step that would save him. Their refrigerator was quickly changed to a new non-Freon model. Detergent use was stopped (cobalt). All foam cushions were taken out of the house (formaldehyde). A dose of 6 drops of Lugol's in ½ glass of water was poured down him; he gulped without struggle. Where did the *Staphylococcus* come from since no dental work had ever been done? Was his immunity so low his own skin bacteria would invade him?

After a blood test, he was given 1 tsp. black walnut tincture extra strength in water. He was to take this daily at bedtime followed by zapping. He was to start the Freon removal program and continue for six to eight weeks. They would come back in four days.

He returned in his wheelchair, holding his head up now; he listened to me and watched things around him, could hold his hand out for testing.

His blood test was reviewed. The LDH showed evidence of tumor activity, as did the high alk phos [*both the result of azo dyes acting on the liver*]. The high GGT showed a liver problem possibly from his medication or a food dye. The high calcium (10.1) showed a thyroid problem. The extremely low iron (8.0) reflected on the underlying cancer problem: copper [*and germanium*] toxicity. The effect of cobalt, too, could already be seen in a very slightly elevated RBC.

At this second visit, Syncrometer® testing showed isopropyl, *Salmonella dysenteriae*, *Staphylococcus aureus*, Negative. The family was doing its part. The remaining six bacteria in our standard "food bacteria" test were also Negative. Five cancer antigens tested Negative; three growth factors tested Negative.

Copper was Negative at cerebrum (brain) and parathyroids, but still Positive at liver. They were in the middle of changing water pipes; had carried his drinking water home from our clinic at last visit. He was started on thioctic acid. Since he couldn't swallow a capsule, it had to be stirred into pure honey. He took it, although it tastes dreadful.

Formaldehyde was still Positive. He was started on taurine and cysteine to detoxify this. The clothes drier had not yet been tested for asbestos release.

He was started on methylene blue powder, 65 mg, one capsule daily. It would

turn the urine blue. The purpose for the methylene blue is, theoretically, to bridge the gap in his brain's respiratory metabolism. Since metabolism is extremely hampered in a tumor, many normal chemicals are missing or in over abundance. It was thought, from the 1920's on, that a "magic bullet" might be found that could substitute for the missing items. Various compounds were tried. Although some were quite successful in some kinds of cancer, they were not successful for all cancers at all times. So they were abandoned along with the concept. This is like abandoning the concept of a locomotive (an early Ford engine) because it couldn't immediately go up a hill at 30 mph. Methylene blue is exceedingly safe; not much is needed. I use it for all brain cancer cases.

The October 4 MRI has many views (frames) pictured on the negative. I chose the view that was numbered 141. This number is shown on the index picture to be a slice that just grazes the top of the white areas. This frame shows the midline quite bent out of its normal straight line. The dark region on the side and extending down to the edge is the gigantic tumor (plus black empty space left by surgery). Fluid from the tumor (edema) has no place to go and, therefore, creates pressure that pushes the brain aside. Another slice, at 147, shows how very extensive (deep) this tumor is.

Here are further notes taken from his file:

November 24, it is four days later. He is keeping his improved status. Still in wheelchair but talking, wanting to give me a gift. Testing showed: benzene, isopropyl alcohol, wood alcohol Negative. Copper Negative at parathyroids and liver (plumbing job at home completed). Formaldehyde and eight food bacteria Negative.

November 27, he is deteriorated, sleeping and crying all the time. I suspected something toxic was back in his brain. Tests were done on his saliva since he could not hold out his hand for testing.

Isopropyl alcohol Positive. He had used regular soap in the bathroom while visiting friends. We then tested for the entire set of 35 tapeworm slides. Three were positive: *Dipylidium caninum* composite, *Taenia pisiformis* composite, *Hymenolepis dim.* Composite. The "composite" slides actually contain pieces of intact tapeworm, without the scolex. Somewhere in his body, he had three intact tapeworms! We administered 8 tsp. black walnut tincture extra strength which he took without rebelling.

December 4, it has been a week. Ronald walked into my office; doesn't need a wheelchair. He is doing much better. No headaches. Has more energy all day until 6 p.m. Better mood. Test results: benzene, isopropyl, wood alcohol and the three tapeworm composite slides all Negative. Evidently the tapeworms were killed by the 8 tsp. dose of black walnut tincture extra strength. He has not needed Decadron for one week and is not on Tylenol-codeine painkillers any more. They will return in one week; it is Saturday.

December 6, Monday. (He returned only two days later), several family members are with him. He is back in a wheelchair-semi comatose. Extreme setback started on Sunday. This may be his last day. He is quite still. Family and staff are poised for action. Or will we give up? I had decided much earlier not to subject him to IV therapy. The pain and hassle of needles coming out of position or trying to immobilize his arm and the constant disciplining seemed to be not worth the expected benefit. His days were all too few. But now I turned the question over afresh. Should we do life-support? A saliva sample had been taken and rushed to the testers. A dose of black walnut tincture extra strength, 8 tsp. was carefully poured down his throat, just in case some tapeworm remnants were responsible. His throat bubbled as he gasped for air.

The saliva sample tested Positive for benzene. They had allowed him to eat dessert (on benzene list) two days ago to celebrate his great improvement then. He was told to take vitamin B_2, 900 mg/day for 1 week.

I noticed a family member pouring another dose of 8 tsp. BWTES into his mouth, cradling his head and carefully avoiding choking. This was his second dose. Someone had misinterpreted my instructions which were a single dose. And someone zapped him.

Later, I was notified that they were getting ready to wheel him out. I arose to say goodbye to the family at the exit door and to take that last-goodbye-look at little Ronald.

Before I could get up, he came running into my office door. His face was animated. He was caught and set back in the wheelchair. What had happened? Was it the zapping? Was it the 16 tsp.?

He was suddenly well enough to sit for testing! We lost no time. The entire tapeworm set of 35 slides was to be tested at nine brain locations or as long as he

could sit. This extensive search turned up at least one of six different tapeworms (or stages) at seven brain locations! Two brain locations, optic chiasma and astrocytes were Negative to everything I tested.

Location	Tapeworm Found
spinal cord/cervical region	Hymenolepis nana eggs, Diphyllobothrium latum eggs
optic chiasma	none
astrocytes	none
medulla	Diphyllobothrium latum scolex
pineal body	Hymenolepis diminuta, Taenia solium eggs
choroid plexus	Hymenolepis nana eggs
post central gyrus	Dipylidium caninum scolex
basal ganglion	Taenia pisiformis composite, Taenia solium cysticercus, Dipylidium caninum scolex
dura mater	Taenia solium cysticercus, Taenia pisiformis composite

Evidently, tapeworm stages had been accumulating in the brain and were not so easily vanquished, not even by a dose of 8 tsp. black walnut tincture extra strength. But he had gotten <u>two</u> doses about ½ hour apart. Would that be effective enough? This slate of tapeworm stages was a formidable one. Success was dubious at best and probably too late.

We said goodbye, but it wouldn't be the last one.

December 8, it is two days later; a phone call (he must still be alive!). His mother will be bringing him in. He walked in. He is very well. Is playing at home. Hadn't played for a very long time. His mother thinks he is feeling better from deep inside. Test results: benzene, isopropyl, wood alcohol Negative. Malonic acid Positive.

At this time we had just learned that wherever a tapeworm was to be found, malonic acid could also be found. In fact, about $^{2}/_{3}$ of all the tapeworm slides themselves were actually Positive for malonic acid! So merely testing for malonic acid would be a quick way of finding tapeworms. Of course, we would miss many. But if the test was Positive, we could expect a tapeworm there without going through the 35-slide test. The exact tapeworm could be identified later, if feasible. Right now, Ronald was still Positive for tapeworm, according to this interpretation.

He laughed and he spoke. The staff enjoyed seeing every movement of his. He was dosed with black walnut tincture extra strength again.

tumor

Dec. 27. MRI index. Frame 107. Frame 112.

December 15, improvement is maintained. Patulin and copper Negative at cerebrum. Malonate Negative at cerebrum. Were the tapeworms really all dead or gone from his brain?

Meanwhile, our new tapeworm killing program was shaping up. We found coenzyme Q10 could kill tapeworms, but the dose was not yet set. Ronald was started on Q10, 500 mg, two a day, and continued on black walnut tincture extra strength, one tsp. a day, plus niacinamide. He could be off cloves since they burned him. And wormwood was down to one dose a week.

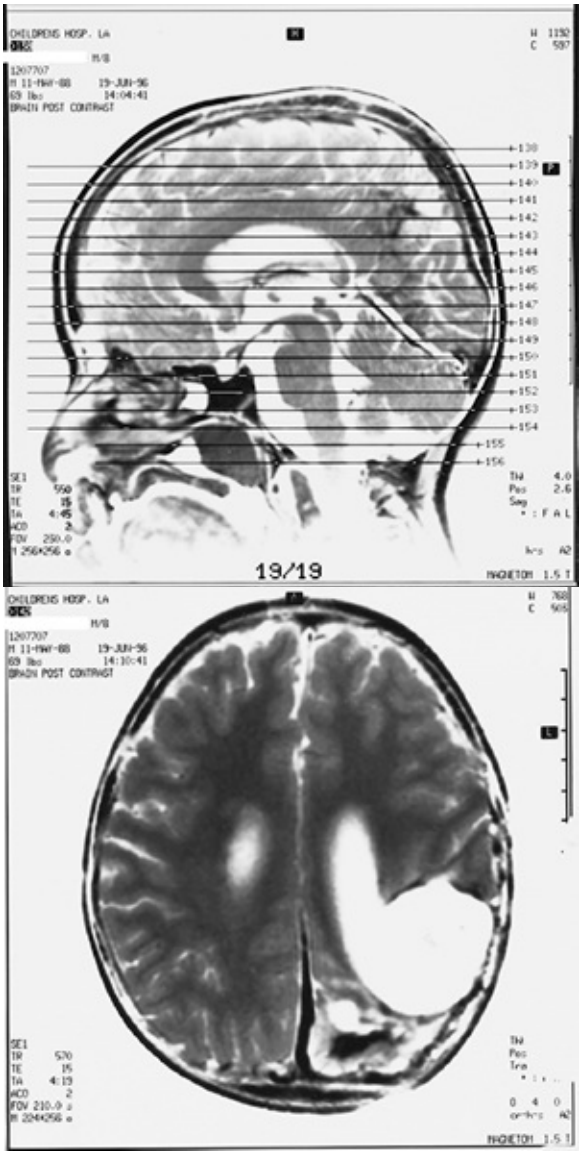
His mother had cut his Tegretol dose in half since he was having no seizures. He was to start on some vitamin C-but we had recently found it to be contaminated with selenium (metallic selenium is very toxic). We could not trust it. Ronald must wait till a new brand of vitamin C was found.

December 18, he is very well, brought me and staff Christmas gifts. He is an affectionate child. Still on 200 mg Tegretol but no Decadron for three weeks. Before this he needed it daily. He continues on methylene blue, one a day, and Q10 250 mg, one a day.

December 29, he got through Christmas without one slip-up on forbidden sweets. His benzene test was Negative. His mother was complimented. They brought his new MRI done at home two days ago. We compared it with his October 4 MRI. The improvement was astounding. There was 1) no midline shift

and 2) no swelling.

To compare MRI results, we must look at exactly the same place. We must search for the slice that just grazes the top of the putamen foramen, number 107. Now we see that the vertical dividing line between the two brain hemispheres is quite straightened. There is still considerable tumor at the bottom right and side, but decidedly less than before. And a lower slice also shows definite improvement.



June 19, next year

Ronald's mother said he had not had any regressions; they were as vigilant as on day one with him. To the staff he seemed lively, walking moderately well, and very alert with hugs and kisses and gifts for all.

His mother stated that Ronald's doctor wants to give him gene therapy, experimentally.

He still cries in the night, most nights.

January 17, 1996, he has only cried in the night once since last visit. Malonate Positive at spinal cord cervical region, evidence for tapeworm again. But at least malonate was Negative at astrocytes, spinal cord, lumbar region. Benzene, isopropanol, methanol Negative. He was started on our new tapeworm treatment, Q10 3 gm, once a week in a single dose. If 3 grams of Q10 was definitive (kills them all), why would there be any need for another treatment? For some strange reason, all the malonate could disappear a few hours after the big dose of Q10, but reappear a few days later! Were they newly acquired? [*This seemed unlikely at the time. We were unaware that common raw vegetables are spattered with tapeworm eggs*.] I thought he was hatching eggs that had gone undetected before! Many things were possible; we couldn't take any chances so we killed them over and over.

January 26, malonate was Negative for the first time throughout his brain, testing at about two dozen locations. And his mother needed to get back to work.

Ronald could be taken care of by a family member. The staff and I were very anxious about this new arrangement.

July 27, "Ronald" with the author

February 21, a month has passed. Ronald is doing well. Malonate, isopropyl, benzene, methanol are all Negative. They are watching him closely at home.

March 5, no symptoms. No crying at night. Sleep is good. Continue methylene blue. Test results: glutathione (reduced) Negative at cerebrum, glutathione

(oxidized) Positive at cerebrum. There is obvious lack of reducing power. There is some interference with glutathione metabolism.

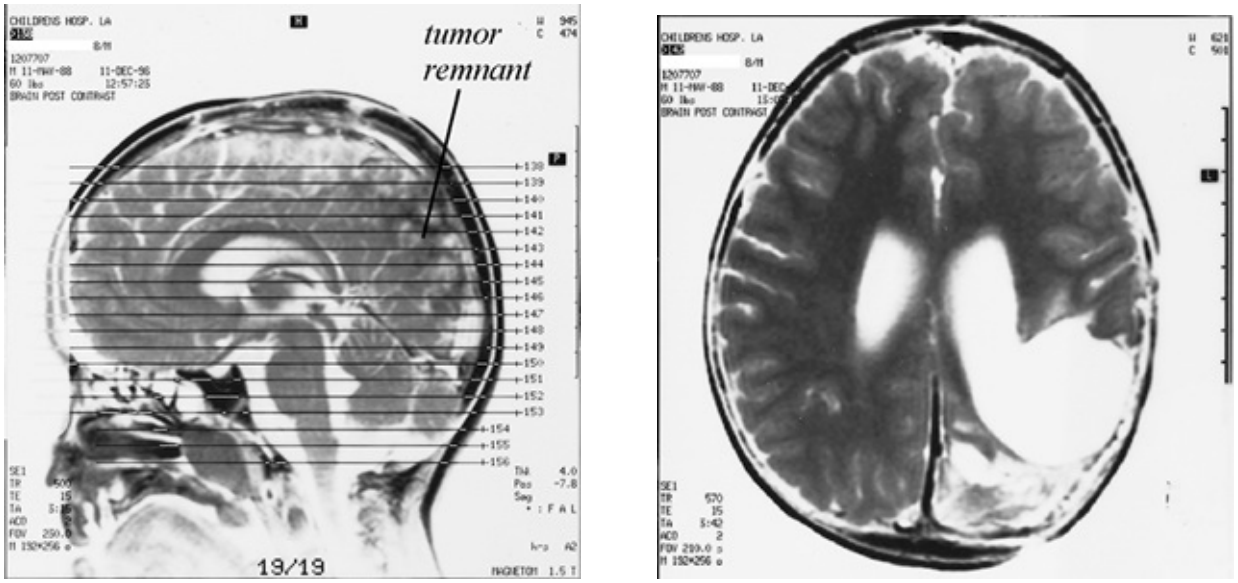
I focused on the cerebrum and found mercury, thallium, D-malic acid Positive, while cobalt, copper were Negative. D-malic acid does not belong in the human body. There was still a parasite.

We started him on a supplement of glutathione, reduced, 100 mg three times a day, and this time again identified paper towels as a source of mercury and thallium for him. They agreed to discuss this with his "sitter". These would use up his precious glutathione.

March 11, March 28, and April 30, doing fine. Still his affectionate self.

July 27, doing very well. He has been evaluated and is ready to go to school in fall. Mother brought latest MRI, done June 19. Slice number 142 shows a midline that is straight; there is no evidence of pressure or edema. Slice 148 shows more normal structure, too.

The mother was ecstatic and little Ronald beamed: "They had made me a copy of the MRI for my very own" and Ronald presented me with it. Ronald wanted a picture taken.



Dec. 11. MRI index. Frame 142.

December (his last visit). I did not see Ronald myself. His mother brought in a

duplicate of his latest MRI and a good report from his regular doctor. Considerable healing can be seen on the index which has the side view. The former disturbance is now closer to the edge. Slice 142 looks even more normal than six months ago.

Autumn of the following year and Christmas of the next two years: a telephone call from his family related that he was doing fine at school.

Summary: 1) Was it the absence of metal or plastic in his teeth that gave Ronald his chance to survive? 2) Was it the absence of IV therapy that improved his chances? 3) Was it the methylene blue? Should I be using it for other cancers, too? 4) Was it that lucky mistake with the double dose of black walnut tincture extra strength that saved his life? One thing is certain: his family gets top grades for changing water pipes promptly, for getting all the supplements down him, for never giving up.

10 Jennifer Pinney Breast Cancer

Jennifer Pinney, a young mural artist of considerable note, offered the clinic some of her paintings in exchange for service. Two months earlier she had discovered a rather large lump in her right breast. It was 3 inches in diameter right under the center. She had already been on the herbal parasite program for five weeks when she arrived so she was free of malignancy (ortho-phospho-tyrosine), but still tested Positive for isopropyl alcohol, which would prevent the tumor from shrinking. She was also Positive for asbestos, copper, cobalt, PCB, patulin, arsenic, chlorine, mercury, thallium, *Staphylococcus aureus*. These were "whole body" tests with no tissue slide in the circuit, reflecting on her rather high "systemic" levels of these toxins.

There were numerous bacteria in the breast, too. She was switched to the new parasite program, which uses 2 tsp. of black walnut tincture extra strength instead of the earlier "drop" recipe she had started herself on. She was to begin zapping, also. And stop wearing a regular bra (only the athletic variety) to improve lymphatic drainage under the breasts.

She was to go off the isopropyl alcohol list, stop using pesticide and bleach,

change her refrigerator to a non-Freon variety, and start the Freon removal program even though Freon tested Negative on her "whole body" test. My experience had been that we always found it present at the tumor site, even when it is absent in the systemic test. She said that three air conditioner failures had occurred in the past summer, implying that Freon had escaped into her air space and she breathed it up. She believed that her water pipes at home were plastic, not copper, but she would bring in a water sample next time she arrived for follow up.

She was to stop using detergent or washing soda (which now also has cobalt) and arrange for removal of metal from her teeth. She was to use Lugol's iodine daily to prevent salmonella species from getting into the breast, although they did not show up at the "whole body" test.

A blood test was scheduled, but she could not wait for the results. Work necessitated her return; she stated she had only come to assess our capability of curing her cancer. Her ultrasound of breast did not get done. The blood test results were back next day. A single glance reveals the toxic effect of either cobalt or vanadium, the RBC is much too high; a check of the initial toxin test (above) revealed cobalt was Positive. And the WBC was also much too high showing an intense bacterial infection somewhere. Albumin was elevated, another cobalt effect. LDH was somewhat elevated showing liver toxicity [actually Sudan Black dye].

Also, there was a toxin in the thyroid, allowing the calcium to be too high; this could be due to cobalt, copper, or any other toxic substance. Creatinine was much too low, implying poor ability to make this compound or a high excretion rate, both typical of cancer.

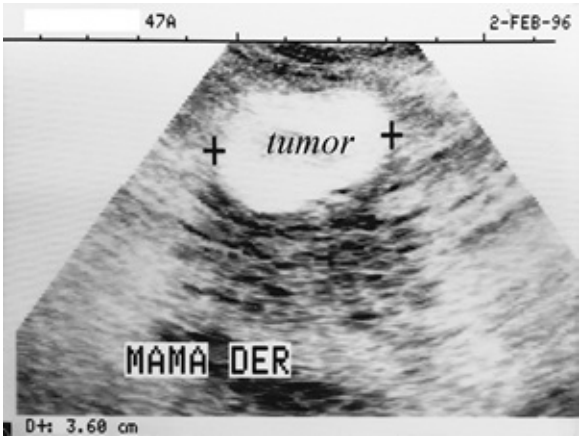
Liver function tests (AST, ALT, GGT) were good, as was alkaline phosphatase. Uric acid was probably "masked", hiding the true disturbances.

The potassium level was too high, implying inability of the tissue cells to absorb it. This usually reflects on the thyroid, which we already see is malfunctioning (high calcium), but it could also mean that malonic acid is directly or indirectly inhibiting potassium uptake by the potassium pumps of cells.

So the tumorous process was, indeed, underway. How would she stop it, all by

herself, without our guidance in a distant place? We underestimated her determination.

Two months later she returned with a much smaller lump. She had achieved a lot on her own. But she wanted it all gone. This time she was willing to stay three weeks. An ultrasound showed a tumor, 3.6 x 3.0 x 2.1 cm (3.0 was the depth).



Feb. 2 Breast ultrasound

It was palpable, meaning you could feel it quite easily. In fact, the radiologist thought it was merely a cyst now and could be drained. Jennifer declined.

She was now Positive for Salmonella-she had run out of Lugol's and was unable to get it locally. She was also Positive for formaldehyde, zirconium, aflatoxin, copper, and patulin. Her patulin was particularly high, so that tumor necrosis factor (TNF) the body's own tumor shrinker, was missing. Copper was especially high, too. She was started immediately on an EDTA IV to pull it out, together with DMSO, vitamin C, and magnesium. She also had benzene toxicity for which she was given vitamin B_2. It was easy to see why the tumor could not shrink further.

A new blood test was done. A glance at the RBC shows she is still toxic with either cobalt or vanadium. We will compare the two tests, item by item.

She was given glutamine as a supplement. Also calcium and hydrochloric acid, 10 drops of a 5% solution at meals twice a day. She was started on glutathione 500 mg., three times a day and coenzyme Q10, 3 gm every fourth day for a total of 5 doses. This would give her oxidizing power to kill pathogens, burn up their poisonous amines, and help accelerate the Krebs respiration cycle.

She was also taken off fruit in her diet to quickly eliminate patulin. It was gone in a few days and now her TNF tested Positive. She could begin shrinking her own tumor. She began to do her dental work.

In two weeks all toxins were testing Negative. Her breast lump was smaller to touch. She was no longer feeling twinges going to the breast. Only *Staphylococcus* and *Shigella* continued to test Positive at the breast and parathyroids.

A new blood test (Feb. 7) reflected on the removal of heavy metals; the RBC was finally normal.

But the LDH had risen just enough (over 160) to suggest a tiny bit of tumor activity again. What was happening? What was new? Dental work! [*We were not aware how the new plastic dentalware could put azo dye right back into her mouth permanently. And cobalt, vanadium, malonic acid, and copper, too.*] Would all her gains by avoiding toxins be lost in a sudden introduction of them by dental work? Kidney function continued to be hindered and albumin was again too high. But the calcium had come up, so I knew the parathyroids were now functioning better.

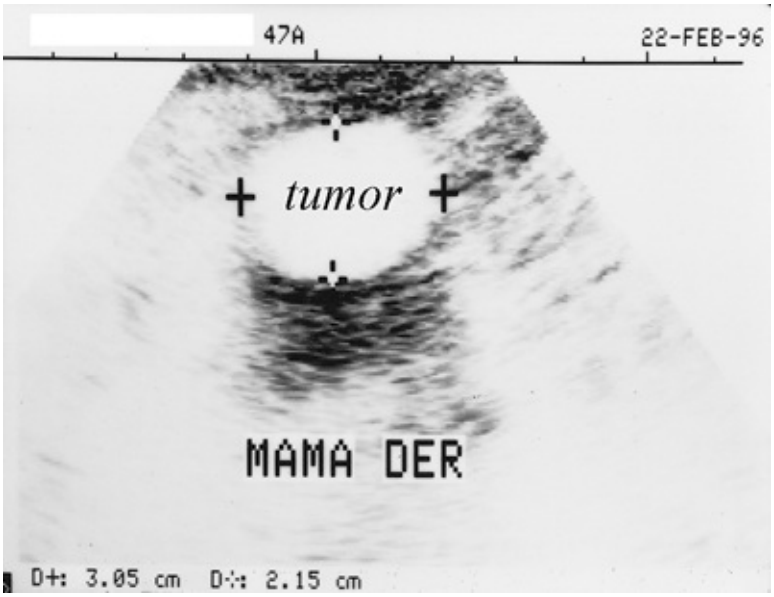
Jennifer Pinney	11/27	2/1	Results
RBC	5.05	5.09	No change. Probably still cobalt as before.
WBC	12,100	7,600	Many fewer bacteria, since tumor is smaller.
BUN	10.0	9.0	Urea formation is further inhibited.
creatinine	0.6	0.7	Still too low
AST	28	19	All liver enzymes (AST, ALT, GGT) are im-proved.
ALT	33	16	
GGT	11	9.0	
LDH	202	135	Liver is healthier, can metabolize lactic acid now. [Sudan Black B is gone.]
alk phos	62	59	Same as above.
albumin	5.2	4.7	This is now normal in spite of continued cobalt toxicity.
uric acid	3.2	1.5	There is a severe lack of glutamine (as well as ongoing Clostridium infection and purine shortage)
calcium	10.4 (8.4-10.4)	8.5	The problem has shifted from the thyroid to the parathyroids, resulting in too low calcium.
iron	92	119	Perfect each time. Not being affected by cop-per or germanium yet.
potassium	5.0	4.3	It has returned to normal. Thyroid is function-ing better. There is less inhibition of the potas-sium pumps.

By the next week, she was still in the middle of dental work. The entire breast had now visibly shrunk and looked perfectly normal. Her IVs were stopped and a new blood test done (Feb. 13). The LDH was, gratifyingly, back down and liver enzymes, too. But albumin was not yet normal; was there still some old

cobalt in bits of forgotten amalgam [*or was it new cobalt freshly put in her mouth*]?

She was given evening primrose oil and a selenium supplement. Salmonella continued to plague her. So she stopped using all dairy products. Then she accidentally picked up isopropyl alcohol and benzene during a weekend visit to friends. They appeared again in the breast. The breast was twinging, too, to tell her so. But patulin was not back so she continued to produce TNF and continued shrinking the tumor.

The third week was ending. A blood test and ultrasound were ordered.



Feb.22. After 3 weeks

The blood test was too beautiful to read without emotion as it was compared to her first one. Tumor activity (LDH) was even below the level of security. Albumin, and calcium were normal, as was potassium and the RBC. Only the low BUN and creatinine told the secret of malonate toxicity while low uric acid told of *Clostridium* infection.

The ultrasound showed what we felt and knew to be true. The breast was softer, less fibrous. The size of the tumor was down to 3.05 x 2.15 cm; it was obviously benign now to the radiologist's eye.

Raw flaxseed was added to her diet before going home. She could soak it for five minutes to make it chewy rather than hard. This would substitute for

evening primrose oil which would always be processed.

Summary: Has she kept her new state of health or will the new dental plastic sabotage her gains? We got her murals, they decorate our walls with inspiration and joy.

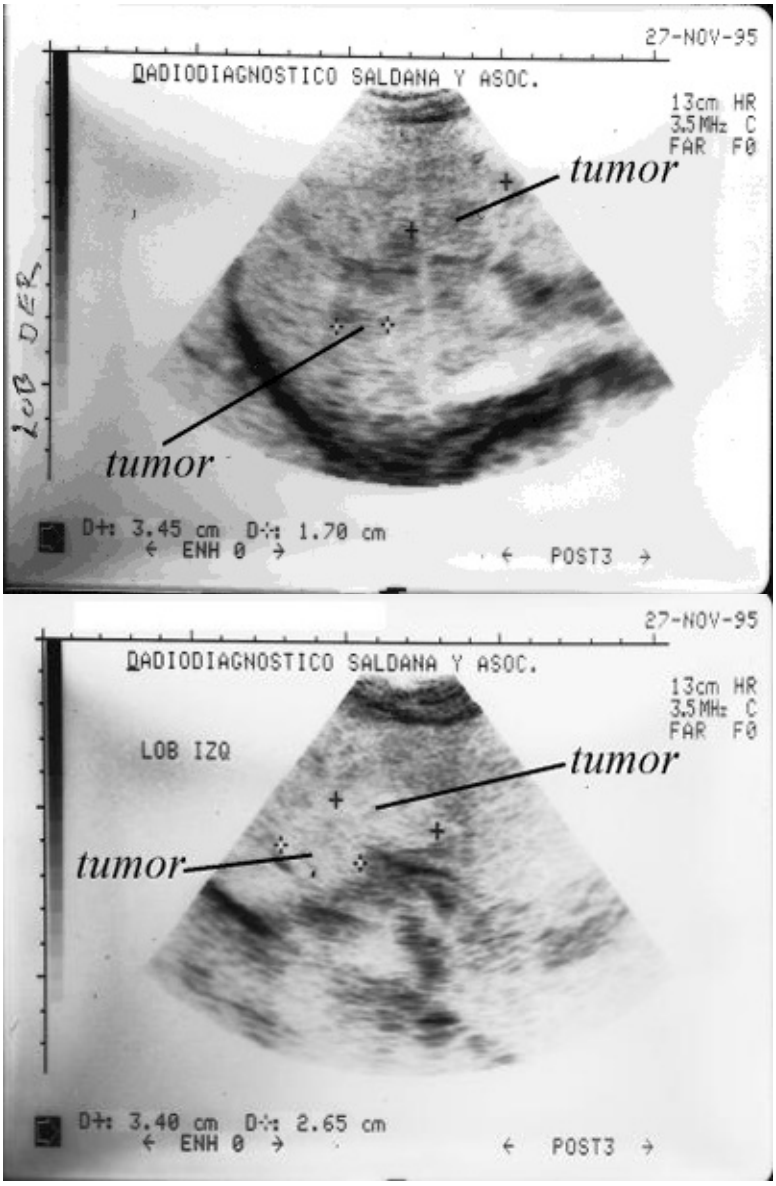
11 Irene Bambrough Liver Cancer

Irene Bambrough, sixty-two, was the perfect example of a lucky patient. Her liver cancer had been diagnosed in August 1995, so she had put herself on the drop-routine for the BWT parasite program and the kidney herb recipe. She left her home in a northern climate to stay with a friend in Arizona who had plastic water pipes. (This is probably what saved her life.) When she arrived at our clinic from Arizona, her initial toxin test was already Negative for isopropyl alcohol, CFC's, and copper, though she still had copper at the liver. She was off to a good start, but was still Positive for fiberglass, aluminum, arsenic, cadmium, thallium, patulin, aflatoxin (very high), and salmonella bacteria.

She wore full dentures. (This is probably what saved her life again.)



Nov. 27 ultrasound of R and L liver lobes

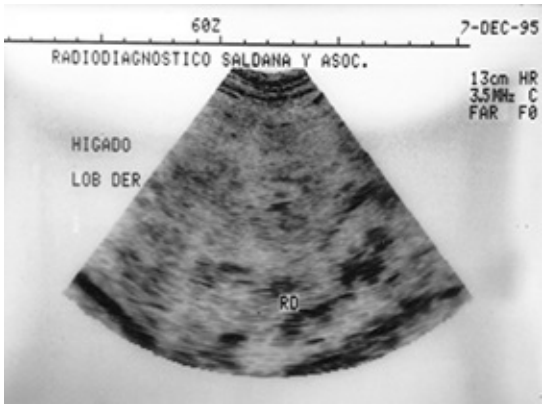
On the day she arrived, November 24, she was given these instructions: (1) change her metal glasses frames to solid plastic-no metal, and washed carefully before wearing them. (2) Use no hygiene products from the drugstore, such as band aids, cotton swabs. These have mercury and thallium residues. [*At that time we did not suspect leftover bits of amalgam in her jawbone as a source of mercury and thallium or other metals; in retrospect, such tattoos were the probable source of her thallium.*] (3) Take Lugol's for *Salmonella*, four times a day as written in the cancer program. (4) Take black walnut tincture extra strength, 2 tsp. daily in a ½ glass of water; (sip it) for 4 days. Then zap. Also, take 7 cloves and 7 wormwood capsules the first day. (5) Get a blood test. (6)

Get an ultrasound of the liver.

She didn't return for four days. We had planned to outline our cancer program to her and really get her started on her second day. Was she just not taking this seriously?

On November 28, she returned. She had accomplished everything without help! We reviewed her blood test. Besides her anemia and her extremely high white blood cell count (15,800), her liver enzymes were too high, especially the GGT. Her LDH was somewhat elevated indicating tumor activity, as was the alkaline phosphatase [both due to dyes]. Her triglycerides and cholesterol were rather low, showing she was losing her good nutritional status. Calcium was ominously high at 10.5, showing there was a problem in her thyroid gland. The high potassium level was further evidence.

Indeed, she had been born with a cyst on her thyroid gland and had part of it removed. She also had radium treatment for it. Now she was on Synthroid tablets daily. (Her third piece of luck was that her thyroid tablets were not polluted with isopropyl alcohol.) She was started on the Freon removal program. She was given coenzyme Q10 to kill tapeworm cysts or other stages that inhabit every tumor. The plan was to search for surviving tapeworm stages the next day. She was also given silymarin tablets to improve her liver function. She was scheduled for three IVs a day, containing glycyrrhizin, laetrile, and vitamin C (50 gm daily).



Dec. 7 R and L liver lobes with no tumors

The next day, the surviving tapeworm stages in the liver were searched for from a set of 33 slides. She still had: *Taenia solium* cysticercus, *Taenia solium* eggs, *Diphyllobothrium erinacea*, *Moniezia expansa* eggs, and *Taenia solium* scolex.

Evidently coenzyme Q10 was not effective, at least not at this dose. We decided to go back to our previous tapeworm treatment, a big dose of black walnut tincture extra strength. She was given 8 tsp. in water, sipped in ½ hour, and another 8 tsp. two hours later.

The next day, November 30, she was tested for tapeworm stages again. Four out of the five tested Negative now (the fifth, *Taenia solium* cysticercus was omitted in the test; this slide was temporarily mislaid). She had also gotten rid of her aflatoxin by avoiding all grains in her diet and eating no nuts.

She missed more days-precious IV days. Arriving on December 4 she was tested again; all tapeworm stages were still Negative. Aflatoxin was still Negative. Even copper was now gone from her liver, although no EDTA was used in her IV to chelate it out.

We discussed her liver ultrasound done on November 27. It was abysmally bad. There were tumors strewn about like trash on a windy day. There was no way to count them. Yet she smiled blithely as we spoke about them. The radiologist simply described them as "multiple liver metastases." Only two were measured in each lobe. Why couldn't she take our program more seriously? It would be a certain fatality. Should I send her to a different cancer doctor, one who would frighten her with threats and vivid descriptions of what it's like to die of cancer? Tubes everywhere, pain in spite of morphine, a distended belly, no

appetite, etc. I decided against it, for a few more days. Other doctors would manage to keep her more dutifully getting her IVs, but the same IVs would be polluted with isopropyl alcohol and *E. coli*-the risk seemed greater than the benefit.

On December 5, she was feeling exceptionally well. She tested Negative for pyruvate at the liver, indicating the pile-up was gone. Malonic acid was Positive, though, and very high at the liver. The question immediately arose: how could she have malonic acid in her liver when no more tapeworm stages existed?

I concluded [*wrongly*] that she must still have a tapeworm stage, but not a variety I had tested for. She was given another two sets of black walnut tincture extra strength, 8 tsp. each, one hour apart. (This was her fourth piece of good luck; in our ignorance we maximized her treatment, instead of minimizing it.) Then she zapped. She was perfectly cheerful about this, without a snippet of a complaint about the taste or the cost. With equal cheerfulness, she announced she was leaving in a few days for home!

Leaving for home with a liver full of ticking bombs? It seemed the height of folly. We scheduled her final ultrasound, but did not manage to do a last blood test, at least not then.

She was back on December 8, ultrasound in hand, and an impish grin on her face. She couldn't interpret the negative herself, but the radiologist had told her there were no tumors!

We quickly taped the negatives onto the windows for all of us to review. There was nothing that could be identified as a tumor. The texture was bad. Possibly a CT scan of the liver would have shown more detail. But the overriding truth was she had made tremendous improvements in the past two weeks and would survive. She could count on living again. How did it happen? She had missed most of her IVs, and taken very few supplements. [*Nor did she observe a malonate-free diet because we didn't know there was malonic acid in food at that time.*]

She left for home, to be with her family for Christmas. She promised to come back in January. We felt she was squandering all her gains.

Irene Bambrough	11/27	1/24
RBC	3.96	4.64
WBC	15,800	6,300
PLT	166	188
glucose	83	102

BUN	16	13
creatinine	0.7	0.1
AST (SGOT)	65	55
ALT (SGPT)	59	50
LDH	209	238
GGT	409	332
T.b.	0.6	1.2
alk phos	120	129
T.p.	6.5	6.5
albumin	4.0	4.3
globulin	4.0	4.3
uric acid	3.6	3.4
Calcium	10.5	8.9
Phosphorus	3.2	2.8
Iron	70	82
Sodium	140	139
Potassium	5.3	4.7
Chloride	109	107
triglycerides	80	258
cholesterol	128	146

But her husband had a new refrigerator for her for Christmas, all fiberglass was sealed up tightly, the water pipes had been changed-it was a case of true love.

We had wished her a Merry Christmas in wonderment. On January 24 she returned, quite lively and energetic looking. Could she really be that well? She tested Positive for benzene this time... maybe she had allowed herself some lotion or soap she got for Christmas. And *Salmonella* was plaguing her again, but cadmium was her only heavy metal now. Was it her pink dentures or her galvanized plumbing? Patulin and aflatoxin were again Positive. But all in all her results were much better than before.

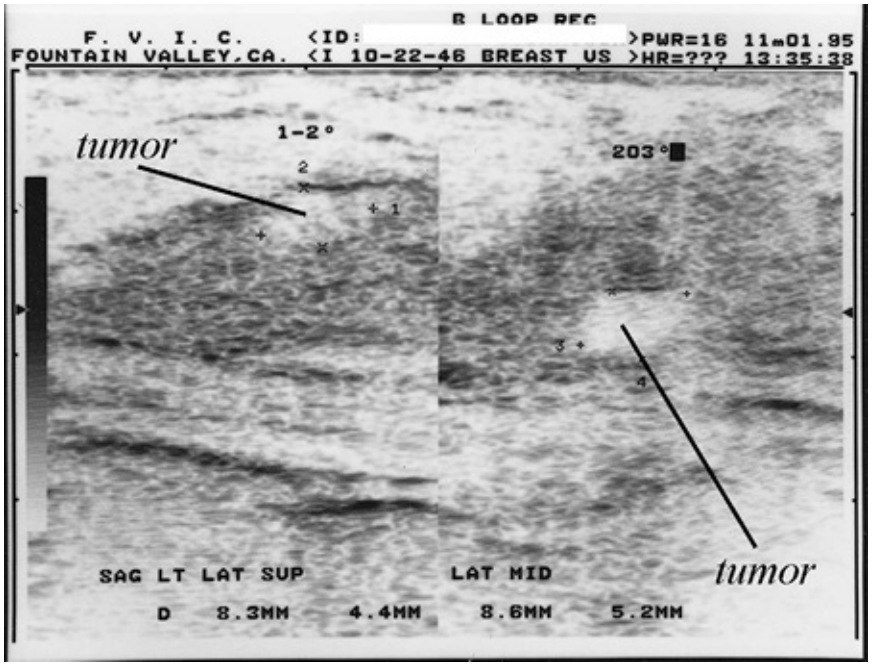
A new blood test rewarded her for her family's efforts. The RBC and WBC were now perfect! The liver enzymes had improved! But LDH had crept up to 238. Did this reflect new tumor activity or the burden on the liver from opening tumors [releasing their Sudan Black and lanthanides]? The tell tale sign of aflatoxin was present in the bilirubin. It too, had just passed the 1.0 mark. We carefully warned her about moldy food. The calcium level had dropped, iron had risen, and potassium was normal again.

And she was obviously much better nourished, judging by the triglycerides and cholesterol. But we had mislaid her file and had nothing to compare her results with as we reviewed her blood test. We couldn't make a strong case for her staying longer for more treatment. And she was off again to care for her home and family. She had made a success story out of an imminent tragedy.

Summary: A year later, a beautiful Christmas card arrived. Was it from her

bereaved family? It was in her handwriting, signed by her. She said she was entirely well and wished us all the very best.

Did she have a fifth piece of luck? What was it? That we lost her file? Or she just didn't like malonic acid foods and nobody gave her chocolates and such for Christmas? I wished all cases were this easy.



Nov. 1 mammogram. Oblong white areas are tumors

12 Janelle Ford Breast Cancer

Janelle Ford arrived with her therapist friend because of a Positive mammogram obtained four weeks earlier. She had brought the mammogram showing two small tumors, each just under 1 cm long. They had grown over the past year while "being carefully watched" by her doctor.

Now her doctor wanted to biopsy them, but her therapist wanted her to change her lifestyle drastically first, in accordance with the instructions in my earlier book, *The Cure For All Cancers*, to see if this would work. In fact, her friend had already started her zapping and taking the herbal recipe.

By the time she arrived, her ortho-phospho-tyrosine was already Negative (meaning no malignancy) but her isopropyl alcohol test was very Positive! She was evidently taking something or using some product that had it. This would allow the growth factor, human chorionic gonadotropin (hCG) to form [*as well as isopropylidene ascorbate and isopropylidene nucleic acids*] which would certainly prevent the tumor from shrinking.

Her initial toxin test also showed Freon, asbestos, copper, mercury, *Salmonella, Shigella dysentery, Staphylococcus aureus* Positive.

Her first instructions were to go off all the supplements she had been taking. They could be polluted with isopropyl alcohol. She should learn to use the Syncrometer® and test them herself later. Her therapist agreed to do this herself since she had given the advice to take them.

Continue the parasite program, complete with niacinamide, zap daily. Change her water pipes to PVC. Change her amalgam to composite [*at that time we were not aware of the hazards of dental plastic*]. Start the Freon removal program, but first get a new non-Freon refrigerator; also test the car dust for Freon. Take turmeric and fennel to get rid of *Shigella*. Take Lugol's iodine, 6 drops in a half glass of water four times a day after meals and bedtime to eliminate *Salmonella*. Stop wearing a regular bra (athletic bra okay) to improve circulation of lymphatic fluid under the breast.

"Is that all?" she said. "Is that all I have to do to get rid of these, ugh... lumps. And I don't have to have that needle?" Her extreme anxiety was visible. But her therapist's determination to be successful was just as visible.

Janelle had also brought a blood test, done at the time of her mammogram. Nothing was abnormal, yet, except uric acid. It was much too low (2.5), showing a lack of glutamine. The enzyme, glutaminase, is stimulated by malonic acid and would decrease the level of glutamine. (Later we discovered the complete absence of purines, accompanying *Clostridium* infection, as well as absence of glutamic acid.) She was given glutamine, 500 mg, one a day for 5 days [*although our present choice is glutamic acid*].

She was eager to get all these things done and planned to come back in two months. When she came she brought a list of her accomplishments:

She was on the maintenance parasite program.

She had been on the kidney program four weeks.

She had zapped daily.

She had been on Lugol's for six days so far.

She was still on the Freon program.

Electronic testing now found benzene, wood alcohol, isopropyl alcohol Negative. Tumor necrosis factor (TNF) was Positive (good!) at the breast. Malonic acid was Positive, and assumed to be due only to tapeworm stages, so she was given CoQ10. GSSG (oxidized glutathione) was Positive at the breast and GSH (reduced glutathione) was Negative. This is opposite to what it should be.[115]

Copper was still Positive at the breast; this would certainly oxidize glutathione. She had not changed her copper water pipes yet, in the hope that a new device she had purchased to clean her water would take it out. It did not. She had not completed her dental work yet.

A month later, she followed up with a visit; she was bloated and uncomfortable. And she still had twinges of pain going to the breast. Testing showed *Salmonella typhimurium* Positive at the whole body. She was returned to taking Lugol's and the Bowel Program. On the bright side, malonic acid was Negative at the breast, and GSSG/GSH were Negative/Positive.

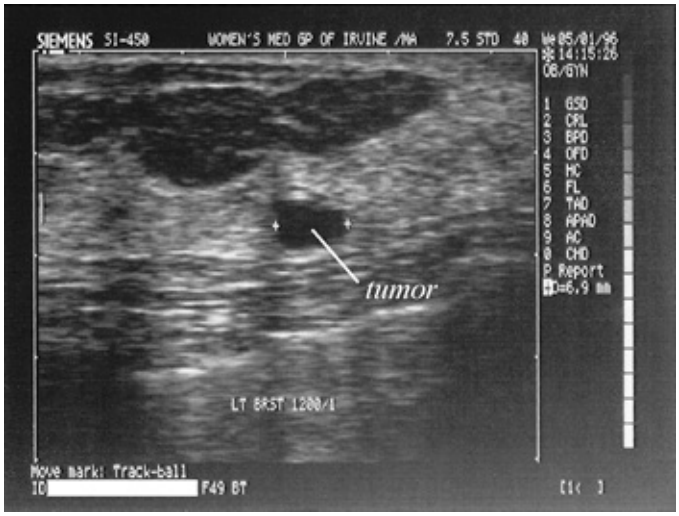
In another month the twinges in her breast were gone. She had recently been ill with a viral infection and was still quite short of breathe when she arrived. Testing showed: benzene, isopropyl alcohol, wood alcohol, copper, mercury, thallium all Negative at the breast. Malonate Positive at the breast.

Noting malonate again, we gave her another large dose of CoQ10 (3 grams) to take daily for 7 days. [*Another regimen we tried in our effort to abolish tapeworm stages definitively. We didn't realize you could reinfect from raw vegetables*.] We also supplemented her diet with glutathione.

TNF was still positive. Were the tumors shrinking in spite of setbacks?

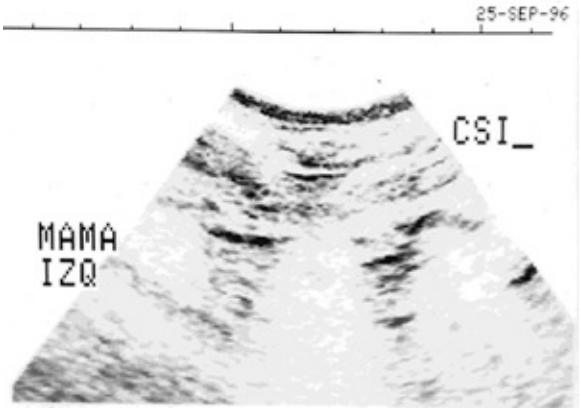
In May, seven months from her first visit, she arrived with her new ultrasounds of the breasts. She was beaming. Only one tumor remained and her

doctor considered it benign, not worthy of a biopsy anymore. The length was estimated at 6.9 mm (pea size) quite a bit smaller than earlier.



May 1, one small, benign tumor left

She still needed to replace copper water pipes and complete work on two teeth. She felt very well.



Sep 25, no tumors

Four months later, she returned to get updated on our tapeworm program, since she had heard it had been changing. We were happy to announce that malonic acid also came from certain foods and dental plastic, as well as pollution, not solely from tapeworm stages. But she was too pleased to be annoyed that there was more to do and certain foods to be avoided. Pleased with the new ultrasounds she was bringing. They showed there were no tumors at all in her breasts anywhere. Even the texture was much less fibrous though not yet normal.

Her toxin test showed malonic acid Positive, benzene, isopropyl alcohol, wood alcohol, all bacteria Negative. Freon was Negative (she had a new refrigerator). Asbestos was Positive (due to her new hair dryer?). I recommended that she use no dryer at all. Copper was Positive (she was still treating her water instead of changing pipes). Mercury was Positive (probably an amalgam tattoo). Aflatoxin was Positive-she should eat home baked bread and avoid peanuts.

She was feeling very well and had her new blood test results with her. Her uric acid was up to 3 now. Calcium was too low, showing a developing parathyroid problem. No doubt, her toxins were accumulating in her parathyroid glands; this reduces parathyroid hormone enough to test Negative with the Syncrometer®, and keep calcium absorption very low. Calcium is also kept low by malonic acid, which simply chelates it away.

Her albumin to globulin ratio had shifted slightly, so that albumin was just a bit too low (to accompany the low calcium) and globulin too high, an effect of cobalt toxicity. Both effects had been discovered to be due to plastic dentalware that same fall.

Her LDH continued to be very low, in fact, too low (101), a toxic effect of cobalt, I believe. Her RBC was also too low, definitely anemic.

We were now able to inform her that both malonate and cobalt could come from her new dental plastic. It should be removed. Her last two amalgams should not be replaced till safe plastic was found for her. [*Waiting could be disastrous, too, so I now recommend extraction.*]

Janelle Ford	11/6/95	9/16/96

As before, she took the news without resentment. Her expectations had been more than fulfilled. Her breasts belonged to her again. She planned to rid herself of toxic plastic, too. Truly, an exemplary patient. Her therapist, with her through it all, smiled with satisfaction.

Summary: Janelle was fortunate to have a therapist, someone who really cared about her welfare.

Certainly the "wait and see while we carefully watch" policy of clinical doctors is better than nothing. But it is as irrational as waiting and seeing if crocodiles will bite while you swim in their territory. In a disease partly caused by mutations, the mutagens should at least be searched for and eliminated during the "wait and see" period.

13 Albert Mikalauskas Liver Cancer

Albert and Pamela Mikalauskas came from Israel for his liver cancer in November. Four years ago he had surgery for a colon tumor. He was presently on a pacemaker and was afraid to zap. He had been on the parasite program for four months already, but he was still full of isopropyl alcohol. They were quite shocked and disappointed to think it was lurking in the vitamins and other supplements he was taking [*and coming from Clostridium bacteria*]; they had brought quite a large bag of them. But they didn't pine over them, or over the money lost, they just threw them out. They were happy to hear that liver cancer is not necessarily difficult to clear up. Their heritage served them well in meeting adversity without a whine. Perhaps he also reminded me of my own father who died of liver cancer at age sixty-two. The appearance of a slightly built man, sallow and chronically ill tugged at my memory every time he arrived. He was on diuretics and heart medicine. The CT scan he brought (not

shown) showed the entire liver full of tumors except part of the left lobe. This was sustaining him.

He had large purpuric patches on hands and forearms (purple patches where blood vessels had broken). He was tested for sorghum mold and found Positive so he was taken off brown sugar and any other sweet except honey.

His initial toxin test showed he was full of Freon, besides nickel, aluminum, copper, cobalt, and mercury. He also had aflatoxin, *E. coli*, *Salmonella*, and *Staphylococcus*. He was started on the Freon removal program, Lugol's, and supplements of assorted minerals (zinc, manganese, molybdenum, selenium, chromium, boron) in a daily small dose. He would continue the parasite program and add niacinamide daily.

His starting IVs contained cesium chloride, glycyrrhizin, laetrile, vitamin C. Cesium is used in liver cancer on the assumption that it pulls excess sodium out of tumor cells and surrounding tissues. Glycyrrhizin, too, is specially useful for liver cancer; it is licorice extract.

His blood test showed nothing presently life threatening, although the liver enzymes were clearly elevated. The iron level was very low (33), yet his bone marrow was still making RBCs as needed.

To pull the copper out of him quickly, two 3 gm doses of EDTA were added to his IVs the next day. At the same time cesium and glycyrrhizin were doubled. He was sent to the dentist to exchange amalgam for plastic.

He was started on coenzyme Q10 and silymarin tablets. But all this got his stomach churning constantly, interfering with his food intake. The cesium dose was cut in half again, which relieved his stomach.

A week later, there was clearly a worsening of the blood test. His bilirubin was over 1. He was eating some high-aflatoxin food [*a liver tumor opened*]. It affected nearly all the other liver enzyme tests, too, raising AST, ALT, and LDH. This would be very serious in a matter of days. The aflatoxin was found in the bread brought from home; they were still eating it because it looked and tasted good. Aflatoxin was also found in some white rice they had purchased from a bulk bin. He was taken off all grains, including bread and rice, as well as nuts. Only oatmeal and corn on the cob were allowed.

In spite of this setback, a new ultrasound (not shown) indicated the masses were of lower density in his liver than before.

To get the LDH down, a BQ shot was given on alternate days. His IV was changed to include 50 gm vitamin C, plus calcium and vitamin B complex.

Next day, his dental work was complete; his energy was much better; and he had very little stomach distress, so he could eat well. He was given 10 drops of hydrochloric acid (5%) to put in his beverage, once a day at dinner time.

A week later, *Echinococcus granulosis* (tapeworm larval cyst) was found at his liver; no other tapeworm stages. But *Fasciolopsis* stages were also present. His dose of black walnut tincture extra strength was raised to 8 tsp. to make sure all bowel parasite stages would be killed. Two days after this, he could sleep without a sleeping pill for the first time. And a new blood test showed improvement. The bilirubin was nearly back to normal (1.1); the LDH had dropped sharply; liver enzymes were much better and calcium was back up. A new ultrasound of liver (not shown) revealed further shrinkage of the right tumor masses.

By the third week, his purpuric spots were almost completely faded.

By the fourth week, his homesickness overwhelmed them. After a last blood test (Dec. 8), they flew home.

Many things had improved. His iron was coming up, so more RBCs could be made. But, obviously, he still had aflatoxin arriving at the liver. All liver enzymes were again elevated. The bilirubin was especially sinister. We could only pray that back home, their customary good habits would bring them all down again. At any rate, the tumors were softening and shrinking.

It lasted for three and a half months; then he was in trouble. His LDH was up. He quickly returned. This time with a friend, not his wife. It was just before Easter.

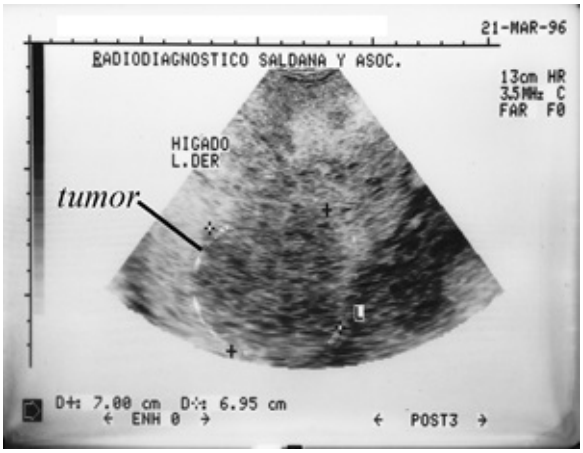
He appeared in rather good health. He was energetic. His insomnia had returned, but he had no other symptoms. However, the blood test showed there was no time to lose. A rising BUN signaled beginning kidney failure! Years of diuretics in the past had no doubt taken its toll on them. [*We did not suspect* Clostridium *or methyl malonate yet.*] He would have to go off his diuretics and

substitute the kidney recipe. Double strength was recommended, sipped slowly throughout the day. He was started on glutathione, and coenzyme Q10 to abolish all malonic acid.

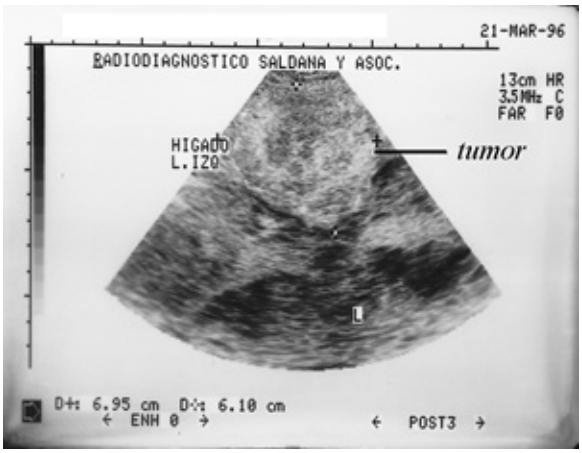
Aflatoxin was again Positive, this time at the kidney [*beginning to drain a new tumor*]. His bilirubin had edged up a bit. He was off grains and nuts again.

On the fourth day, Albert was in sudden distress in the night. He recognized it as his old congestive heart problem. He was waiting for me as I arrived at the clinic in the morning, breathless and with chest pain.

In a strange land, with a strangely behaving body, and strange recommendations made for it, it is easy to make a mistake. He had gone off his diuretic but had completely forgotten about the kidney herb recipe. Now he had not only kidney failure, but heart failure. We thought of his wife patiently waiting for him to arrive at home magically cured in Mexico a second time. We ran to the kitchen. Somebody was dispatched to the grocery store for an armful of fresh parsley. While he waited, he was given hawthorn berry and coenzyme Q10, also folic acid, B12, and magnesium oxide. In an hour, some strong herbal brew was ready. He was to sip throughout the day, in spite of discomfort in the bladder.



Right liver shown above. Left shown below.

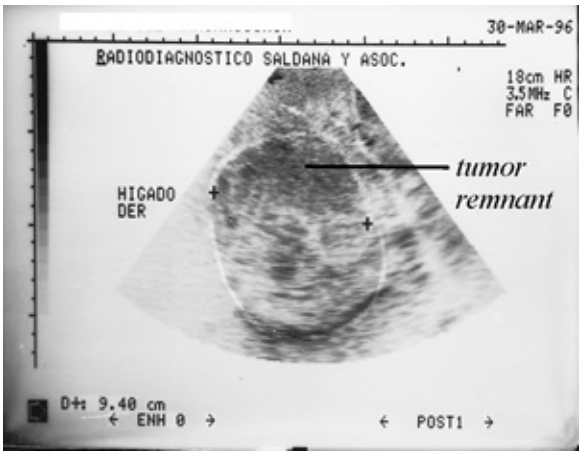


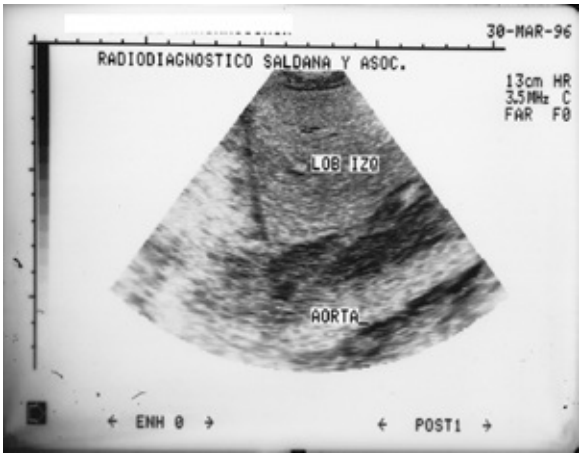
Mar 21, liver tumors on second visit

A new ultrasound of liver had been taken upon his arrival (March 21). The right lobe of liver showed a very large mass of tumor, seemingly made up of smaller tumors. The large size would make it difficult to measure accurately, since a slightly different angle could make the measurement quite different. The left lobe of liver also was one large tumor mass. Yet, there was enough functional liver outside these masses to carry out life's functions.

A day after the kidney herbs were started, a new blood test was done, dated March 26. It is tempting to believe the kidney recipe bailed him out. But the drop in bilirubin was more likely responsible. And down came all the liver enzymes. The drop in LDH would let more uric acid be excreted, another help for the kidneys and heart. The BUN was down again and kidney failure averted.

He was now given half a dose of spironolactone (the body's own diuretic) for a few days, twice a day to help the kidneys further.





Mar 30, liver tumors reduced, going home

Another blood test was done in two days because the previous test was simply too good to be believed. Was he really saved from kidney failure or heart failure or advancing jaundice? And another ultrasound of liver was scheduled. Yes, the bilirubin was staying low, liver enzymes were staying down, LDH slightly lower. And best of all the BUN and creatinine were those of a healthy man!

He could reduce the kidney herbs to half a daily dose. His breathlessness had disappeared completely, a minor chest pain persisted and procaine was added to his IV recipe. (Procaine doubles as pain reliever and benefactor to heart.) But home was even a better recipe. His wife and an ethnic holiday were waiting for him. He was homeward bound once more and once more very prematurely.

His final ultrasound (Mar. 30) showed the large tumor in the right lobe much less dense in its bottom half. The overall dimensions were greater, an effect of scattering of hard centers. The left lobe tumor was gone. It could not be found in three different frames. This lobe now looked quite smooth and healthy. To be certain, a CT scan should be done, but that could be done at home.

Summary: Albert deserved his good fortune; if only my father could have lived at a time when this treatment was known.

The chance that Albert could keep his gains at home would be very slim, though. His improvement was not solid enough. In fact, it had only just begun. But forces greater than the need to survive tug at us. Albert died at home a year later.

14 Tammy Adsit Bone Cancer

Tammy Adsit left her husband and children in England to find a cure for her bone cancer. She had already had a double mastectomy and had been on tamoxifen since then, but the cancer was now throughout her bones. A bone scan was done two days after she arrived (Dec. 22, page 320).

The white regions represent bone. There should be no intensification of white zones within bones nor fuzziness along bone edges. They represent lesions where bone is dissolving. Lesions or "hot spots" can be seen in the ribs on each side. The front view shows the breast bone is involved. The neck, skull, spine, and ribs showed massive cancer invasion, as did the pelvis and legs, not shown.

She had been on the parasite program and zapper for seven days upon arrival. She was already free of malignancy. The bones still had copper, Freon, patulin, benzene, and two bacteria: *Shigella dysenteriae* and *Staphylococcus aureus*. [*Cobalt and vanadium were not tested because they were not yet suspected as routine carcinogens.*] Exchanging amalgam for composite in restored teeth and removing copper from the water supply were our first priorities. She was started on 3 IVs a day, obtaining EDTA, Clodronate, vitamin C, and magnesium. The EDTA would pull out copper; the Clodronate would stop bones from dissolving.

A panoramic x-ray showed a number of infected teeth, besides. These would prove to be her undoing as our dentists at that time did everything in their power to "save" them, repair and restore them, in fact, do everything but extract them. She was also given vitamin $B_{Ã¯â,¬²}$ to detoxify benzene, coenzyme Q10, the Freon removal program, and Lugol's; of course she would continue the parasite program, stay off the benzene and isopropyl alcohol lists, and zap.

The next day she was free of copper and her *Staphylococcus* level was down, though still Positive in her bones. Her IV was changed to contain laetrile, instead of EDTA.

Her blood test results were still quite good. Only the LDH was slightly elevated, considering anything over 160 implies toxicity and tumor activity by our standards. [*The low RBC reflected bone marrow insufficiency, but the true cause, vanadium or cobalt toxicity, was not suspected*.]

In six days she was able to walk a few steps unassisted. A new blood test showed numerous improvements. Lower alk phos slowed down bone dissolution. Removing copper let the iron go up higher. Giving folic acid let the uric acid drop to a value below the range, exposing the serious shortage of glutamine (and glutamic acid) that existed. Potassium was now too low also, showing the body's ability to utilize it better. But the calcium rise unmasked a thyroid problem. The parathyroids had become well again (removing copper, Freon, and patulin), so calcium absorption could occur. To heal bones, we need to further stop bone dissolution by means of calcitonin made in the thyroid. What could still be lurking in the thyroid gland? [*At this time we were unaware of the roles played by Clostridium bacteria, malonic acid, and food dyes.*]

She was given glutamine. [*Later, we would give glutamic acid instead*.] Malonate was Positive, so she was given a massive dose of Co Q10 to kill tapeworm stages. [*Its origin in dental plastic and food was not known then*.]

In another six days she was pain-free except for her upper chest. Pain at the spine was gone and her walking was improving. Malonate was no longer present at the kidneys. Rhodizonic acid was added to her supplement list, taking one capsule (100 mg) 4 times a day. Also, hydrochloric acid (5%), 10 drops in beverage with each meal. Her next blood test showed two good changes: the LDH was dropping and uric acid rising. The lymphocyte level (not shown) was only 12%, though. The lymphocyte level should be at least 20%; 12% implicates

a toxin in the bone marrow consistent with the dropping RBC and WBC. Her IVs were continued, the same as before, 3/day.

In another two days, she was more aware of the pain at the right rib. (She was still in the middle of dental replacement.) The dentist found an abscess under a wisdom tooth and pulled the tooth. This cleared the rib pain.

A new bone scan now showed a 50% reduction in lesions. Many small lesions could no longer be seen. We were overjoyed. Our herbal bone tea was now added to her regimen.

The next blood test done a few days later, Jan. 9, showed further small improvements. The lymphocytes were up to 29%. But what happened to the alk phos? Were tumor cells dying, letting their alk phos escape? [*The presence of carcinogenic dye (DAB) and its connection to elevated alk phos levels was not suspected until a year later. Her new dental plastic was no doubt supplying it.*]

A few days later she was suddenly in a lot of pain. Copper had accumulated again. Its source was found by the testers and removed by her; the new pain disappeared, then returned again. Finally, a few days later, another "bad" wisdom tooth was extracted and the extraction site thoroughly cleaned. She got immediate pain relief for her bones. She could go off all painkillers. She could walk now.

Her IVs were reduced to 2/day. She was given Clodronate to take by mouth instead of IV. Malonate was still positive at her joints, although tapeworm stages were Negative. The source was not known at the time.

The next blood test showed an extreme blood sugar drop, unexplained. Uric acid was down again. But calcium and alk phos had declined. The bones were healing. And potassium had come up.

She was still in a lot of newly created pain from recent dental work. The dentist had persuaded her to go on antibiotics and use <u>cold</u> water packs instead of <u>hot</u> as in our Dental Aftercare. The pain spread to her whole body and left side of skull again.

Bedridden now, she was too afraid to go off the antibiotics for fear of heart damage, in spite of our pleading.

A friend came to take Tammy to her home nearby for the total care she now needed.

Ten days later, she was brought back in a wheel chair, too ill to care about much. She wanted to go home to England while she could still appreciate her family a little longer. We feared if we released her, she would not even survive the trip home. We prevailed upon her to stay one more week. She agreed to go off antibiotics and let herself be hot packed instead, continually, all day long. She changed her departure time.

A week later she walked in the door unassisted. Her pain was nearly gone. Her mind was alert and her face smiled. She wanted her picture taken because "she was going home!" Half a dozen fellow patients jumped up to oblige her request.

Her new test results (Feb.6) showed great improvements. Her bone marrow had finally turned around and was now able to produce both red and white blood cells. There was still a toxin present, though [*we still did not suspect plastic teeth*]. The alk phos was up again. The LDH was its best ever. The calcium rise showed a toxin in the thyroid again. Albumin was slightly elevated to keep up with calcium. She also got a final bone scan, which showed great improvements as well. But not nearly enough to go home with. Yet, she missed her family. She promised to return if pain would return. And return it did.

Three and a half months later she arrived on two crutches, feeling well though, and having gained weight. Another large abscess in the lower jaw had been found by her dentist at home, but she was too fearful of the consequences to risk pulling it there (she would be put on antibiotics again to replace thorough cleaning of the socket).

Her first blood test showed a threatening BUN rise. This was top priority. It must be contained at once. The kidney herb recipe was started immediately. Alk phos was improved, but LDH had risen.

There was *Staphylococcus* and malonate in the bone marrow, while glutathione was absent.

Our new food list of malonate-free varieties was given to her. New supplements were also given, including taurine, cysteine, B_{12}, folic acid. And a solution of white iodine to irrigate her mouth frequently. We gave her new

mineral supplements prepared from yeast varieties. They included molybdenum, manganese, chromium, zinc, as well as boron.

Her IVs now contained magnesium, vitamin C, Clodronate, DMSO, vitamin B complex and calcium.

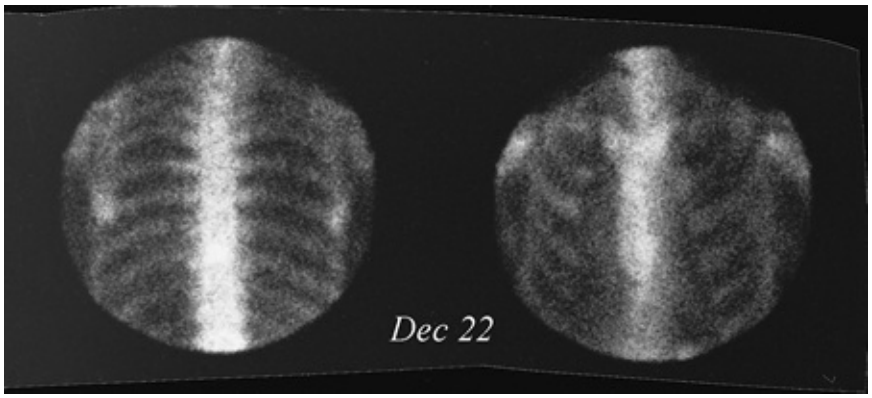
Seven days later her blood test showed numerous improvements.

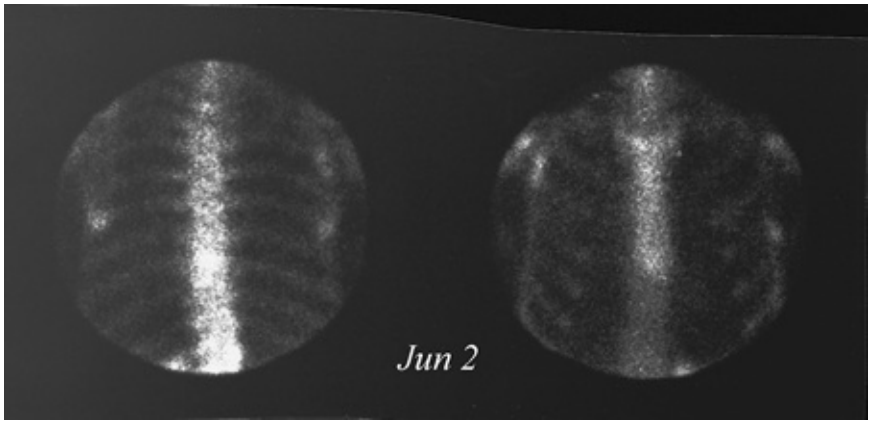
She was once more turning the corner with her bone cancer and bone marrow function; both RBC and WBC were coming up. LDH was going down again, a gift from the gods it seemed, as was alk phos.

But calcium was now too high. The BUN was down to normal, but the uric acid dropped too low. More glutamine was given. Potassium was doing well now. But iron had dropped. Was there copper somewhere? Indeed, copper was found in the bone marrow. Cobalt, too, was found there [*the source in the new dental plastic was not guessed*]. And *Staphylococcus*, again. Another rotten tooth was suspected. She was given 1 dose of EDTA to pull out copper and cobalt; they were both Negative next day.

She was getting better. She could visit the friends who had taken care of her earlier. She got her fourth rotten tooth extracted. This time she applied hot packs and did hot swishes all day from the time she got out of the dentist's chair. She merely smiled when the dentist gave her the antibiotic prescription and put it in her pocket.

We scheduled one more blood test (May 27). Calcium had come down.

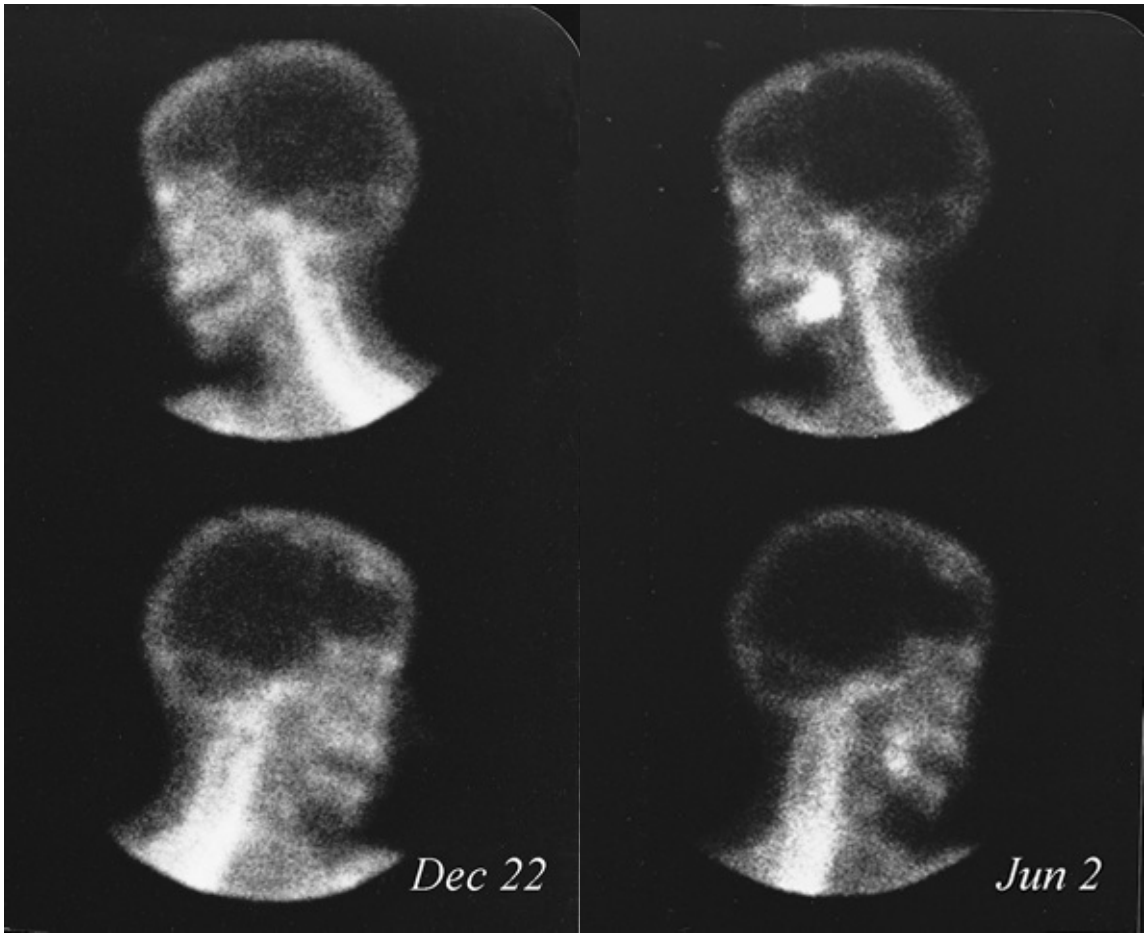




Dec 22 vs. Jun 2 back and front chest bone scan

With wellness came happiness. She wanted to go home again. Although healing was underway, we felt the chance of another abscess hiding in her jaw was quite good. It was not simply a matter of taking x-rays of teeth, spotting the infected teeth, and dealing with them. These abscesses were hidden. [*At that time I did not know about digital x-rays.*] She should stay till this possibility was cleared completely. But she was quite sure her dentist at home would do all the proper things. Our pleadings were in vain. She had one more bone scan done (June 2) to prove her point, it seemed. It was much improved. Bones are more distinct, less "fuzzy." Scan shows much less whiteness.

She could walk without crutches. She was not on painkiller. It was the perfect time to continue, it seemed to us. But her children beckoned. And go she must, in true motherly fashion. Would she ever come back? She promised. But promises mean nothing to the great reaper.



Dec 22 vs. Jun 2 head and neck bone scan

A few months later she was in deep trouble. Too sick to travel to her dentist. Too impoverished to travel back to us. It seemed likely to be just another abscessed tooth. But her friends and family interpreted her visits to our clinic as useless, since she didn't "really get well." What a toll such hasty and uninformed judgment can take. We heard no more.

Summary: In hindsight, we should have pulled all her teeth at once, upon arrival, as we do now instead of piecemeal and only at the brink of death. The newly developing problems were also due to plastic replacements for teeth. We would not make that mistake again, either. She should have and could have survived. If only we were given second chances.

15 Sean Pokorny Lung Cancer

Sean Pokorny, fiftyish, came with his wife after he had lung surgery at home to remove a cancerous tumor. He had been through radiation and chemotherapy

already, too. But now his original symptoms were coming back: a lot of back pain and a pitting edema of the legs plus swelling. That was how his cancer had struck him at the very beginning.

We found he was still positive for malignancy, but it was not in the lung, lymph nodes, stomach, or bone; it was at the kidneys.

His first tasks were to get off isopropyl alcohol sources, kill the intestinal fluke, get his plumbing changed at home, and do dental work.

His initial test showed aluminum, chlorine, cadmium, nickel, cobalt, patulin, and aflatoxin to be positive. Freon and copper were very high at the kidneys, not elsewhere. Malonic acid was at the kidneys, too.

He could stay three weeks, certainly enough time to learn preventive measures, so his cancer and tumors would never return. His lung cancer surgery was 1½ years ago; it had spread to the lymph nodes then. But we did not do a chest x-ray or bone scan at first. We requested an ultrasound of the kidney region instead.

While waiting for the blood test and ultrasound, he was started on IV therapy, receiving two a day. They contained EDTA to remove copper; laetrile; vitamin C, calcium, and magnesium. The Freon removal program and dental work got off to an early start, too.

Two days later his blood test was reviewed with him. His RBC, WBC, and platelet count were all slightly elevated. [*At that time I was not aware that cobalt or vanadium toxicity could each raise the RBC. In this case, Sean had tested Positive to cobalt.*] The WBC is also elevated; suggesting a hidden infection somewhere, getting out of control. The elevated platelet count suggests minute bleeding. Lung tumors have a propensity for bleeding, but his lung cancer was in the past, or so we thought. At any rate, we needed to focus on the kidneys, because of severe edema, pain, and the current malignancy there. Tumors at other locations would be healing right along with the healing process going on at the kidneys.

The globulin was too high. [*But its link to vanadium toxicity was not suspected then. We thought it was just a normal, though mysterious, fluctuation of this liver protein product.*] The most relieving result was the LDH; according to this, there was little tumor activity when Sean arrived, December 27. Yet

according to the elevated alk phos, there was considerable tumor activity. [*This discrepancy is easily understood now; he was full of DAB dye, not Sudan Black B.*] The low iron level was interpreted as a copper toxicity and should be easy to correct. His better than average cholesterol and triglycerides would help, too.

He was a model patient. Every recommendation was implemented immediately. Even his metal tooth fillings were removed by the end of day two. He also got a fever, possibly from a general *Staphylococcus* release during dental work, but it was gone in a day.

By the fourth day, his edema was gone. TNF was already present, but his leg pain and back pain persisted. An ultrasound of the kidney area showed no tumors so, whether they had been there or not, he should be ready to leave on schedule, having acquired some new anti-cancer tactics.

By day seven he was feeling very well, but malonic acid was still positive [*malonic acid was not suspected in food or dental plastic, only in tapeworm stages*]. We gave him the definitive dose of Q10, 3½ gm. After this, he had no more fevers.

By January 8, his alk phos had dropped over 100 points, indicating tumor activity was way down. But iron had dropped, too, in fact, "out of sight". And, indeed, copper was found at both parathyroids and liver. Since his motel had all plastic pipes, the copper source was mysterious. [*We could not guess at that time that it might be put, along with cobalt, vanadium, and malonate derivatives right into his mouth in his plastic dentalware.*]

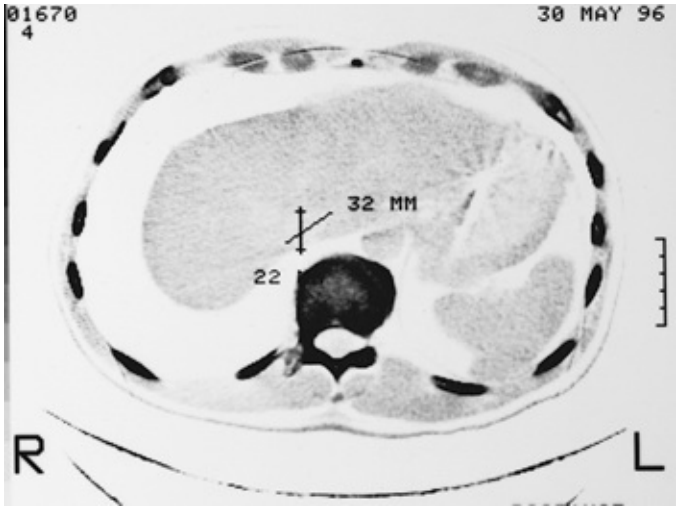
We supplied him with Iron Booster (chlorophyll product), 1 tbs. a day and quickly applied more EDTA by IV to pull out more copper. The Q10 had done its job and killed bacteria, along with tapeworm stages.

Notice that his calcium had swung from too low (8.9) to too high (10.3), shifting the problem from parathyroids to the thyroid. Immediately the toxin in the thyroid shut off calcitonin production, allowing bones to dissolve and flood his blood stream with both calcium and phosphate. We added Clodronate, a diphosphonate, to his IV to inhibit bone dissolution.

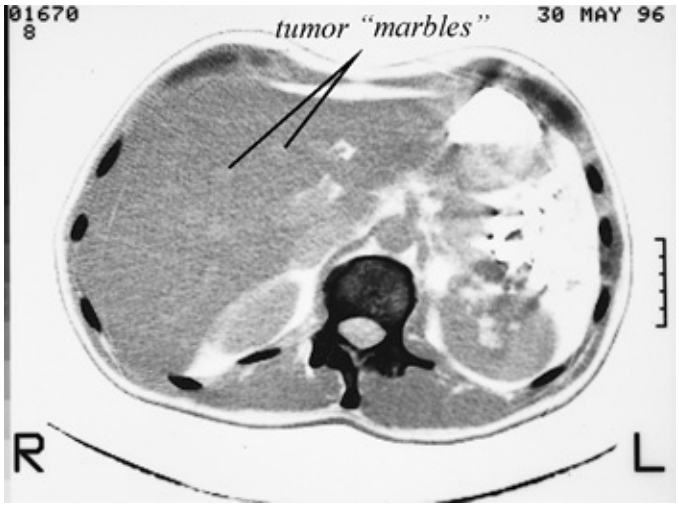
Meanwhile, the LDH had gone up, instead of down, implying new tumor activity. How could that be? Could it be happening in a different organ that was getting a new larger dose of malonic acid, cobalt, copper than before? We gave

him a BQ shot to lower LDH.

By January 12, we stopped his IVs-he was simply too well. The next day a new blood test was done. Obviously, his bacteria were under control, wherever they had been, since the WBC was now normal.



CT of liver shows the largest tumor to be 2.2 x 3.2 cm.



Another level of the same scan shows numerous small "marbles" (tumors)

May 30, arriving with new liver tumors

Calcium, too, was returning, but was still too high along with phosphate. The albumin to globulin ratio was now correct. The liver enzymes ALT and GGT were very much better. Most important, the LDH was back down and the alk

phos was down to normal too. If there were additional tumor sites, they must be fairly inactive.

Copper continued to plague us though and iron stayed low. This was in spite of taking iron pills, as well as Iron Booster liquid. He was due to leave in a few days. His mission was accomplished from his point of view: no tumors seen, blood test greatly improved, edema and swelling gone, pain down. He could walk normally, which he interpreted as beating the race against cancer. And his time and money were spent. They left for home.

But we knew there was a mysterious source of copper and also malonic acid, two vicious tumor growers.

Four months later, he came back. He was full of pain, full of isopropyl alcohol, full of cobalt and PCBs and fiberglass. This must have aggravated his lungs continually while he was home. Two *Shigella* varieties were growing in him. His copper level was quite high, again at the kidneys. And his low back pain required constant painkilling drugs. A CT scan of upper abdomen as well as lower abdomen was ordered and he was started on glutathione.

The lower scan showed normal kidneys. The surprise came from the upper scan. His liver had a half dozen small tumors, including one, not so small at 2.2 x 3.2 cm. This should be our top priority.

His new blood test (May 28) showed a general worsening. In fact, iron was so low, it could not even be detected. This was an emergency. He was put on iron pills, liquid "Iron Booster," and given iron shots again, on alternate days.

Our testing soon found one source of copper and cobalt. They were riding along as pollutants in his iron pills! [*We still did not suspect the dental plastic*.] To help the liver, we gave him silymarin, B_{12}, folic acid, and vitamin C.

His IV now included calcium, magnesium, vitamin C, glycyrrhizin and DMSO. The new blood test showed that alk phos was up slightly, not the LDH. The low LDH implied no tumor activity at all. While the alk phos implied some.

The very low iron, together with the elevated platelet count suggested minute bleeding, possibly in the lung. But, again, another organ took precedence. The lung would not be life threatening (unless it hemorrhaged), the liver would.

In five days, his pain level was down. He had been staying off malonate-containing food. He was on all the programs, parasite, kidney herbs... all of it.

We had decided to do weekly ultrasounds of the liver for him to follow his progress, since they were inexpensive, about $45.00. He brought in his first one June 4, at the end of his first week.

The ultrasound was Negative! No tumor could be seen. This was just too much good news. We planned to back this up with a CT scan in two more weeks. Could it really be true? Our hopes, fears, denials, determination were at a peak with suspense. The new blood test, June 5, told the same story. Something had allowed the serum iron to shoot up in a single snap. This is seldom seen from taking iron supplements.

And finally, for the first time, the platelet count was coming down. Did this mean the hidden bleeding had stopped? Kidney function was better too.

But why had the RBC gone higher, if the cobalt-polluted pills were stopped? This time it was due to vanadium. The source was not found [*in the dental plastic*]. He was again having some plastic put into his mouth. The vanadium toxicity can easily be spotted in the elevated globulin, too. [*Also note some newly encountered Sudan Black B dye can be detected by the LDH rise. And newly encountered inorganic copper or "bad" germanium caused the iron level to plummet again*.] He needed more glutamine-uric acid was still only 2.4.

It was June 18, the "magic" date for repeating his liver scan. The pictures tell it better than the radiologists' words.

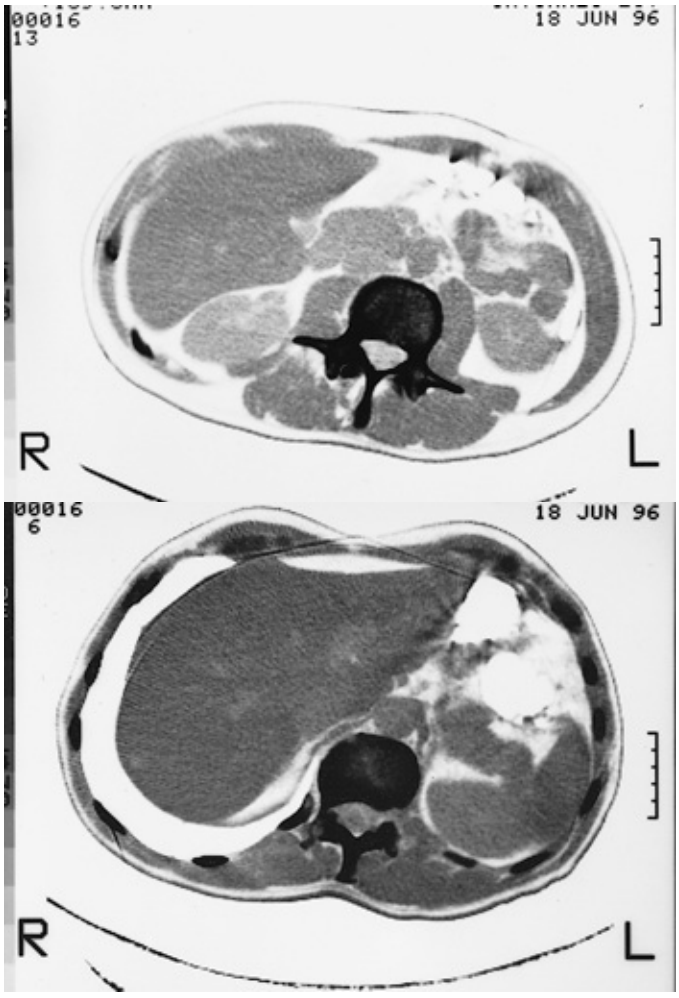
The liver tumors were gone, the nightmare of cancer about gone. Only a chronic, mysterious toxicity problem remained, the same as before: copper, cobalt, vanadium, and malonic derivatives.

Would Sean and his wife leave again before finding the source? Sometimes he would be Positive for mercury and thallium making his leg pain worse. This time his pain was not all conquered. staphylococcus bacteria would not leave. And he continued having dental plastic put into his mouth.

They were not thrilled about having his liver tumors vanish. They were too torn about staying or leaving. He was coughing a lot. His wife voted for staying. She thought he should have a chest x-ray. Sean thought he was "all done" again.

It was July 1. The blood test continued to show toxicity effects from vanadium, copper, and malonic acid. The LDH was back down, but alk phos was not. And the platelet count stayed high. His wife finally persuaded him to have a chest x-ray. On July 3, a chest x-ray revealed a large lung tumor! This could explain the numerous mysteries we had encountered. His wife was happy to find it and wanted to focus on it immediately. The tumor appeared fluffy and not too dense. It should not be difficult to dissolve. But Sean was crushed. He felt he had "put in his time" and wanted nothing so much as to leave.

Lung tumors have a propensity for producing pain and for bleeding. But we had gained experience with a new Chinese herb, Yunnan Paiyao. It seemed to prevent bleeding or reduce it, often stopping it. We started him on this, fearful of using tumor shrinkers that would work too fast and cause more bleeding.



IMPRESION: Con la técnica utilizada, NO se demuestran lesiones tumores secundarias." (With the technique employed, no metastases are seen.) Another slice reveals no "marbles", although texture is still poor.
June 18 right lobe CT of liver reveals no tumors

By now, he had two new crowns in his mouth, against recommendations. Had the dentist swayed him? He was coughing more, although not bringing up blood. Still, he felt demoralized. Perhaps all the new toxins placed in his mouth caused depression (copper often does that). He should have been hopping with excitement over his successes, not labeling the remaining task "failure." They decided to leave.

Summary: They went home with mixed feelings. Maybe all will be well, as it so often is. A lung tumor that isn't hemorrhaging is, after all, "the best kind". And, of course, it could be surgically removed. Maybe they did that. We wish them the best.

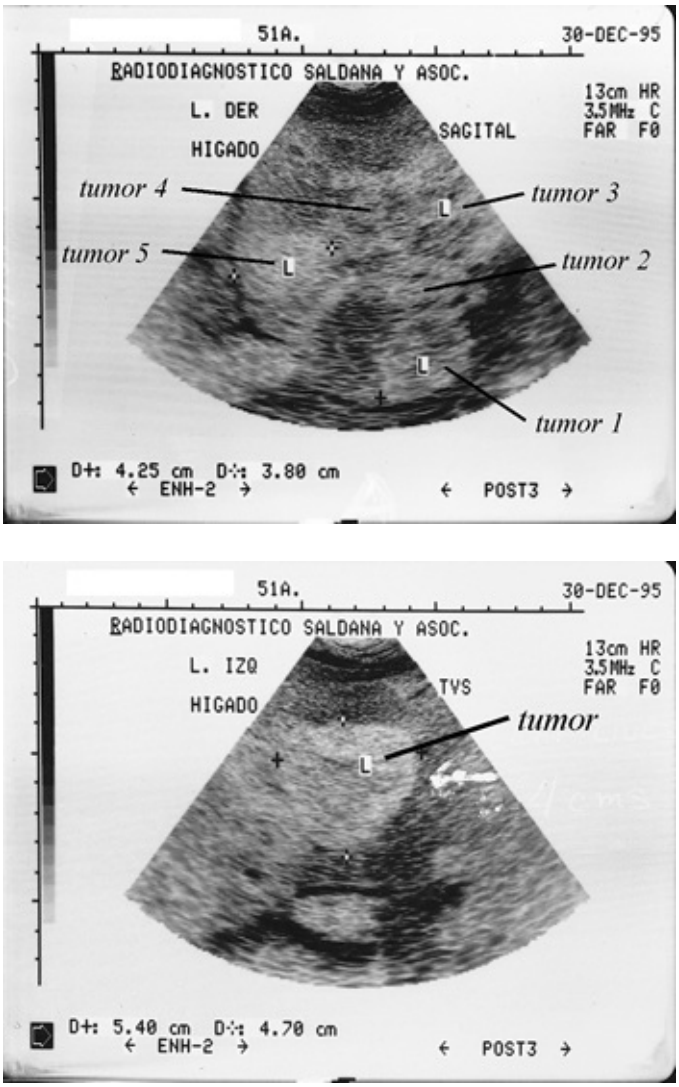
16 Betty Fries Breast Cancer

Betty Fries, under fifty, seemed quite well and certainly desirous of living when she arrived with her teenage son from Australia. But she had been given 18 months to live; her previous breast cancer had gone to her liver where she now had five or more large tumors. The breast had been removed, there could be no recurrence there. It had all been a big success by clinical standards, but these standards would not let her survive.

She had already started the parasite program, but was still using isopropyl containing products.

Her initial test showed *Salmonella paratyphi*, copper, *Shigella dysenteriae*, cadmium, CFC's, mercury, asbestos, patulin (fruit mold toxin), nickel, aflatoxin (grain and nut mold toxin), all Positive. All of these were high enough to be detected systemically with the Syncrometer®.



Right lobe (top) has 5 tumors, left lobe (bottom) has a large one with white arrow drawn on negative by radiologist.
Dec 30 right and left lobe liver ultrasounds

A blood test was done and ultrasound scheduled. Removal of amalgam was scheduled. She moved into a nearby Mexican "copper-free" motel. Her son started her on the Freon removal program, Lugol's iodine, and three grams of coenzyme Q10 to kill tapeworm stages. She was given silymarin for the liver, in addition to the liver herbs in the Freon program. She zapped daily. It was December 30, a Saturday afternoon.

The ultrasound arrived a few hours later; it showed the five masses in the right lobe to be about the size of small potatoes, while the left lobe had a similar tumor.

There was no time to lose. She was started that same day on 3 IVs daily,

containing EDTA (metal chelator) to remove copper, glycyrrhizin for liver support, vitamin C, and magnesium.

By the next day, she had gotten rid of isopropyl alcohol and was negative for ortho-phospho-tyrosine. The malignancy was gone. But would she survive with a liver full of tumors?

On Monday, her blood test results arrived. We feared the worst, and were pleasantly surprised. Not that a GGT of 794 did not send chills down our spine. But the LDH (tumor activity) was only 278, the alk phos only 156, and calcium quite correctable, too, at 10.0.

Electronic testing at the liver showed malonic acid and aflatoxin Positive, as well as cobalt. [*At this time, we did not know all the sources of malonic acid and cobalt.*]

By Monday, the copper was gone and her IVs were simply glycyrrhizin, vitamin C, and magnesium. Potassium was supplemented by making her table salt a mixture of sodium chloride and potassium chloride. [*Currently, we emphasize potassium supplementation much more*.]

She had developed insomnia. Testing showed it to be due to *E. coli*. Three days later, she still had it in spite of zapping, using Bowel Program herbs, and another big dose of Q10. We gave her hydrochloric acid (5%), 10 drops in beverage at mealtime, 3 times a day for several days, which cleared it. By January 5, patulin was negative, aflatoxin was negative, TNF was Positive.

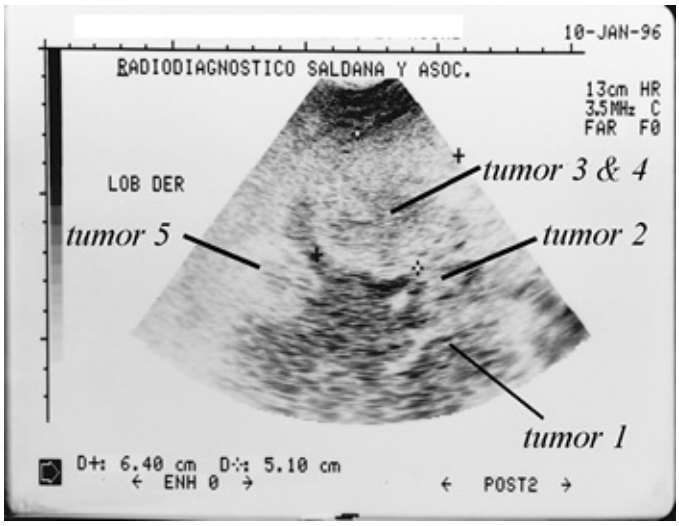
On January 8, she was much improved; she had much more energy now; she had spent two hours on the beach; and she was not sleeping during the day anymore. She was in the middle of dental work. Her IVs were changed to include laetrile.

The following day a new blood test showed her RBC was down from 5.3 to 4.98. Had she lost her cobalt toxin? But her liver enzymes had climbed, not dropped, as we had hoped [*due to opening tumors*].

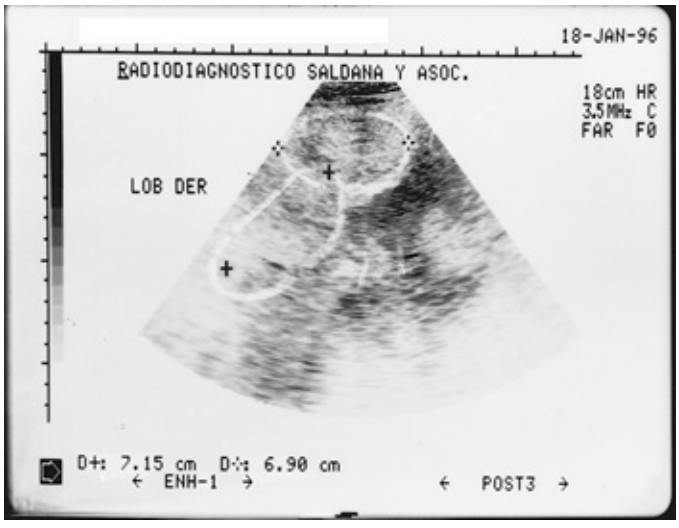
Surprisingly the alk phos was up, so bone or lung could be involved. Yet, she had no symptoms at these locations, and we did not investigate either; we had enough to cope with.

A new ultrasound on January 10 showed a passageway of normal liver tissue separating the tumors on the right side.

In spite of worsening liver tests, she continued to feel well, she was eating and sleeping. But the next blood test, on January 13, again did not bring good news. The RBC was back up, the WBC stayed too low [*more opening tumors*]. Liver enzymes continued to climb, but the GGT and alk phos were beginning to decline.



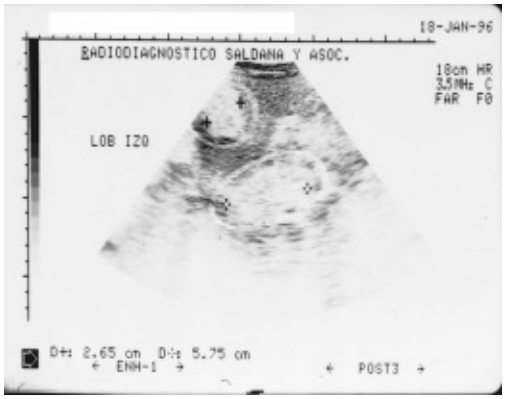
Jan 10 right lobe improvement



The dropping serum iron was the clue: it must be copper again, and cobalt besides. [*We never suspected her new dental plastic to be seeping copper, germanium and dyes. We found it in the water from her "copper-free" motel.*]

She was requested to move and her son eagerly arranged it. Her IVs were changed again, adding cesium chloride (about 8 grams), and DMSO to the previous recipe.

On January 18, a new blood test and ultrasound were done. The RBC (5.55) showed persisting cobalt toxicity; it was poisoning the bone marrow; we had not found her sources [*hidden* Ascaris *colonies*].



The encircling lines were drawn on the negative by our pathologist.

Jan 18 right and left lobe liver ultrasounds

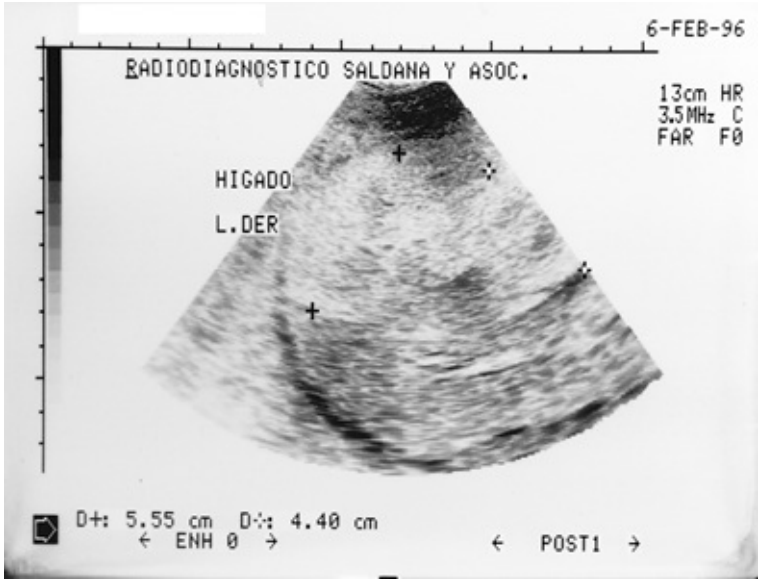
The copper problem had been improved by her move, and serum iron was rising again. The ultrasound showed great improvements. The largest mass in the left lobe measured 2.65 x 5.75; had a piece become severed? Was it breaking up? And the five tumors in the right lobe all looked smaller.

In spite of all this good news, Betty was beginning to worsen [*toxicity from opened tumors*]; she could not go for walks and spent her daytime in bed. Her son had to coax her to eat every mouthful. What was wrong? We added thioctic acid to her regimen. Her son admitted that Betty had not been taking supplements [*just what was needed to combat toxicity*] as directed for over a week already. She was failing rapidly. A nurse was sent to her residence to do a CBC. It had improved! RBC was 4.72, WBC was 4,600. (Remember, an RBC over 4.7 reflects a cobalt or vanadium toxicity):

Yet she continued to decline and had a fever. A saliva sample brought to us was positive for *Salmonella* and *E. coli*. All her foods were quickly tested. But I was sick myself for several days and only prayed that the conscientious staff would do their detective work well. She was given 3 grams of Q10, Lugol's iodine, 4 times a day to conquer the infection, and urea powder, 5 tsp. a day in

water for liver support. Each day I asked if she had survived. In a few days my own illness had improved enough to continue studies. I decided to try glutathione (reduced) for Betty. It seemed to return my own health rather swiftly. She was given $^{1}/_{8}$ tsp., 3 times a day, before meals.

The very next day, she claimed she was "feeling good." I was seeing her myself now; she had arrived in the office in a wheelchair. Meanwhile, her son was undaunted, keeping her spirits high, and her thoughts on success. A new blood test showed three of the liver tests improving now.



But the LDH and alk phos were rising [from emerging dye]. She was losing weight, her son said, and losing ground. In desperation we ordered her tested for 80 toxins. [*The toxin test did not include food or hair dyes at that time.*] From the rising alk phos, I suspected bone or lung metastases, but did not bring up this possibility; there was enough to cope with and this would not change her treatment anyway.

The results of the complete toxin test were: praseodymium, chromium (III), tin, platinum, holmium, terbium, zinc, rhodium, bromine, Positive. The remaining 71 elements were Negative. Only tooth fillings could give such results! How could this be? All amalgam had been removed! Was it left over amalgam? Yet, mercury was missing. Could it be the plastic replacement? Was the dentist not using the customary composite? We asked. Indeed, she had gone to a different dentist, unfamiliar with our dental standards. The cost was less! It was our lowest moment. She was much too ill and weak to sit in any dentist's

chair now.

Feb 6 ultrasounds show tumors less dense, smaller

And *Staphylococcus* from improperly cleaned sockets and cavitations had spread to her bones and lungs. She had a constant fever. The pain at her left shoulder blade was relentless. To all appearances she was dying of cancer, yet her blood test of February was not worsening. And a new ultrasound showed further improvement. If the pain was due to a large gallstone stuck in a bile duct, she could do a liver cleanse; there was nothing to lose. Her son prepared it. Indeed she got out a large stone. Her pain level went down, but her general condition stayed the same. She made the mistake of having some high fat food the very next day and was in extreme pain again. We declined to give morphine or codeine, explaining this would be the kiss of death. Better to do another liver flush right away. It was only four days later. But this time it was successful. She bounced back to her old self. In a day, in spite of bathroom sprints, she felt like exercising. She was definitely improving. Some pain over shoulder blades persisted, but her appetite returned and hope had returned.

On February 19, a new blood test was done. Her BUN and uric acid were extremely high, no doubt due to the urea we were giving by mouth; the creatinine was not elevated showing kidney failure was not responsible.

We stopped her urea supplement. [*With hindsight, we should have merely reduced it.* Besides this, to our utter amazement the GGT, our nemesis, had dropped in half. Her alk phos, our other nemesis, had dropped drastically, too.

Calcium and potassium normalized! And one liver enzyme, AST, began to drop as well as the LDH. Was this the turning point? Did the liver cleanses do this? Or the urea? These were the two extraordinary treatments.

A few days later her dental work was complete and now she had a mouthful of plastic.

For eight days she gradually improved, although her left arm was incapacitated with pain again. On February 29 she suddenly lost her walking ability, due to spasms in her left hip. [*Hip pain is always dental*!] We guessed the problem was dental. But she also had picked up vanadium, thallium, mercury, and copper again! She was even full of malonate! We knew not from where. She wanted a cortisone shot for both hip and shoulder. But hot packing and water swishing her mouth was the right answer. She agreed. The next day she walked in, no wheelchair or assistance! It was time for a blood test and ultrasound. Just for good measure, we persuaded her to include a lung x-ray.

March 4 was a red-letter day. There on her chest x-ray was a tumor as large as a fist (not shown), not far from the location of her constant pain. This explained the dropping RBC. The tumor was no doubt bleeding in a minute fashion. The platelet count was rising to accommodate this bleed.

The BUN had returned to normal. To our surprise the AST liver enzyme took another steep drop and the LDH also fell. Now the albumin was worrisome, though, because it was only 3.0. We thought it could reflect copper toxicity again, since the iron had stayed very low.

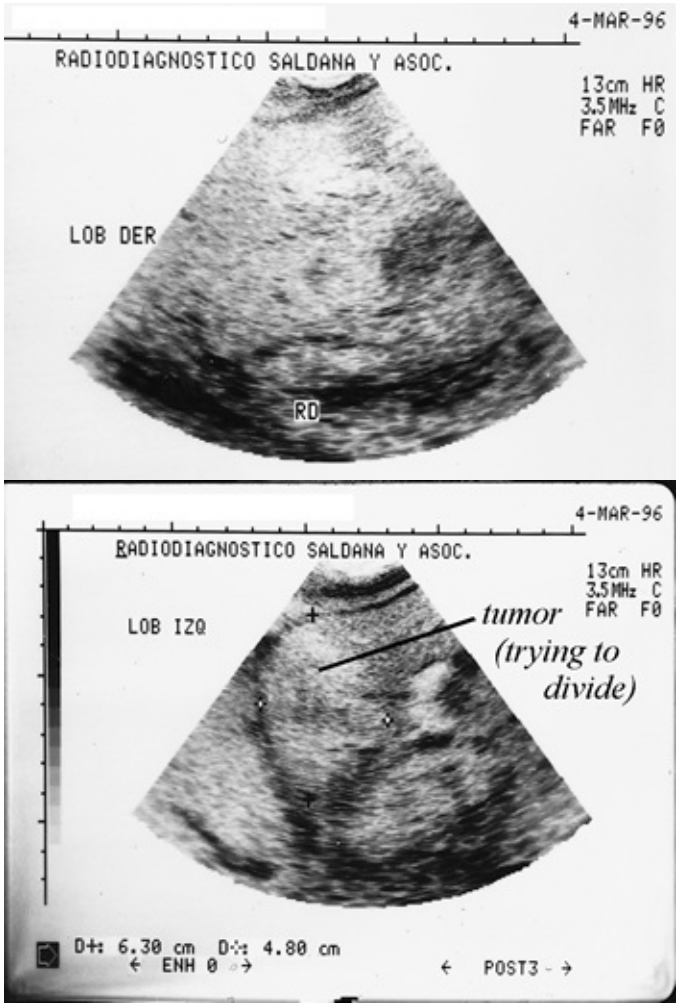
How long had she had this large lung tumor? The beginning of her shoulder pain probably was the beginning of its shrinking and pulling away from the pleura. Then why did the liver cleanse give pain relief? The pain was probably made of two pains; the gallstone and the lung tumor.

We dug into the new tumor problem with determination and panic. Her RBC was sinking. She was hemorrhaging! Unless we could stop this, all would be lost. I brought up the subject of transfusion, so it would not be so scary later. Besides, her son had been spelled by her daughter who had been too busy to read the literature that explained our treatments. She was impatient for her mother to come home. No amount of transfusion can keep up with a hemorrhage. [*We had not yet learned the usefulness of the Chinese herb, Yunnan Paiyao. We only*

knew about the anti-hemorrhaging action of cayenne pepper which we had already used extensively.]

Besides cayenne capsules, we started her on lung tea. It had two ingredients, comfrey and mullein. She cooked them herself and was to drink 2 cups a day. She was to eat a small clove of garlic daily, raw, with a bit of bread, also for lung improvement.

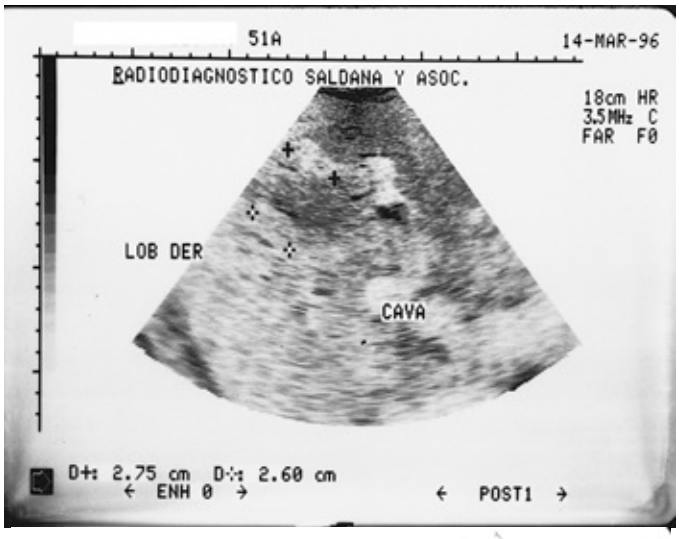
Her liver tumors now took second priority. The right lobe showed much better texture, the former tumor outlines weakly discernible. The left tumor, 6.3 x 4.8 cm was still trying to divide across the middle.

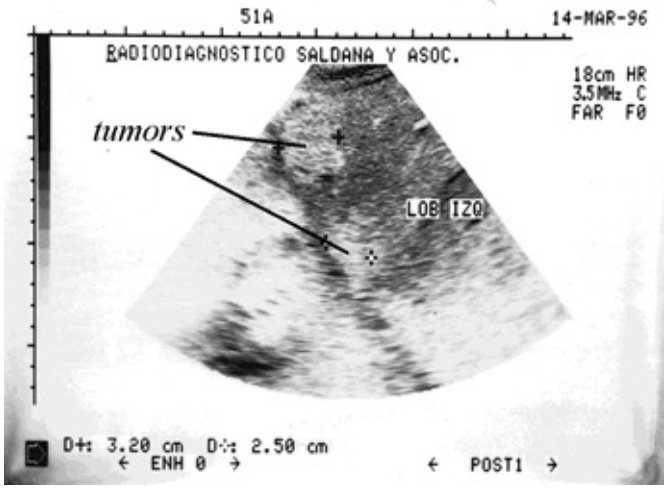


Mar 4 ultrasounds show more improvement

In four days, she was feeling better. Her shoulder pain was gone, simply gone. The lung tumor must have pulled free-and without hemorrhaging! Extraordinary good fortune! A fresh x-ray showed the lung tumor smaller and with barely discernible borders.

By March 14, she was walking quite well by herself. She could speak of nothing but going home. We begged, in vain, for her son to return for her last few weeks. He understood the vagaries of her situation. She was finally on more solid ground with her recovery. It was premature to stop overseeing developments in her path to health. We ordered a last blood test, ultrasound of liver, and x-ray of lung. The lung tumor was gone... completely gone.





The left liver tumor had pulled apart, leaving two small pieces, one 3.2 cm in diameter, the other about 2.5 cm. The right liver tumors were reduced to a few fragments also. The texture was good. But the blood test still had its warning signs. The RBC at 3.18 was lower than ever. An RBC of 3.0 is the cut off point, where we give a transfusion. Was she still bleeding? Platelet count was 431, suggesting she was.

The liver function tests were greatly improved. The liver could make albumin again, raising it to 3.7. The calcium was normal, but the iron level was lower than ever; had her copper water pipes been changed at home? Perhaps being home would get her away from the chronic copper burden she was picking up here. Maybe leaving prematurely would not be all bad.

She was instructed to do a blood test every week until the RBC was on its way up. Otherwise, to get a transfusion without delay. She promised to send follow-up ultrasounds and blood tests. Then they grabbed their x-rays and dashed to the airport. And we chalked up another successful failure. Success in clearing up the cancer and shrinking the tumors. Failure to completely restore her health.

Summary: A glance at first and last blood tests shows her remarkable improvement. But if it is obtained by means of IVs that merely "catch up" with a toxicity problem, temporarily, it is not a good solution. Better ways had to be found, so we searched on.

17 Nikki Ashby Lung/Liver/Bone/Lymphatic Cancer

Nikki Ashby, a thin and wiry woman, always active, came with a dedicated friend to take care of her. It all started five years earlier. She had undergone four surgeries to remove tumor (melanoma) from her eye, but then it had gone to the lung, liver, bone, lymph nodes. There were two marble size tumors at her neck and another small one coming up on her neck on the other side. An ultrasound of the liver (not shown) showed two lesions. We planned to use these little neck tumors as monitors of her progress, but all that would soon change.

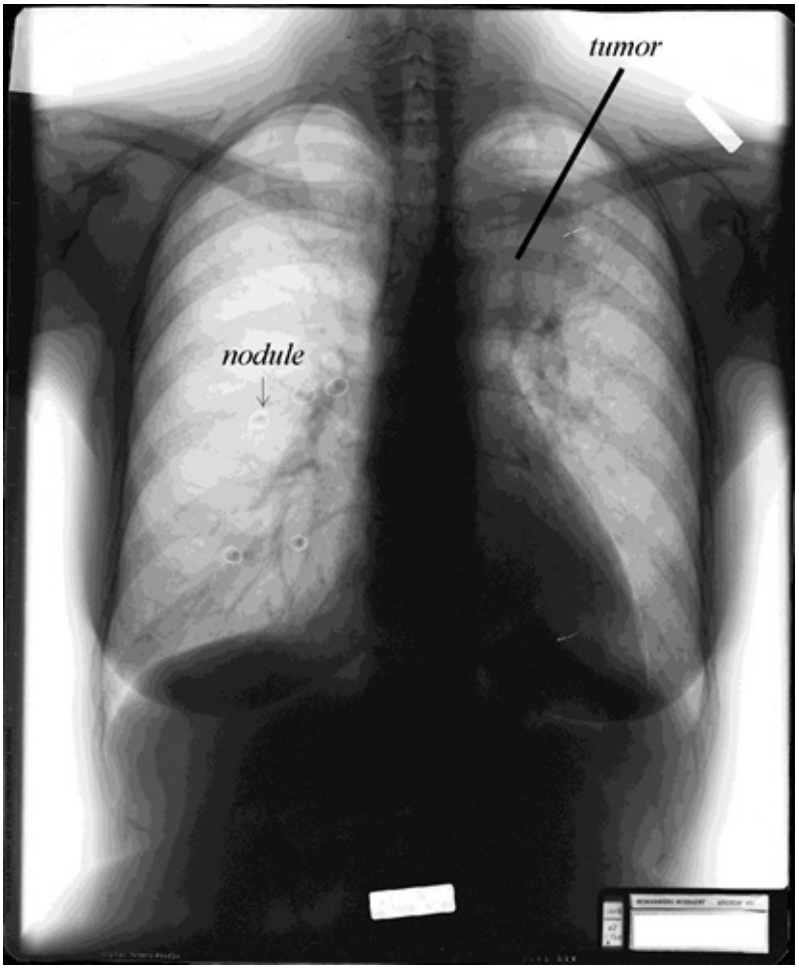
She was fairly clear of toxins at her initial test, only Freon, asbestos, arsenic and mercury showing up at the "whole body" test. The copper test was negative, but it showed up at her liver and retina (eye). She was positive for aflatoxin and

malonic acid. Also shigella and *staphylococcus aureus* bacteria, besides the usual isopropyl alcohol.

Her last surgery was a month ago, the fourth one, and she worried about losing her vision if it grew back again. We reassured her that could be prevented. We focused on the retina, although her major complaint was severe low back pain.

A glance at her blood test shows she also had cobalt or vanadium toxicity, since her RBC was too high.

She was obviously coping with too many bacteria (WBC 10,700). But the LDH and alk phos were only moderately elevated, so there was not a lot of tumor activity.



Nov chest x-ray shows 1 large tumor, 5 malignant nodules

She had three vicious air toxins at home: Freon, asbestos and arsenic and the season was winter time when air toxins are especially high and people mostly indoors. It was good for her to come to Mexico where there is no heating or air conditioning. [*At that time we did not yet know that malonic acid came from food nor that malonate plus cobalt and vanadium could come from plastic dental fillings.*] We encouraged her to start on dental replacement with plastic.

Her IVs were begun at once, three a day, including EDTA, glycyrrhizin (for the liver lesions), vitamin C and magnesium. Soon she was switched off EDTA, after copper tested negative at the retina and liver. Then she was given two glycyrrhizin doses, vitamin C, magnesium, cesium and DMSO. We also gave her silymarin tablets (concentrate of milk thistle).

Her intense low back pain was nearly gone in the first few days. She did everything: Q10 three gm, parasite program, Lugol's, bowel program, Freon program and the dental replacement. We were mystified that malonic acid would not disappear; it was always present at the lung. She promised to bring her previous chest x-ray of November.

The second blood test (Jan. 17) shows severe inhibition of urea formation, no relief for the LDH, a considerable worsening of alk phos [*the damaging effect of DAB in colored plastic*], and more bacteria (WBC) probably from dental work.

But improvement occurred in other areas, where glucose was up and calcium was down. Yet the iron had dropped, a sure sign of copper toxicity. We searched immediately; it was present in the liver. She needed to move to a new motel where the water pipes were all plastic, which she promised to do.

The smallish lumps at her neck were now about half-size; the one at her ear was entirely gone. Her low back pain was 50% better. Her muscle spasms all over were gone. Her breathing, which had been labored was much improved. She felt she was "out of the woods." Her caregiver needed a rest. She planned to go home for one week against all advice. But this drew out to three weeks and she was much the worse for it. Her home had not been adequately cleaned. When she returned, February 14, she was once again full of toxins: isopropyl alcohol, wood alcohol, benzene, copper, aflatoxin, patulin.

She had brought her previous November chest x-ray; a large tumor was visible! We took our focus off the retina and liver and put it squarely on the

lungs.

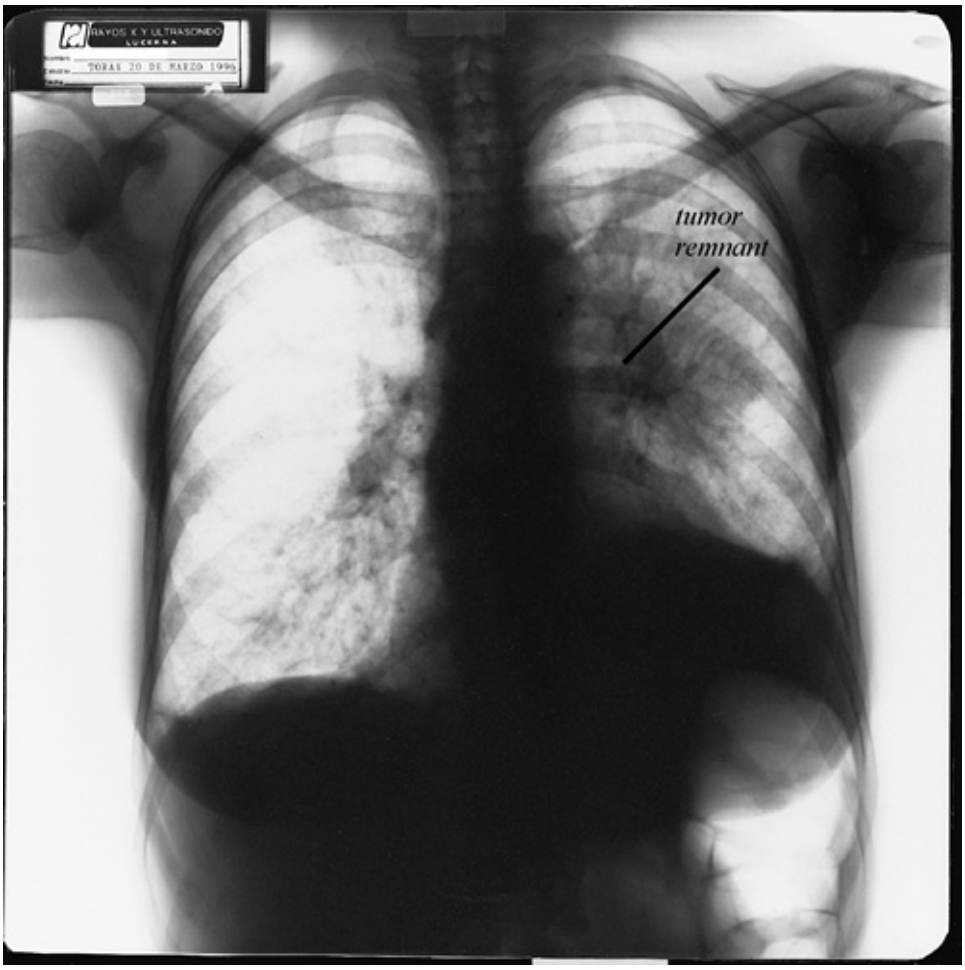
While at home her LDH and alk phos had gone up steeply, causing the worsening lung problem. It was probably due to the malonic acid derivatives and a slate of carcinogens including dyes placed in her mouth before leaving.

The calcium level was again too high now. But the most startling was the steep drop in iron; she had been using coppered water at home. So it was back to EDTA IVs to pull out copper, then cesium, laetrile, DMSO to shrink the lung tumor, plus vitamin C, calcium, and magnesium. She bounced back with energy and an appetite. Then we added glutathione 250 mg three a day, vitamin A 25000 units, and carrot juice daily for beta carotene [*not suspecting carrots contain malonic acid*].

By February 27, two weeks later, the LDH was coming back down in spite of persistent malonic acid, maleic acid, and maleic anhydride at her lungs. Their sources were a mystery. But alk phos was at a new high. (Note: the blood sample of Feb. 27 was left standing too long before being tested. When this happens, the red cells that have broken during standing have let out their potassium. The potassium level is then too high. Such "hemolyzed blood" often shows a falsely low glucose, too! Such data must, of course, be discounted.)

Suddenly she was very much better. She decided to go home for one week again. The staff agonized over the prospect of another return under emergency circumstances.

But Nikki surprised us this time. She returned three weeks later with this news: Her follow up visit with the ophthalmologist at home who had done her eye surgery had said there was no sign of regrowth. Her cough was gone. Her neck nodules were about the same. We ordered a chest x-ray and scan of liver. She had chills and fever, some shortness of breath, and was full of pains. But all in all, her three-week recess seemed to do her good. Still, when she returned on March 19, her LDH had risen further, though the alk phos (lung condition) had dropped a lot.



Mar 20 chest x-ray shows large tumor breakup

Now calcium had dropped much too low and iron was critically low. She was full of copper again, as well as isopropyl alcohol (drinking bottled water on the airplane). We quickly gave her "iron booster" (a chlorophyll beverage), an iron shot, vitamin B12, and folic acid, 0.4 mg. [*This small dose was used before our discovery of the great folic acid deficiency in all cancer patients.*]

The reward, though, and highlight of her return was her new chest x-ray. The large tumor was broken up. No margins could be seen. It was dispersing. And the enlarged lymph nodes in the right lung were no longer noted by the radiologist. But water accumulation had continued, as it must in the presence of maleic anhydride.

The rest of her story is typical of a cancer patient anywhere in the world today. Pain and painkillers, nausea and anti nausea medicine.

In spite of tumor dissolution, her health did not improve. I was beginning to see that we typically do not die from the malignancy or tumors themselves! We die from the toxicity that caused the tumor growth. Doing away with the tumors, either surgically or by alternative methods, does not do away with the toxicity that generated them.

Notice how her BUN remained very low till June 12, the date of her last blood test. This would keep her toxic with ammonia. Gradually, her liver function worsened, as AST, ALT, GGT values rose. Her body's metabolism could not make energy. [*As soon as pyruvate was made, it was diverted by the hugely increased LDH. The dye causing all this had come out of the tumor but was not being detoxified or eliminated.*] Eventually her LDH was 1293. Alkaline phosphatase, another enzyme rose to 1538. Calcium fluctuated from too high to too low, as the thyroid and parathyroid took turns coping with the burden. The burden of copper, cobalt, vanadium, [*and dyes*] always varying as we chelated them, detoxified them, removed more sources [*but never ever guessed they were put in her mouth willfully, invisibly, in dental plastic and pink dentures; iron fluctuated similarly from the newly implanted copper*].

On March 28 the liver was scanned and no trace of the two tumors was found. Our hopes for her fluctuated with her condition. When she got better, she would go home and come back in worse shape. It took till June 9 before Nikki's family began changing the plumbing at her home. Each time she loaded up with copper and dropped her serum iron.

On May 15 another chest x-ray was done (the quality was poor, so it is not shown). But the large tumor she originally had was gone. To verify this marvelous result, a CT scan was ordered. But she had stopped coughing blood and had enough breathe to walk around at a "swap meet" so it was not a priority to her.

By June 1, she slept through the night and was hungry. Her vomiting had stopped and intestinal pain, as well as other pains was gone. She wore a brace for back support and was on B_{12}, glutathione, vitamin C, folic acid, taurine, and sodium alginate mixed with moose elm herb daily.

Summary: ultimately she spent a fortune on her treatment with us, probably $8000.00. Her retina tumor was gone, her neck nodule was gone, her lung tumor was gone, but a glance at her blood test on June 13 shows that her health was

worse.

She left for the last time June 12. We feared the worst and dared not inquire. The lesson she taught us was priceless: We can stop the malignancy, dissolve the tumors, but this cannot save a cancer patient from the ongoing toxicity from copper, cobalt, vanadium, malonates, and dyes. We are deeply indebted and grateful. Nikki always kept a smile, even in pain. She led us to discover malonic acid in foods after battling it for such a long time.

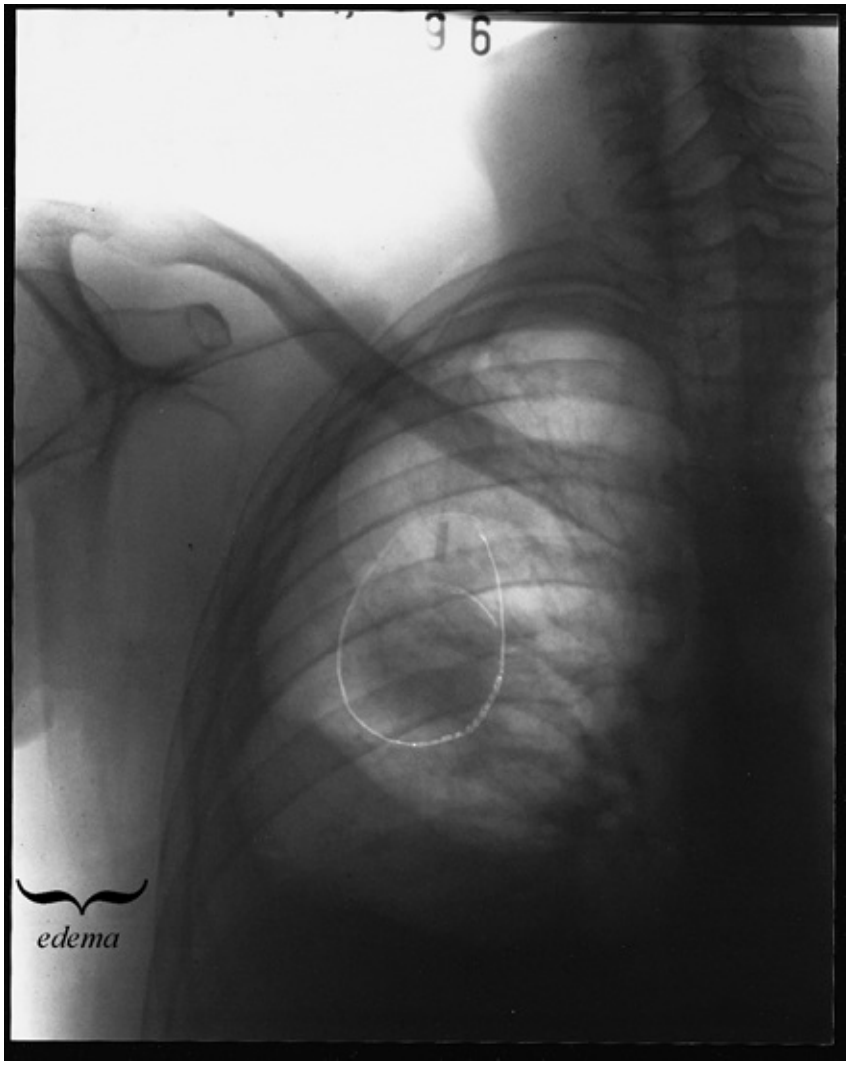
18 Martha Berland Breast Cancer

Martha Berland was still a stunning beauty in her new crop of bristle short hair; some white, some black, some gray. Her husband brought her from Israel on this "last chance" venture. She was on morphine, already a sure sign that doctors had abandoned hope. And so had she. She believed she was dying. And whenever he raised hope or spoke optimistically, she fought back.

Yet her blood test results, as is plain to see, were quite good-her body was still functioning well and she had every chance to recover.

Her breast cancer started two and a half years earlier. She had been on chemotherapy for two and a half years! And survived its toxicity. She had been on tamoxifen, steroids, and radiation-the works! Now the cancer had spread all over her body in lumps under the skin like small mole hills everywhere. She had just had a chest x-ray done (Feb. 13) before leaving home seven days ago; it showed a large tumor in the lung. And "water" had accumulated in the lung; the water level was clearly visible (all the dark area below the tumor). She had pain in the chest, arm, and back and generalized weakness. She was wearing a "portacatheter" (indwelling catheter), parts of which can be seen on the x-ray, to make it easy to inject things. It is just a tube that leads to a vein. But, it must be cleaned regularly and doused with heparin to prevent blood clots from forming around it.

Only her husband spoke English. We began the task of explaining the program to him, who explained it to her. Most important was getting off morphine, substituting some other painkiller. We tried to explain that it was "morgue-medicine," intended only for the dying and would greatly inhibit her progress. It slowed bowel action, making laxatives necessary and for some unexplained reason, prevented weight gain. She resisted him.



Feb 13 chest x-ray shows large tumor (circled)

Her initial toxins included fiberglass, arsenic, and chlorine, all of which would be inhaled and "feed" the tumor in the lung. She also had mercury, thallium, and aluminum from dentalware and cosmetics, no doubt. She had patulin and aflatoxin, as well as *Salmonella* and *Staphylococcus aureus*. She still had benzene, xylene, and isopropyl alcohol solvents. But not much malonic acid. Her dentalware was mostly gold-the very "best" gold-some amalgam and some plastic.

Our electronic metabolite test, done with the lung in the circuit showed maleic anhydride Positive at lung (cause of "water" accumulation); t-retinol (a vitamin A member) Positive at lung (good); t-retinoic acid (also a vitamin A member) Negative (meaning insufficient vitamin A); vitamin C Positive at lung (good); tumor necrosis factor (TNF) Negative at lung (bad); NADP and NADPH

Negative (insufficient NAD enzymes) at lung; rhodizonic acid Negative (lack of oxidizer activity) at lung; benzoquinone Negative (lack of oxidizer activity) at lung; glutathione, reduced, Negative at lung (bad).

Metabolism in the lung was quite poor. She was given benzoquinone by IM (1 ug) a single shot, and rhodizonic acid, 15 mg four times a day, besides the usual starting program. Her blood test showed there was only a small rate of tumor activity-that is, production of lactic acid (LDH) and alkaline phosphatase, probably due to intensive "tumor killing" clinical treatments at home. Rather, she was dying from toxicities which we must determine and remove.

She was extremely fatigued, due no doubt to lack of oxygen and to ammonia toxicity. Lack of oxygen due to fluid in the lungs. Ammonia toxicity due to not being able to convert it to urea; the BUN was very low.

But, clearly, her chief toxin was copper [*and germanium*]; iron levels were down to 22. And at no time during her stay did we manage to discover the source and remove it. The toxic effects of cobalt and vanadium were noticeable in the elevated globulin and RBC.

All these metals could be part of the gold composition as well as in the amalgam and plastic. She did not want to part with the gold in her mouth. Yet the gold would contain nickel, too, commonly used to harden the gold. Nickel is especially toxic to the lung and is often seen there. We started her on IV therapy, with 3 vials of EDTA, 100 gm vitamin C, magnesium and DMSO.

In two days her energy was up; she was feeling very much better. Yet, in spite of giving her 250 mg glutathione four times a day, we could not detect any reduced glutathione in her lungs. Electronic tests only showed the oxidized useless variety. Selenium, (elemental, toxic!) was in oxidized form, too. But maleic anhydride was already Negative.

With maleic anhydride absent, no more fluid would be accumulating in the lung. Would this be enough to improve lung capacity? Would the lung reabsorb the fluid already escaped? She had already been surgically drained four times before coming here.

In five days her mood had improved so much she agreed to do dental work-but amalgam replacement only. The good and bad effects of this would soon appear. But she was eating well and had appetite. She decided to go off

morphine. The pain in her shoulder and in the breast and skin everywhere intensified. She tried coffee enemas for pain relief, but didn't get much.

Two weeks later, on March 4, she was feeling a lot better, but still very fatigued and pain ridden. New tests showed vanadium Positive at lung; mercury Positive at lung; thallium Positive at lung. This showed there was leftover amalgam in her mouth. The source of the vanadium was not guessed. Copper was Negative at lung and liver. Evidently, our chelation-type IVs were keeping up with the steady stream of copper coming from her dentalware. TNF Positive at lung; NADPH, NADH Positive at lung; NADP, NAD Negative at lung. This means there is no oxidized NAD to enable respiration to continue. Notice how parts of metabolism can be over-oxidized while other parts are under-oxidized. The links are missing. Glutathione, reduced and oxidized Positive at lung; cytochrome C Negative at lung (one of the links in the respiration chain). Aflatoxin Negative.

Mar 5 chest x-ray is missing the tumor

Both glutathiones were now present (finally!). But cytochrome C, necessary to "catch" electrons in the respiratory chain is not high enough to appear positive. This would be an iron problem or a mutation. Iron was much too low.

This much progress invited a new chest x-ray, scheduled for March 5. She arrived, x-ray in hand. The tumor was missing! Simply gone. Could there be a mistake? No. The radiologist's report stated it clearly. He was quite certain. But the waterlogged condition (pleural effusion) had not shown much reabsorbtion-she still had difficulty breathing. Yet, there was too much joy in her husband's heart to allow any pessimism. She caught some of his enthusiasm.

Mar 15 x-ray shows reduced edema, too

The blood test of March 5 shows the effects of amalgam removal (gold was not removed) which probably removed quite a bit of copper and cobalt, too. The RBC is down to normal. But, although there was less copper, there was still some copper [*or germanium*], since iron stayed very low.

On March 9, she had a sudden pain crisis. She wanted her morphine back. She felt entitled to it, since her country gives it liberally. All our pain substitutes were not satisfactory. Her husband tried to cope. After all, she was doing so much better. He must have prevailed.

By March 13, she could go upstairs without help. She only used her oxygen tank for 1 hour a day and that was at my insistence. We searched the complete set of 80 toxic elements trying to find anything besides gold, nickel, and copper

to explain why her liver enzymes had been steadily getting worse and LDH had risen, not suspecting dyes or lanthanides.

The Syncrometer® found only cerium, europium, niobium, and thulium Positive. The first three were obviously dental alloy or dental plastic. Were they in the gold? Were they in the remaining bits of amalgam, now covered with plastic? Or in the plastic? The thulium came from her brand of vitamin C, which she stopped immediately. The blood test did not show improvement on March 13.

She could not yield the gold in her mouth, nor the plastic. Again, she wanted to go home desperately! She also wanted morphine. None of the doctors agreed to supply morphine. We scheduled the final blood test and chest x-ray.

The tumor was still gone! The water level had receded significantly. The overall reduced edema could be seen along the margin of skin along the x-ray's left side. There is much less distance between rib cage and outer skin than before. Much fluid had been reabsorbed. She was still weak, but coughed less.

Her last blood test, March 18, showed a dramatic drop in LDH, in fact tumor growth had stopped completely. It was not the right time to stop or interrupt the progress she was making. We prevailed upon her to extend her stay by one week at least. But to no avail.

We couldn't guess that she was back on morphine (procured from another hospital) and dreaded nothing more than running out of it. At home it would be plentiful. Her bowels couldn't move because of it, but she could take a laxative. Her appetite was gone because of it, but she could be fed by IV. She didn't aspire to a natural life, a secure life.

She was feeling very well the day before they left. But she was sailing on a magic carpet of morphine, IVs, and supplements. It couldn't last.

On May 9, they called from home by telephone. She was swelling, full of pain, getting worse every day, and bedridden. Clearly going down hill.

Summary: It was not her fault for being addicted. (The medical profession has had 100 years to develop painkillers that are not addictive). It was not his fault for yielding. He thought she had turned the corner and would survive. She didn't care. We respect them both. The tragedy is in the disease and the current

professional response to it. We must make every effort to improve this.

19 Holly Bessant Cancer of the Spine

Holly Bessant, fifty-five, was a tiny woman whose cancer (multiple myeloma) of the spine began in 1994. As small as her frame was, she could create a general panic for the entire staff. Just the sight of her colorful hat coming along the pathway stopped everybody's conversation. We knew she was coming for a crisis. And when that was past, it would be "living as usual" for her, till her next crisis.

Multiple myeloma is a cancerous condition of the bone marrow. This is where our RBC, WBC, and platelets are made. As the dyes, parasites, metal, and bacteria destroy the bone marrow, it is less and less able to keep up with the demand for blood cells. Holly had malonic acid at the bone marrow. [*At this time we did not know about the risk of getting malonic acid "placed" into your mouth in the form of non-metal restorations of decayed teeth.*]

Holly was on quinidine for her arrhythmia and an antibiotic, preventively, from her heart specialist in the US; in fact her heart was about twice normal size. She had severe lower back pain, too. But she displayed an impish smile as if aware she was panicking us.

From her first blood test we could see that her problem in the bone marrow was mainly due to vanadium (albumin low, globulin high) and malonic acid derivatives (low calcium), not so much copper and cobalt. Notice that the RBC is not elevated, though. The elevation phase is an early one. As the disease progresses, the bone marrow becomes totally incapable and all cell types drop, as we see here.

In fact, her water samples tested Negative to copper; yet she was Positive at her liver and parathyroids. Where was it coming from? We guessed her amalgam alloy. And she began the removal process.

When she arrived she was all done in. She was being seen at several other alternative clinics as well as her oncologist at home in California. She tried to do them all justice, no doubt. And perhaps it was even best, in the long run, somewhat like a rotation diet, thereby avoiding too much toxicity from any one food; in her case, health programs.

We took one look at her calcium level (7.9) and started her on an IV of 3 gm calcium, magnesium, B complex, and DMSO to be given twice daily. We also gave her coenzyme Q10, 3 gm to be taken every third day for 6 doses and ½ gm daily in between to assist her heart. Also, Lugol's for her *Salmonella* and the Bowel Program for *Shigella*.

Testing at her bone marrow showed TNF Negative; glutathione, reduced Negative; glutathione, oxidized (useless) Positive (high levels); glutathione reductase (enzyme that makes reduced glutathione) Negative; patulin Positive. We supplemented her with glutathione.

We found vanadium and Freon in her kitchen dust (refrigerator). *Shigella* came from eating unsterilized cheese. She was to be off fruits entirely until her patulin was gone. The IVs must have given her an immediate lift. She disappeared without a word. We also guessed the IV therapy was too expensive for her, but we did anxiously await some kind of communication. She had been, after all, rather close to needing a transfusion, (RBC 3.23) which we give when

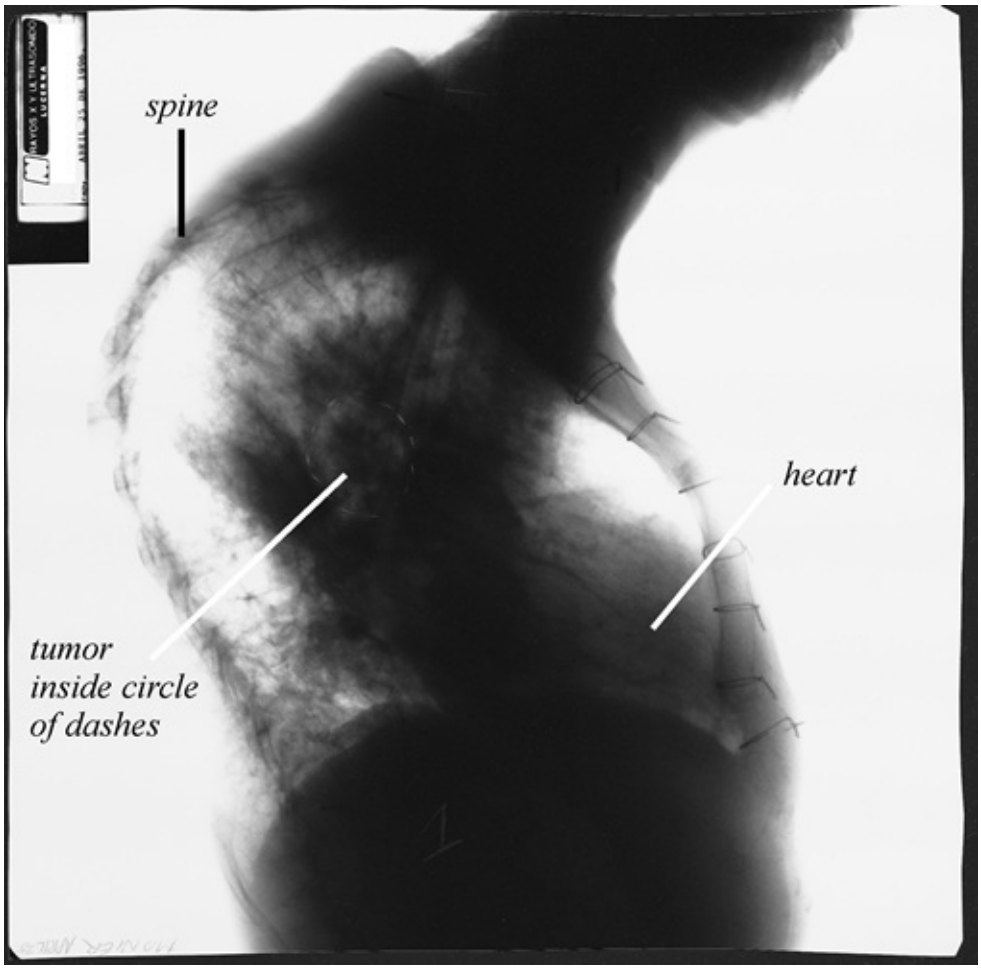
the RBC can't even be kept up to 3.0.

Six weeks later she reappeared. This time, April 24, we put her right in our emergency room. She was very ill, wracked with pain and gasping for breathe . We ordered a chest x-ray, did a blood test, put her on oxygen, and started IVs going. They contained 3 gm calcium, procaine, magnesium, cesium, vitamin B-complex, DMSO, and vitamin C. The calcium was based on her last blood test, much too low. Procaine was for pain relief, magnesium to help the heart, B-complex to help metabolism, DMSO to help the B vitamins penetrate the cells. While taking her IVs she was given Q10, 3 grams, glutathione, and a 2 tsp. dose of black walnut tincture extra strength. We thought this could be her last leg on life's journey.

Copper was now present in her liver and parathyroids, but we could not use EDTA to get it out quickly-it would interfere with the calcium being given. There was malonate at the bone marrow. We had just found that malonic acid could come from foods; we quickly warned her about orange juice, her favorite beverage.

Surprisingly, she walked in quite ably the next day, her x-ray in hand, declining any IV, probably for financial reasons. The x-ray showed a distinct tumor in the lung, side view. There was very little air capacity due to the enlarged heart and "water" effusate taking up lung space. Yet, she was rallying. Especially at the bone marrow on April 24; the WBC (3,800) and platelet count (185) were up significantly.

Best of all, her LDH was down, way down (205), meaning there was less tumor activity in the bone marrow and now, the lung. In fact, the lung must be healing already, since alk phos had not come up at all.



Apr 25 profile x-ray with tumor outlined

But the iron level was shocking. Was this why her RBC failed to come up? Lack of iron? But she had quite enough earlier. Perhaps her bone marrow was using the iron to make more cells, but the quinidine drug was simply killing them. We quickly gave her an iron shot to be repeated weekly and a liquid supplement, "iron booster," 1 tbs. daily (chlorophyll).

The plan was to repeat the test in four days, since she did not want a transfusion, and yet was poised right at the transfusion level. Perhaps if we switched her from quinidine to a different heart medication, it would save the RBCs and let them come up. She had not seen her specialist.

Five days later, her breathing was much better, she was not fatigued or wracked with pain. In fact, she was walking daily on the beach. She was an enigma to us. We repeated the blood test; it was April 29.

There was no significant change anywhere to be seen. She stayed an extra day to make progress with her dental work. We persuaded Holly to take another IV, containing calcium, magnesium, procaine (for persistent pain between shoulder blades near her lung tumor), B complex, cesium, and vitamin C.

She was also started on niacin 100 mg, three times a day and vitamin E, 400 units one a day (to reduce fragility of RBCs). She was on the kidney herb recipe and Q10, all intended to help the heart.

In a few days, she was breathing better still; she was no longer on painkillers, although she hadn't really started on the niacin or vitamin E. Her lower back pain was gone.

And she vanished.

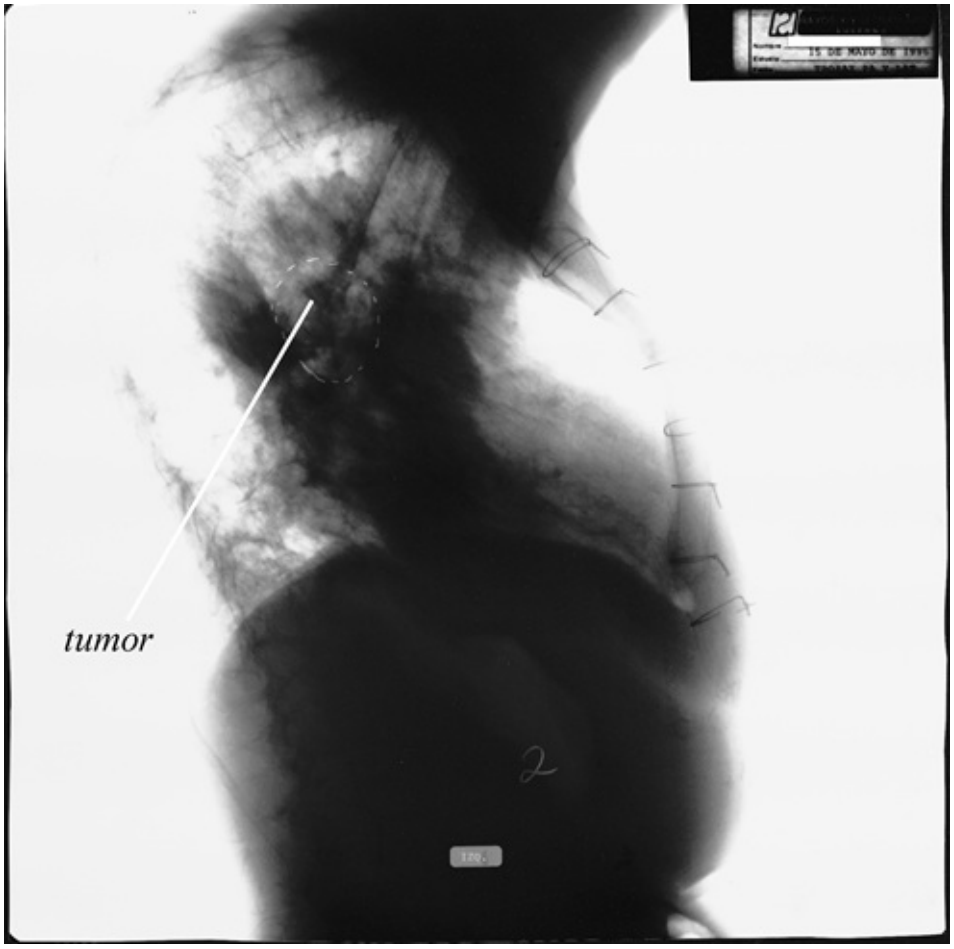
A week later, she appeared, breathing almost normally. Her pain was much less. Had the tumor finished its antics finally? She had enough energy to take the Syncrometer® class. She was here to continue dental work; she declined any treatment. We scheduled a chest x-ray.

Although expecting a small degree of improvement, we were very surprised to see the shrunk tumor (reduced to three small shreds). There was much less edema of the lung. Air capacity was much better; this can only be seen on a front view, not shown.

The former location of the tumor was circled by the radiologist, but there was no clump of dense tissue there now. Only some fluffy fragments. This was probably what had given her so much pain between the shoulder blades and right through the chest. Now it was over. She wanted to leave for home immediately. But I wanted to see her last blood test before okaying her departure.

To our great surprise, a new abnormality was present-a very significant one. Her total protein was suddenly very elevated (11.9), characteristic of her multiple myeloma.

What was the cause? Could it be an error? Not likely, since albumin and globulin are measured independently and then added. [*With hindsight, it was probably due to placing vanadium and/or dye polluted dental plastic in her mouth. The very things she had so carefully removed from her environment when she first came. And, of course, the drained tumor.*]



May 15 tumor broken up

Such a blood test result can be expected to take a lethal course. We persuaded her to stay over the weekend and repeat the test on Monday. The results were even worse (T.p. 12.4). She was coughing a lot-a tell tale sign of heart failure. She was switched to digoxin and off quinidine. She was also given hawthorn berry, taurine, cysteine, and vitamin C by mouth. She refused IVs. We started her on spironolactone, though, for extra diuretic action.

By May 27, the globulin level had dropped. Was it due to our supplements, or switching off quinidine, or neither? Strangely, the phosphorus level was now much too high; this must surely be a lab error. The LDH had climbed, too. Did this represent new tumor activity or new heart stress? Perhaps the quinidine was actually a better choice for her; the RBC was beginning to recover, though, as if responding to the removal of quinidine. Still she refused to go back to her heart specialist.

There was one clue; a rather strong clue. One tooth had been giving her a lot

of trouble. It could be spewing forth staphylococcus bacteria; bacteria that would go right to her heart. We switched her antibiotic to a broader-range one and added carnitine and Echinacea to her supplement list. Then sent her back to the dentist for extraction, not repair.

In a week, June 4, there was no vestige of illness left! She sat in the office chair like a well person. The blood test bears this out. In fact, she wanted to go off all medication and "just try it out." No, no, we cried in horror. She left for home, promising to be back in three weeks.

We will never know what happened in these three weeks. But she kept her promise and was back July 1. She related that she had gone into heart failure, while at home, but had gotten out of it spontaneously, while in the hospital. Surely, she had used up her extra leases on life! But she seemed in good health. We found methyl malonate in her lungs, but the *Staphylococcus* was gone (the extracted tooth). She declined IV treatment and left for home. Before she left, she did one more chest x-ray (not shown). The tumor was completely dissolved now; the heart was unchanged.

Summary: The cancer story was a success, although the remainder will never be known. We shall remember seeing her colorful hat approaching and her impish smile.

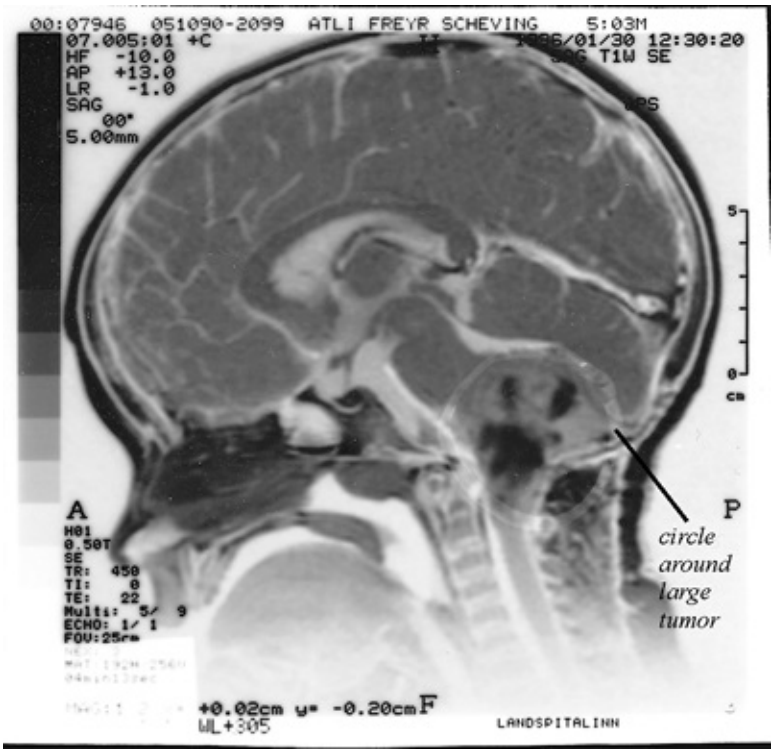
20 Felipe Gustafson Brain Cancer

Felipe Gustafson, age seven, was droopy and glum. He didn't play; he preferred to sit. A letter from his doctor revealed that Felipe was diagnosed with astrocytoma of the brain stem at 1½ months of age. He came from Iceland.

Surgery at that time removed it; it was graded I to II. It had re-grown and required another craniotomy at age three. Now it had re-grown again. They brought two MRIs, the latest one was dated January 30, about a month ago.



Jan 30 initial MRI showing 5 cm brain tumor

The scan of Felipe's brain showed a 5 cm tumor at the brain stem. (The scale at the right of picture represents 5 cm. By holding this scale over the tumor its size can be seen.) The tumor has been circled by the radiologist.

When he arrived, he tested Positive for xylene, as well as isopropyl alcohol. Xylene is a common pollutant solvent that is attracted to the brain. Xylene is always found in brain tumor cases. We did not learn how he was getting xylene. We cautioned that Felipe be off all store bought beverage powders and ready

made beverages regardless of whether they came from health food stores, and this included all purchased water. Of course, his home water came through copper pipes and was promoting tumor growth, too. His family at home was instructed to change water pipes to plastic during his stay with us. No shortcuts were to be taken. No distillers or filter was to be installed. Water was not to be transported for drinking purposes. The water used to wash hands, shower and do laundry must not be coppered either. PVC endures temperature extremes very well.

He tested positive for copper and vanadium at high levels. Evidently, there was chronic gas leakage from their utilities, spewing out vanadium; they were advised to switch to electric utilities in spite of the cost. He would not soon outgrow this "sensitivity."

He also had patulin and aflatoxin in the cerebrum (brain) as well as salmonella bacteria. This implies a growth of fungus as well as bacteria at the tumor site.

Malonic acid, too, was built up at the cerebrum, implying a tapeworm stage. [*We did not know about the food source at that time*.]

On his first day he was instructed to: (1) go off all items listed on the isopropyl alcohol list in *The Cure For All Cancers*. (2) Take a 2 tsp. dose of black walnut tincture extra strength and 3 capsules of the other herbs, then (3) zap daily. Repeat herbal program once a week. He was to be re-tested for ortho-phospho-tyrosine later that day to verify its absence. (4) Take Lugol's three times a day, 6 drops in water. (5) Go off all fruit for 2 weeks to eliminate patulin fungus growth in brain. (6) Eat only white bakery bread to eliminate aflatoxin; no peanut butter. (7) Take coenzyme Q10, 2 gm to kill tapeworm stages in brain.

Testing showed that glutathione was Negative at his cerebrum. The oxidized form was Positive. So there was no shortage of this major factor. There was simply a shift to the oxidized, useless form. Indeed, the enzyme glutathione reductase, whose job it is to change the oxidized form of the glutathione back to the reduced form, was absent. Absent because it was being inhibited, or not being formed? FAD, representing the flavin enzymes, also essential for metabolism, was missing, too. So vitamin B_2 (riboflavin) was supplemented, 100 mg daily.

At the end of his first office visit, I decided to give Felipe a chance to improve without using IV therapy-but only ten days; if he was not visibly improved, we would begin. His mother agreed. We did no blood tests, either, to spare his over-punctured, over-prodded body this extra trauma. Electronic testing seemed enjoyable to him.

The very next day, aflatoxin and patulin were already Negative at the cerebrum. The big dose of black walnut tincture extra strength kills any fungus that is growing in the intestine, destroying the source from which the brain could be re-seeded. Hopefully, he would not eat it again. But malonic acid was still Positive; tapeworm stages had survived, seemingly.

Another dose of Q10, 2 gm, was given. Also glutathione, 125 mg, three times a day and vitamin C to make up for malonate damage in the brain.

On the second day, March 6, malonate, as well as aflatoxin and patulin were Negative at the cerebrum. *Salmonella* and *Shigella* were now absent, too.

Nevertheless, the 2 gm Q10 dose was to be continued daily for 6 more doses.

Tumor necrosis factor, TNF, was now Positive, meaning his body had regained some of its ability to destroy tumors.

Copper was absent; they were housed in a copper-free motel.

Felipe was started on methylene blue, 65 mg, one a day, to assist brain metabolism by shuttling electrons and hydrogen atoms to and from the NADs.

By March 7, Felipe was a changed boy. He smiled. The staff and other patients all smiled back at him. He was sleeping better, eating better and, without help or coaxing, playing. It is a marvelous sight to see a sick child begin to play.

Solvents, malonic acid, copper, and patulin were all Negative at the brain. TNF continued Positive.

On March 8, he continued sleeping and eating well; he was playing, smiling, and running; not sitting much.

On March 11, re-testing showed he was Negative to all previous toxins.

On March 12, he was acting like a normal child, very energetic with loud screams and laughter amidst running and jumping off the garden wall (against the rules). Both oxidized and reduced forms of NAD and glutathione were present at the cerebrum. Malonate and copper were Negative, TNF Positive. His daily series of Q10 could end.

We reduced Lugol's to once a day and glutathione to twice a day. We reconsidered the need for IV therapy with his mother and agreed to keep off it.

On March 13 and 14, all electronic tests came back as they should.

On March 15, behavior assessment with his mother revealed he was holding his head straighter most of the time. His behavior had no hint of abnormality. All test results were appropriate. They went to visit friends (or was it the San Diego Zoo?) for two days.

On March 18, isopropyl alcohol was Negative. This is the toxin most people acquire on a visit away from the Diagnostic Center. His family had taken good

care of him. Malonate was Negative, too. We reduced his glutathione to one a day.

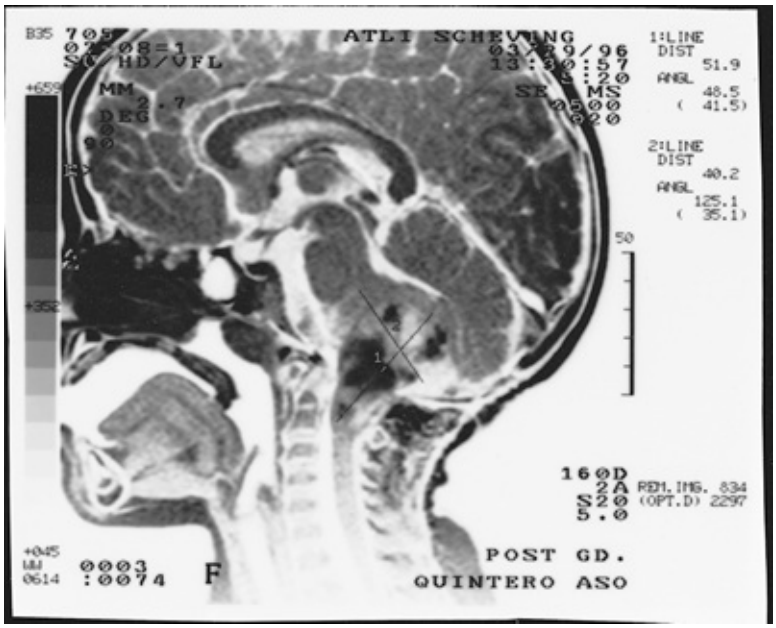
On March 20, patulin was Positive at the thyroid, though not at the cerebrum. And copper was present at the brain. This was probably acquired on the recent visit to a copper-plumbed home. We would watch it, before resorting to a chelating IV.

On March 21, patulin was still there but copper was now in the cerebellum, not the cerebrum. Other toxins were absent.

On March 22, copper was still present at the cerebellum. He was still very susceptible to it, attracting it to the brain instead of excreting it. Would the plumbing job be complete before going home? He was allowed to have watermelon and banana as his first fruit now.

During the next week, there was no recurrence of malonic acid or copper. Was he now able to metabolize malonate and excrete copper?

They were given parting instructions for home and scheduled for a final scan. He would take a series of Q10, 2 gm doses for 7 days in a row every 6 weeks. On other days he would stay on glutathione, 250 mg, one a day for one half year. He could go off methylene blue, but stay on vitamin B2, 100 mg a day.



Mar 29 going home, tumor reduced to 4 cm

The new scan shows a significant reduction in tumor size from 5 cm to less than 4. (See scale at right for 50 mm.) Good work, Felipe! Good work Felipe's Mom! Now the responsibility passes to his family at home. Did they prepare a safe environment at home?

A telephone call, months later, related that Felipe was entirely well, had not regressed in any way. It sounds hopeful.

Summary: we can't help wondering what made this case so easy. Was it the absence of any metal or unsafe plastic in his teeth? Was it the perfect compliance? Was it luck, so he escaped polluted supplements? Was it absence of IV therapy? Or something else? Till we learn these secrets...good luck, Felipe.

[*Since then his family received the malonate-free food list. They were eager to follow it. We hope to get a follow up scan eventually.*

A telephone call two years later related he was a happily growing child.]

21 Donna Balders Breast & Lymphatic Cancer

Donna Balders, fifty-eight, came with her right arm wrapped in elastic bandage from the hand to the shoulder. This left the fingers bulging and stiff. Fifteen years earlier she had cancer in her left breast, which was surgically removed. But eleven years after that, the right breast developed a small tumor which she did not have removed until two years later when it was 4 cm across. But recently another tumor had grown, plus an enlarged lymph node in her armpit the size of an egg. It was easy to see, bulging out. This was probably the cause of pressure on her lymphatic vessels, so they couldn't drain the arm fluids well enough-thereby causing the swollen arm. The swelling had recently reached her hand. She also had a prominent goiter, a swelling of the thyroid gland. She was always cheerful, pointing out the smallest improvements.

Her initial toxin test showed: wood alcohol, benzene, copper, cadmium, aluminum, asbestos, mercury, thallium, aflatoxin, malonic acid, *Shigella sonnei*, *Salmonella enteriditis*, all Positive. CFC's and patulin were Negative at breast,

Positive at parathyroid. And isopropyl alcohol was Positive, in spite of going on the cancer program over a year ago. (Cosmetics or a favorite vitamin supplement is many a patient's downfall [*and now we have seen that Clostridium bacteria themselves make it*].)

Her arm was getting to a critical size and the fluid could get infected; we doubled our efforts to get quick results. The breast felt hard all around it, as if there were a submerged shelf.

The first day she was started on coenzyme Q10, 4 grams per day for 7 days in a row. (This dose gave very good results with everyone; only the expense caused us to reduce its use later on.) She was to be off all dairy foods to prevent picking up harmful bacteria, off grocery store bread and nuts and off most fruit to avoid getting mycotoxins. She was to go off the benzene and isopropyl alcohol lists immediately, do the parasite program regularly and zap daily. She was to start on Lugol's iodine to kill *Salmonella* and the kidney herb recipe to drain water from her body (diuresis).

She had already changed her amalgams to composite; how could she still have mercury and thallium? It could be left in tiny amounts, tattoos; or remnants could be covered over with composite. She still had some gold in her mouth; she did not want to replace it quite yet. She was started on glutathione, and given a drug diuretic, spironolactone, one a day.

An ultrasound of the breast was done to show us the starting situation; there were 3 tumors. Even her IV therapy was started the first day. It included calcium, magnesium, vitamin B-complex, laetrile, DMSO, and vitamin C. Before these supplements, though, 3 doses of EDTA were given to pull the copper and other heavy metals out of her. Her IVs cost her $330.00 per day.

Her blood test results showed only the beginning of toxicity from copper, cobalt, vanadium, and malonic acid and only a small WBC elevation in response to bacterial infection. LDH (226) revealed tumor growth [*due to Sudan Black B*]. Albumin too high and globulin too low revealed cobalt in the liver.

In two days Donna could bend her swollen hand, so we knew the edema had lessened.

Glutathione and TNF were now Positive at the breast, as well as B_{12}. Cesium

was added to her IV.

Six days after arrival she could see the veins in her hands and there was no pitting edema. Both the armpit tumor and breast felt much softer.

She was using a magnetic mattress pad to reduce pain.

Meanwhile, she had seen how effective our biology-based methods were and decided to finish her dental work. She got her gold replaced by plastic in her mouth. Her next blood test , April 19, showed her RBC was too high. She now tested Positive for vanadium. We suspected a gas leak at the time; she was to bring a dust sample from home. [W*e had begun to wonder if vanadium was coming from her new dentalware. We didn't suspect malonic acid derivatives, yet.*]

3 roundish tumors (white areas) in right breast (mama der.) and armpit (at right edge of picture)

Apr 11 initial ultrasound of breast

Her uric acid had suddenly dropped showing that glutamine levels were much too low [*and Clostridium bacteria were revealed*]. She was given a glutamine supplement. But she had gotten rid of copper water pipes, so her iron level rose to 105.

By April 20, the entire breast was soft as it should be. Only a narrow lump at the armpit could still be felt. But she was all broken out in a rash suggesting a benzene exposure. We also searched for bacteria (which can cause rashes) and

found plenty, at the lymph nodes. Testing showed *Salmonella, Shigella, Staphylococcus aureus* Positive at lymph nodes, glutathione Negative at lymph nodes, benzene Positive everywhere.

Had she eaten some benzene polluted food? Or simply bacteria-contaminated food? [*Benzene and zearalenone are released from a draining tumor*.] A dose of Q10 (6 gm) came to the rescue.

By April 24, she still had *Salmonella* infection, and she still had no glutathione at the lymph nodes. A new blood test showed her total bilirubin had suddenly risen to 1.1, a serious danger sign. She was immediately requested to stop eating all breads and nuts, since she must be getting aflatoxin again. Aflatoxin was found in potato peels, even after cooking, so she was reminded to peel all potatoes.

The vanadium problem did not go away, in fact a copper problem also loomed (iron dropped to 50). D-malic acid was now found at the lymph nodes. [*This too, could originate in the teeth*.]

The potassium was suddenly too high (5.2) a sign of thyroid malfunction besides the goiter. She was given 1 grain of thyroid a day. All in all, by the blood test, she was in worse shape now than when she arrived. But the tumor was shrinking, because the arm was less swollen and the breast was nearly normal.

On April 29 she began to give herself coffee enemas [*not recommended now, unless filtered for asbestos*], an idea taken from the Gerson program, another alternative cancer therapy available in Mexico.

On May 2 a new blood test showed a lot of improvement. The bilirubin was back to normal. LDH was down, implying less tumor activity. Albumin and globulin were normal. Uric acid was normal. Potassium was back to normal. And iron was back up, implying less copper interference. Her arm was much smaller, less swollen; her fingers could all be used. The breast was soft. Would an ultrasound show the improvement? It did.

The fibrous texture (white streaking) was still quite evident in the breast, but only two "lumps" were rated as tumors by the radiologist. The largest one had pulled apart and was now considered normal tissue.

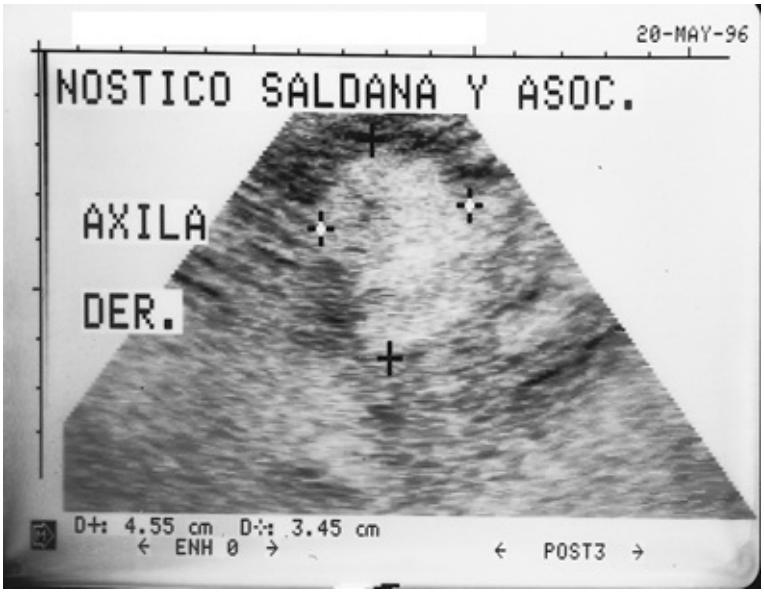
She could use her arm and hand normally again. The immediate threat was

gone.

Her next blood test, on May 14, showed more improvement. The LDH dropped to 160, normal by our standards, meaning no tumor activity.

May 4 down to 2 tumors and a fibrous mass

Her third ultrasound reflected this. Both lumps were now gone. Only some diffuse fibrosity remained in place of each of the original tumors. The largest one, measured between the plus signs, did not qualify as a tumor to the radiologist. The breast itself was free of everything. She was feeling fine and eager to go home.



May 20 No tumors, only fibrous remnants

But the May 27 blood test had suddenly worsened. Her LDH was up; RBC and WBC were up.

What was the problem? We didn't know.

By May 31 it had not improved much. Vanadium was Positive again. Albumin was up again, the thyroid was affected again (calcitonin was negative at the thyroid, calcium was too high and potassium too high) and copper had returned from some unknown source, so iron had dropped.

But there was no time left on her schedule. Her mission was accomplished. And more: her goiter was no longer visible no matter how she turned her head. She could swing her arm. She was going home.

Summary: We know now there was more to do. Toxins had inadvertently been placed in her mouth to suck on the same way she had gold and amalgam before. But for the present she savored success. Surely she will come back if she loses her new found health.

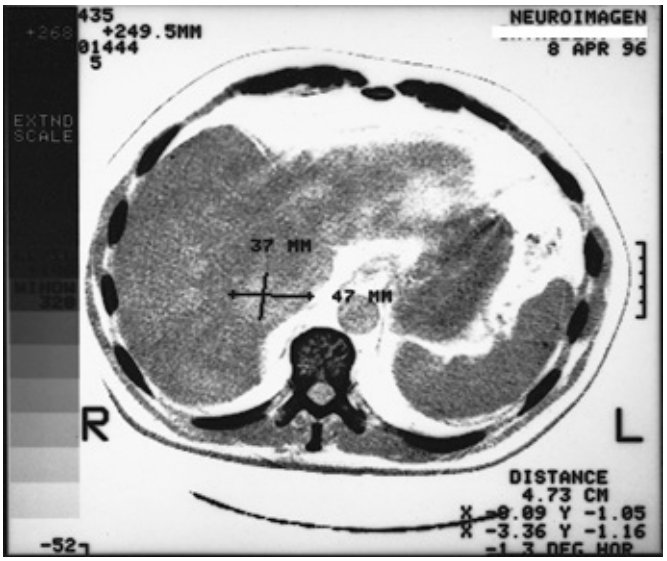
22 David Forness Prostate Cancer

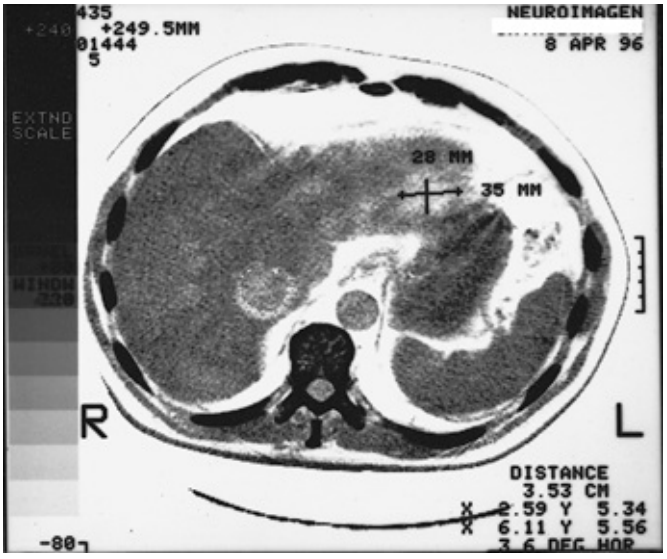
David Forness, a middle-age man, was tall and just a bit on the portly side. He had diabetes along with his cancer, a rather unusual coincidence. His cancer was in the prostate, colon and liver, starting about a year ago. In fact, he was just out of the hospital where 18 inches of colon had been removed. But he still didn't have a colostomy. He was just in time. We would focus on the liver, though, to monitor his body's recovery. The colon would recover along with it. His first CT scan showed two fairly large tumors, 3.7 x 4.7 cm and 2.8 x 3.5 cm visible in different frames.



In fact, a closer look at these frames shows the liver was packed with small to medium size masses (light gray spots). He also had tumors in the spleen, a most unusual location. He was not sick at all. He had no symptoms. This was in spite of testing Positive to four solvents, five bacteria, malonic acid, aflatoxin, PCB, chlorine, asbestos, CFC, and six heavy metals! His first blood test was equally bad. It showed that toxicity had already affected several of his vital organs including:

- The bone marrow (very low RBC).
- The thyroid gland. Potassium too high from lack of absorption by the body tissues. Diabetes contributes to this.
- The parathyroids. Calcium very low.
- The liver (portion controlling albumin production). Albumin low.
- The spleen (where iron is released to travel to the bone marrow). Iron moderately low.
- The liver (where cholesterol is made). Cholesterol too low.
- Location where triglyceride levels are regulated (much too low).

Things could get worse quite quickly for him. But the LDH and alk phos were not very high, meaning the tumor growth was slow at this time.



Apr 8 CT scans show 2 liver tumors

An unusual feature was the high blood sugar due to his diabetes. Since this means that sugar has difficulty entering cells, perhaps it also has difficulty entering the tumor cells. Tumor cells need a lot of glucose to grow. The mineral chromium is in short supply in diabetics. Chromium helps sugar enter the cells. Should it be given to help the rest of the body reabsorb the tumors, or withheld to starve the tumor? I planned to do a little of both, watching carefully for abrupt changes.

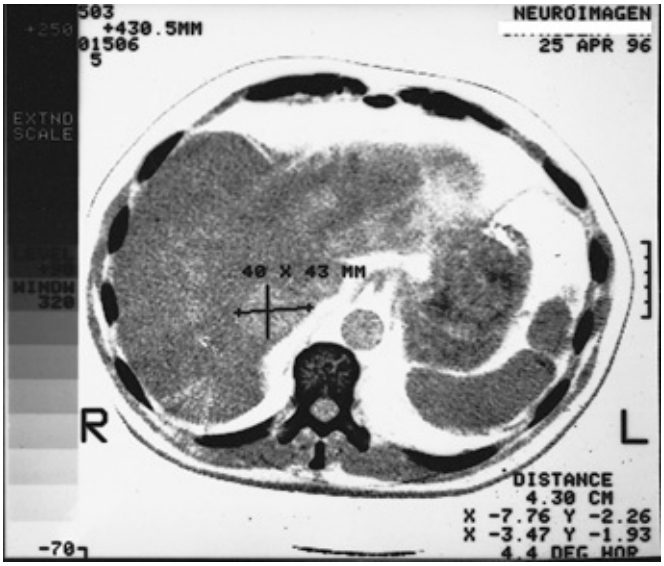
He was started on the Freon program, parasite program, Lugol's, Q10, and glutathione. His IVs began with EDTA, vitamin B-complex, glycyrrhizin, DMSO, laetrile, and vitamin C. The EDTA would pull heavy metals out.

On the second day, the EDTA was exchanged for calcium and magnesium. Methyl malonate could repeatedly be found at the liver and spleen. He was given B_{12}, folic acid and silymarin.

Although some things improved by April 17, some things were worse. The thyroid and parathyroids were better, allowing calcium and T.p. to rise and potassium to fall. Somehow he was getting more copper [*or germanium*] than before; his iron had dropped. His LDH had risen somewhat. In fact, gradually worsening liver function can be seen throughout his stay [*in spite of and possibly due to shrinking tumors!*]. One significant change is the drop in blood sugar; more sugar might now be entering tumor cells and causing a burst of activity. Glucose was 190, down from 316, but still needing to fall below 140.

Maybe trace minerals would be of help now. We gave chromium yeast, selenium yeast, molybdenum yeast, germanium yeast, manganese.

By April 24, he was testing negative at last for cobalt and vanadium. Improvements in the blood test can be seen everywhere, except in the liver enzymes and LDH.



Apr 25 One tumor gone, remaining tumor shrunk to 4.0 x 4.3 cm, smaller masses more diffuse

The new liver scan already showed one tumor absent on all frames (no longer mentioned by the radiologist) and the larger one beginning to shrink. The liver texture was much better, but there was still a lot of improvement needed.

He was feeling so energized, he enrolled in the two day Syncrometer® class and decided to do a liver cleanse. He got out hundreds of gallstones. But the liver function tests continued to worsen (May 6). He had been doing dental work. He completed exchange of dental metal for plastic by May 13.

We doubled his trace mineral intake and added zinc, 30 mg daily. We doubled his B_{12}, folic acid, and vitamin C intake. We added thyroid, taurine, and cysteine. It was no use. Vanadium, malonic acid, and copper continued to appear and they would not be "neutralized" by any of our supplements or IVs. There must be an ongoing source; but where?

Another scan of the liver was done May 16 showing even further improvement. His last tumor was no longer recognized as such by the

radiologist. Only poor texture was noted (light gray areas).

May 16 Only poor texture left

He had gained a lot; his life was not in danger from liver cancer. It was time for him to leave. But his future was not secure.

Summary: This case teaches us an important lesson. Tumors may dissolve and liver texture may improve, yet toxicity is hidden in certain organs. They fight bravely, using every adaptation, but until the source of the toxicity is found, and removed, the battle continues. [*We know now that a plastic tooth can be that source.*]

23 Todd Wilcox Testicular Cancer

Todd Wilcox, age forty, had gone to the Gerson clinic immediately after "stopping by" our clinic in March. He had been diagnosed with testicular cancer at home in Canada. He had gotten his right testicle surgically removed first, but it then spread to the lymphatic system. Now it was called "embryonic carcinoma". At that point he headed for Mexico on the advice of a friend. In fact his abdomen was full of tumors with one very large one when he arrived there. After three months at the Gerson clinic he came back to our clinic. An ultrasound now showed that the large tumor was gone, but he was still full of enlarged lymph nodes (not shown).

He had already been on the parasite program plus zapping for three weeks. His ortho-phospho-tyrosine and isopropyl alcohol were Negative. Still testing Positive in his lymph nodes were:

Solvents	Heavy metals	Bacteria	Others
benzene	nickel	Salmonella enteriditis	malonic acid
xylene	copper	Salmonella paratyphi	formaldehyde
	cadmium	Shigella flexneri	CFC's
	cobalt	Staphylococcus aureus	asbestos
	thallium		aflatoxin
	mercury		

The malonic acid, copper, Freon, cobalt, solvents, and other toxins had used up the glutathione in his abdominal lymph nodes, glutathione tested Negative here. This lowered their immunity to bacteria, which now could colonize there, making growth factors. They also caused the lymph nodes to grow and enlarge. At one time fluke parasites had inhabited them, too, causing malignancy, but this had been stopped. The bacterial invasion could not be so easily stopped. The toxins had to be removed first.

He was encouraged to continue with his Gerson program and diet, except to go off carrot juice because we had just discovered it contained malonic acid. He already was on a potassium supplement, Lugol's iodine, and thyroid tablets! His

pulse and body temperature were being monitored at the Gerson clinic as they rose to a point where sweating, nervousness, and insomnia were felt.

After his blood test, he was given our "Day 1" cancer program [*for that time*]. It included:

1. A large dose of coenzyme Q10.

2. The malonate free diet.

3. Lugol's to kill *Salmonella*. We had to wonder why he still carried *Salmonella* after all the iodine he took from the Gerson clinic. Either it wasn't enough or he constantly reinfected.

4. Instructions to get metal out of his dentalware and do the Dental Aftercare program.

5. Instructions to change his refrigerator at home to a new non-Freon variety and start on the Freon removal program.

6. Instructions to stop using a hair blower.

7. Instructions to change his copper plumbing at home (in Canada) to PVC plastic in spite of the weather there. Water from his local residence had copper, so he was instructed to move.

8. Going off detergent for every purpose.

9. Throwing out his foam mattress and detoxifying his formaldehyde with taurine plus cysteine both for 3 months.

10. Paying special attention to moldy foods to avoid aflatoxin. And taking glutathione (reduced) on an empty stomach in the morning.

11. Of course, he was to continue the maintenance parasite program plus zapping.

He was then given an IV of EDTA, vitamin B complex, and vitamin C, each

item being tested for a set of eleven pollutant toxins (copper, cobalt, vanadium, benzene, isopropyl alcohol, wood alcohol, malonic acid, maleic acid, methyl malonate, maleic anhydride, D-malic acid). [*Now we also test for dyes and urethane.*] The IV bag of saline was tested for these also.

After a single IV, Todd was re-tested for copper at the lymph nodes, liver, and parathyroid. He was Negative now and could stop taking this kind of IV.

It was a day of swallowing, drinking, taking supplements, zapping, and IVing; but at the day's end, he felt better instead of being fatigued. He went back to his Gerson residence, but stuck to the malonate-free diet. He took copper-free drinking water with him until he could have his own tested.

Next day, he was free of benzene and xylene, having stopped drinking bottled water. His copper was still Negative, so we gave him our tumor shrinking IV to be done daily. It contained calcium, magnesium, laetrile, cesium chloride, vitamin B complex, vitamin C, and DMSO. Again, all items were tested for the 11 tumor toxins.

His first blood test showed a very low potassium in spite of his Gerson supplement of potassium. He was instructed to double his intake of it. His blood sugar was extremely low, as is common for cancer patients.

His blood urea nitrogen was much too low, also, in spite of taking 26 grams (5 tsp.) a day on his Gerson program.

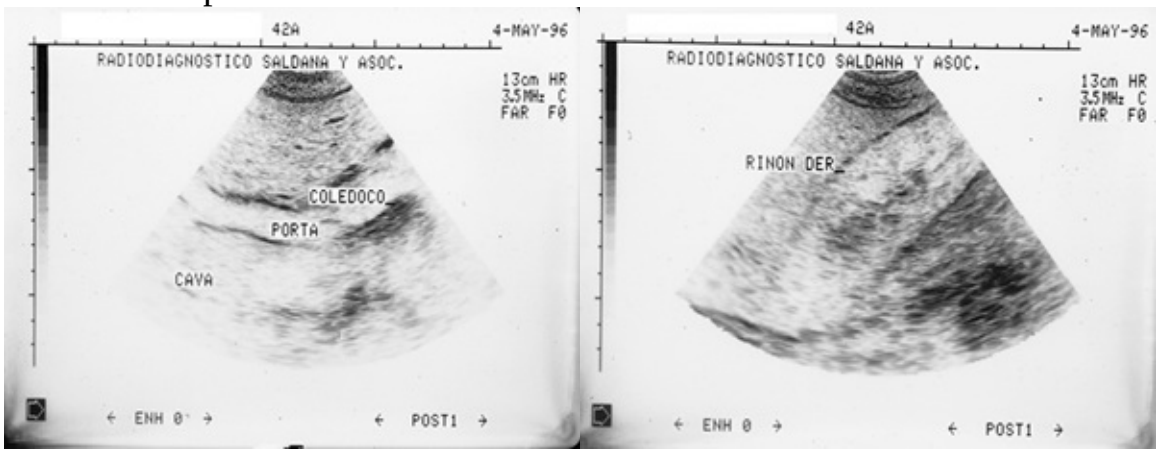
The supplementary urea was evidently a drop in the bucket and not even noticeable after many weeks. This was understandable, since he had been dousing himself with carrot juice (malonic acid inhibits urea formation). He also took creatine, by mouth. His albumin was too high, no doubt due to cobalt in the liver. Serum iron was quite satisfactory, showing his copper intake had been slight. His LDH and alkaline phosphatase were gratifyingly low [*showing that Sudan Black B and DAB were not the problem*]. His good results so far were a tribute to the Gerson program and Todd's personal determination to comply. He continued his IVs for a week and then did a follow up blood test (May 15). Now his BUN was still lower. Only a strong inhibitor of urea formation could be responsible, such as a stalled urea synthesis cycle in the liver or large quantities of malonic acid. Checking back in his test records, malonate was found to be present each day he had come in for testing. [*But we did not suspect it might be*

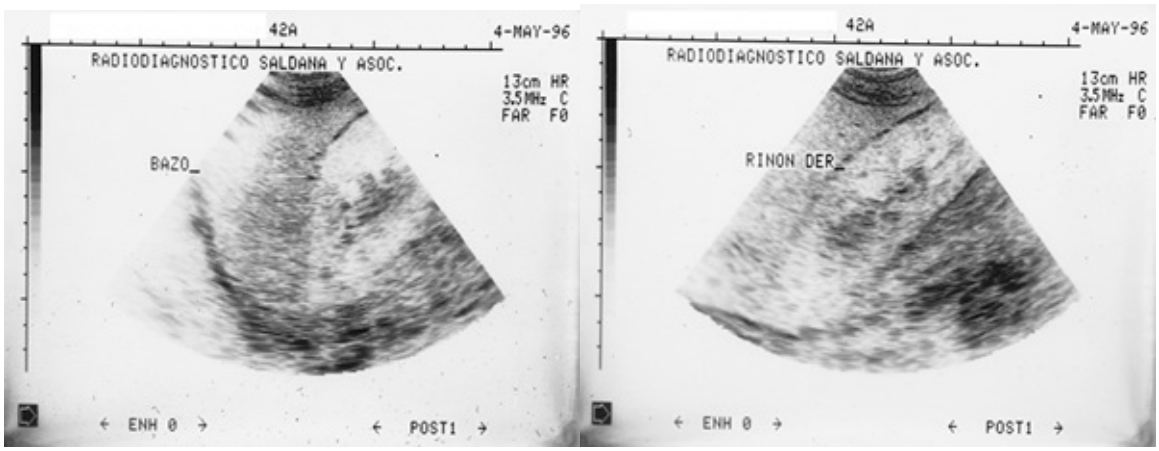
in the very plastic we had recommended for amalgam replacement!] His calcium had risen too high, along with phosphate: (calcium 10.3, phosphate 4.1) showing that bone was being dissolved. Something toxic was still in his thyroid! This would inhibit calcitonin formation, removing the protection his bones relied on. Testing showed: cobalt Positive at thyroid, vanadium Negative at thyroid, copper Negative at thyroid, parathyroid hormone Negative at parathyroid, calcitonin Negative at thyroid.

This electronic test supported the toxicity conclusion. But where could the cobalt come from? It was wreaking havoc with his blood test results, which seemed worse than before, in spite of getting his dental work done! [*His neck got stiff and painful, which should have pointed us to his teeth. But "body language" was still too vague for us to interpret at that time*.]

His new ultrasound arrived. The abdomen had been searched and viewed from the liver down. Not a tumor or enlarged lymph node could be seen! Was it lack of resolution (power) of the ultrasound? His previous ultrasound (not shown) pictured them quite well. We recommended a CT scan for greater certainty. But the truth was already before us. He had first dissolved his large tumor; then gradually all his remaining tumors.

Was it Gerson's program or our program that did it? Their program was certainly responsible for dissolving his large tumor; why couldn't it simply continue dissolving the rest? Perhaps our program merely helped. He was a happy man again, although a mysterious enemy, cobalt, had not yet been vanquished. And *Staphylococcus* was still present in his lymph nodes; the source of this would have to be dental, so we checked and to our surprise he still had a root canal to be pulled!





4 of 12 views shown here.

May 4 many views of the abdomen reveal no tumors

But joy overcame him. His five month vigil was over. When he came, he had quit his job and decided to stay as long as it might take; after all, his chances for survival at home were nil. We didn't want him to leave with an elevated calcium, though. We prevailed upon him to delay departure.

He delayed 3 days. We tested again.

His calcium had dropped somewhat, along with phosphorus. Evidently, his thyroid was doing better. But we searched the thyroid and parathyroid glands electronically. Cobalt Negative at thyroid, parathyroid; parathyroid hormone Positive at parathyroid; calcitonin Negative at thyroid; malonate Positive at thyroid.

[*Although the thyroid had been freed of cobalt temporarily by IVs, it was sure to return since it really derived from his new plastic fillings. The thyroid would continue being poisoned by malonate too and therefore jeopardize production of calcitonin*.] The LDH and alkaline phosphatase stayed reassuringly low.

BUN was still too low. His hCG marker (not listed) was under 2. Gerson clinic had been using hCG and AFP as tumor markers for him. Without finding and eliminating his last sources of cobalt and malonate, he neverthe-less desired to go home.

As a parting reminder, we gave him several extra supplements to take: vitamin B_{12}, folic acid, vitamin C, taurine. His coenzyme Q10 was reduced to 3 gm once a week. Glutathione was reduced to two a day. And glucuronic acid was added.

He still had not pulled his root canal. But he felt he deserved a vacation. Perhaps it will be a lasting one. Perhaps not. Toxins and bacteria are as relentless as any other predator. I believe his intelligence will serve him well again if new tumors pop up.

Summary: Todd was the perfect patient-he blended two alternative treatments, even though this is distasteful to both providers. He caused no friction by taking full responsibility for his choices. He listened to the reasons given for the various treatments without pitting them against each other. He fused them and found success. I have since been asked where the initial scans are. He took them home. Yet having in my possession his final scans that show nothing, is success, no matter what was on the initial ones.

24 Sonja Eckenroth Lymphatic/Lung Cancer

Sonja Eckenroth, a tall stately woman of about fifty, arrived (with her daughter's help) extremely emaciated, but not in a wheelchair. She originally had lung cancer, diagnosed in 1990. She had the usual treatments, but had a recurrence in 1993. It spread through the lung again, this time to lymph nodes.

In the last two months she had severe shortness of breath, weight loss,

insomnia, and pain down her left arm. This arm and fingers would frequently go numb. A lump on her neck was called a thyroid "cyst". Sonja's daughter was determined to get her mother well, hovering over her with the supplements, checking supplies, and asking questions. This was fortunate because Sonja had a do-as-I-please approach and often this meant late afternoon arrival when there was no time left for an IV. We engaged the nurse for overtime work for her.

She had received one series of chemotherapy, but was given only six months to live even if she completed the other two, so she "jumped ship" and headed for Mexico. She had already been on the Kelly program which uses large doses and varieties of digestive enzymes to digest tumors. A glance at her first blood test shows she was still in fair condition.

Her electrolytes were normal. Kidney function was good, although creatinine was much too low, probably due to a shortage of glycine, arginine, and methionine. Two liver enzymes were very good, but the GGT was "out of sight" (254). Her calcium level was extremely low and this would contribute to permeability of her tissues that were already letting fluids seep out and also fan the flames of tumor growth. But her liver could still make enough protein, though barely. If this didn't improve in a few days, we would put albumin in her IV.

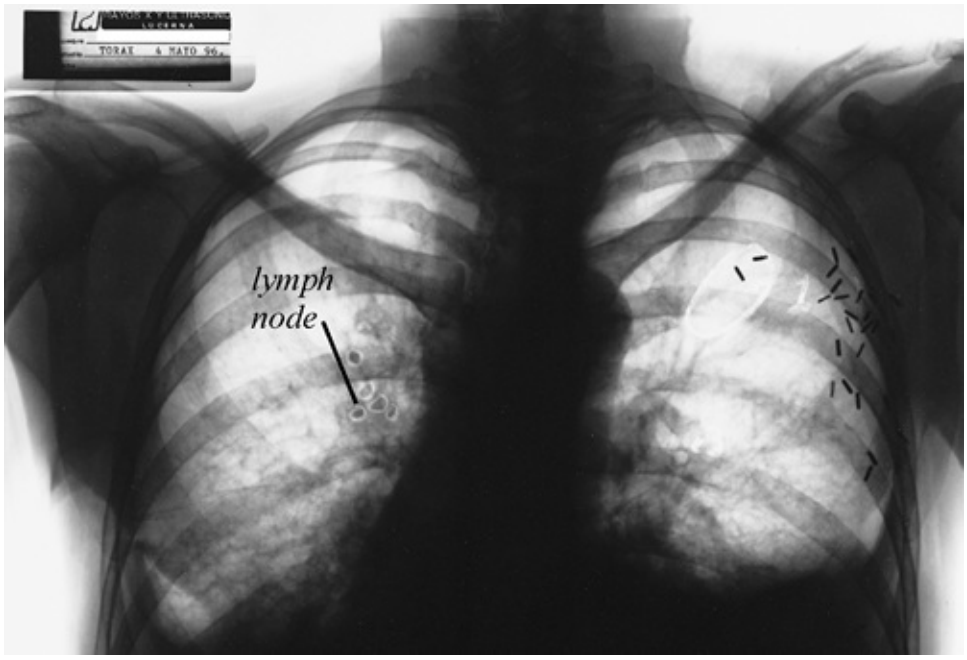
Her tumor activity level, judged by LDH, was quite low, though judged by alk phos was extremely high. [*Evidently, she was suffering from DAB, not Sudan Black B dye toxicity.*]

Copper [*or germanium*] toxicity is easily seen in the very low iron level (27), but her nutrition was still adequate, in spite of her emaciation. She should be able to get well, provided no accident happened, like hemorrhage. The platelet count, at 448, looked dangerously like evidence of minute bleeding. The low RBC reinforced this idea, though of course the bleeding might be anywhere, not necessarily in the lung. Our policy has never been to scan from head to toe, although such knowledge would be very welcome. We started her immediately on the Chinese herb, Yunnan Paiyao, to help prevent more bleeding. Perhaps it was responsible for the rather good history for the platelet count all the way to October 2.

She had brought her own x-ray showing a large lung tumor and much pleural effusion (water accumulation), but we needed a current one which she did the

same day.

The tumor was circled by the radiologist and lies under two of the metal pins left in her from a previous surgery. On the other side, the enlarged lymph nodes (small round masses) were circled, also. The white area represents air; there is rather little of it, due to "water" accumulation (dark area), at the base of both lungs. She had been drained of this fluid twice already. The numerous finger-like dark projections are the bronchioles, much too prominent due to inflammation and infection. The entire lung looked moth-eaten on close inspection.



Small circles on left are enlarged lymph nodes.

May 4 initial x-ray shows large tumor

On her first day parasites were killed, the Freon removal program was started and dental work was scheduled. She had very bad teeth. She had quite a list of toxins built up in her, including Freon, asbestos, nickel, and formaldehyde, all of which are lung toxins. Just being away from home would help a lot! The cadmium, copper, aluminum, lead, and mercury would be chelated out with IVs. That left patulin and aflatoxin for her daughter, Sharon, to take on. The ever lurking salmonella and shigella bacteria were present, in addition to malonic acid and, of course, isopropyl alcohol.

As supplements, we started with glutathione, glucuronic acid, coenzyme Q10, Lugol's iodine, and taurine and cysteine, specifically to detoxify formaldehyde.

In five days her chronic diarrhea had stopped and for the first time in two months she could sleep at night.

Vitamins A and B_2 were added to her supplements. And after seeing her blood test results IVs were begun. They contained 3 grams calcium, magnesium, vitamin B-complex, DMSO, and laetrile.

By May 11 all her dental metal was out. She immediately could breathe better. The rattling sound of her breathing was gone.

The blood test, May 13, was in agreement. The calcium level and total protein was up significantly. The big improvement in health could also be seen in the lowered GGT. But the LDH went up [*probably due to azo dye in new dentalware*].

By May 18, she was feeling well enough to walk a mile to a restaurant. Her appetite was very good; she had lost 20 lb. just before coming and needed, desperately, to gain weight.

We could stop putting calcium in her IV now, giving her only B-complex, DMSO, and laetrile. By mouth, we gave chlorophyll "iron booster" syrup, B_{12}, folic acid and vitamin C.

By May 28 her appetite was still good, she was not panting so much after walking. Yet, her LDH went higher and calcium dropped back down, a sign of malonate toxicity [*and dye*]. Both vanadium and cobalt were detected in her parathyroids. Several malonic acid derivatives were again present at her lungs. *Staphylococcus* had already returned, too. We desperately searched for their sources.

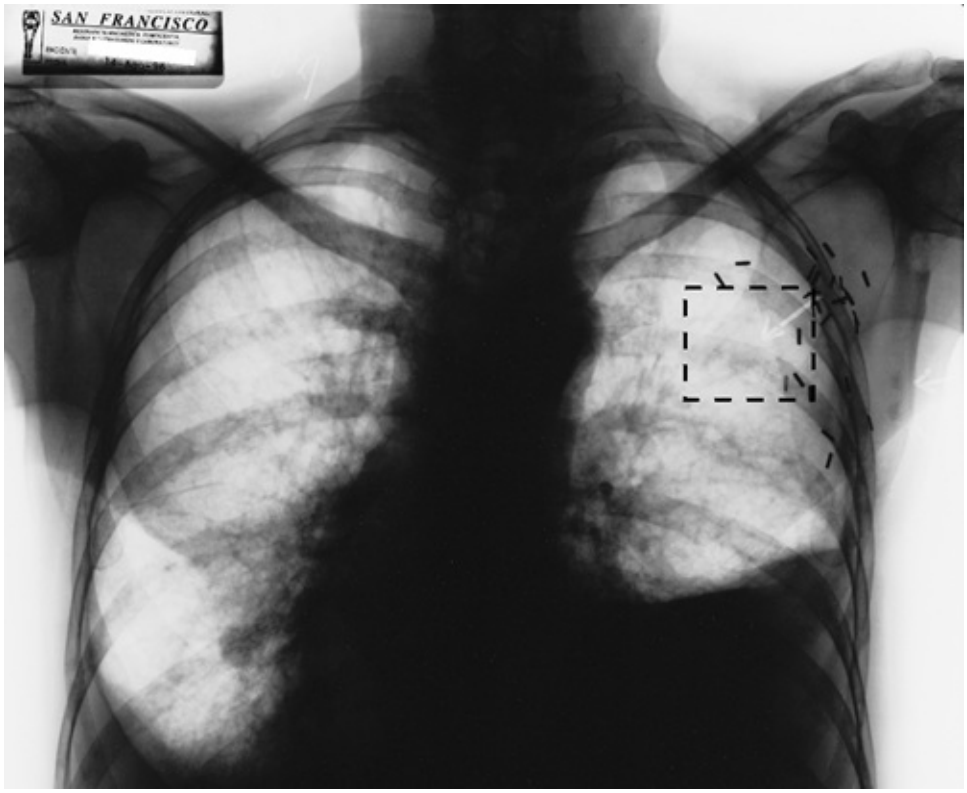
In a week, she began to fail quite seriously. She came in a wheelchair and lay huddled on her cot while getting her IV, without talking or moving. We feared the worst. Her family probably did, too. But she found the strength to point out a painful tooth-just the clue we needed. We hustled her to the dentist and were very grateful for her acceptance in her condition. He found an abscess, drained it and cleaned it with Lugol's, but she would not allow extraction. Immediately, she became alert and willing to eat. That was a close call! She had lost weight during this week. To help her gain it back we prepared the lemon-oil beverage recipe for her. She would get one a day. She enjoyed it. She got better again. We

were all elated. Even Sharon began to smile. But not for long. The copper and malonic acid continued to plague her. LDH, alk phos, and iron were going up and down unpredictably. Was she eating junk food? (That is, off the malonate-free list.) **Yes**. Was she not taking her supplements? **True**. But I was not convinced these transgressions were entirely responsible. It was something more.

By June 25, she could exercise again. She would feel pain over her heart occasionally, but her arm had long since been pain free and she no longer got numb spells.

But by June 30 her breathing was worse. She had a bad cough. Both malonic acid and maleic anhydride were present at the lung. In the next few days she became very weak again, was in the wheelchair, and vomited with coughing. We took her off thyroid medication-she was on 1½ grains, the lump on her neck was gone. We took her off the lemon-oil beverage. Her uric acid had dropped abnormally low; was this a factor? We did not understand it. She frequently didn't take her glutamine. We searched everywhere for her malonic acid source...and found it...right in the eggnog beverage we made for her to replace the lemon-oil variety. We had not yet learned to detoxify it (a dairy product) with vitamin C. But learned the same day.

It was mid-July. She had stopped vomiting, but couldn't regain strength. She was now on oxygen continuously and seemed to be losing ground. The family was considering giving up and taking her home. But once more she pointed the way. There was a hard spot on her right lower jaw. Was it another abscess? This time a special dental surgeon was called in to make a "house call" due to her frailty. The surgeon reported to us, in surprise, that she had several plastic crowns, and a bridge! We had not been informed of this during her dental work. Could this explain her chronic malonate problem and recurrent acute illness? Under one of the crowns, the surgeon found a black tooth, full of decay. Another abscess was opened and cleaned up, but she refused extraction.



Aug 14 tumor now a diffuse region

The next day she was not nauseous, for the first time in a long while. Her breathing was better again. She needed less oxygen. Her *Staphylococcus* disappeared. It was time to check her lungs with an x-ray again and drain if necessary.

The lung tumor was much smaller, in fact, nothing but a diffuse (fluffy) region of remaining inflammation. (Search for the radiologist's white arrow.) Her lungs had twice as much air in them (white space) and the enlarged lymph nodes were gone. Nevertheless, one more liter of fluid was drained from her chest. She could drink better now and was started on "lung tea" (mullein, comfrey) and a clove of garlic daily.

On August 15 she left. Her family was disappointed. Yet she was clearly better according to the x-ray and blood tests. They didn't think so; she was wheelchair bound, had lost more weight, and needed oxygen occasionally. The grapevine whispered she was going home to die.

Summary: Two months later, the family called. I expected the worst. But it was Sonja herself! She wanted something, but I could only sputter back: How

was she? She was fine, she said. Had she gained weight? "Oh, yes, 4 lb. already." That was the telling news. She had turned the corner. She was getting well. But she was calling about another tooth! "Yes, do come back. Don't refill it, pull it!" But she refused. In her blithe way, as always, she just refused. Her hard won victories may have been in vain. But she treated us to one more follow up blood test. She had improved in many ways and had a better chance to get well than in the beginning.

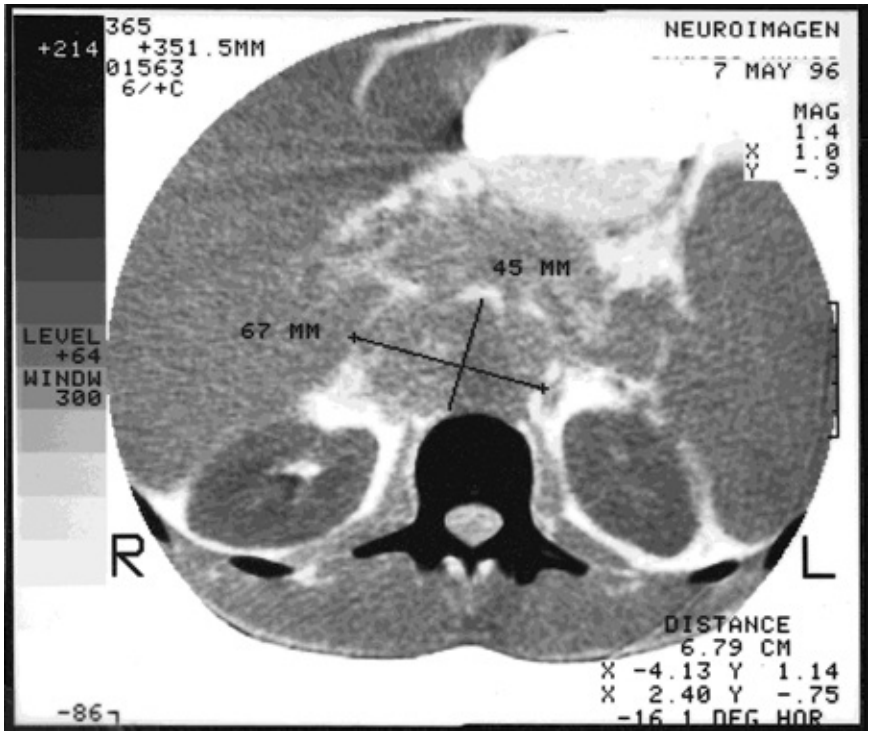
25 Robert Marcoux Hodgkins Disease

Robert Marcoux, in his early forties, came from French Canada with a friend. He had been diagnosed in 1990 with Hodgkin's disease. In spite of regular clinical treatment at home, the lymph nodes of his abdomen were getting bigger again. He was now having night sweats. [*This is caused by* Mycobacterium avium, *brought in by* Ascaris.] He was losing weight. His appetite was poor. He was extremely fatigued. There was constant pain and pressure in the groin area.

His last CT scan was done in February, so we immediately ordered a new one. This one, done May 7, showed a large tumor in the abdomen between the kidneys, measuring 6.7 x 4.5 cm, about the size of a potato. The scan also showed considerable ascites (water seepage and accumulation) around the

kidneys. The radiologist noted that the liver texture was quite poor, on the verge of developing tumors there.



May 7 6.7x4.5 cm tumor in abdomen between kidneys

They were nervous and frightened, unable to comprehend a word of Spanish. Yet they had to stay in a Mexican motel, because, although an environmentally safe one had just been opened, it was already full. They could only stay for three weeks, giving us a rather impossible task. We reasoned that it was long enough to learn the essential change in his lifestyle and environment to save his life if he was diligent. And we hoped they might extend their stay if they got good results.

On his first day, May 6, he was given the parasite-killing herbs and coenzyme Q10, 3 gm, to be repeated every fourth day. [*At that time we were still not certain of the great importance of glutathione; we only gave him one 500 mg capsule a day*.]

His initial toxin test showed he had two salmonella and one shigella varieties invading his body tissues. He had benzene, wood alcohol, isopropyl, and xylene solvents. He had fiberglass, aluminum, nickel, arsenic, copper, chlorine, and mercury. And he was full of aflatoxin, the fungal toxin that can raise the total bilirubin and cause a lethal jaundice. He was taken off grocery store bread

immediately. Malonic acid was Positive, too.

Next day the blood test results arrived. The extremely poor liver function was apparent in the GGT (574). [*And somewhere (in the WBCs) the carcinogenic dye DAB had accumulated so much it raised the alk phos to a wildly high 701. Was he using hair dyes?*]

The copper [*or germanium*] toxicity was easy to discover; serum iron was only 24; yet his RBC count was adequate. The calcium level was much too low-conducive to seeping of body fluids. The total protein was rather low, probably causing the ascites we could see around the tumor and kidneys, although maleic anhydride was probably the real culprit.

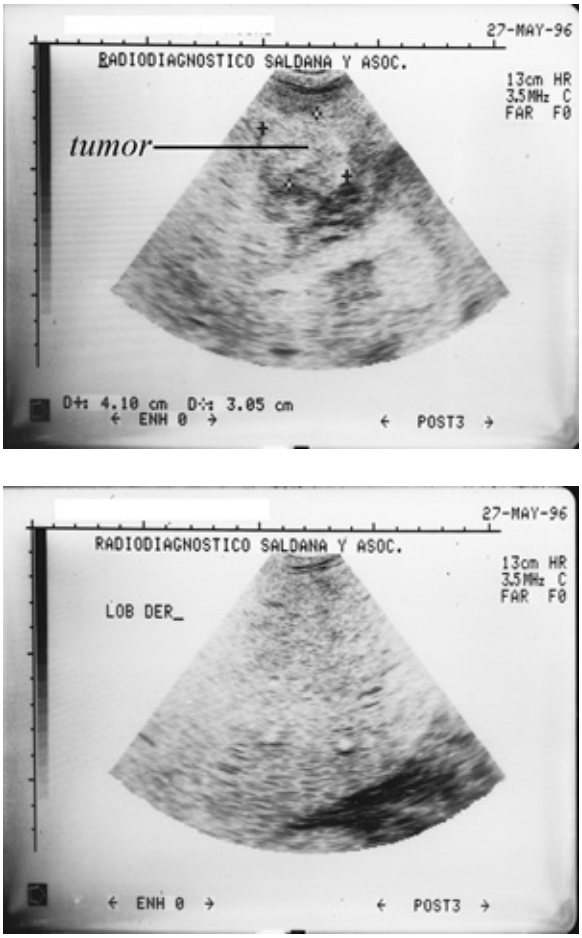
Time was most important to them, so we started IV therapy to speed up the tumor shrinkage. After 2 doses of EDTA to pull out copper we administered by IV 3 gm calcium, magnesium, 25 gm vitamin C, 2 vials laetrile, DMSO, 3 gm cesium chloride, and 1 ampoule vitamin B complex. But the next day he was Positive for copper again. He was moved to a motel without copper water pipes. Here rotenone pesticide was often used. He was to request NO pesticide treatment while there. Rotenone is another very strong metabolic inhibitor. We

planned to watch and test him for it. More EDTA chelation was used.

In one week, all his dental work was done; we omitted to record in his file what was done, however. We can only guess that amalgam was taken out and composite put back in. The blood test showed some improvement (GGT 539), but the alk phos went higher [*dyes are used in dental plastic*] and the iron level lower.

Somehow, he continued getting copper, in spite of moving to the "copper-free" motel. [*It was no doubt in his new dental plastic*.] Would we be able to keep ahead of it with our IVs that pulled it out in order to let the tumor shrink? Calcium had risen, probably from intensive IV therapy.

Nevertheless, tumor activity was stronger than before, in some respect, since the alk phos was up. The LDH drop, though, was a hopeful sign.



May 27 tumor down to 4.1x3 cm

We increased his glutathione to 500 mg, eight a day to help the liver detoxify everything. He was started on silymarin for the liver also. In spite of having no appetite, he was asked to drink a cream-shake every day as well as lemon oil drink accompanied by digestive enzymes (our own formulation), three with each meal.

By the end of the second week, May 18, he was still frequently Positive to copper; he had to switch motel rooms again. Rotenone was now showing

up in his liver besides malonic acid at his lymph nodes. Nevertheless, his appetite had picked up and he was now out walking on the beach. He was started on taurine and cysteine to detoxify the rotenone. And he was given caster oil packs to place in the groin area every night, both to ease pain and provide immune stimulation.

Seven days later, May 25, his fatigue was gone, he was sleeping better. The pain in his groin was better. Yet there was cobalt at his kidney. He was still on EDTA and tumor shrinking IVs daily. It was two days before departure time. What had been accomplished?

A final blood test showed more improvements. Alk phos came down substantially. His cholesterol and triglycerides were improved. Iron was the highest it had been, but still much too low, a testimony to ongoing copper [*or germanium*] toxicity. This would of course, not go away if it was in his new plastic teeth. Our chelations may have kept pace with this toxicity, but away from the clinic-what was in store for him?

Calcium had come up a little, but was still too low, evidence for continued malonate toxicity. Could it be from the new dentalware? Uric acid was now unmasked and much too low. [*We did not understand Clostridium infections at that time*.] We started him on glutamine to raise it and thereby allow nucleic acids to be made again. The RBC was good. But the GGT liver enzyme was still dangerously high.

Although the blood test showed some improvement from the time of arrival three weeks earlier, his best news was tucked under his arm as he brought in his new ultrasounds. The large abdominal tumor had shrunk to 4.1 cm x 3.05 cm, about two-thirds of the original size. Its contour was now rough; it was beginning to fragment judging by density change. The ultrasound of the liver

showed a smooth, even texture as it should be.

Summary: They departed with all our best wishes. And with the admonition to do a scan or ultrasound once a month till it was all gone and a blood test that included serum iron. Little could we perceive that obtaining these elementary data records would not be easy even in a country like Canada with a "well developed" medical policy. We heard no more.

26 Remi Parker Kidney Cancer

Remi Parker, a very pleasant, grandfatherly person, came with more than a degree of despair. He was my age and certainly too young to succumb to cancer. He had only one kidney, on the right side. The left kidney had been surgically removed for liposarcoma. But after that, a new tumor grew in the empty location where the kidney had been (called the renal fossa). This was removed in a second surgery. It was the size of a bowling ball. And now it was growing again. It was already over an inch long. It was a despairing situation.

Besides this, he had already lost his spleen and one end of the pancreas to previous surgeries for cancer.

He had started the parasite program eleven days ago, but still had isopropyl alcohol built up in him. His initial toxin test, done at the "whole body" showed:

Bacteria and Solvents	Metals	Other Toxins
Staphylococcus aureus Positive	aluminum Positive	PCB Positive
Salmonella typhimurium Positive	nickel Positive	CFCs Positive
Salmonella enteriditis Negative	copper Positive	fiberglass Positive
Salmonella paratyphi Negative	cobalt Negative,	patulin Positive
Shigella dysenteriae Negative	Positive at kidney	aflatoxin Negative
Shigella sonnei Negative	cadmium Positive	arsenic Negative
Shigella flexneri Negative	mercury Positive	asbestos Negative
	lead Negative	chlorine Negative
isopropyl alcohol Positive	thallium Negative	formaldehyde Negative
wood alcohol Positive		malonic acid Negative
benzene Negative		
xylene Negative		
toluene Negative		

His first blood test showed the effects of some of these toxins. RBC was elevated due to cobalt. Calcium was too low, due to malonic acid and other toxins appearing in the parathyroid glands. Iron was too high; cause not known. A generous level of triglycerides and enough cholesterol would certainly help him succeed.

The slightly elevated BUN and creatinine showed that his one remaining kidney was working hard, perhaps too hard. The rest of his test results were exceptionally good. There was no LDH or alk phos elevation.

But there was no time to gloat over his good health; there was a tumor to shrink, and he had come many miles to do this. We decided to proceed without IVs at first. He was started on:

- the parasite program and zapping
- going off the isopropyl alcohol list in the book, *The Cure For All Cancers*
- going on the malonate-free diet
- the Freon removal program
- changing his glasses frames to plastic
- stopping use of detergent for anything
- staying off apples in any form (to eliminate patulin)
- use of coenzyme Q10 (to kill tapeworm stages)
- glutathione, taurine, cysteine, vitamin B_{12},folic acid
- changing his plumbing at home to PVC from copper. He was advised to move into a mobile home with plastic water pipes temporarily while his plumbing got changed.

All supplements had to be procured from us to be sure they had been tested and were free of the common tumor-causing pollutants.

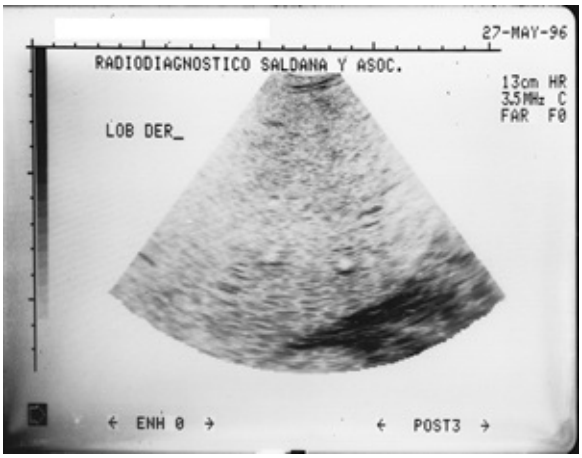
Two days later, May 22, he was feeling better, his malignancy was stopped (ortho-phospho-tyrosine Negative), but copper was still present.

An ultrasound of the lower abdomen, done this day, showed the tumor was 3.8 x 2.75 cm.

On June 5, he was still Positive for Freon, fiberglass, and copper.

On June 26 although copper and fiberglass were now Negative, he still tested Positive for *Staphylococcus* at the kidney location. This originates in a dental infection, reaching out to his tumor. A blood test was scheduled. He had not yet started on the Freon removal program. He had just begun dental cleanup, but hadn't been using white iodine to brush; he was quickly started on it.

It is easy to see, he still had either cobalt or vanadium toxicity; his RBC was still too high.



May 22 tumor measures 3.8x2.75 cm

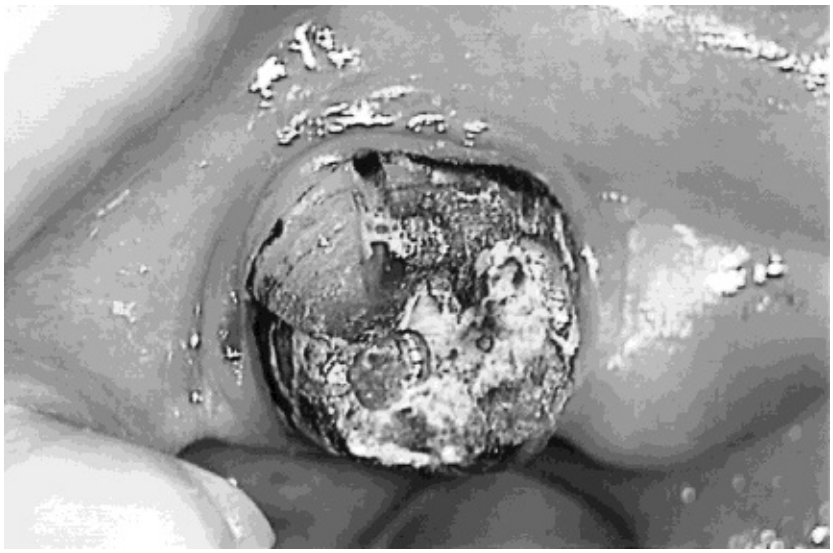
His WBC was higher, probably from ongoing dental work which releases bacteria into the whole body while wounds are open. This was a good immune response, though! His LDH, although indicating no malignancy before, was now even lower (good).

The albumin had gone higher-too high. The calcium level had come up and was now normal. Albumin and calcium are linked by your body so that the more calcium there is, the more albumin there is. In case the calcium should go too high, the albumin is present to sponge it up and take it out of action in the bloodstream.

Although calcium had come up significantly, it was still low, a parathyroid problem. Testing at the parathyroid showed copper and vanadium Negative there, but glutathione, biotin, and glutamine were also Negative. With glutathione Negative, this tipped us off that a heavy metal was still present or a malonate. Cobalt was Positive. How can a tiny gland do it's work with an interfering metal there?

What was the source of his cobalt? It is not written in his file. We probably searched his supplements, body products and other things. [*But never suspected his new plastic teeth.*]

His next visit was a week later, July 3. An ultrasound of the kidney tumor was scheduled since it had been six weeks since he began the cancer program.



Tumor gone, was this rotten tooth the culprit?

Then, a strange event followed. The radiologist, not being able to see anything at the left kidney site (remember it had been surgically removed) thought the patient must be mistaken so he took the ultrasound of the right kidney instead. When the patient returned, the missing ultrasound of the left side was seen as an error so the patient was sent back to the radiologist. But the radiologist explained to the patient there was "nothing to take," since the kidney was gone, so why spend the money? This made sense to the patient who returned a second time without the negative. It seemed unfair to send him a third time just to get the missing tumor namely, nothing on record. Remi and his family were pleased and convinced, although only the radiologist's word could ascertain that the tumor in

the left kidney fossa was gone.

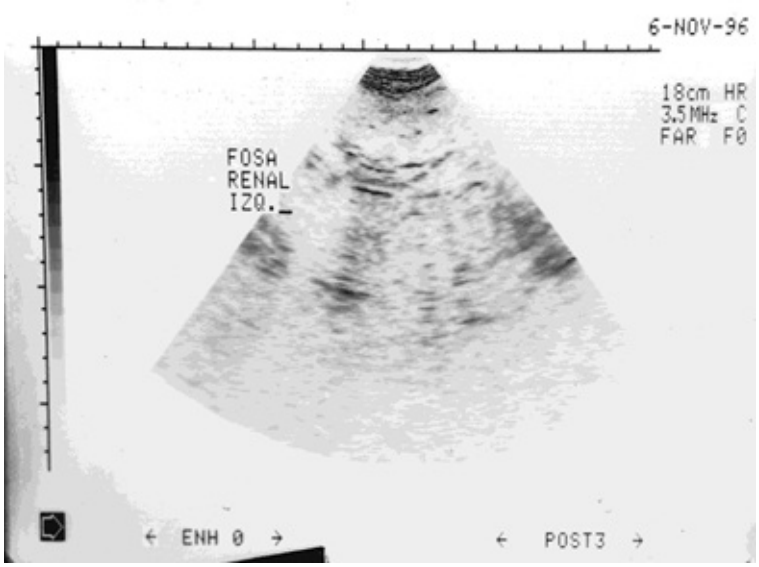
Chloride	100	102	109
triglycerides	214	251	170
cholesterol	171	182	204

On July 17, his blood test still showed abnormalities. RBC was too high (cobalt Positive); WBC was too high (bacteria); glucose was too low; creatinine was too high (kidney insufficiency); T.p. was too high (cobalt) calcium was too high (thyroid problem); and potassium was too low.

By now we had begun to suspect dental plastic as the mysterious source of cobalt. He was advised to have it all reviewed, tested by the staff with scrapings or chipping of the plastic; and some of it replaced, again!



Nov 6 "wasted" ultrasound of missing tumor

But Remi was much too happy with his vanishing tumor to take this advice seriously. There was nothing to do away with. His health was good. He was done. And deserved it richly. Except, for one tiny detail...how did he know his tumor was gone? He had no picture of its absence.

But he did have a picture of a very rotten tooth the dentist had pulled for him earlier. Could this have been the real culprit that tipped the scales in favor of tumor growth? Even the dentist was appalled and made this print for him.

He left for home without testing his "bad" dental plastic or replacing it. He promised to send an ultrasound from home in August. But we heard nothing.

Summary: Suddenly, on November 6, he popped into the office for a follow-up. He was persuaded to return to the radiologist. This time to request an ultrasound of the location of the space where the left kidney had once been. Nothing else. He soon returned, ultrasound in hand. It was as the radiologist had said-just plain nothing. No tumor in sight anywhere. Nothing to take, just a waste of money! And a good, hearty laugh was had by all to cheer Remi and his wife.

Danielle Andersen came with her husband, Karl, from Canada for brain cancer. It started as non-Hodgkin's lymphoma, but a year ago there were several brain lesions found by scanning.

One was removed surgically and was diagnosed as diffuse large cell non-Hodgkin's lymphoma, intermediate grade. She then got ten radiation treatments to the head, which brought two of the remaining lesions down to 1.5 cm and 0.5 cm at the thalamus and internal capsule respectively.

That was as much progress as could be made. And she was fine until recently. She began going to sleep for half hour periods during the day, her balance was bad, and her eyes weren't focusing so she couldn't read anymore. Something must be growing.

We reviewed her scan on May 8; we could see what looked like a disorganized tangle in the thalamus filling the depression that hangs down and mushrooming above it. It was about 2 cm in size. Unfortunately, this negative was not printed for my collection. One look at her blood test shows she was still quite well. If the tumor could be shrunk in a permanent way, she would not need to recover from anything. Only one liver enzyme, the GGT, was too high, in fact extremely high. Could this be due to the dilantin she was on to prevent seizures? This drug is ordinarily rather harmless.

Her alkaline phosphatase was slightly high, but not extreme [*showing DAB dye toxicity*], and the total protein was rather low due to the low globulin. The calcium level was too low, showing that the metabolic problem involved the parathyroid gland. Iron showed some depression (it should be about 100), but not enough to interfere with red blood cell formation. Although her blood fats (triglycerides) were much too low, cholesterol level was excellent.

Her toxin test showed:

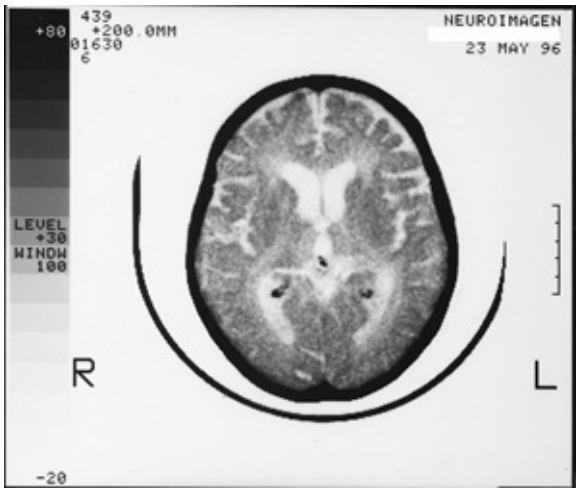
Bacteria and Solvents	Metals	Other toxins
Staphylococcus aureus Positive	aluminum Positive	malonic acid Positive
Salmonella Positive	copper Positive	aflatoxin Positive
	lead Positive	patulin Positive
isopropyl alcohol Positive	thallium Positive	CFCs Positive
	mercury Positive	chlorine Positive
	nickel Positive	

In addition to the usual Lugol's, Q10, Freon program, parasite program, and glutathione, she was given methylene blue, 65 mg (three times a day). She was reminded that her urine would look blue...not to worry about "turning into a blueberry".

Her IVs were started the day she arrived and contained 3 vials EDTA, to pull heavy metal out of her brain, vitamin B-complex, laetrile, and vitamin C. The next day, though, May 4, she was still testing Positive for copper at the brain and liver; it was found polluting the dilantin pills she was taking. A Mexican brand of dilantin was chosen that tested free of toxins. Another course of EDTA was given.

Two days after that, May 6, she had to be assisted to walk straight. She was losing ground. Copper was still Positive. They had already moved twice to different rooms in their motel, each time bringing the tap water in to test for copper. Meanwhile, time was flitting away. An emergency loomed.

On May 9, six days after her arrival, she was still Positive for copper in the cerebrum, in spite of chelating it out with EDTA. She was advised to move to our environmentally safe motel. It would mean sitting in a long line of border traffic each day, but at least the copper problem would disappear. On May 11, copper was Negative. She could read again, her eyes and her balance were much better. She was in the middle of dental work. And malonic acid was testing Negative in her brain.



May 23 after 20 days, no abnormalities

By May 15, she was much less dizzy and walking better. Glutathione was testing Positive, now, at her cerebrum. But TNF was still Negative. Patulin must

still be present at the brain. She was taken off all fruit in her diet till this would be gone. On May 18, she was so much better, she was talking conversationally with anybody. She had no dizziness at all.

Her blood test, done May 16, showed the typical drop in uric acid as it becomes unmasked by folic acid and other supplements. [*Later we found the true cause of a low uric acid to be clostridia bacteria. This results in almost no purines (nucleic acids) being formed or used (catabolized) and hence a low uric acid.*]

By May 22, she no longer dragged her foot even slightly. She said she felt great and was walking a lot without help. A follow up CT scan of the brain was scheduled. The next day, our tests showed maleic acid Positive at her liver [*we did not know, then, that maleic acid is used in some dental materials*], but the brain stayed free of it.

To everyone's surprise, there was no trace of any tumor on her CT scan. Had we missed seeing it because no contrast was used? It was repeated, with contrast. [We would never do this now. The contrast medium brings in all the lanthanide elements, causing serious immune lowering.] Nothing abnormal could be seen anywhere! This shows how very easy it really is to shrink a deadly tumor. If only we understood them enough to do it reliably and quantitatively. Until we know which part of her treatment program was responsible, we do not understand it and cannot abbreviate it in any way.

Did her next blood test, May 25, reflect the improvement? Certainly her iron level had become normal (about 100), indicating the absence of competing heavy metal, specifically copper [*and germanium*]. She would now be able to make more red blood cells and improve her immunity so deadly bacteria could no longer live in her brain lesion. And in turn, this would stop production of bacteria-derived growth factors.

But there were also bad things happening. The BUN and creatinine were even lower, calcium had dropped again, and her blood fats had dropped, too [*new dyes from plastic teeth*].

They were getting ready to leave as a happy couple again feeling, as we all did, that their mission had been accomplished. They were scheduled for an MRI at home in a month; this would give them the extra certainty they needed.

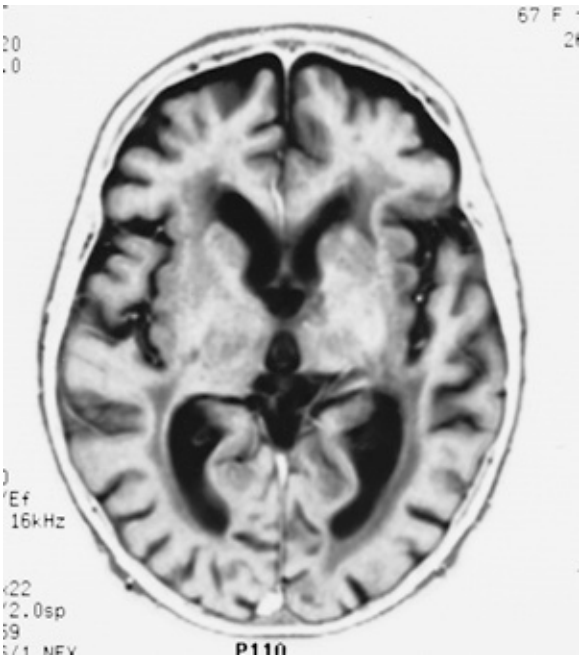
Her last blood test left us quite uneasy on May 31. Her RBC and WBC were still much too low; there had to be a toxin remaining in her bone marrow. Her blood sugar (glucose) was much too low, as were BUN and creatinine. Something was severely curtailing her ability to make these; after all, no cancer patient's kidneys simply get better and better. Liver enzymes and LDH were quite poor.

And total protein had fallen. But at least the calcium and iron levels were improved. Going home would get them away from auto exhaust and public food if these were involved. It was Bon Voyage to Danielle and Karl with just one caution: to hurry back if anything went wrong. Soon we heard that a confirming MRI had been done at home. It was sent for my examination.

A month later we got a Fax telling us Danielle was fine, not gaining but not losing weight. Her functioning was even better than it was here. But a marble-like lymph node had popped out at the left side of her neck near the collar bone. [*This is invariably dental in causation.*] It wasn't growing. By then we had learned of the toxins in plastic dental ware. And we knew that Danielle's mouth was full of it! There was only one thing to do. Get it out. Hurry back and get it out! But she didn't hurry.

By September there was a second marble. Would they never get back?

But the MRI, done on July 26, had shown her oncologist at home there was no abnormality in the brain. So what was the hurry? They had been coasting on the good news. How could the new plastic dentalware be suspect? It didn't sound reasonable to them.



July 26 MRI confirms tumors gone

The Return

They arrived again on September 24. Home had been good to Danielle these four months. She had gained 2 lb. and then could gain no more.

Her toxin test showed she was getting toluene on a daily basis; this would certainly go to her brain. She was losing her balance again. She was not drinking commercial beverages, so toluene was suspected in the prescription pills and capsules she was taking. She was to stop everything for a day till the culprit source could be found. She was happy for the reprieve. Mexican brands were tested and substituted.

Her malonic acid level was high. Now we knew it could come from plain food, as well as dental plastic. We gave Karl the malonate-free food list; his determination was greater than ever.

She was Positive for *Staphylococcus aureus* at the lymph nodes; we knew the problem would be dental since the lymph nodes at the neck drain the mouth fluids. She also had *E. coli* and aflatoxin. But gone were all the other toxins she had originally come with. No Freon. No aluminum. No nickel. No copper! No chlorine. No lead. No mercury. No thallium. And no patulin. She and Karl had

done an exemplary job of keeping a "clean" environment at home.

But my curiosity was piqued. Could there be a tumor growth-even just one-that did not contain copper: free, metallic copper? This was interesting for its own sake; it would be a "first".

We searched specifically in the lymph nodes next and there we found: xylene, malonic acid, aflatoxin, cobalt, vanadium, salmonella, and copper. Copper was <u>not</u> seen at "whole body" testing, above. The level of her exposure was certainly very low. But the lymph nodes were picking up that small amount and "bio-accumulating" it. [*Dental plastic is a source.*]

Her two neck lumps had been biopsied at home and pronounced melanomas by her doctors. But, with her huge improvement quite visible, they had decided to "wait and see" for a month. One was 1 inch (2.5 cm) in diameter, the other about $^{3}/_{8}$ inch (1 cm). The first thing to do was test the upper denture she had received at her first visit. It was Positive for copper, cobalt, vanadium, the malonates, and urethane! She had been getting copper from her polluted dentures. It was replaced immediately (in a few days) with an identical denture, free of the toxins.

She had *Staphylococcus, E. coli,* and three varieties of salmonella in her brain again. Plus maleic anhydride which would give her the symptoms of edema again, also due to polluted plastic in her mouth.

Her blood test showed significant improvements almost everywhere. Only alk phos had gone up. And iron had dropped. The blood fat level had stayed much too low (triglycerides 63).

She was started on potassium gluconate powder to raise her potassium level, and on creatine powder. She would put castor oil hot packs on her neck over the lymph nodes to help them shrink.

A new x-ray of her teeth showed a root tip had been left in from previous dental work. All the remaining plastic in each of her lower molars and premolars was scheduled for removal.

She immediately had better balance after this, but it was not perfect. And *E. coli* continued to test Positive at the brain.

By September 30, her iron had come up significantly, but copper and malonic acid were still testing Positive at the lymph nodes. She had not yet changed her metal glasses frames to plastic. She did this at once. This could be the last mysterious copper source.

On October 1, she was still Positive for copper and malonate at the lymph nodes. They had not returned to the copper-free motel! They planned to move into it the same day. But this would not explain the malonates-all four malonic derivatives were present in her lymph nodes. Yet they were meticulously following the malonate-free diet. All supplements had been tested and re-tested. She had been taking Q-10 on schedule to kill tapeworm stages. There was only one conclusion: there must be left over toxic plastic in her mouth. [*We had not learned to test for urethane and bisphenol-A at the teeth to specifically implicate plastic there.*]

But there was nothing plastic in her mouth. There were only eight teeth present, across the front on the lower side and these were pristine, untouched, never-filled teeth!

She was started on olive leaf tea to help shrink lymph nodes. They were already noticeably smaller.

On October 3, the lymph nodes were down to ¾" (2 cm) and $^{1}/_{8}$" (½ cm) in diameter. But she had accidentally fallen down the previous night, and we were all concerned that it could have been due to a seizure. She had taken herself off dilantin, although she had been on two a day when she arrived. Could it have been due to rotenone used liberally in all motels except the safe one? She did test Positive for rotenone, from the previous motel. She was given taurine, and GABA. Unfortunately, the GABA was not provided immediately and she was without for another 2 days.

She soon had another "seizure". [*They are caused by* Ascaris *escaping from a draining tumor.*] This time they went to an emergency facility in the U.S. where she was hospitalized. It now required 3 tablets of dilantin a day to get her blood level up high enough. While in the hospital, a new blood test was done for her (October 6). Although the ranges are not strictly comparable and serum iron was missing, the results are informative. The good trends were continuing, the LDH had dropped almost to normal and liver enzymes were getting better.

On October 8, she returned, in a wheelchair now, due to the injury from her fall. But her appetite was good. It was just her general grogginess that disturbed us. If it was indeed seizure activity, then she was still getting maleic anhydride to her seizure center causing edema there. (We did not suspect *Ascaris*.) This would derive from maleic acid, namely dental plastic.

On October 9, she tested Positive for cobalt at the liver, vanadium at the bone marrow, and copper at the liver. This trio implicates plastic or metal. We went to work. Each of her remaining eight lower "pristine untouched" front teeth was rubbed with an emery board. The end of the emery board with the rubbing was cut off and dropped in a baggie for testing (water added first). The last tooth on the lower right side was Positive for cobalt, copper, and vanadium. But this tooth appeared pristine. It had never been tampered with! Nor had any of the other seven in the row. We sampled the tooth again, compared it with the saliva test; there was no mistaking the Positive results for the familiar trio. We recommended extraction of that perfect-appearing tooth. The dentist rebelled. He had examined these teeth several times. He could not in good conscience extract a "perfect" tooth. We discussed the risk and possible benefit for Danielle, namely death versus a gap in her teeth.

On October 12 the tooth came out. It was brought in for my inspection. It had a huge plastic filling on the back side! The dentist visited later. He explained that plastic can easily escape detection by x-ray, as well as by the dentist's eye even with the help of dental dye. Although three individual x-rays had been done to search for it, plus numerous dental visual inspections, it had escaped detection.

No sooner was the dentist's drill applied than its true soft nature was revealed. *(Now we would easily find it with a digital x-ray.)*

By October 14, she was alert, active, and completely normal appearing. She was put on dexamethasone instead of dilantin. The smaller of the two enlarged lymph nodes was completely gone. The larger lump was no longer visible (but parts could still be felt below the skin). Now was the time to stay and finish the task for Danielle, so she could be secure at home.

But it was "home again" after a last blood test. The calcium was again too low, the blood sugar was too low, and Bun and creatinine were too low (in spite of taking creatine by mouth).

Iron was still too low as were triglycerides. And the anemia and leukopenia (low WBC) were quite apparent. Possibly, not enough time (two days) had passed to reflect the dental improvement (latest extraction). [*Nor had we yet found the pollutants in the capsules that held her supplements before they left.*] Nor could we be sure she did not have yet another plastic filling! They left before all this could be checked.

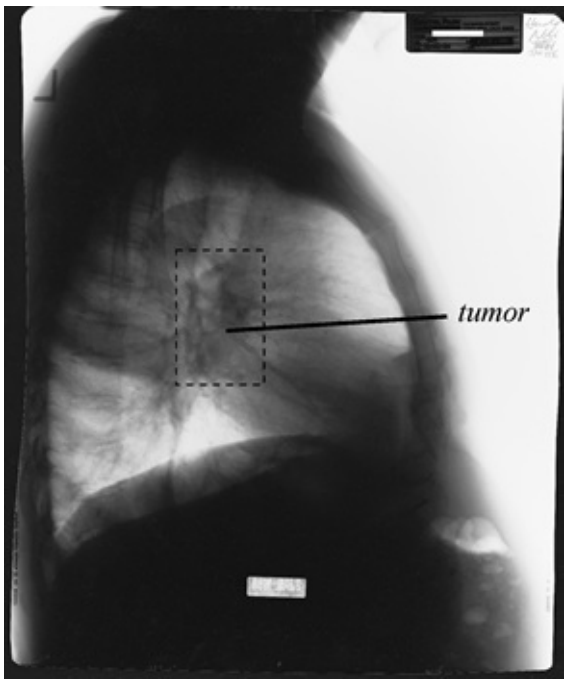
Summary: People as beautiful as Karl and Danielle deserve every chance. Of course, people of all sorts deserve such a chance, too.

The toxicity of dental plastic is unknown, its relevance to tumor growth is unknown. Dentists can't be expected to know. The general pollution of human food products with a dozen tumor-growers is unknown. Manufacturers can't be expected to know this. Who then, is responsible?

28 Herve Curo Lung/Liver/Brain Cancer

Herve Curo lived just a few hours' drive from the clinic and did not choose to be either an in-patient or out-patient. He wanted to come and go as he pleased; especially, since his doom had been sealed. It lay on his lap in the form of scans and summaries; lung cancer, liver cancer, possibly now the brain, as well as skin.

His January 2 chest x-ray showed a large tumor, the size of a pear lying vertically in the right lung. He was put on chemotherapy, but it made him sick. Besides, it would cost him $800.00 for 20 pills. And it would all be hopeless anyway. So he had put himself on the parasite program and zapper on Jan. 6. He also had considerable "infiltrate" meaning fluid accumulation in the lung tissue.



Jan 2 x-ray shows pear-sized tumor

When he arrived on June 14, he had the appearance of a tired old man, rather corpulent and quick with the lip. He was losing his balance, needed someone to help him get about, and had some pain around the lung area, but he still made quips about all this. His arms became numb for periods of time and his legs felt tired. His knees were quite painful, but he could still walk.

His initial toxin test showed: asbestos, arsenic, copper, chlorine, cobalt, formaldehyde, lead, mercury, thallium all Positive. He also had systemic *E. coli* and staphylococcus bacteria and, of course, malonic acid. He was given the parasite-killing herbs on the spot and zapped. He was advised how to do his dental cleanup and sterilize dairy foods. He was given the malonate-free food list and told to change his copper plumbing, which was also giving him lead. He was sent out to change his glasses frames to plastic. [*We did not yet know that plastic frames could shed vanadium and dye and also needed careful washing before they are first worn.*]

He was scheduled for a fresh x-ray of the lungs and CT scan of brain and liver that afternoon. He was given the kidney herbs and all his supplements. No other supplements or drugs were to be taken due to risk of pollution. He obtained Lugol's, glutamine, coenzyme Q10, B_{12}, folic acid, vitamin C, taurine, cysteine, methionine, and glycine.

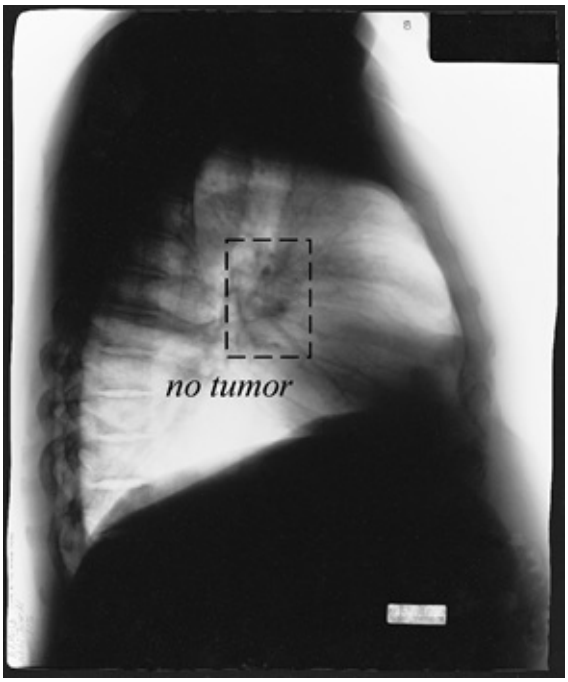
His IV of EDTA was formulated and ready to pull his heavy metals out. Then Herve disappeared. He was nowhere to be found. He had paid his bill and simply walked away without even making a follow-up appointment. He had left his new scans on the desk (not shown). The liver showed numerous small tumors, the lung had its very large tumor. He had even done a bone scan which showed numerous lesions in the skull. What were his chances, we wondered. "Entirely nil" said the pathologist and two assistant physicians. Two weeks to two months was the forecast. We called him at home just to make sure he had understood we wanted him to come in for IV therapy every day and to monitor his progress by daily testing. He had understood.

Twelve days later he returned. We gasped. No faltering gait and stooping. He said his numbness was gone. We reviewed his earlier blood test with him. We asked if he was diabetic, since the glucose level was 350! He suggested not to "give it any mind," since he wasn't. He wasn't feeling bad; in fact, he was feeling better and didn't want any "medicine". He brought a new chest x-ray done June 21, a week after his initial visit.

His LDH showed absence of tumor growth (152)-possibly due to chemotherapy he had been given previously. The lung tumor, though, was implicated in the high alkaline phosphatase (317). [*Research results from the Syncrometer® indicate the dye DAB causes a particular mutation that elevates the enzyme alkaline phosphatase. (This enzyme controls calcium deposition in bone.) If alk phos is high you know immediately bones or lungs are involved, and you can expect to find lesions and tumors. Current clinical theory holds that high alk phos is a result of cancer; I see the opposite. But at this time I was still using alk phos as a tumor indicator.*]

The albumin was too high and globulin too low, evidence for cobalt in the liver. Uric acid was much too low, showing there was not enough glutamine to manufacture purines which metabolize into uric acid. (Other explanations come later.) Phosphate was too high, showing that his bones were being dissolved at a fast rate, by the high alk phos. But there at the end of the report were his

cholesterol and triglycerides! Especially his triglycerides were nicely elevated! This would give him a fighting chance. Maybe he could survive. Maybe his diabetic status would even help. Dying cancer patients have extremely low glucose and triglyceride levels. Their tumorous tissues consume it so fast. Perhaps diabetics' tissues cannot consume it fast. Maybe this puts a brake on the tumor activity. And perhaps this speculation was completely wrong. We would see.



June 21 a "negative lung"

We formulated his IV to readiness again. But Herve was nowhere to be seen. He disappeared again! He had done another blood test, picked up fresh supplies of supplements, had been tested for copper and malonic acid and left! (Both were Positive.) We hadn't even reviewed his x-ray! He had gotten it done at home and just kept it tucked under his arm. What could we do about Herve? It seemed he wanted less of life than we did for him. But at least he came in sporadically and we would have a chance to see if it was possible to improve without IV intensive care.

This time he returned in a week, July 3. His knee pain was gone now besides his earlier numbness. He had looked at his new x-ray and was eagerly shoving it at us. It was almost embarrassing to see the improvement. The tumor remains were barely distinguishable in the lung. Was it still tumor? We would have to

wait for the radiologist's report. We warned him about coughing up blood. If this should happen, he should come in at once; we would give him a Chinese herb to prevent hemorrhage-as much as possible! We explained that as lung tumors shrink they may pull away from tissue, causing pain and bleeding, not to be alarmed. It was plain to see that we were the alarmed party, not him.

He had not yet started his dental cleanup. They were working on the plumbing at home that afternoon. He did another blood test and disappeared again. We had told him about his blood test improvements, in the hope this would improve his concern for himself. His kidney function was no longer blocked by malonic acid; BUN was up strikingly.

His lungs were improving; there was less tumor activity, alk phos was down. Uric acid was up (he was eating no malonate foods and taking glutamine supplement). His thyroid was better; calcium was down and less phosphate was coming from his bones. Potassium was up. A week later, July 10, he came again. All the symptoms he had come in with were gone, he said. He did a new blood test, got supplies, and left.

Two weeks later, July 24, we reviewed it with him. His glucose had dropped 100 points (glucose 250). His diabetic condition was much better. Kidney function was better (creatinine lower). His LDH was keeping low. His lung tumor must be shrinking (alk phos 260). His albumin was a little lower and globulin a little higher-a better liver. Uric acid was higher; phosphate lower.

Did he have his own kind of magic? Or was his "stubbornness" paying off in avoiding possible IV pollution and plastic dentalware pollution? We had not even reviewed his June 21 chest x-ray with our own radiologist yet. The clinic radiologist was away on temporary leave, so we viewed it in August. What a surprise. The letter with summary stated there was "no tumor or pleural effusion or pulmonary edema or hyperinflation. In fact, he had a negative chest."

His August 2 blood test showed further improvement in the alk phos. He now got his dentalware changed to plastic.

A month later, September 11, his blood test was decidedly worse. It would be a harbinger of things to come. We must somehow trap him long enough to sample each of his new dental fillings and test them for copper, cobalt, vanadium, and the malonate compounds. He had changed his glasses frames

quite early, did get his copper plumbing changed, and said he was "doing everything." His WBC showed that bacteria were on the rise; glucose (208) continued to drop showing improved diabetes; ALT showed a liver toxin was up; [*LDH showed tumor activation by Sudan Black B dye;*] GGT showed more liver toxicity; alk phos implied that lung tumor remnants were shrinking.

But trapping Herve was no small challenge especially now that life was being handed back to him.

Summary: We saw him again a few months later; he was still his devil-may-care self. It is tempting to think his negligence somehow benefited him. We hope so. As for ourselves; we would rather choose diligence. Yet, there are lessons to be learned from even the most contrary approach.

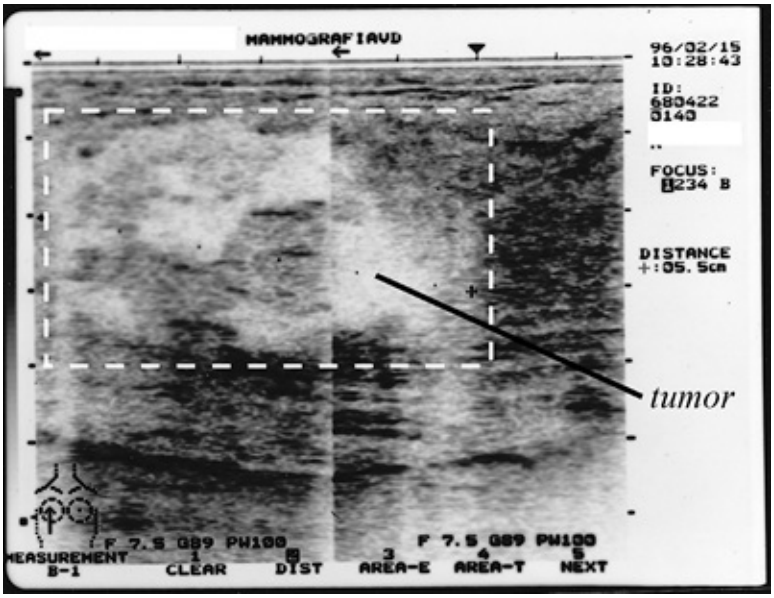
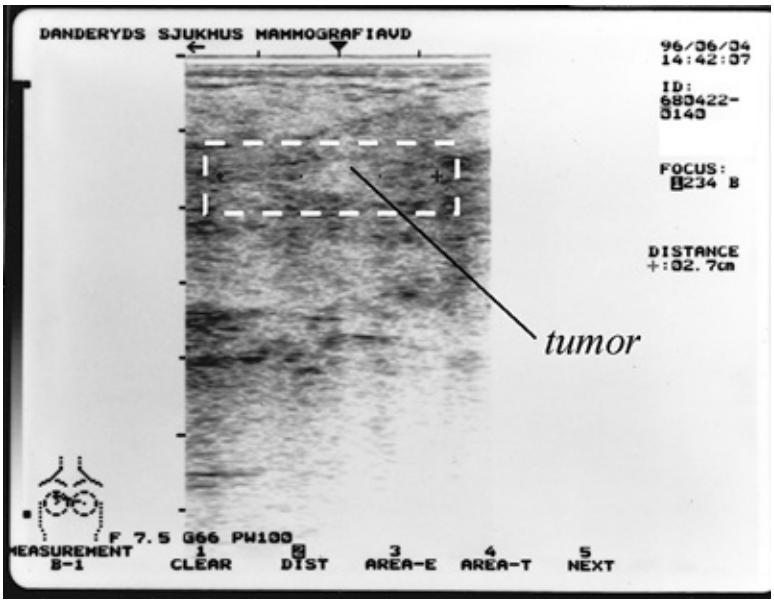
29 Jess Ingerson Breast Cancer

Jess Ingerson, age thirty-one, came for one month, all by herself, from Sweden. Friends had prevailed upon her to come to us rather than lose one and soon both breasts to a mastectomy at her young age. But family was very much against it. Throughout her stay she vacillated between optimism and pessimism, not sure whether to go with the opinion of friends or family.

Her family had insisted on four courses of chemotherapy, which brought the breast tumor down from 5½ cm to half that size. But did not completely destroy it. It did destroy the small nodule in the arm pit. In spite of these improvements, they still wanted to do a mastectomy. No professional person would want to see a young life snuffed out, so whatever dismemberment could guarantee safety for her was gladly recommended. We would do no less, if there were no other way to give her hope for life.





Feb 15 mammogram showing 5.5 cm tumor, Jun 4 mam-mogram after chemotherapy shows reduction to 2.7 cm

But she wanted to attend to her teeth before coming to Mexico. A relative, being a dentist, gave her eight beautiful, shiny porcelain teeth right across the front of her mouth to replace amalgams; he felt he knew best for her. This would prove her undoing, because she was afraid of his wrath if these teeth were touched. Besides, she was in love with these teeth, as any young woman might be after a lifetime of bad dental health and a defensive smile.

So with our hands tied by "untouchable teeth", we decided to do our best with the tumor she brought. Perhaps she would learn the issues herself and then be personally able to control her destiny. It was not to be. At least not in this visit. Although the tumor disappeared, it would surely return under the strong influence of heavy metals and malonates seeping from her porcelains. One couldn't help but wonder what she had been eating to give her eight rotten front teeth in the first place. But this was past history and comes now Jess with mammograms in hand.

The Feb. 15 mammogram shows the tumor as it had been (football shaped white area between the two + signs) at 5.5 cm. By June 4 the tumor was reduced, but still covered a narrow oblong area of 2.7 cm in length. She arrived three days later. Our initial tests showed ortho-phospho-tyrosine Positive at lymph nodes, Negative at breast. Evidently all parasites had been killed at the breast location, perhaps even by the chemotherapy. But they survived at the lymph nodes. Malonic acid Positive at breast; benzene Positive; isopropyl Positive (she would get off shampoo and bottled water immediately); *E. coli* Positive; CFC Positive

(she should change her refrigerator at home); fiberglass Positive; aluminum Positive (probably her porcelain teeth); arsenic Positive; copper Positive (she would go to our safest Mexican motel immediately); formaldehyde Positive; cobalt Positive (she would stop using detergent, but was it hiding in her porcelain?); mercury and thallium Positive (leftover amalgam, now permanently hidden under the porcelain); aflatoxin Positive (she would read the section on moldy food in the *Cure For All Cancers* book).

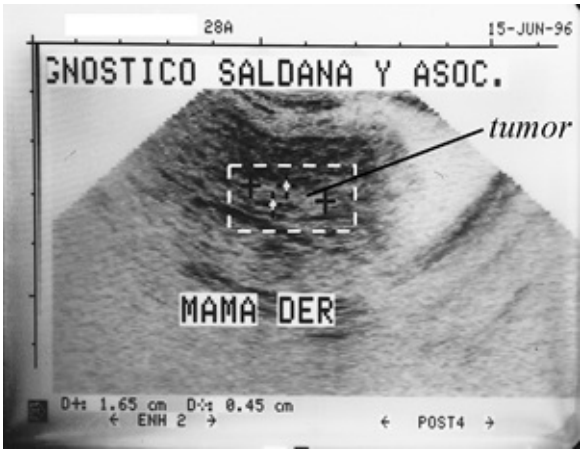
We had no time to lose; thirty days is a very short time to disintegrate a tumor of this size; perhaps it can't be done at all with leftover amalgam and fresh aluminum plus malonic acid placed in the mouth to be sucked on day and night.

We started her the very first day on:

- the Freon removal program
- 2 tsp. black walnut tincture extra strength parasite program with zapping
- vitamin B_{12} and folic acid
- vitamin C
- cysteine, taurine, glutathione
- coenzyme Q10
- thyroid 1½ grain in the morning
- wearing no regular bra, the athletic variety that does not lift would be okay.

Because of the handicap in dealing with her porcelain teeth, and the urgency of saving her from mastectomy in thirty days, the decision was made to use IV therapy daily. Cost was not her main issue. Time was. Success was. Perhaps, too, if she saw the tumor shrink she would gain confidence in the underlying theory and come to her own conclusion that the porcelain must go. They hide Clostridium bacteria, hide bits of amalgam, and seep carcinogenic materials. Her IV was formulated after her blood test was read, June 8. It was rather poor for a young woman, who should be at the peak of her health.

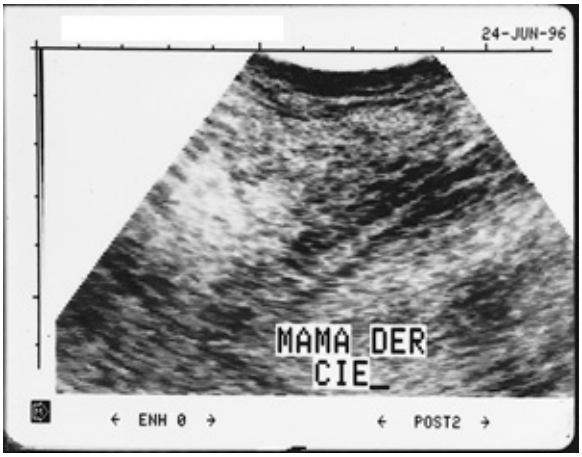
Both RBC and WBC were probably lowered due to the chemotherapy and would soon rise. The two liver enzymes, AST and ALT were higher than a healthy person should have. [*But the LDH showed almost no dye toxicity yet*.] Uric acid was too low, showing a lack of glutamine [*we were not yet aware that it also implied Clostridium invasion*]. She was given a glutamine supplement. Both calcium and phosphate were very slightly elevated, showing an upcoming problem in the thyroid.



Jun 15 sonogram shows tumor down to 1.65x.45 cm

Her iron level, 55, was acceptable, but suggested copper toxicity, which, indeed, it was. Potassium was much too low. She was given potassium gluconate powder equivalent to 1 gm potassium/day and told to use sodium-potassium salt to help keep it up.

Her first IV contained 2 doses of EDTA to pull out copper, plus vitamin B-complex and vitamin C. After these, she was tested for copper again, at liver and parathyroids. She was now Negative, so the IV was changed to: laetrile, DMSO, B complex, calcium, magnesium, vitamin C. She would get this daily except Sunday. Since her mammogram was perfectly fresh, we did not schedule a new ultrasound.



Jun 24 no tumors seen

By the fifth day, she was feeling much better and sleeping better. She was now testing Positive for glutathione, TNF, and methionine at the breast. But there was still no glycine. (This is an amino acid that should always be present.) We added glycine to her supplement list. She also continued to test Positive for mercury and thallium.

Her second blood test showed improved liver enzymes, AST, and ALT, but albumin was too high and LDH had gone up slightly, too. Iron had dropped further. The usual culprits were at work: malonic acid, cobalt, and perhaps hidden copper and vanadium. Mercury and thallium were Positive at breast and lymph node every day, in spite of removing every scrap from her environment (paper goods).

A sonogram of the breast eight days after her arrival, nevertheless, showed great improvement. Only a small bit of the tumor remained. It was measured to be 1.65 x 0.45 cm, a far cry from 2 x 2.7 cm when she arrived. The system was working. Unfortunately, she concluded that this proved it would not be necessary to disturb her porcelain teeth and was more adamant than ever!

Her IVs continued. Her mercury and thallium toxicity continued. We added thioctic acid to her supplement list. In spite of all this, her next blood test, June 18, did not show improvement. BUN-that is, her ability to make urea-was lower than ever, and her calcium and potassium were very low, also.

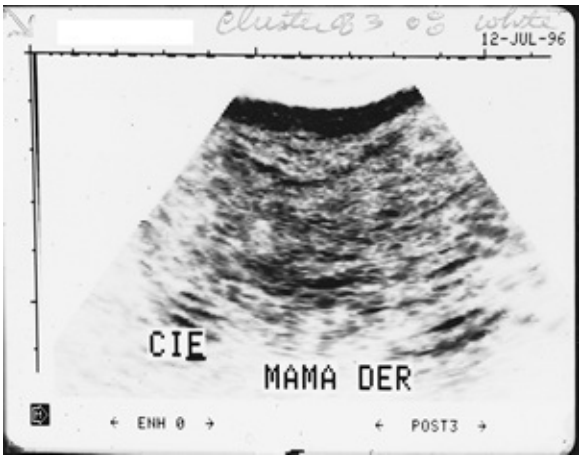
Her next ultrasound done on June 24 showed no tumors in the breast at all! Two radiologists agreed on this. But she was not at all happy. She was sure it was a mistake. Her family, too, by telephone persuaded her it was all a big

mistake; that Mexican ultrasounds were forgeries, rigged somehow, and she should come home at once. And have a mastectomy.

Indeed, there might be a remnant, too small for ultrasound to detect, remaining. We, too, harbored these misgivings. And a CT scan would have been better. But she had money to save and ultrasounds are much, much cheaper. She could do the CT scan at home with fresh resources. The radiologist here could see no tumors. It suggested disappearance.

Several more blood tests showed some ups and downs. Malonic acid continued to be Positive, while uric acid bottomed out at 0.6, and calcium and potassium stayed low. The parathyroids had been targeted possibly due to their nearness to the tooth restorations.

We prevailed on her to stay a little longer; she was still getting sensations in the breast. *Staphylococcus aureus* was still in her lymph nodes. She consented to a panoramic x-ray of her mouth to search for cavitations. Several were easy to spot. The dentist cleaned them.



July 12 still no tumors seen

We took her off IVs on July 3 to see if the tumor would reappear. Her thirty days were up, but her personal intuition prevailed. She extended her stay for two weeks. She could now enjoy her days without being hooked up to an IV bag. Six days later, July 9, her blood test showed significant improvements: LDH down and potassium up. But it was still poor by our standards.

We decided to do a complete heavy metal test. It turned up zirconium Positive; aluminum Positive; aluminum silicate Positive; D-malic acid Positive

at both breast and lymph node. The battle was not won. The implication was porcelain. She called her family for permission to change the porcelain teeth to plastic. It was not given despite copious tears and explanations. One family member was a dentist and one an MD and her body had to be sacrificed for them. Surely, these blind forces of submission, that tie us with irrational might, are no different than live-spouse burials and other human sacrifices we have learned about in history books. She had the power to escape, to make her own decision, but she didn't try. [*That's how I felt at the time. Ironically we now know the plastic might have been worse.*]

One more blood test was done, and another ultrasound. Again, no tumors could be seen. The blood test improved further, but it was not very different than when she arrived.

The accomplishment was only the shrinkage of her tumor.

Summary: We had done our part. And we wished her well. She smiled, but all I could see was the porcelain-it would stalk her like a predator. Perhaps she would understand its true nature eventually. These teeth should all have been extracted.

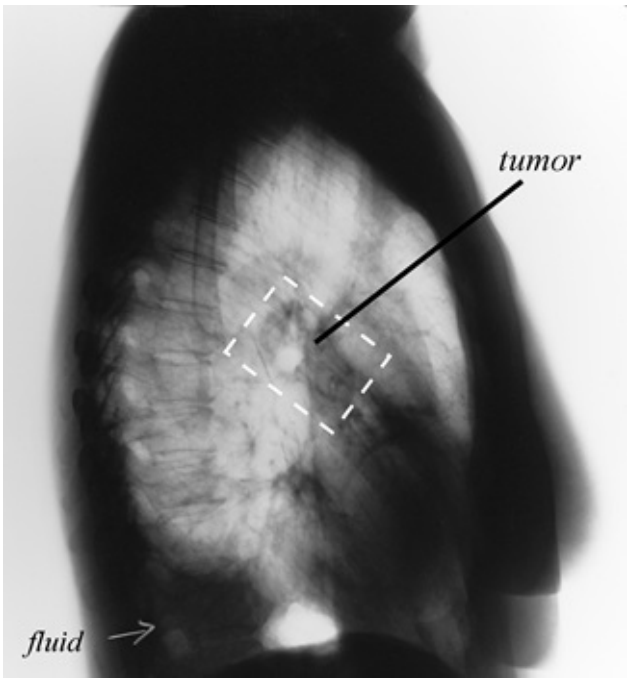
30 Tracy Guerin Ovarian & Lung Cancer



June 13 chest x-ray shows tumor and fluid

Tracy Guerin, fifty-four, started her bout with cancer five years ago. It was ovarian cancer then; but now it was in the lung. She had already been drained of the fluid accumulation three times. It was accumulating faster now, and she arrived huffing and puffing, and somewhat hoarse. In spite of this, she was making plans to leave for another country where she held a post of international importance. If a good attitude plays a role, it had its benefits here. Her cheery smile belied all the facts in the matter.

Her toxic metals included aluminum, nickel, copper, cadmium, cobalt, mercury, and thallium. She was also full of Freon, fiberglass, formaldehyde, three vicious air toxins. She agreed to clean these up at once. She had both patulin and aflatoxin build-up and agreed to stop eating apples, dried fruit, grocery bread, and nuts. She took off her jewelry and cosmetics.

By June 1996, we already knew what causes pleural effusions-maleic anhydride. We could observe maleic anhydride being formed from maleic acid

by the body if vitamin C was present. And maleic anhydride could be further detoxified to D-malic acid, again, if vitamin C was present. [*But we didn't know that maleic acid was a direct component of certain dental plastics and that it would diffuse out forever if you were the unlucky recipient. Nor did we know that acrylic plastic is detoxified to malonic acid by the body, which then could be turned into maleic acid.*] At least one source could be removed, the food source. She began at once to eat only malonate-free food.

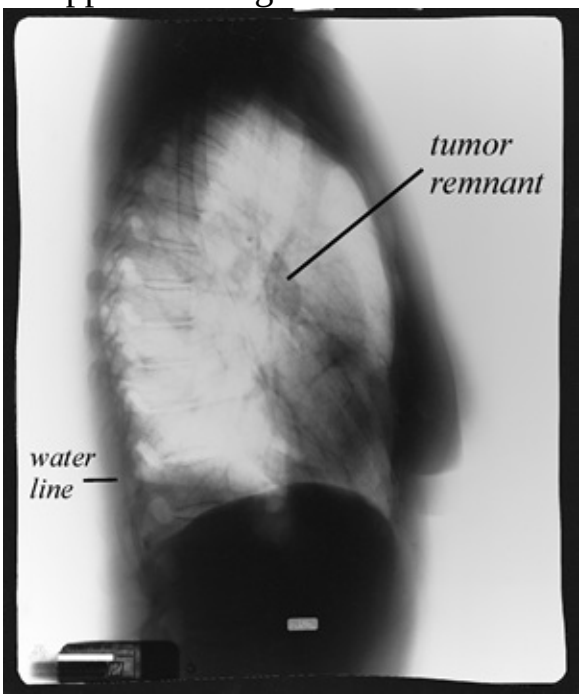
It was June 12; she had to leave in six weeks. The task was impossible. Her chest x-ray showed a pear shaped mass, pronounced lymphatic nodules, and fluid at the base that obliterated the lung margin. This news did not discourage her. She agreed to change her plumbing, get her dental problems corrected, and start right now with an IV containing 3 doses of EDTA to pull the heavy metals out of her body. She started the parasite program and coenzyme Q10, and glutathione. She started taking Lugol's and using white iodine for brushing teeth.

Her blood test did not reveal her critical condition. She was still in good health. And she would be able to recover if her lung problem was corrected. It was only that, a problem. Not broken down health. [*Her LDH and alk phos were both very slightly elevated to show there was some toxicity from dyes, but not much.*]

The alk phos spoke for the lungs. The total protein was also very slightly elevated; the globulin just a bit too high. Iron was too low due to copper, and potassium was too low, also. Perhaps she would be saved by her normal triglycerides and cholesterol. We were grateful for these. She got off to a slow start by not getting into the copper-free housing immediately. Three days later she still had some copper at the thyroid and parathyroid glands. So EDTA had to be applied again. After this the IVs would consist of laetrile, DMSO, vitamin C, and cesium.

In spite of perfect adherence to the malonate-free diet, it was still present at the parathyroids. This would account for the drop in calcium to 8.8 at the next blood test, done June 21. Copper and vanadium, too, persisted at the parathyroids. We wondered if the vanadium and malonate had been newly placed in her mouth. She was in the middle of amalgam replacement. The LDH went up instead of down. Yet, the alk phos, reflecting the lung condition, went down. Would this show up on the next lung x-ray? The effect of vanadium would also explain the RBC rise. The rise in serum iron could only mean there

was less copper toxicity due to amalgam removal. The uric acid dropped as it became unmasked. We supplemented glutamine.



June 26 air capacity doubled, tumor dissolving

By June 26 (two weeks later), Tracy was feeling very much better. She was no longer huffing and puffing; her voice sounded strong; her personality sparkled. Should we dare repeat the chest x-ray? It was only thirteen days from the first discouraging one. Only if she promised not to be discouraged. She did. We needed her continued optimism and compliance if we should do an early follow-up. The new x-ray showed almost double her former air capacity-twice as much white area on the print. Her lungs were filled with air again; no wonder she could walk briskly.

The water-logging of her lungs had stopped, the base of the lung was now fully expanded where water had accumulated before (see arrow drawn by radiologist on earlier x-ray).

The large tumor had lost its top half; it was evidently pulling apart and dissolving. Other tumors were just vaguely visible. The water line was much lower. She had her lungs and her life back. But she did not chafe and beg to leave. We appreciated her wisdom.

By June 28, a blood test showed her iron level up to normal, and other improvements. But by July 4, the gains were eroding. What had transpired in

that time? It had been about ten days since her amalgam had been removed and plastic installed. We could attribute the gain to amalgam removal, should we blame the plastic for the deterioration?

She changed her glasses frames to plastic and abruptly lost her breast pain. The pain was actually under the left breast, no doubt where the large lung tumor had its remains. We stopped her IVs-no longer necessary. We started her on Lung Tea, mullein and comfrey, cooked together to make a strong tea. Plus garlic, one raw clove daily; no need to chew, just bite and swallow.

By July 12, a new chest x-ray (not shown) still showed a remnant of tumor, it was now spindle shaped. And a region of infection was still apparent.

She was still Positive for nickel. She did a liver cleanse, but it did not get rid of nickel. We gave her thioctic acid, but it did nothing. Finally, she found it herself. She pulled out a personal air purifier with a shiny metal case that you hang around your neck; it blows "purified" air at you. Hers blew nickel. She stopped using it. The nickel disappeared in two days. But she still had pain in the lung near the breast bone in the morning when awakening. When she arrived in the morning totally fasted, a saliva sample was still Positive for malonic acid derivatives. Where could it be coming from except her own body? That is, what had been placed in her own body. We began to suspect the new dental work. But her stay was near its end.

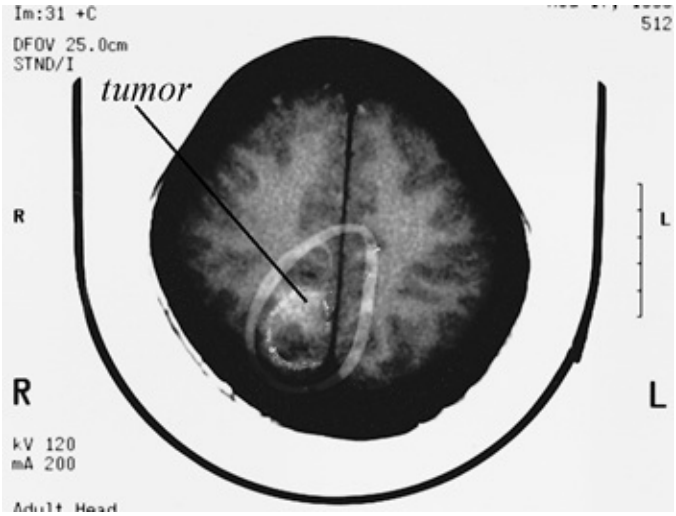
She had received three crowns (against directions), one bridge, eight fillings, and two porcelain fillings (against directions). With a bacterial problem like hers, it was ill advised to invite them into a new hiding place under a crown. She was game for removal of one crown only. We explained it was not a moral issue, as she carefully brushed the tiny bit of plastic that was covering her tooth stub. Then we rubbed it with an emery board. It tested Positive for maleic acid. This would seep out and get to her lungs. The body would detoxify it to maleic anhydride and then not be able to detoxify it further in the lung. The anhydride would cause effusion of liquid from the lung again.

Her mouth had to be redone! But she would hear none of it. Her mouth looked beautiful again, her tumor was gone (last x-ray not shown), her lungs worked, and her departure date was just days away. She felt she could risk it. I didn't. But we wished her Bon Voyage. And we had learned a mighty lesson: that malonic acid could come not only from tapeworm stages and food, but from a totally unrelated, inanimate source-plastic. And it was a precious discovery made by electronic testing of dental plastic directly. Would we now be able to clear up the mystery-source of malonates that had plagued us for so long?

31 Wendy Skoglund Brain & Liver Cancer

Wendy Skoglund came from Finland with cancer of the brain and liver. There were nine hemangioma-like cysts in the liver, which were the cause of her anxiety. She felt the brain tumor was not bothering her, although she had some facial paralysis. She also had numbness in her left fingers.



Aug 17 prior year MRI shows brain tumor

Our testing, though, showed there was malignancy (ortho-phospho-tyrosine) in the brain, not in the liver. Therefore, we focused our attention on the brain. Chronic headache and tremors added weight to this decision.

An MRI done a year earlier showed a single tumor at the posterior occipital on the right side. The radiologist's inner circle marks the boundary. The full skull view showed the bones bulging out in little billows from the internal pressure (not shown).

Her initial toxin test done at the liver showed:

Solvents and Pathogens	Metals	Other toxins
isopropyl Positive	cobalt Positive	malonic acid Positive
wood alcohol Positive	copper Positive	patulin Positive
	arsenic Positive	CFC Positive
Salmonella typhimurium Positive	mercury Positive	chlorine Positive
Staphylococcus aureus Positive at cerebrum and liver		aflatoxin Positive

She was immediately taken to a Mexican "copper-free" motel nearby. Actually it was only copper-free in dry weather. If it rained and a main water pipe broke, water would be brought in by tankers; this always contained copper and all clinic patients did a hasty exodus to other quarters. Her metal glasses frames needed to be changed to plastic, too, to eliminate copper.

A mouthful of gold and plastic would also have to be cleaned up. She had some implants that our dentist did not want to remove. But with dental bacteria in the brain, no metal whatsoever could remain. It would cost a small fortune. In

fact, they had already cost her a small fortune. Wendy was a forward looking person, though, ever practical; she scheduled it all for removal regardless of obstacles. She was only fifty-six.

On her first day, she was started on the following: 1. The parasite-killing program plus zapping. This would eliminate the malignancy. Then began our race to shrink the tumor before her return airline ticket date. 2. Glutathione. 3. Lugol's iodine until *Salmonella* was absent from her brain. Then only once a day, at bedtime. 4. Coenzyme Q10. This would kill tapeworm remnants [*our method at that time*].

She was given the malonate-free food list to observe.

Since her symptoms were gradually worsening, there was no need to get a new "starting point" MRI of the brain. It was unlikely that the tumor had shrunk in light of her worsening symptoms. Would we be able to shrink it?

Then Wendy had to make an important decision. Did she want IV therapy or not? She had come a long way to stop this life threatening disease. We could put her on IV therapy including laetrile, DMSO, cesium, our "tried and true" tumor shrinkers. This would cost $330.00 per day. Or she could try our new IV-free therapy consisting of large doses of supplements. Her question was pointed: Could I guarantee tumor shrinkage with IVs? I could not, in the time frame of her stay. Would IVs be faster than no IVs? This was still unknown. We had only recently begun our no-IV therapy. Her long history of a natural life-style (except for dentistry) won the debate. She chose to go IV-free, unless she got worse.

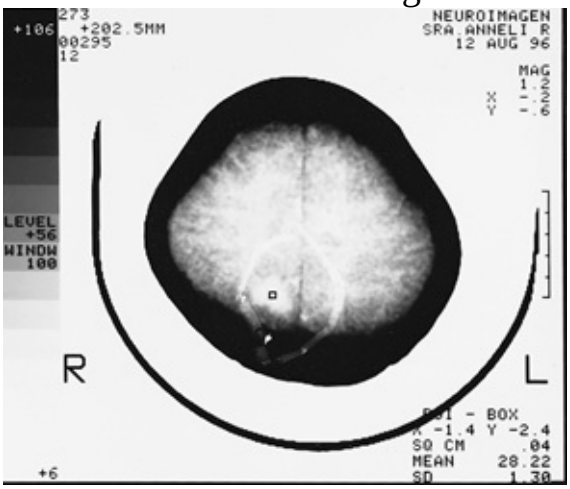
Never had we hustled more than for this brain tumor, one of our first attempts to shrink one without IVs.

Her blood test results arrived the next day, July 31. Only the uric acid was too low. Everything else was nearly perfect. It would not be necessary to do repeated blood tests. We supplemented her with glutamine. [*We did not yet understand the most critical significance of a low uric acid level-Clostridium bacteria!*]

Potassium was somewhat low. She was given potassium gluconate powder to take. Triglycerides were too low. She should eat high fat food, such as avocados, butter, and cream.

Wendy was a perfect example of a patient given a dismal "terminal" prognosis

by her regular doctor, although the blood test shows a truly healthy person. Only the location of the tumor makes it life threatening.



Aug 12 inner white spot with square is tumor remnant

For the first eight days she continued to test Positive for copper and malonic acid. She was still in the process of dental work. She was given EDTA powder by mouth to remove it meanwhile. The dentist had found four cavitations, besides, at her four wisdom teeth. Finally, no metal or urethane (plastic) could be detected in her brain or anywhere. Her teeth were "empty", not extracted (all fillings out, nothing replaced). But she thrived on her "empty mouth" status. Her left hand numbness disappeared. Her heel pain disappeared. The tension left her head. Energy was up. And she just felt better all over. She was getting impatient to have her dentalware put back! We explained the hazard of using anything new till full healing was complete. All foreign things seek out a trauma site-morbitropism.

We were now becoming impatient to see if her tumor was shrinking. After two weeks she did a CT brain scan. The tumor was about half its earlier size of a year ago. It was now 1.9 x 1.9 cm. It had been 2 x 6 cm. A liver scan was done, too (not shown), revealing the nine hemangiomas-not tumors. [*Hemangiomas may be due to oxidation products of vitamin C.*]

Wendy Skoglund	7/31
RBC	4.49
WBC	6,400
PLT	322
glucose	145
BUN	9 (5-26)
creatinine	0.9
AST (SGOT)	28

ALT (SGPT)	22
LDH	159
GGT	9
T.b.	0.8
alk phos	69

Iron	80
Sodium	140
Potassium	3.9
Chloride	106
triglycerides	72
cholesterol	232

A few days later, her finger numbness returned. And also the right heel pain. We searched for toxins; it was mercury. Her foods and products were tested for mercury and thallium. Only paper towels tested Positive. She stopped using them.

We supplemented her with taurine, cysteine, thioctic acid. Nothing helped. She continued to test Positive for mercury. She had not yet parted with all her dental gold. Could it be that?

We raised her thioctic. Yet she was Positive. We searched her for the full list of heavy metals. She was Positive for nickel, too. Then it was obvious. This could only come from gold because nickel is used as a hardener for it. The curse of Midas was in her mouth. There was probably amalgam under the gold. But she only had one day left. She ran to get the gold out! In her haste and anxiety over unfilled teeth, she accepted unsafe plastic dental material for restorations. She boarded her plane. She felt good. Her symptoms were gone again. She had achieved what she came for. And we had achieved our first brain tumor shrinkage without IVs. But she will be back.

Summary: Time and financial constraints shaped Wendy's life as much as ours. What was the final outcome? Could healthful living keep up with toxin release from her mouth? Would she suspect the truth in time? We wish her well.

32 Suzanne Codding ? Cancer

Suzanne Codding was a beautiful twenty month-old girl, but there was quite a lump on the right side of her neck. It might have started with strep throat for which she had been given Augmentin and Amoxicillin (antibiotics). After the strep throat, the lump appeared and grew rapidly. It was surgically removed and clinically tested for everything: malignancy, fungus, and bacteria. Everything was Negative, except possibly a kind of bird tuberculosis. It was only six weeks since the surgery and the lump had already returned; in fact, it was 1½ x 1½ inches in size. Another surgery was being scheduled. The parents were alarmed.

Taking the tuberculosis hint, I searched for resonance with my three *Mycobacterium* slides. I also tested for *Mycoplasma*. The baby's saliva sample was used instead of the baby's hand for testing. *Mycobacterium phlei* was Positive. No others.

The same saliva sample was used to do the initial toxin test. Ortho-phospho-tyrosine was Positive, indicating a malignancy, despite the earlier clinical tests. Additionally, all of these were Positive:

Bacteria and Solvents	Metals	Other Toxins
Salmonella dysenteriae	copper (water pipes)	aflatoxin
Salmonella paratyphi	cobalt	CFC
	mercury (diapers)	malonic acid
isopropyl alcohol		

July 15 20 month old with growing lump in neck

Mycobacterium phlei is considered an innocuous soil bacterium. But I frequently find it present in brain diseases. It is always present in schizophrenia. Usually, family members and their dog have it also. It can be found in the dental area, possibly under tooth fillings or in tooth infections. Of course, Suzanne had neither.

Suzanne's parents both tested Positive to *Mycobacterium phlei*, although there was no family dog. However, relatives had dogs and they would visit occasionally. Perhaps she had been licked on the face: The parents were advised not to let the child near a dog.

She was immediately given the herbal parasite treatment and zapped. Twenty minutes later she was re-tested for ortho-phospho-tyrosine. She was still Positive. Two and three-quarter hours later she was Negative. They could go home for one week. The parents were instructed to treat themselves the same way immediately. The baby's diet was made safe from reinfection. The water pipes were to be changed to plastic. The refrigerator was to be changed. No commercial diapers, or any personal products made of paper were to be used on her. No detergent was to be used. And no crackers, cookies, grocery bread, or cold cereals; only white bakery bread, to eliminate aflatoxin. No malonate-

containing food.

The next week, both parents and Suzanne were Negative for *Mycobacterium phlei*. Isopropyl alcohol and malonic acid were Negative. But copper and aflatoxin were still Positive. They were advised to hurry with the changes. They had done everything else, including daily zapping and once-a-week parasite herbs, scaled down to her age.

On July 29, another week later, the lump was very much smaller and softer. But she was still Positive for copper and malonic acid although they had finished the plumbing job. They had been visiting relatives with her and her milk had been boiled, but no vitamin C had been added (this allows malonic acid to persist). They were all still Negative for *Mycobacterium phlei*.

On August 5, the lump was down to $^{1}/_{2}$ x $^{1}/_{8}$ inch, a mere sliver. It was a joyful visit. The tumor was not growing. It was still soft and receding She had picked up some aflatoxin while visiting relatives, but the parents promised to be more watchful. She was started on glutathione once a day. They were all still free of *Mycobacterium phlei*.

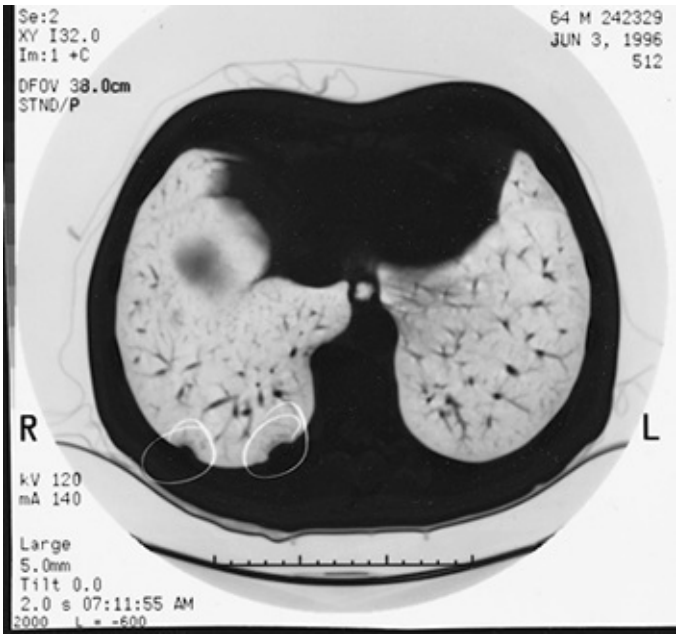
August 12 was their last visit, nothing could be seen or felt at the site of the former tumor. I scheduled a CT scan of the neck region, to be done without contrast, but let them choose whether to do it. After all, it was only for the record, not for Suzanne's benefit. Seeing and feeling was reliable enough for her safety.

Summary: Did it come back? Or did it stay away? We won't know unless the parents inform us. The parents did an exemplary job, and we wish them well.

33 Adam Larsen Lung & Liver Cancer

Adam Larsen had 16 small to medium nodules on the outside of his lungs and liver. They were not calcified, meaning they were active in some way. But were they merely plaque? Some of them looked rectangular, not round. Or were they metastasized from the prostate, a most unusual kind of metastasis? His prostate had a very malignant (stage 4) little tumor in it although his PSA was only 10.0

(over 4 is considered cancerous). If the sixteen nodules were benign, then surgery to remove the prostate seemed wise to one of his doctors. And urgent. But if the 16 nodules were malignant, then he was in a late stage of disease, with very little hope and prostate surgery useless. It would be pretty hard to biopsy one of them, though. Two or three weeks passed in indecision. He started the parasite program at home, corrected his life style to shut out isopropyl alcohol and zapped a lot. He had decided against surgery, and therefore, biopsy, since this couldn't save him anyway, he believed.

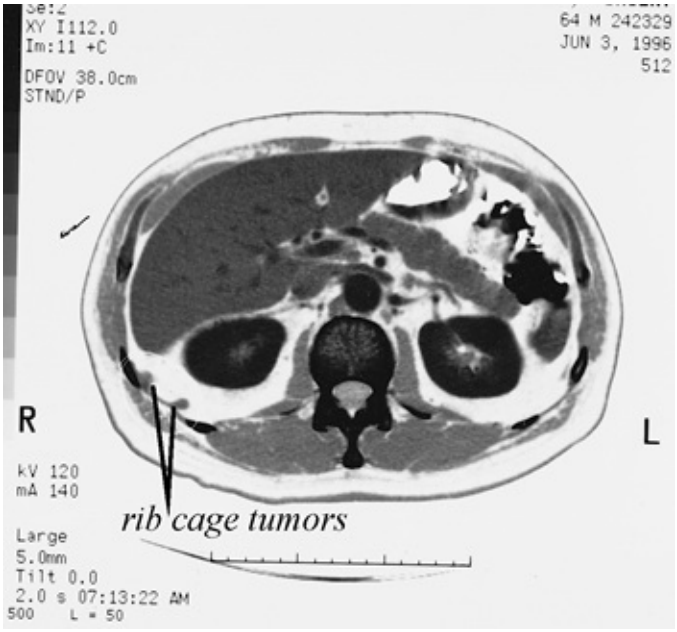


June 3 MRI slice showing lumps on edge of lung

When he arrived two months later in August, he already tested Negative for isopropyl alcohol and malignancy. He had successfully stopped his cancer, but the task was now to shrink his tumors. One look at his CT scan of the liver showed small internal tumors ("marbles") as well. He was Positive for patulin, lead, and CFC. He had a *Staphylococcus* infection spreading from his jaw although he wore full dentures. He had gotten his PSA down to 8 by himself. And a fresh scan of the prostate showed no tumor at all-only enlargement. He was doing well on his own.

He was started by removing both dentures until they could be tested for malonate and the usual carcinogens. This meant he would blend his food and simply drink it until he had teeth again. He did not mind a bit. We reassured him that these liver tumors were small by comparison with the usual liver tumors we see. The nodules on the surface of liver and lungs certainly were perplexing; we

would just wait and see what happened to them after getting rid of the internal liver tumors. And the prostate, too, ought to shrink along with the liver tumors.



June 3 another slice shows ribcage and liver tumors

His blood test showed that he was still in good health. Calcium was too low; implying a toxin in the parathyroids and alk phos was slightly high implying tumor activity in his lungs [*dye toxicity*].

His potassium was borderline low. Other values were quite good. He was still a healthy man, age sixty-one. The high WBC was explained by the bacteria in his jaw and prostate.

Aug 23 CT shows tumors gone

He was given the usual supplements to detoxify malonic acid: B_{12} (4 mg), folic acid (25 mg twice daily), and vitamin C. He was also given glutamine and glucuronic acid. The glucuronate would help his liver detoxify harmful chemicals. And he was given potassium gluconate to raise his potassium levels. All this besides doing the parasite program, Lugol's, and other programs.

His metal glasses frames were scheduled for change to plastic. He was still very Positive for copper at the parathyroid gland even without wearing his dentures. He and his wife were staying at an unapproved motel with copper water pipes. They agreed to move immediately.

The following day he was Negative for copper and malonates. Having dentures made the task easy. Simply remove them and make new ones-malonate free.

He continued to stay free of copper and malonic acid from his supplements and diet. He simply threw away his supplements, except the list given which had been tested. And he never veered off the malonate-free food list.

By the seventh day, he definitely felt better, although he had no real complaints to begin with. Another blood test showed small improvements: LDH down; calcium up; iron up from 57, due to copper [*and germanium*] removal. He was given chromium-yeast capsules containing 500 mcg chromium, two a day, experimentally, to raise blood sugar.

Adam Larsen	8/12	8/19
RBC	4.58	4.63
WBC	10,200	10,100
PLT	160	149
glucose	83	76
BUN	12	14
creatinine	.8	.9
AST (SGOT)	31	29
ALT (SGPT)	30	26
LDH	154	147
GGT	14	17
T.b.	0.4	0.4
alk phos	113	125
T.p.	6.7	7.0
albumin	4.6	4.5
globulin	2.1	2.5
uric acid	3.9	3.3 (3.5-8.5)
Calcium	8.6	9.0
Phosphorus	2.9	3.5
Iron	57	76
Sodium	137	138
Potassium	4.0	4.4
Chloride	104	102
triglycerides	66	105
cholesterol	184	180

On the tenth day he tested Positive for methyl malonate and had picked up benzene, too, no doubt from eating unsafe food. He detoxified it immediately and was Negative the next day. A new CT of the liver was scheduled, without contrast, to minimize this burden for his liver [*and to avoid lanthanides*].

On the twelfth day he fairly bounced into the office, CT scan in hand. Two radiologists could find no "marbles", plaques, or tumors of any kind on the surface of his liver or rib cage. The lung scan could wait till later.

There were no small "marbles" inside his liver, either, although fibrous remnants were visible to me. These were considered to be "bad texture," not tumors, now. He had tested Negative to copper, isopropyl alcohol, and staphylococcus bacteria in the prostate and had probably been free of them for ten full days in a row. He had two new dentures that tested free of malonates and metals and he was eager to eat his food again, instead of drinking it.

It was time for him to leave to practice his new life style. He promised to return in two months for follow-up. As soon as he got home he did a new PSA test. It was down to 5.8.

Summary: Adam was a perfect patient and deserved his good results. Or did luck play a role when no dental problems presented themselves that couldn't be corrected in one minute-just by removing his dentures? They were out of his mouth for twelve days. Or was it the extra-large dose of folic acid? Of course, he had already dissolved the grade 4 malignancy in his prostate by himself before he arrived. We wish him well.

34 Lorene Ralls Fibrocystic Disease

Lorene Ralls, forty-one, had a family history of breast cancer. Her doctor told her not to worry, but she worried more and more as new family members got the disease. Finally, her massage therapist found three lumps and she knew the inevitable was beginning to happen. Both breasts had pain and stinging sensations. She didn't know why. Besides, she was generally fatigued and in poor health. She wanted to do something about her lumpy breasts before she, too, had cancer.

She had started herself on the parasite program three months ago, so there was no ortho-phospho-tyrosine and, therefore, no malignancy anywhere when she arrived. But she had not eliminated isopropyl alcohol so she was at great risk for getting cancer or getting it back if she had it earlier. By using unsterilized dairy products daily, she was picking up the fluke parasite stages. They would multiply in the presence of isopropyl alcohol.

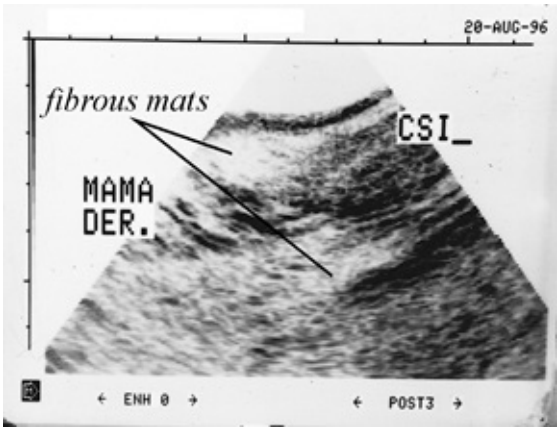
She immediately stopped drinking purchased water or beverages and taking untested supplements. She also had benzene and toluene built up in her. These would be gone, too, by stopping the beverage habit. She was zapping daily.

She had two systemic bacteria, *E. coli* and *Staphylococcus aureus*. The staphylococcus bacteria would be under a metal or plastic tooth or in a cavitation. Both would find a breeding place in her breast lump to make it grow. Her other toxins were: CFCs, nickel, copper, cobalt, mercury, thallium, aluminum, arsenic, and formaldehyde.

She had no patulin or aflatoxin build up. We scheduled a blood test and

ultrasound of breast. Then started her on the current cancer program. The reasoning was that if she could shrink these tumors she could prevent getting cancer in them, and be spared the family fate.

Her program consisted of: starting Freon removal, changing water pipes to plastic, doing the parasite program, taking coenzyme Q10, taking glutathione, taking Lugol's iodine, once a day for prevention of *Salmonella* invasion, replacing metal in teeth with plastic, sticking to the malonate-free diet, and stopping all supplements unless she could test them for copper, cobalt, vanadium, and the M-family (ours were already tested).



Aug 20 ultrasound of breast

Of course, she would change her refrigerator to a non-Freon variety. She was very interested in cause and effect relationships, so she planned to learn the technique of testing in order to protect herself from breast cancer in the future.

The hardness in her breasts was quite easy to feel. The ultrasound showed fibrous masses throughout both breasts, the right side being more extensively involved. They should all go away, leaving the breast soft. She was eager to start.

Two days later, we reviewed the blood test with her. The early stages of cobalt and malonate toxicity are clearly present: globulin is too low and calcium is too low also. The damage from copper and vanadium is not yet visible.

The RBC, WBC, and platelet count are perfectly normal showing that the toxins have not yet reached the bone marrow where these cells are made. Blood sugar (glucose) is extremely low, showing she was using it up much too fast without getting the energy benefit from it. This is characteristic of tumor disease.

Triglycerides, another fuel, are also low. This would explain her general fatigue. The BUN is still unaffected. The LDH is still normal, below 160, showing the absence of dye buildup and aggressive tumor activity. Alk phos, which also reflects dye buildup and tumor activity, is low, too. Total protein, which is the sum of albumin and globulin, is completely normal, but the globulin is a little too low. This is caused by cobalt in the liver. It agrees with the finding of cobalt in the initial toxin test. Calcium should be 9.1 to 9.6. Low levels are caused by toxins, such as malonate in the parathyroids, one of its earliest toxic actions; perhaps it simply chelates out our valuable calcium. Potassium is too low. Perhaps this is due to vanadium. Vanadium is known to displace potassium, but the evidence is not yet clear. It could also be low due to insufficient potassium pump action by the tissues and a subsequent loss through the kidneys to keep the ratio between inside and outside of tissues correctly balanced. The thyroid, too, plays a role in potassium usage. For the present, we must be content to supplement potassium, since this is known to stimulate respiratory metabolism and could help the tumor tissue to normalize.

She was given the following supplements:

1. Vitamin D to raise the phosphate level to 3.

2. Potassium gluconate powder.

3. Vitamin B_{12}.

4. Folic acid, 1 mg, 25 a day. It would be easier to take a single 25 mg tablet, but that is not available. It takes 25 mg to team up with vitamin B_{12} to begin to detoxify all the malonic acid and its derivatives in the body. Even this amount cannot keep up with detoxifying malonic acid if it is eaten as food or constantly being sucked on in the mouth (dental plastic). The cancer patient has a huge deficit of these two nutrients. Chemotherapeutic agents frequently are "anti-folate" compounds, intended to kill cancer cells. Our approach is not one of killing tumor cells; it is one of removing the factors that stimulate these cells to abnormal growth rates and repairing their metabolism so they begin to make their normal metabolites again (differentiation).

5. Vitamin C.

6. Biotin 1 mg once a day to repair the body's ability to utilize malonic acid in fat metabolism (this is hypothetical).

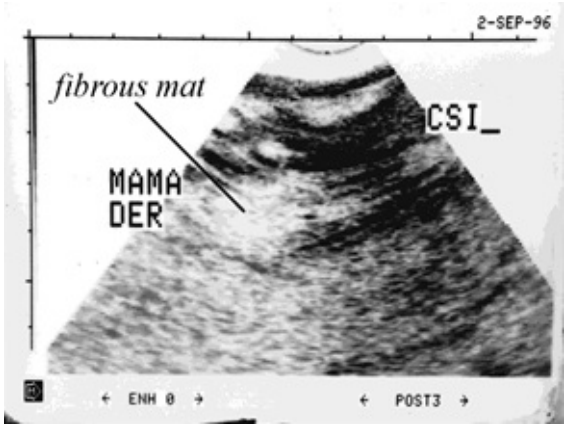
Lorene did her best to get rid of cobalt from her lifestyle, at one point even finding a trace in a blue T-shirt and blue jeans (detergent residue). She carried her own dishes and glasses to avoid detergent washed ones. She cooked only at home. To no avail. The situation got worse instead of better.

She was testing Positive for more, not less, malonic acid derivatives although she had stopped eating any. And now she was showing copper again, although her water had been copper-free for four days already and the body level should have been going down.

We had become suspicious of dental work, since this seemed to be the only big event occurring. We decided to chip a bit off an old plastic tooth she had had for several years. It tested Positive for titanium and lead! And titanium and lead had been found in the breast!

The race was on to find other toxins in the dental plastic that were traveling to the breast. Here they would use up her precious glutathione. We began testing the dental materials presently being put into her mouth.

The new plastic had malonic and maleic acids, besides copper, cobalt, and vanadium! But not much had been put in yet! It was stopped-put on hold-till all plastic ingredients could be tested.



Sep 2 Breast is softer; only one intensely white area remains

Meanwhile, the breasts had gotten much softer. The only hardness left was

one area near the top of the right breast. The left side was already clear.

An ultrasound and blood test were scheduled. Her frustration with stalled tooth filling and the frequent interruptions for testing and removal, all faded as she produced the negatives. Almost all the fibrous mat underlying the right breast was gone. A small area still persisted at the top. This matched her interpretation by palpation (feeling it). It was all worthwhile. She was escaping the family curse-on the women's side, and doing it in two weeks! The curse had existed for decades.

But the blood test showed a different side to the story. All was not well. The blood test is a tough-minded teacher.

The WBC was up showing some infection, probably from the dentist's hands. It can be avoided by swishing with Lugol's solution or 1% chlorine bleach (see Recipes) right in the dentist's office before, during, and after the procedure. The blood sugar was not yet up, so metabolism was not yet normal. She could make less BUN (urea) than before. Most significant was the big rise in LDH [new dyes put into teeth]. I suspected correctly that it was caused by new toxins put into her teeth. But the albumin and globulin levels were corrected; implying removal of cobalt. Uric acid was not yet up in spite of giving glutamine. And calcium, too, had not risen a bit; more evidence of malonate being put in her mouth to suck on continually. In spite of taking vitamin D, the phosphorus dropped instead of rising-toxins were reaching the parathyroids.

Lorene Ralls	8/21	9/2
RBC	4.56	4.53
WBC	5,900	8,000
PLT	242	283
glucose	69	72
BUN	13	9
creatinine	1.0	0.9
AST (SGOT)	19	19
ALT (SGPT)	13	17
LDH	156	200
GGT	14	13
T.b.	0.8	0.4
alk phos	46	61
T.p.	6.7	6.4
albumin	4.8	4.4
globulin	1.9	2.0
uric acid	3.1	3.1
Calcium	8.6	8.6
Phosphorus	2.6	2.3
Iron	124	63
Sodium	140	136
Potassium	3.9	3.9

Chloride	101	103
triglycerides	89	114
cholesterol	254	217

But iron had dropped a large amount. Only copper [*or germanium*] could do this. These must have gone into her mouth with the dentalware. Potassium did not come up in spite of considerable supplementation. But triglycerides did rise, always a good sign. She was going through less fuel in some ways.

The low calcium pointed to the parathyroids. Indeed, we found the copper there. Would Lorene stay and search for its source? Would she pursue her problems till LDH and calcium were correct? Not this time. She accepted the joy the ultrasound brought, but not the thundercloud on the horizon. The breast was normalizing at a very fast rate.

Summary: And we again learned that important lesson: the tumorous situation is distinct and different from the toxic situation revealed by the blood test. The tumor cannot be equated with the underlying toxicity. In fact, the tumor is not the lethal entity, unless of course it obstructs something or becomes infected or hemorrhages. The underlying toxicity is the life threatening part of tumor disease. The changes, subtle at first, brought about by copper, cobalt, vanadium, malonate [*and germanium and azo dyes*] are the real killers. Perhaps she will return when the good news has been savored sufficiently. Or perhaps, she can make the final changes herself; she may learn where the problem resides, what to do about it, and get it done all by herself.

35 Kristie Barnes Ovarian & Liver Cancer

Kristie Barnes had surgery a year ago for tumors, possibly ovarian, pressing against the colon. They were the size of lemons, but gave her no symptoms. Since the surgery she had continued to bleed from the rectum. She had refused chemotherapy and radiation, since she never had symptoms. But now a CT scan had been done and to everyone's surprise the liver was full of tumors. Some rather large, most rather small.

She had been zapping for a time before she arrived, so the largest tumor looked a bit cyst-like, rather than malignant. But she still had isopropyl alcohol in her system.

Her initial toxin test showed Freon at the colon; cobalt at the colon; and lead, thallium, arsenic, and copper at the bone marrow. *Salmonella* was Positive as well as malonic acid. But ortho-phospho-tyrosine was already Negative, giving her a nice head start to clear these liver tumors. The tumor marker, Ca 125 was still elevated (61), representing the remaining tumors. They should be easy to mop up.

She was in good physical health, otherwise, except for an intense tinnitus, which was her most troublesome symptom. I thought we could reduce this considerably, as well. She had brought a recent blood test (Aug. 27) with her. The main feature was an elevated total protein. The globulin was too high. Calcium and phosphate were also too high. And her body was definitely anemic (RBC 3.98).

The radiologist circled several tumors (dark blotches).

Sep 4 CT revealed a liver full of tumors

The high albumin and globulin were due, no doubt, to the presence of both cobalt and vanadium in the liver. And the source of these must be her dentalware [*and Ascaris*], since all her supplements had been tested for these metals. She used no detergent or washing soda, no cosmetics or medications. So we did our new "tooth test" for her when she was in the fasted state in the morning (and after killing all tapeworm stages first). We tested for malonic acid and/or its derivatives in the saliva. She was Positive. Therefore, she must have plastic

tooth restorations seeping malonates. Perhaps these restorations even covered bits of amalgam (thallium)!

She could not recover without removing these metals; the liver was not able to control albumin and globulin production due to them. She was scheduled for plastic removal.

Besides the usual first day procedures and supplements, she was given potassium gluconate powder to raise her potassium. She would also be off malonate containing food. In spite of this and killing all tapeworm stages and removing all plastic from her teeth, she still tested Positive for malonate in the fasted state. Bits remained and had to be searched for.

She had arrived on September 9, and her new blood test showed that her anemia was worsening (RBC dropping); hemorrhaging from the rectum was our greatest fear. Could we stop it in time? We didn't even know the cause. A CT scan of the bowel (not shown), taken after her last surgery showed a much disturbed, improperly positioned bowel. Perhaps it just wasn't healing. The bowel was also very dilated. But the cause for bleeding could not be seen. She was started on the Chinese herb, Yunnan Paiyao, to stop bleeding.

It was her eighth day, September 17, and the bleeding had lessened. But one change was dramatic. Her tinnitus was down by about 50%! It happened after a dental visit. She had been back to the dentist a number of times to remove small bits of leftover metal and plastic. Although we had carefully selected safe composite ingredients for her, the completed job would often not be safe. Only one tooth at a time was being worked on so we could identify the cause of any new problem more easily. After each visit she was re-tested in the fasted state and often found Positive for malonates and metals. It seemed never ending. Sometimes unsafe plastic would be put back in, although we had tested the ingredients. This was not the dentist's fault [nobody knew that acrylic plastic is turned into malonic acid by the body]. At first, we tested only the kit components (dental supplies for composites come in kits), not realizing that every tiny dab of sealer, every bit of adhesive or liner the dentist supplied personally, could carry the fateful carcinogens and be sealed into the tooth permanently. And they would seep. In contrast to the anesthetic which would dissipate.

Her September 21 blood test probably reflects this as the total protein is again

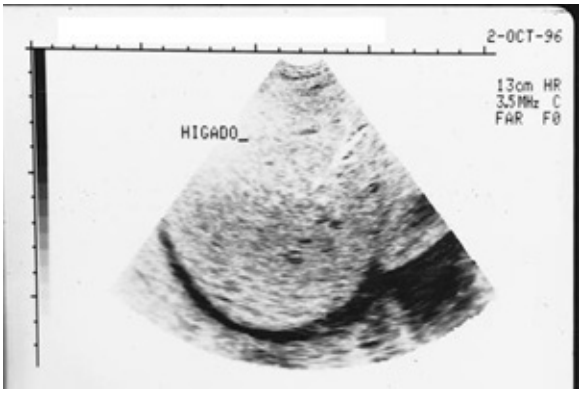
too high (8.2).

The drop in calcium probably resulted from some malonated restorations. But uric acid was normal now and her RBC was finally coming up, a basic sign of improved health. Obviously she could make enough blood to replace the small amount she was still losing.

On October 2, ten days later, she was done with all her dental work, but was she really free of all metal and malonic acid in each and every tooth? A single tooth could change her prognosis from very good to very bad. She was feeling very well.

The ultrasound was scheduled. No traces of tumors in the liver could be found. Was it too good to be true? Even the large cyst was gone. Had it been missed somehow? The texture of the liver was exceptionally good; this was obviously a healthy liver now. If there were remnant bits of tumor, they would be just that...remnant bits. The ultrasound showed many views of the liver taken from different angles. They were all uniformly good. One is shown.

The new blood test, done Oct. 2, was not yet perfect. But the total protein was no longer too high. The iron level was perfect. And bone was no longer dissolving. Maybe her dental cleanup was perfect. She will do a CT liver scan in a month and another blood test including Ca 125.



Oct 2 right lobe of liver, no trace of tumors

Summary: Kristie did very little more than clean-up her dentalware, kill parasites, and stop eating malonate-foods. It was all her liver needed to dissolve and digest all the tumors and function well again.

36 Denny Hemstead Liver Cancer

If cancer has its personality type, it is sweetness and lack of guile, not festering anger or self-hate as is sometimes portrayed. Denny Hemstead was pure sweetness even in the greatest stress of his life. He offered his much awaited turn to a new patient once, after being "in line" for hours, and when I inquired about his missed appointment, he guilelessly said there was a sick woman in line behind him and she needed to see the doctor before dark. Denny had been given one month to one year by his doctor at home, for a metastasizing adenocarcinoma with an unknown primary source. There was no tumor anywhere, but his whole body was full of cancer cells. His abdomen was distended and tight as a drum. He had recently had a peritoneal paracentesis done at the Cleveland clinic; this means "water" had been removed from his abdomen by needle due to its abnormal accumulation there. Before he was discharged from Cleveland clinic, "palliative care" was discussed. This means taking care of pain and comforts only, no treatments of any kind to be pursued. He was discharged on coumadin and lasix, a blood thinner and diuretic.

But these simple treatments were no match for his condition. He arrived toxic with isopropyl alcohol, wood alcohol, Freon, nickel, copper, cadmium, cobalt, mercury, and aflatoxin. He was septic with *E. coli* and staphylococcus bacteria.

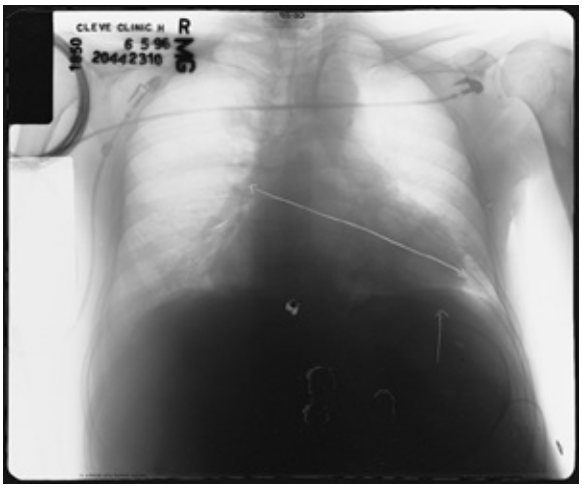
He had brought his chest x-ray with him. His lungs were pushed upward by his abdomen (see vertical arrow on x-ray), which was full of "water" again. In fact, his entire chest was water logged. The heart was enlarged, as the pathologist pointed out with the long arrow drawn from its point, right across it to the other end.

He related that he had been on my parasite program about three weeks and also on an Essiac program for three months. He had been zapping for about one month. He asked in bewilderment why these treatments hadn't worked since he had done them very conscientiously. It was quite painful for me to point out to him, "Denny, your mouth is full of carcinogenic metal and plastic; you are sucking on it day and night. It goes to your bone marrow, thyroid, parathyroid, liver, spleen; it fills up your body so your glands can't function. You don't have a

tumor anywhere-your doctors have already searched. But you are toxic with those things that cause tumors. Cancer patients die from these things, not from tumors!"

He gave the correct response to this explanation, saying "I am dying, then, not from my cancer?" I agreed, "You are sent home to die from those things that cause tumors, not the tumors themselves. And we know what these things are. It is not difficult to get rid of them. But you need to hurry." He danced out of his chair with eagerness to hurry. But first he was informed about his blood test results (Sept. 30).

The RBC was much too high, due to either cobalt or vanadium toxicity. In his case it was cobalt; it was very high in his bone marrow where red blood cells are made. The source would most certainly be his metal and plastic teeth. First priority was to get all metal and plastic out of his mouth; first the metal, then the plastic. We would not use IVs unless he didn't make good progress.



Lungs hazy with "water" and heart enlarged. (Extra markings are scratches on negative.)

Jun 5 x-ray three months ago

Globulin was too high, for the same reason, causing the total protein (albumin plus globulin) to be too high. Potassium was too high due to toxins in the thyroid; this gland is very close to the mouth with its toxic drainage; any toxins can have this effect. His liver enzymes were too high; I suspected lead from his copper pipes or some medicine. But he had every chance to recover, if he acted swiftly.

Besides the usual start-up instructions in the cancer program, he was given a

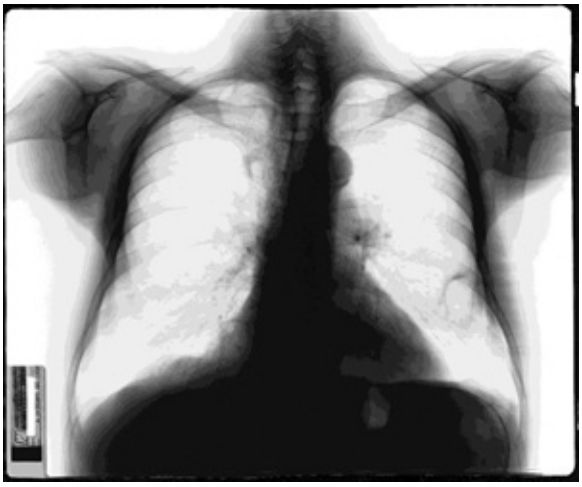
thyroid tablet, 1½ grains, taken upon rising, daily. He was also given glucuronic acid, and niacin. This would replace the coumadin (readers are reminded not to try this on themselves at home) and we could check his blood clotting times whenever a blood test was done to verify this. He was instructed to change his metal glasses frames to plastic.

Five days later, October 4, he had his first chest x-ray from us. But it was too late! His lungs had already improved. We did not catch the first day presentation. Nobody could have anticipated such a speedy improvement.

The heart was much smaller, water level much lower; there was much more air in his lungs. A little "fuzziness" still remained to the outlines of ribs-showing a general "dampness" of his lungs. The ribs were still spread far apart, persisting evidence of his recent emphysema. He was breathing well now, in spite of his abdominal distention. He was not coughing. He was halfway through his dental clean-up. We were removing metal first.

By October 11, all metal was out of his mouth, at least we thought so. His abdominal distention was now much less and he was in less pain. Yet his blood test did not show the drop in RBC to be expected when all toxic cobalt and vanadium are gone! Had a bit of metal been overlooked?

Using an emery board, each remaining tooth was rubbed, followed by testing for copper, cobalt, vanadium, and the M-family. Three teeth still had cobalt! One had vanadium! And one had maleic acid! This single tooth would be the source of maleic anhydride which was causing the liquid escape (ascites) into the abdomen. Evidently the tooth scraping was a more sensitive detection means than simply searching for these toxins in the bone marrow or lungs, as we had been doing.



Oct 4 x-ray after five days on program

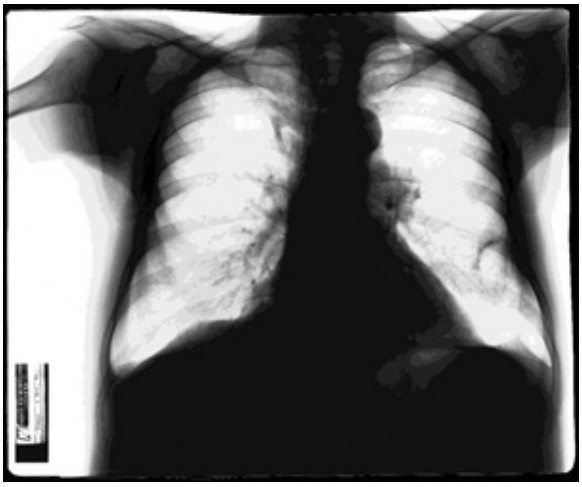
Denny was sent back to the dentist for a repeat metal cleaning. Maybe this time it would all come out. There was very little change in his blood test results. On October 17, his saliva was still Positive for copper, too, although he was staying at the environmentally safe motel. We repeated his tooth filings. He must still have metals and maleic acid somewhere in them!

The painful truth had to be accepted. His plastic fillings contained the copper, cobalt and vanadium or were covering up remnants of metal. There was only one option: to remove all his plastic fillings, too. His abdominal ascites and pain would not leave permanently without it.

Removing plastic was even more difficult than removing metal because remnants are much harder to see.

By October 29, all four quadrants of his mouth had been reworked, removing every bit of synthetic restoration ever placed. Meanwhile, his waist size had increased by two inches and he was most uncomfortable. His ankles were still swollen. They should have slenderized in spite of being off diuretic. We searched at his kidneys for the explanation.

Malonic acid Positive at kidney. Methyl malonate Positive at kidney (this is known for its kidney toxicity). Maleic anhydride Positive at kidney (known to cause seepage and edema). Cobalt and vanadium Positive at bone marrow.



Nov 8 going home with good aeration, all organs normal

There was only one conclusion possible: there was still plastic in his teeth even after all the dental searching. It could not be found or removed by a dentist. (We had sent him to three, including one who used a microscope attachment for precision viewing. It just couldn't be done.) [Now we use digital x-rays.]

The blood test of November 4 reflected it for the sixth time: the red blood cell count stayed much too high and globulin stayed too high. Iron stayed low and triglycerides were too low.

The only solution was to extract the teeth that had had the plastic fillings. He wanted to do this at home, in Canada, where the comforts of wife and familiar surroundings would lessen his stress.

His abdomen was still hard, although the pain was gone. Delaying even a few weeks could tip the scales for him to (1) further ascites (2) hospitalization (3) a massive drug regimen (4) morphine (5) morgue. And delay might be unavoidable at home.

But he missed home cooking. With his painful jaws (he had extracted three teeth before leaving) and "open" unfilled teeth, we had cautioned him against chewing too much. I worried that he might be eating less and losing weight, so I asked him what he was actually eating. He replied he did not know. How could he not know? Were his eyes closed while eating? He explained that he ordered his food to be blended-the entire dinner, together-so he never knew what was passing his lips at any one moment. He enjoyed giving precise answers. I was relieved. Perhaps with this personality trait he could be trusted to finish his

dental task at home. We scheduled his final chest x-ray.

It was even better than before, with very good aeration, stretching the full length of both lungs. Gone was all "fuzziness". The heart was normal in size, giving greater credibility to the previous x-ray. Heart and lung disease were, in fact, absent. Even the emphysema was improved. No enlarged lymph nodes could be seen. He left us behind, wiser and sadder. Wiser about plastic dental materials. Sadder to know the truth: pollution is everywhere, with the tumor-promoting group of toxins. Our determination strengthened to find "clean" dental plastic to replace metal. But, until then, extractions would be the only way to salvage a critically ill patient.

37 Anabelle Orenza Breast Tumor

Anabelle Orenza, sixty-five, did not come for a cancer problem. She called her aching bones, arms, legs, shoulder "environmental illness." She was allergic to almost everything she ate, touched, or used. She tested Positive for malonic acid, isopropyl alcohol, *Staphylococcus aureus*, copper, cobalt, mercury and aflatoxin, and of course, benzene when she arrived.

With environmental illness, the first step is to stop using all cosmetics, skin treatments, and other body products whether purchased at pharmacies, health

food stores, or by mail order. They are all polluted with antiseptic solvents and petroleum products (petroleum derived products all contain ultratrace amounts of benzene); even small amounts of these solvents are too much for the liver to detoxify. She had already done all this.

A second major source of toxicity in environmental illness is copper water pipes, which usually bring lead with them. She was advised to move to a new home or change the copper pipes to PVC.

The third and possibly most important source of toxicity could be her own teeth.

Anabelle tested Positive to malonic acid and methyl malonate the morning of her "dental test." This test was done by us in the fasted state in the morning, on a saliva sample. Only artificial teeth could be a source of malonates in this setting (not food or tapeworm stages).

Two days later she had all plastic fillings drilled out, leaving holes. But due to confusion (and the dentist's persuasion), she had two holes refilled by another plastic at the same office.

Another dental test was arranged to evaluate the new plastic fillings. Malonic acid was Positive again. To be absolutely certain it was coming from the new fillings, we chipped them for testing; after all, they could be easily repaired. They contained copper and malonates, but we felt she might be able to tolerate this small amount-after all, she was not a cancer patient. To test this assumption, the bone marrow along with liver, parathyroids, and thymus were tested for malonates and copper for seven days in a row to see if they would accumulate there. Only on one day did the thymus test Positive for malonic acid and D-malic acid. So we thought her two new plastic fillings were safe enough for her-besides, she did not want to lose them. A final x-ray (full mouth series), of her teeth was scheduled. It revealed several amalgam tattoos! The next day the dentist removed these. She left for home, with reduced symptoms, although taking no supplements on a regular basis due to allergies.

She was using cosmetics made with recipes from *The Cure For All Cancers*, looked well, and now had more energy. She left with several open teeth which she would keep clean with 35% peroxide brushing, and promised to return in a month.

During her three week stay her blood test had shown a very significant improvement. Her WBC, which frequently dropped below 3,000 she said, had come up to 3,600 by September 23. This would strengthen her immunity. The RBC dropped from too high to a perfect value.

But all was not well. She returned from Canada two months later. This time she had very high levels of isopropyl alcohol again, as well as benzene, copper, formaldehyde, and urethane (plastic component known to cause cancer). Recently, she had felt a lump in her left breast and, in fact, had not felt well for all the time she was away.

Tests showed copper and vanadium at the breast and cobalt in her WBCs. The liver had D-malic acid and she was Positive for aflatoxin and patulin, too. How could a lump come up so quickly?

Ortho-phospho-tyrosine was Negative, so the lump was not malignant. But certainly it was growing. An ultrasound of the breast was scheduled as well as a new blood test. By now we could interpret the low uric acid correctly. It implied high bacterial levels, something that would only happen if glutathione levels were much too low. The glutathione was busy mopping up new toxins. In fact, it had already been revealed the day she left for home two months ago, after two new plastic fillings were put in.

She kept her gain in the WBC, and calcium was finally rising, showing that toxins had left the parathyroids.

The metabolic effects of bacteria and their ammonia could easily be seen in the breast. We were beginning to suspect Clostridium bacteria as the true culprit at this time. All the purine nucleic acid bases (adenine, guanosine, xanthosine, and inosine) tested Negative at the breast!

Something was even preventing the pyrimidine bases (uridine, cytidine, and thymidine) from being made. The tumor was growing (DNA Positive) while important enzymes were not being made (RNA negative).

Transferrin was Negative, as was xanthine oxidase, the enzyme that helps prepare iron for transport. I already knew that without xanthine or xanthosine, no xanthine oxidase would be present.

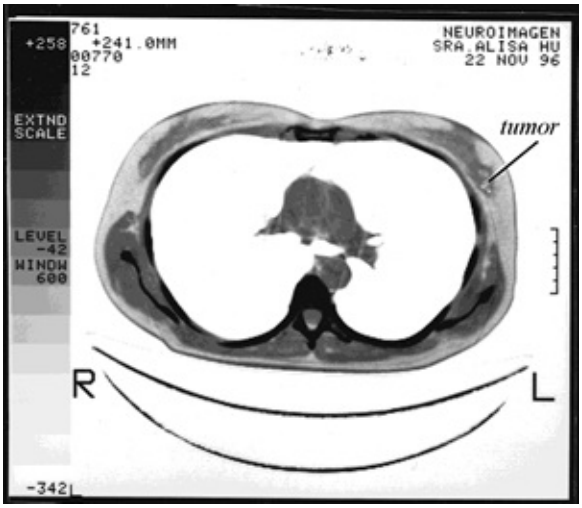
The ultrasound of breast did not show any masses identifiable as such,

although it could be felt by hand. She needed a CT scan.

She started immediately on the cancer program, including glutathione, Lugol's, glutamic acid (instead of glutamine, to help reduce ammonia levels), arginine, ornithine, vitamin B_{12}, folic acid, etc. [*our Day 1 program at that time*]. Plus the usual zapping, parasite killing, and stopping wearing a regular bra. The plastic fillings were quickly removed from her teeth. She was told to eat sardines to help supply nucleic acid bases.

Two days later, on Nov. 22, all four nucleic acid bases (plus two precursor bases) were Positive once more at the breast. Xanthine oxidase was also Positive there, as well as transferrin; she was now transporting iron again the way she should, from storage sites in the liver to the work stations in the bone marrow where RBCs are made. Eight common food bacteria were now Negative at the breast. Healing and tumor shrinking could begin.

She had a CT of breast done. It showed the mass she was feeling, although it already felt smaller to her.



Nov 22 radiologist drew a line to the tumor

Three days later, Nov. 25, a new blood test was done. To her surprise and joy her WBC was higher than it had been for the last five years. Uric acid was starting to come up, reflecting on conquest over bacteria. (Note that her initial uric acid level on September 3 was masked.)

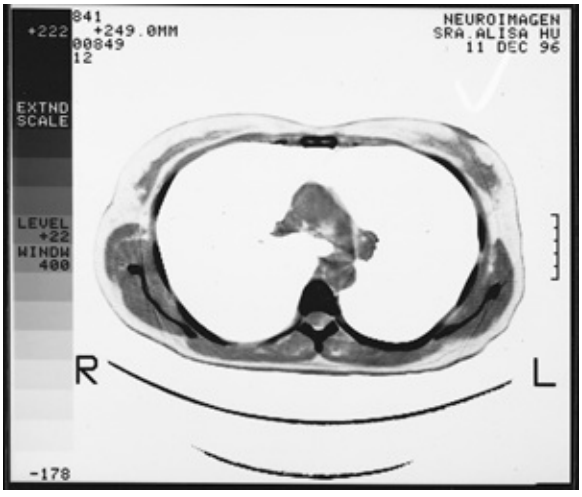
But calcium and phosphorus had fallen back down. The cause was not known. Perhaps just a trace of plastic was left in her mouth, or another amalgam tattoo-

too small to show up in electronic testing, but not too small to affect the parathyroid glands. We decided to send Anabelle to a dentist who could do air abrasion of teeth to remove even the smallest particle of leftover metal or plastic (provided he could see it; this would be challenging).

A number of amino acids were also searched for in the breast, to see if they were all present, so healing could occur. Lysine, aspartic acid, glycine were Positive, but glutamic acid, arginine, glutamine, and ornithine were Negative. Was supplementation with glutamic acid, arginine, and ornithine not working? Experience had taught Anabelle to be very, very cautious in trying any new supplements in her hyperallergic state. So she had eaten sardines, but not taken the supplements. Fortunately a few days later arginine, ornithine, and glutamine were Positive even without the supplements.

Now, too, Clostridium and Lactobacillus bacteria tested Negative at the breast! Had they been responsible for the RNA-to-DNA switch before the recovery? Anabelle's case helped us to see the connection between *Clostridium* and DNA presence.

Then Anabelle was gone again. Perhaps she had a side-trip planned. Perhaps there were other pressing matters. Two weeks went by before she returned with her bright cheery smile that lifted all of us. We quickly scheduled a blood test and new CT scan of the breast. Meanwhile, a complete search for DNA in her body organs uncovered it at the lungs and thyroid gland! Obviously, there was still a serious problem.



Dec 11 tumor gone, going home

Cobalt and urethane were still Positive! Only plastic could explain it. But she had gotten a final air abrasion cleaning of her teeth. The dentist had superlative skill. Was he leaving small plastic fillings in her teeth? Or was it an impossible task? The pain in her breast had disappeared right after this visit. And she thought she felt a lot better afterward, too.

We were mystified. The blood test showed she had kept her gains in RBC and WBC counts. And the uric acid level was, indeed, a lot better, implying much less ammonia from bacteria. Calcium had come up, showing toxins were now out of the parathyroids. But it went too high, 9.8, showing they were still in the thyroid.

Were the cobalt and urethane going to her thyroid? We had to find the source or leave her in great jeopardy. It was her going-home day. We also needed to review her new scan.

The breast showed no tumor; the radiologist did not even consider it a significant fibrous remnant. He merely made a check mark to indicate which breast had been involved. That was a pleasure. The breast tumor was gone. She could no longer feel it, either, although I think the scan shows remains of fibrous tissue.

Summary: We were all elated. But not with a sense of security for her. That plastic must come out. In the meantime, she was to take 10 drops of HCl (5%) once a day to help kill food bacteria in her stomach. And digestive enzymes with

vinegar water at mealtime for the same purpose. This could even help her environmental illness...what remained of it.

38 Sarah Armbruster Breast & Bone Cancer

Sarah Armbruster, a young mother of thirty-six, was not prepared for her diagnosis with breast and bone cancer, not with young children to raise by herself and a job to keep. Actually it was her second bout of breast cancer. Her first bout was five years earlier. She had a lumpectomy plus six weeks of radiation at the left breast at that time.

Now there was a new lump in the same breast and pain at her right shoulder. The bone scan (not shown) she brought with her showed hot spots all over her skeleton, though she was not in generalized pain, yet. She could easily feel the spot on her right fifth rib, though.

Her anxiety was intense, almost palpable, and to top it off, we told her she had to quit smoking-that very minute! Not one more cigarette. Nothing hidden away anywhere. We could cure her cancer (by this time our success rate was over 90% because we had learned the hazards of plastic dental restorations), but only with her full cooperation. She agreed to TRY-not to QUIT.

Her initial toxin test results were Negative for:

Bacteria	Metals	Solvents	Other toxins
E. coli	aluminum	isopropyl alcohol	formaldehyde
Staphylococcus aureus	cobalt	xylene	CFC's
Salmonella typhimurium	lead	benzene	fiberglass
Salmonella dysenteriae	thallium	toluene	PCBs
Salmonella paratyphi	cadmium		asbestos
Shigella flexneri	nickel		arsenic
Shigella sonnei	vanadium		chlorine
But Positive For:			
Shigella dysenteriae	mercury	wood alcohol	aflatoxin
Salmonella enteriditis	copper		malonic acid

These tests were "whole body" tests. They do not detect items unless the quantity is quite large. In this way, only the most abundant toxins are seen. Cobalt and vanadium were not abundant. They need not be abundant to be killers at the bone marrow, spleen, or liver.

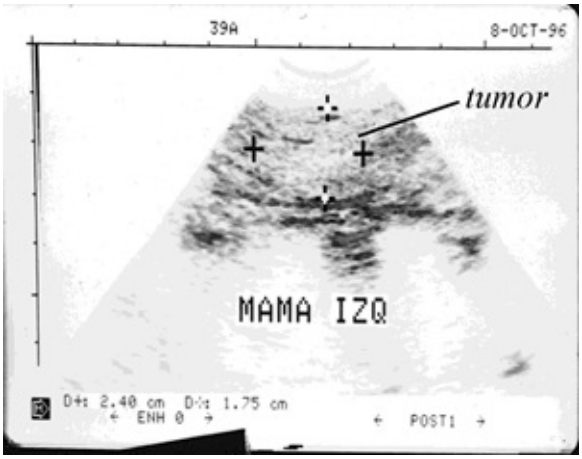
The surprise was that she had already eliminated isopropyl alcohol, all on her own, before coming. She must have some hidden determination. This meant that all her tumors and lesions were already reduced to nonmalignant status. But they certainly would grow and spread since the bacteria inside them would continue making growth factors [and DNA] and spread to new locations.

She also had done an exceptionally good job of cleaning her home. But copper water pipes were still there. That would be top priority upon her return home. There was also the mercury in her mouth and the ever present aflatoxin and malonic acid.

She made the intelligent decision to stay as long as it took to clear her cancer. On her first day she was started on the malonate-free diet, glutathione, Q10, and Lugol's iodine. Of course, she would continue the parasite program plus zapping. She would stop wearing a regular bra since it limits circulation under the breast. We would not need IVs.

By day two she had gotten rid of aflatoxin and wood alcohol. She was still Positive for copper. She had not gone to our copper-free, environmentally safe motel; there were no vacancies. Her motel water had copper.

Her blood test results arrived. They did not show a depressed serum iron. In fact, the iron was too high. Is this also due to copper? The answer awaits further research.



Oct. 8 lump in left breast is 2.4 cm x 1.75 cm

But the blockage of creatinine and blood urea is easy to see; they are too low. I suspect malonate [*and azo dyes*] as part of the cause but simple lack of amino acids and urea synthesis enzymes are also possible causes.

She was supplemented with urea powder, 2 tsp. a day (10 gm, which is about half of a regular dose) stirred into water, and creatine powder, 1 tsp. a day (about 5 gm). Urea is not merely a waste product, it has important functions besides.

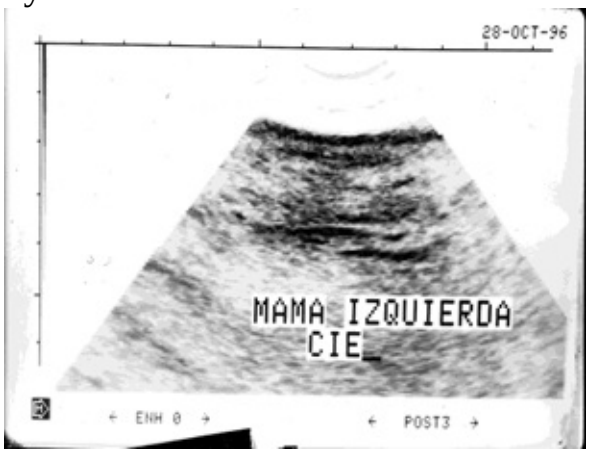
Her potassium was low so we supplemented her with potassium gluconate powder. Her LDH, alk phos, calcium, and total protein were entirely normal. And liver enzymes were very good. The good blood test results contradicted the appearance of an ill person with disseminated bone cancer.

Her new ultrasound of the breast showed the breast lump clearly; it was 2.4 x 1.75 cm.

We began her dental cleanup immediately. She had a very "bad" mouth. There were metal fillings everywhere, four root canals, and four caps. It was obvious that all her teeth should be extracted. Bad dental health may have caused her early development of cancer, at age thirty-four. Fortunately, she did not rebel.

By day 4, she was in withdrawal (from smoking), she had headaches. We were happy to have this evidence of quitting smoking, not just cutting down. Each day she was being tested for all the cancer-related toxins at the breast and bone: copper, cobalt, vanadium, five malonates, solvents, urethane, aflatoxin, and patulin. She was testing Negative to all, including copper.

By October 14, her blood sugar was still too low. Uric acid was too low. Phosphorus was too low. She was started on vitamin D. She was also started on thyroid, 1½ grains a day.



Oct. 28 lump gone

By October 19, her new dentures arrived. We tested them for copper, cobalt,

vanadium, and five malonates. They were Negative. But we still couldn't risk her wearing them. What if the dental lab was aware that soaking them in vitamin C water overnight would guarantee that they tested Negative-for a day-and would pass our test deceptively! She was instructed to wait for our duplicate testing of them a few days later. She did not rebel. She blended her meals and drank them.

It was October 24. Her eyes shone; she looked animated. She said she felt "very much better." She seemed to be entirely well. She could not feel her rib and shoulder pain anymore.

But bone lesions take time to heal. In spite of healing, the bone density would be less at those spots. Only after half a year would it be worthwhile to repeat the bone scan.

On October 28, a second ultrasound of the breast was done. There was no trace of the tumor. (Actually, six ultrasound views were done; only one is shown here.)

The breast wasn't even fibrous anymore. It was soft and normal. Her new blood test continued to be satisfactory, although the serum iron was still too high. All her supplements were reduced or stopped. She could go home. We wanted her to send a picture of her two girls. And of course, follow up with blood tests and ultrasounds, and a bone scan in six months. But, most of all, change her water pipes and stick to a smoke-free life.

Summary: A follow up done a few months later found her well, no evidence of any cancer. She had no pains. There was no DNA found "Positive" in any tissues. And her blood test (not shown) showed improvement.

39 Bernard Johnson Lymphatic Cancer

Bernard Johnson, fifty-seven, was given a terminal prognosis at home and had the chest x-ray to prove it. Lymphatic cancer was easily visible in his right lung (dark areas with protrusions into the lung along the inner edge and a bit on the left side, too). The heart was quite enlarged; his doctors at home talked about congestive heart failure. The cancer had spread to three enlarged lymph nodes on the left side of his neck where he had previous surgery. They were quite visible and palpable. The largest one was a half inch in diameter. He was very worried because his doctors had given him only six months, even with chemotherapy. That didn't seem worth it, so he opted for our treatment. He was extremely nervous. In fact, unwilling to believe the good news when we told him he was still basically healthy.

A glance at his blood test showed he was not at all at death's door. If we could shrink his tumorous lymph nodes and reduce his enlarged heart somewhat, he could probably get back to normal living.

His blood sugar, triglycerides, and cholesterol were not lowered yet, showing that he was still well nourished; his cancer had not yet consumed him. He was in

time. But he was too anxious to believe this; he would simply have to experience it. The telltale signs of toxicity could be seen. Creatinine was a little too high, so kidney function was stressed. Calcium was too high, showing the thyroid was toxic. And potassium was slightly low.

Our testing showed two Clostridium species of bacteria in his lymph nodes besides *Staphylococcus aureus*. The cause was obvious since these are dental bacteria. He must have a mouthful of bad teeth.

In addition to the usual cancer program, he was started on olive leaf tea-2 cups a day to help shrink his lymph nodes. He was also instructed to put a hot pack on his lymph nodes at the neck each day with a hot, damp towel. He was eager to comply and happy with the news, but still disbelieving.

Enlarged lymph nodes on right side; enlarged heart almost touches the chest wall at lower left side.

Sep 17 terminal diagnosis x-ray a month before

His mouth was full of "restored" teeth. We tested each tooth by scraping it with an emery board, searching for copper, cobalt, vanadium, and malonates. Some of them were in very bad shape, anyway, and needed extraction. He did not object.

By October 22, the benefits of the kidney herb recipe could be seen in the blood test results, creatinine was down to 1.1. Kidney function was better. The malonate free diet and general detoxification had cleaned up his thyroid, but not yet his parathyroids, so calcium shifted from too high to too low. Malonate was still coming from his teeth, as well as copper. He could see the logic of extracting them and took the plunge. All of the uppers were removed. He felt better, instead of worse, to his surprise. In fact, there was almost no recovering

to do.

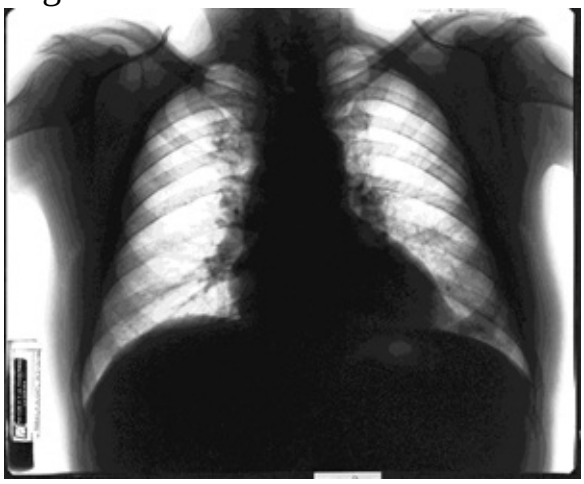
By October 28, his kidneys were even better, which would, in turn, help decongest his heart.

But calcium stayed low, due, no doubt, to the toxicity of the lower teeth. His lower front teeth were pristine-he could not recall having any fillings put in them. Yet they repeatedly tested Positive for copper and malonate when scraped.

Potassium had come up enough; we could stop his potassium gluconate.

On October 29, one of his neck nodules was not visible and could not be felt. There were only two now. A new chest x-ray was scheduled. He was very eager to see if he could really allow himself to hope.

The x-ray showed great improvement along the bronchial edge of the right lung. And the heart had shrunk considerably. No wonder he was out walking now; his heart was stronger.



Oct 31 enlarged heart has shrunk

Each day our testing showed he still harbored cobalt and urethane, tumor inducing toxins, indicative of plastic, probably in his remaining teeth.

He decided to part with his lower front teeth, too, and make a set of dentures the solution. The very next day he felt "a thousand times better" than he had felt for a long time. It seemed unexplainable to him. He could now walk a mile. And testing was now Negative for copper, cobalt, vanadium, the five malonates and the plastic pollutants, bisphenol A and urethane. He finally believed he was getting well.

On November 4, after his extractions, he was Positive for urethane and malonates again! Was it leftover from when his teeth were still present? Not likely, the body cleans up a site very quickly. It was two days since the extraction. All his foods and supplements were tested. One supplement tested Positive.

It was during Bernard's stay that we found urethane pollution in the wormwood capsules. They had been provided by Self Health, our most reliable source. We typically didn't test capsules of herbs because we had never suspected them. Was it in the wormwood itself or in the capsule? Self Health provided us with samples of wormwood and several brands of gelatin capsules. The wormwood was fine, but some of the capsule brands were polluted. Self Health sent their inventory to the landfill and ordered new wormwood capsules made, using the safe brand of capsules. Meanwhile, Bernard (and everyone else) had to stop this supplement immediately. Tested capsules were filled with wormwood by hand till the safe ones were again available.

He was given D-glucuronic acid immediately in an attempt to detoxify the urethane which was showing up at his kidneys. His tests were perfect after this. No cobalt, copper, vanadium, malonates (5), solvents (3), patulin or urethane in kidneys or lungs.

His final blood test was done November 7. His iron level had not yet come up sufficiently; he was still wearing his metal rimmed glasses, a source of copper. He agreed to get them changed to plastic. And the LDH was up slightly higher than acceptable, probably due to the polluted wormwood capsules. But the calcium level was finally correct.

Nov 7 almost normal, can go home

[*After finding urethane in gelatin capsules, we looked for other pollutants, too. A shocking number were there, including tartrazine (a yellow azo dye) and asbestos. It would be a while, however, before I discovered how damaging asbestos and azo dyes were.*]

By November 9, his new dentures were ready. We tested them for pollutants. The upper denture was safe. The lower one was polluted with all the usual toxins! (Although they were made at the same time by the same dentist in the same way!) They would diffuse out into his body if he should put them in his mouth. He was not even tempted. The dentist explained that some of the teeth used for the lower set had come from an untested lot. He made a new lower set. They tested free of all pollutants. He could put them in his mouth. It was a perfect fit. He had been worried about the appearance of his smile. But his smile was beautiful-as any smile based on happiness is.

His last chest x-ray, done November 7, showed no heart enlargement, ventilation was normal, lymph nodes even better than the last time. He could go home. But he was not about to leave without his precious x-rays. Fortunately, I had already sent them to be reproduced, or we would not have this story to tell.

Summary: Bernard had the patience and tenacity it takes, in a research setting, to accomplish his purpose and to leave no stone unturned. He deserved his success.

40 Mark Warwick Bladder Cancer

Mark Warwick, barely in his fifties, came from Australia to avoid having a bag connected to his kidneys in place of his bladder. He had been diagnosed three years ago with bladder cancer and had twenty-eight radiation treatments for it. But now he was passing blood in his urine again. He also had pain in the lower abdomen. He couldn't sleep at night due to pain. He was very gassy and also had pain at the back of his neck on the right side (an obvious dental symptom). His surgeon at home was waiting for him to show up. Would he be able to cheat the surgeon's scalpel?

His electronic toxin test showed the usual assortment: benzene Positive (this destroys immunity so bacteria can spread); xylene Positive (this would invite tumors to the brain); malonic acid, CFC's, copper, aflatoxin, *Salmonella enteriditis*, *Shigella sonnei*, *Salmonella typhimurium*, arsenic, vanadium, all Positive, but isopropyl Negative.

He had obtained *The Cure For All Cancers* book and started on the lifestyle change two weeks ago. He also got all his dental metal changed to the recommended plastic. Now he had a mouthful of composite. He expected this to start his tumors shrinking. Why didn't it?

Note the absence of mercury and thallium in this "whole-body" test. The levels must have come down since removing amalgam. We ordered a CT of lower abdomen to show the bladder in detail.

He was started on marshmallow root tea-2 cups a day for his abdominal pain that I guessed might be coming from the bladder. This was in addition to the usual cancer program.

His first blood test showed the RBC was too high, evidence of cobalt or vanadium toxicity.

The creatinine was extremely low. The usual interpretation is "exceptionally good kidney function keeping this muscle waste so low." Because I had been testing for amino acids recently, and finding huge deficiencies in cancer patients,

my new interpretation was "lack of arginine and glycine to make creatine which makes creatinine." Or "lack of methionine which makes SAM." If creatinine isn't being made, you know creatine isn't present, and creatine becomes muscle "food". Perhaps this explains the fatigue that is so devastating in tumor-bearing people.

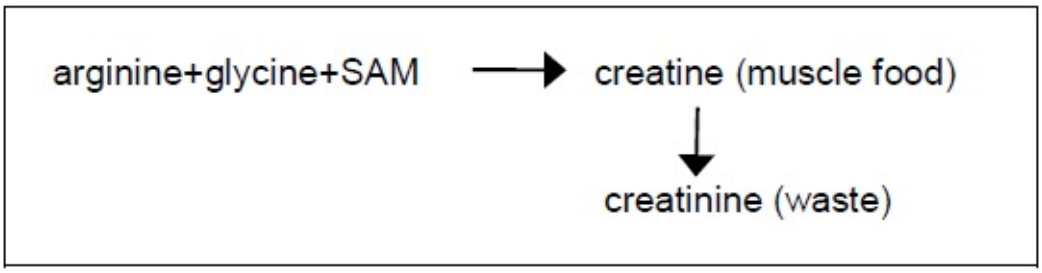

Fig. 47 Requirements for creatine

We eat creatine straight when we eat meat, fowl, or fish. To get Mark's creatine up quickly, we gave him the pure compound to take: 1 tsp. a day.

The calcium was quite low, as was phosphate. When phosphate is below 3 mg/dl, there is a vitamin D shortage. This was understandable since vitamin D is activated in the kidneys, and the kidneys were part of Mark's cancer problem.

The low LDH was a nice surprise, along with the low alk phos. [*His composites were not shedding azo dyes significantly.*]

The liver enzymes, too, were exceptionally good (low)! In addition to the parasite program, Lugol's, kidney program, Mark was started on potassium gluconate powder even though his potassium level was not seriously low; it would certainly help.

The Chinese herb, Yunnan Paiyao, was given to stop bleeding. And niacin, 100 mg, three times a day to make sure he had enough NAD and NADP to help his body's enzymes work.

Altogether, there was no serious deterioration in his health. Recovery should be fairly simple. Should be, that is.

By now, the fall of 1996, we had already learned that dental plastic both contained and was polluted with carcinogens. We had begun sampling the artificial teeth in each patient's mouth for testing purposes.

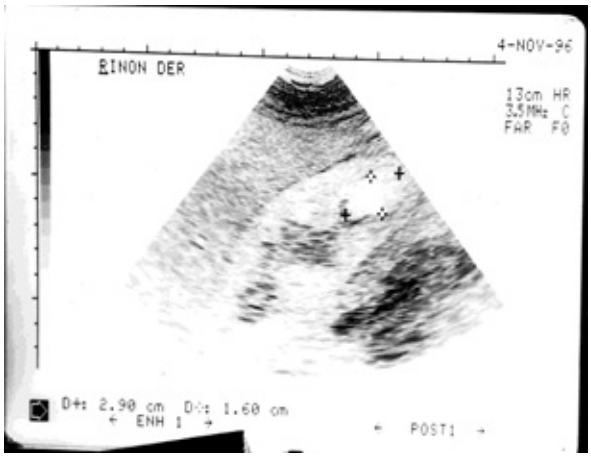
Only five of Mark's new plastic teeth were found to be free of copper, cobalt, vanadium and the M-family toxins. They had all been put in only two weeks ago! Now most of them must come out again.

A week later, he still had not begun his plastic removal. In the meantime the bleeding had stopped, leading him to think that all was well again and he might not need to make such heroic efforts.

And the second blood test, Oct. 29, showed minor improvements, supporting his idea. Creatinine had come up, the LDH had dropped a bit, liver enzymes were better, and calcium and phosphate had risen.

These were probably the rewards from going on a malonate-free diet and taking the supplements that were begun on Day 1.

By the ninth day the bleeding was back; he had not yet changed his metal glasses frames to plastic either. We started him on oral EDTA powder, ¼ tsp. once a day for five days. This would help pull the copper, cobalt, and vanadium out while he deliberated about his teeth. After all, he had just put them all in-and spent a lot of money on them.

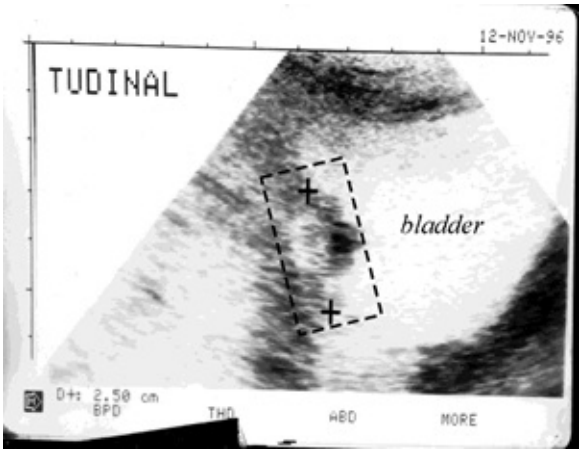


Nov 4 2.9x1.6 cm kidney tumor

On his tenth day (Nov. 4), the CT scan was read (not shown). It showed that his right kidney was dilated, perhaps due to a small nodule or stone, causing blockage. No stone was visible, though. A small tumor on the colon showed up! He had been unaware of it. But the bladder did not show its tumor! We recommended an ultrasound of the lower abdomen instead.

All this discomforting news persuaded him. In four days all fillings were out of his mouth. His pain level dropped so far he could sleep at night. There was only a trace of blood in his urine now.

Then I noticed Mark smelled of tobacco smoke! Perhaps he even wanted me to notice. He agreed immediately to switch to our "smoking herbs" that can be chewed all day to keep the mouth happy and busy.



Nov 12 bladder tumor shows up on magnified ultrasound

The ultrasound arrived, showing a tumor in the kidney! The bladder had not been pictured; it was missed due to an error in communication with the radiologist. The kidney tumor measured 2.9 x 1.6 cm. What a shock.

We knew now that he had three tumor locations: the kidney, bladder, and colon. We turned our attention on the kidney tumor instead of the bladder.

In spite of getting all his plastic out, he still tested Positive for copper, cobalt, vanadium, all five M's, and urethane which we had recently discovered as another dental plastic toxin. They were all in his liver. He was still getting trace amounts, not enough to show up in his daily toxin testing at the whole body level. There must be leftover plastic in his mouth!

We arranged for another dental appointment, this time with a dentist using a magnifying lens and a monitoring screen to see every tiny remnant left in an old cavity. Mark now reminded us that his air flight home was only a week away, and we hadn't even seen his bladder tumor yet. On November 12, he went for the bladder ultrasound. There it was in a magnified view, measuring 2.50 cm. He decided to extend his stay.

Even after his second dental plastic removal he still tested Positive for copper, urethane, and vanadium in the bladder.

This was just at the time we discovered urethane in a supplement's gelatin capsules-the capsules themselves. We stopped all his capsules of supplements: he was requested to use bulk supplies only. Toxic components of plastic still showed their effect in the blood test on Nov. 13. Although the RBC had come down nicely, iron and calcium had dropped, too.

This implies the continued presence of copper [*and germanium*] and malonic acid. But where from? In desperation, our entire toxin test of 80 elements was done at kidneys and bladder. Only one extra toxin was found, thulium. It was present at kidneys, bladder, and parathyroids. And we knew just where to look for it. In his vitamin C. Indeed, he was using up an old supply of vitamin C, not procured from our specially-tested stock. [*What we did not know is that lanthanides including thulium are regular components of amalgam.*]

Now his ankles were beginning to show a minor edema. But all his pain was gone. He slept well. He was still passing a trace of blood in his urine.

On November 18, there was again clear evidence of leftover dental plastic. The RBC was too high; the calcium level was down further.

A full mouth series x-ray was tried to find bits of leftover metal or plastic. Instead, several molars and one upper front tooth appeared to have large infections! Was this the clue? They were extracted immediately, and healing went well. But no dental plastic was seen in them.

A week later, Nov. 25, we studied the nucleic acid bases and amino acids in his bladder. The results were dismal.

Adenine Negative	xanthine oxidase Nega-tive	glycine Negative
xanthine Negative	transferrin Negative	arginine Positive
guanosine Negative	DNA Negative	glutamic acid Negative
inosine Negative	RNA Negative	glutamine Positive
uridine Negative	lysine Negative	ornithine Positive
thymidine Negative	aspartic Negative	

He was requested to eat one can of sardines a day (for nucleic acid bases). He was also given: aspartic acid, glutamic acid, glycine. This proved to be insufficient to make them appear at his kidneys so amounts were doubled.

Bladder tumor has shrunk to 1.45x1.1 cm

Cobalt and copper were still showing up regularly. (We could have IV-ed them out with EDTA, but this would give a false sense of security; I advised against it.)

There was only one conclusion to be reached-another remnant of plastic was present that had escaped all the dentists so far.

We sent him back to the dentist whose dental microscope and painstaking procedure would surely give him the final cleanup so much needed this time. He had only one week left before his second plane reservation.

After this final "microscopic" cleaning, we expected to see a little improvement on his blood test, but we were astonished to see his results (Dec. 2) were completely normal! The RBC, calcium, phosphate, and iron were all correct. He now tested Negative for copper, cobalt, vanadium, all five malonates, and urethane, at last. Was he ready to go home?

Suddenly, a trace of bright red blood showed up in his stool! We had not paid attention to the small tumor seen in his colon on his original CT scan. What was it doing? His dental partials were made, tested, and fitted fine. His fatigue was gone. He had slightly swollen ankles. We advised him to have the colon checked to see if there was anything suspicious on the inside. But it was not done.

Dec 5 Kidney shown between the + signs has no trace of former tumor

Instead, a follow up ultrasound of kidney and bladder was done. On Dec. 5, his new ultrasounds showed NOTHING in the kidney. Nothing at all where the tumor had been. And the bladder tumor was about half the original size. Happiness reigned for the rest of that day and he was determined to go home. But not before his cavities were filled! He had twelve empty holes in his teeth. Without authorization he got them all filled.

On Dec. 6, we tested him one last time. He was positive for cobalt and vanadium again! And the RBC was back up.

He had obtained new temporary fillings: twelve of them. Only zinc oxide and eugenol was used; we had tested many such products and always found them pure. But had the new dentist used some "nerve protectant"? Or a faster-setting variety of zinc oxide plus eugenol? Or had unsafe plastic strips been used to contain and polish the wet cement-like mass before drying? We tested immediately. He was toxic again. He had only three days left before his flight; we could not persuade him to extend his stay to tend to his edema problem. Or his colon problem. Yet we could not let him go home with a mouthful of toxic dental fillings.

He agreed to return to the microscope dentist for complete removal again, by air abrasion; (this does not enlarge the hole). But there was no time to do another blood test and see that all toxins were gone. He rushed right over to yet another dentist for the approved zinc oxide and eugenol. Then he was on his way homeward. But too much was done too hastily. Would his edema get better or worse? Would his bladder tumor continue to shrink? Would the rectal bleeding stop or worsen?

Summary: If Mark had lessons to learn about patience, we, too, had lessons to learn. Removing plastic from teeth is not as simple as tooth-cleaning. And removing metal is also a time-intensive and demanding skill. If it is not done perfectly, it will not be good enough to save a life. It would be better to extract as many as possible, before the patient is too weak or anemic to sit in the dentists' chair.

One thing is obvious: tumors shrink rather readily. But every detail must be attended to. Nothing can be done half-way with full expectations of success.

41 Paul Garcia Beginning Tumors

Paul Garcia, in his early thirties, was an employee of the Diagnostic Center. Like other Mexicans in Tijuana, he had become habituated to drinking bottled water, instead of boiling it, and soda pop as a beverage. His can of pop for lunch was neatly hidden from view though. And after lunch he smelled of tobacco smoke. He had no symptoms whatever.

It was late Saturday afternoon and my plan was to search for the presence of DNA and RNA in as many healthy persons as possible, using about 40 organ slides. The pure samples of DNA and RNA had recently arrived, and I wanted to see whether they could be detected everywhere, nowhere, or at selected locations. There were still a few employees present who would be willing to "sit" for testing, besides some staff members.

The DNA and RNA samples were left in their original bottles, and simply placed on one Syncrometer® plate while the organ slide was placed on the other. RNA was found to be present in all organs tested, but was normally missing in kidney and bladder. Why was there no RNA detected in the kidney and bladder? Is this normal or sick? Is it also absent in young people? These questions are not

yet answered. But it seemed safe to assume that it is normal and healthy to be able to detect RNA in every organ except kidney and bladder.

But DNA was only present for 20 seconds out of each minute, and at rather low levels. Except in the ovary where it was present constantly. Even though every cell has DNA in its nucleus, it is bound to protein here most of the time. Our test-DNA was not bound to protein, a different electronic entity from the body's DNA. Being post-menopausal didn't seem to matter; DNA was still Positive at the ovary. Would it also be present in the testes of a male? We called Paul to help us discover the facts.

The test set for organs begins with adrenals and ends with uterus. When we got to liver, the circuit resonated. Several repeats gave the same answer. Paul had DNA, evidently unbound to protein, in his liver. Was that significant? Did it portend a malignancy? A growth? We continued testing in silence.

When we got to the prostate, the circuit resonated again. And again at the testes slide. We repeated these several times; there was no mistake. Did this imply a tumor or a malignancy at the prostate too? Or neither?

Paul assured us that he had no difficulty urinating, did not have to get up at night to visit the bathroom, and had no indigestion from a possible liver tumor.

Not wishing to alarm him over nothing, we scheduled a CT scan of the liver and ultrasound of the prostate for him. We would pay the bills if he did it immediately. We confessed our suspicion of some problem. Perhaps only metabolic as yet.

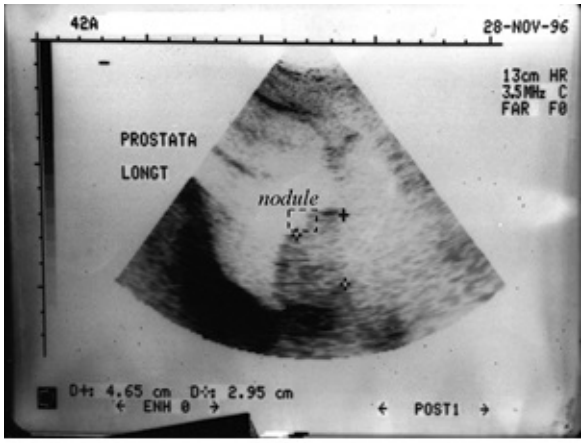
Being conscientious and very appreciative of our concern for his health, he did both scans promptly.

The prostate did indeed have a problem. It was much too large, so that it pushed into the bladder (large white area) above it. Furthermore, the wall of the prostate was not perfectly smooth; it was rough.

And at one edge, close to the 10 o'clock + sign and just above it, a tiny portion of the wall was missing. The missing portion appears white. (Remember, this would be black on the negative.) This small white nubbin is a small nodule, a tumor; this is what the DNA test was trying to tell us.

No tumors could be seen in the liver. A small nodule there could easily be missed by a CT scan, though. Even if there was none, there was a potential for one, implied by the DNA result.

The next question was "Is the prostate tumor malignant?" Ortho-phospho-tyrosine was tested next. It was Negative at the liver and testes, but Positive at the prostate. It was malignant. Paul was eager to correct his ways. He started the parasite-killing program immediately and zapped. He promised to drink no more bottled water, soda pop, or commercial fruit juice.



The prostate gland between the + signs has pushed into the bladder (white area).

Nov 28 radiologist spots small nodule at wall of prostate

<u>There was not a single dental repair in his mouth!</u> All the copper, cobalt, and vanadium in his prostate would have to come from his new beverage habit. (His childhood diet did not include these beverages.) The malonate was coming from food; he was given the malonate-free food list. The DNA-making bacteria, the clostridium family and lactobacillus, came from eating ordinary dirt in common foods [via the rabbit fluke]. Clostridium had colonized his colon. He promised to stop eating dairy foods or sterilize them; eating yogurt was another newly adopted habit.

But can a young man with no symptoms deprive himself of foods considered ordinary and safe by the public? Even an especially conscientious young man? We would see...

Meanwhile, it seemed advisable to search for early tumors in every patient, using the DNA test. If it was found, a scan would follow. More important, though, would be clearing the bacteria out of the organ involved, killing

tapeworm stages, eliminating malonates [*and azo dyes*] in processed foods. Of course, killing parasites regularly and staying off the isopropyl alcohol list would come first to stop any malignancy.

Feb 17 Nodule in prostate wall is gone

More than two months passed. The clinic was in operation again at the site where Paul worked. We asked him if he had been diligent and stopped eating yogurt and drinking pop. He felt insulted. How could any intelligent young man not stop drinking pop if it was harmful in such an important way? We apologized. Then sent him out for a new ultrasound of the prostate. In two hours he had the negative in his hands.

The tiny nodule was gone. The radiologist could not see it.

Summary: Silently this tiny malignant nodule came, and silently it went. Only the ultrasound knows the story. But Paul rose in our esteem by many feet that day. A common laborer he was, but with uncommon intelligence.

42 Victoria Boelman Breast Cancer

Victoria Boelman, age thirty, arrived in December. She had breast cancer and was pregnant. It was called "infiltrating ductal carcinoma." Her doctor at home had recommended a modified radical mastectomy plus chemotherapy. What would happen to the fetus? No one knew. She had started herself on the parasite program one week before arriving. And she had already gotten rid of isopropyl

alcohol so her tumor was no longer producing ortho-phospho-tyrosine, my marker for malignancy. But she still had benzene, wood alcohol, aflatoxin, patulin, D-malic acid, and maleic anhydride accumulation according to the whole body test. She also had Freon, asbestos, aluminum, copper, mercury, and thallium. And the bacteria, *Shigella sonnei*, and *Staphylococcus aureus*. Urethane and bisphenol-A, plastic toxins, were appearing at the breast, too.

We ordered an ultrasound of the left breast and armpit. The tumor was 3.25 x 1.4 cm.

Her mouth was full of medium size amalgam fillings, fourteen in all and some plastic.

Her blood test showed only the earliest effects of tumor disease, blocked urea and creatinine formation and very low calcium and phosphate levels. The presence of D-malic and maleic anhydride implied the presence of malonate before it was detoxified.

Dec 12 Left breast tumor is white area between +

Her liver enzymes were especially good (low), as was LDH and alk phos [*implying few dye-related mutations*].

But the uric acid level was sounding a warning. It was much too low. By now, we had seen the link between bacteria and low uric acid levels. Somewhere ammonia was being produced in large amounts just when it could not be easily converted to urea. Besides, the breast would not have a large capacity for making urea such as the liver and kidney would. So nucleic acids would be used

for this ignoble purpose. But only the pyrimidine variety, so that a great excess of uridine and cytidine would be produced. Both of these lead to thymidine formation, also in excess.

Somehow, the excess pyrimidines lead to insufficient purines. The purine variety of nucleic acids is absent or very, very low. And with low levels of purines, such as adenine and guanine, uric acid levels must also be low since they are derived from purines.

There are always two explanations for a low level of anything. Either not enough is made or too much is used up. If too much uric acid were used up, could this be explained by bacterial action, too? Do bacteria simply eat purines? Which bacteria were they? It was Victoria who would find the answer for us.

She was started on the usual program, and was sent to remove all metal from her teeth. Also, specific for breast cancer is wearing no bra of the regular style. Ten days later she announced that all metal was out of her mouth. A new blood test should prove this fact and was ordered.

Certainly, the WBC was lower and more normal. But the BUN and creatinine were still blocked. And the uric acid, becoming unmasked by her new procedures, indicated hordes of bacteria were still present.

The calcium level had come up and the phosphate with it, showing that the parathyroid was free of toxins at last and could make parathyroid hormone again.

A quick check at the breast and liver tissues showed glutamic acid and glutamine were Negative. Ornithine and arginine were Negative, too! Without ornithine and arginine, urea (BUN) cannot be made. Without glutamine, purines cannot be made. Without glutamic acid, glutamine cannot be made. Where had they all disappeared to? After all, she had taken these supplements that very day. A supplement check was ordered, to make sure she had them all and was taking them all. She was. Could some factor(s) in her plastic teeth impede progress?

DNA testing showed it was still present at the breast, as it must be when bacteria are turning RNA into DNA nonstop. I decided to search through my entire bacteria collection (the slides) for any clues to the responsible varieties.

Five Clostridium species, *Lactobacillus acidophilus*, and *Staphylococcus*

aureus were all still present at the breast. The Clostridium family of bacteria, as well as some *Lactobacillus* varieties can make DNA from our RNA. The staphylococcus bacteria implied dental infection. The dentist had pointed out to her that three out of four wisdom teeth pulled a long time ago appeared to have cavitations left behind. These would house staphylococcus bacteria.

She had acquired an enlarged lymph node under her chin just recently, testimony to the streams of bacteria and toxins flowing from the mouth. And to the spread of these dangerous bacteria. Time was important. But she was reluctant to proceed with plastic removal. It was now December 23. Her family and friends wanted her home for Christmas. How would she look? So the plastic cleanup was delayed.

She returned January 3. Her first task was to see the special dentist for plastic removal by air abrasion.

When she returned from the dental visit, the breast still had all the malonates accumulated as before. A quick check showed copper, cobalt, vanadium Positive too. Had the dentist missed something?

Only two Clostridium and one lactobacillus variety were still at the breast. Salmonella was also Positive at the breast. Others were Negative. Some progress had been made, but not enough. Unless the malonates and metals were removed from the teeth with meticulous care, the bacteria could not be eradicated. She was sent back to the same dental specialist to search again.

At her next visit, January 6, the results were good: copper, cobalt, vanadium, five malonates, urethane, bisphenol were all Negative at the breast. All Clostridium bacteria, lactobacillus and the eight common food bacteria were Negative at the breast. She could schedule her follow-up ultrasound of the breast in ten days if this continued. A new blood test was done (Jan. 6).

BUN and creatinine were still too low, uric acid and calcium were too low, too. Perhaps not enough time had passed since the final tooth cleaning-only two days. She was started on a calcium supplement accompanied by magnesium and vitamin D.

Two days later, January 8, she passed the three month pregnancy point. Suddenly, DNA was everywhere! At the ovary, uterus, pancreas, parathyroid, breast. The magic of pregnancy was in process. The growth of the fetus could be

detected through the mother.

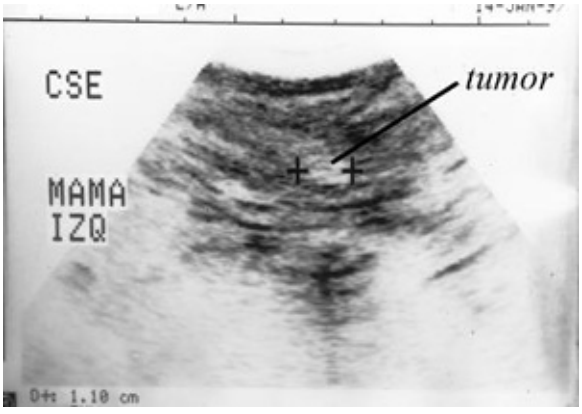
By January 10, Victoria thought the tumor felt softer and smaller. We searched for bacteria; they were gone. We searched for DNA again. It was now Positive at adrenals, liver, lung, cerebrum, skin, thyroid, thymus, optic chiasma [*of the fetus?*]. It was still Negative at cerebellum, kidney, and stomach. What did this pattern mean? Only more research would tell. Victoria was impatient to be done. She wanted to go home. But her fourteen empty teeth struck fear in her. What if they got infected? She was instructed to floss once a day with nylon thread and brush with white iodine. But she knew her husband would be very put out. Perhaps even demand that she fill them.

Would a new ultrasound show the tumor had shrunk? If it had, would this persuade her and her husband to be patient and keep the fillings open at least till the baby was born?

On January 14, she had her follow up ultrasound of the left breast. She also had a blood test done. But while on these errands panic struck and anxiety sent her directly to a dentist to put fourteen temporary fillings in her mouth.

The ultrasound was beautiful. The tumor had shrunk to 1.1 cm. No wonder she could hardly feel it.

The blood test finally showed the BUN was rising. The calcium level was the best ever. Blood fat and cholesterol were higher; she was better nourished. Uric acid though, remained very low.



Jan 14 One month later tumor has shrunk to 1.1 cm

The next day, January 15, only one day after the temporary fillings were put

in, Clostridium and Lactobacillus bacteria were back in her teeth! She was devastated. We were devastated. The bacteria would reach the breast in a day. Her tumor would grow right back. The fillings were reported to be just ZOE, zinc oxide and eugenol. No Lugol's had been used to sterilize the holes before filling either. She could not bring herself to remove it all again. Her fear of the tumor was distant now. While her fear of her husband's reaction to the "open" teeth was near.

But I could not authorize her departure for home as planned. It would be a certain mastectomy and a certain death at a young age when motherhood, I felt, was her birthright. We persuaded her to extend her stay.

Two days later, January 17, depressed and anxious instead of happy and dancing, she still had done nothing. We tested at the breast again; copper was already present. We tested for copper and malonic acid in her teeth. The temporary fillings were polluted! Was the ZOE itself polluted? Not likely. But a single swipe to "coat the nerve" with any special "desensitizer" and "sealer" was probably the true cause.

How could a dentist know this? It had taken our diagnostic team two years to find the extreme sensitivity of the cancer patient to even the tiniest dose of tumorigen permanently placed in the teeth. No dentist could guess it or be blamed for applying the state-of-the-art details that make dentistry sophisticated and enjoyable. Our resolve had to be to tighten our hold on the unsuspecting patient to prevent misguided dentist visits. Only a special dentist, aware of the pitfalls of using adjunctive materials could ever be patronized in the future.

Next day, Victoria had most of the temporaries removed again. Yet she remained Positive for tumorigens; it did not all come out.

She went to another dentist with special removal methods. But the pollution remained. She would have to go back to the specialist who could do air abrasion for

Victoria Boelman	12/10	12/20	1/6	1/14

the third time! But she didn't go. It would cost $100. With the newly cancer-free breast all but a certainty, she did not want to spend another $100. Not even to guarantee her future. What will it hold?

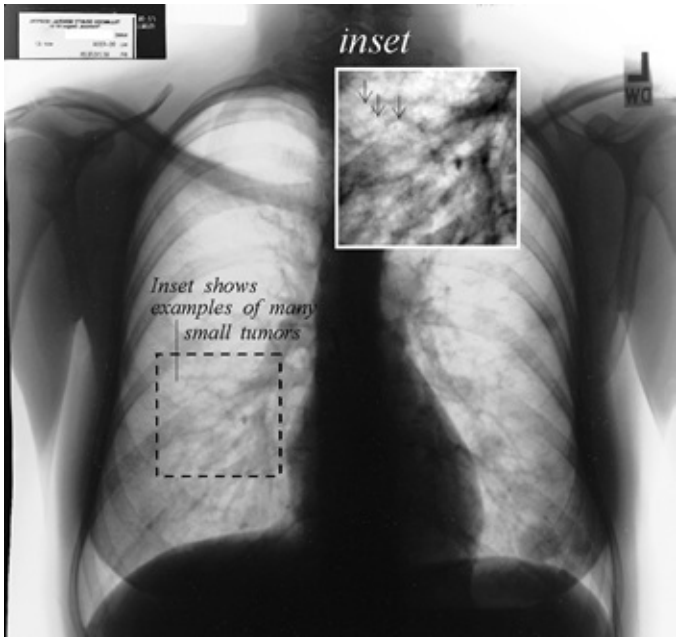
Summary: A young couple have the right to expect safety in dental materials, so that they cause no harm to mother or child. Until that can be guaranteed by the dental profession, conservative treatment is best: clean the infected area with air abrasion or drilling, then keep the hole sterile by brushing with colloidal silver, white iodine, oregano oil and occasionally bleach. No fillings needed. As long as there is no further infection the holes cannot get larger. If infection is stopped and the holes do not get larger, why fill them?

43 Stacy Riley Lung Cancer

Stacy Riley, forty-one, was riddled with lung cancer. She tested Positive for nickel and formaldehyde when she arrived, two serious lung toxins. She would have to clean up her home before returning to it.

She was diagnosed just half a year earlier with metastatic melanoma. But it must have begun four years earlier when a mole on her back was removed. Now she was started on interleukin at the National Cancer Institute of Bethesda,

Maryland-an immune therapy. She had two sessions: 11 doses the first time and 8 doses the second time. The doctors said the cancer was advancing too rapidly, the interleukin was doing no good; she was on their high dosage already. So they told her to go home and arrange with hospice for her terminal care. That was December 22, fifteen days ago. She took the news with the stoicism of a Roman gladiator: she was given two months.



Dec 31 about 200 closely packed small tumors (small white areas) in the lungs

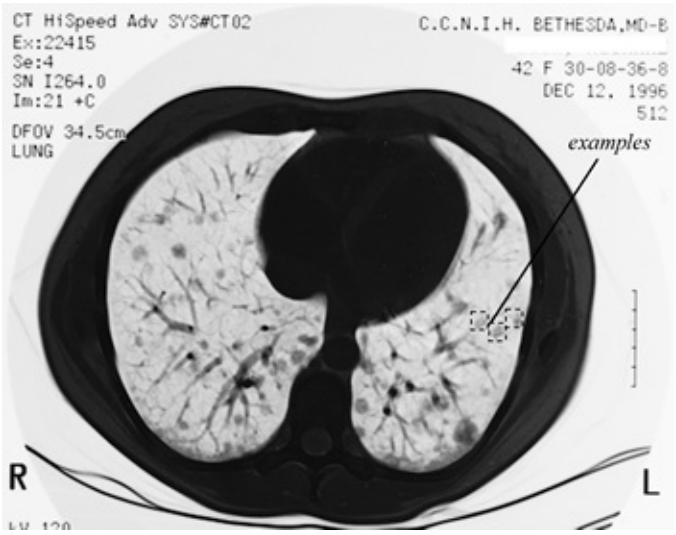
When she arrived, she was on no special medication, only Synthroid 1.25 mg. She had brought a CT scan from three weeks ago and her latest chest x-ray, made three days earlier; the lungs had a moth-eaten appearance and the report indicated 200 lung tumors, packed side by side. Only the lungs were involved. This did not seem too ominous to our staff, but Stacy did not light up with the prospect of life. She seemed resigned to her fate. We would have to pull her from the depths, not just throw her a life belt. Her family, at home, was totally against this, she said. They didn't want to spend the family assets on her wild grasping-at-straws. And we would need to work very quickly, before her sudden collapse.

We must avoid massive infection at her lungs. Would there be bleeding on a grand scale when the tumors pulled away from the thin pleura, as we had seen so often for large tumors?

Initial electronic testing at the lung showed 5 Clostridium species,

Lactobacillus acidophilus, E. coli, 3 salmonella varieties, *Staphylococcus aureus, Shigella flexneri* all Positive. Maybe *Shigella flexneri* was taking its toll on her mood; it is a depression-causing bacterium.

When so many bacteria are present, I expect a lot of growth factors to be abnormally present also. In her lungs the Syncrometer® found Ca 72-4, CAA-B antigen, CAA-O antigen, alfa fetoprotein (AFP), fibroblast growth factor (FGF) very high, epidermal growth factor (EGF) very high, platelet derived growth factor (PDGF), CAA-GI, and insulin-like growth factor (ILGF). In all cases I find these are gone when the bacteria are gone!



Dec 12 CT scan shows many tumors

Four amino acids were tested at the lung with these results (they should all be present): glutamic acid Positive, arginine Negative, glutamine Negative, ornithine Negative.

Lactoferrin was Negative at breast, liver, and bone marrow; it should have been Positive.

Her blood test was exceptionally good and belied her tumor-ridden lungs. Her good health and youthfulness would now be called upon to make success possible.

Neither LDH nor alk phos was elevated [*showing that damage from the azo dyes in food, hair dyes, or dental plastic had not occurred*]. The liver was still exceptionally good. But anemia was prominent and creatinine was too low. The

low creatinine implied there was not enough arginine or methyl groups or glycine. Calcium and potassium were low. But her body was still well nourished.

She had been on iron tablets daily when she arrived, no doubt responsible for the excellent iron level. But it was not getting to the bone marrow to build RBCs due to absence of transferrin.

She was started on a daily enema using black walnut tincture extra strength to reduce the bacterial levels in the bowel, thereby reducing them overall.

She was told to drink raw milk, boiled 10 seconds and vitamin C-ed, to provide lactoferrin. [*More recently, in this 21-day cancer program, no milk is allowed, to avoid any possible errors in selection or treatment*.] This was in addition to the usual program of parasite killing, coenzyme Q10, glutathione, Lugol's, and other supplements.

She thought she was allergic to iodine, so peroxide was tried for dental sterilization instead of Lugol's. Her mouth was full of large fillings; she would need a lot of extractions. Later she was given homemade colloidal silver to take during dental-work days; it was definitely superior to peroxide. [*This was before our trial of diluted USP bleach, which turned out to work the best*.]

By her third day, she had extracted three teeth, but she was still Positive for DNA at the lungs. She also had maleic anhydride there, starting liquid effusion and water accumulation. And, of course, still mercury and nickel.

After one week, she had six teeth extracted by our oral surgeon. Immediately after this, her chest began hurting. Would this lead to bleeding, perhaps hemorrhaging? But we dared not slow down since time was racing her. In spite of this, DNA and the p53 gene mutation were still Positive at the lungs. Three Clostridium bacteria were still Positive at the lung and one Clostridium (septicum), was still Positive at the tooth location. Clostridium was also present at the parathyroids, as was the p53 gene mutation. [*The parathyroids are always targeted in cancer cases; this was pointed out by Dr. Wm. Koch nearly a century ago*.] Suspicion that parathyroids are involved occurs when calcium is too low.

Amino acids were tested. Phenylalanine was Negative at liver, lung, lymph nodes, breast, parathyroid, and thyroid. Phenylalanine is always present in our tissues in health. Why was it absent? Tyrosine, its closest cousin, was tested next. It was positive at all these locations. Evidently phenylalanine could convert

to tyrosine, but not the other way around. Was the enzyme that converts tyrosine back to phenylalanine inhibited? She was taken off dairy and meat products entirely to reduce phenylalanine in her diet. This would keep tyrosine from building up. By now, *Clostridium* was eliminated from the tooth location, though it was still present at the colon.

How could we get rid of *Clostridium* in her intestine? She was started on the bowel program. [*At that time we had not discovered the magic of betaine and hydrochloric acid.*]

Her next blood test, done January 15, showed significant improvement in the RBC; she was less anemic. Creatinine was up to normal. She had been taking arginine (and ornithine) daily. Her uric acid level had fallen, revealing throngs of Clostridium bacteria remaining. By making more RBCs, her iron level had dropped from 100 to 36, but then was unable to raise her iron level back to normal because of copper [*or germanium*] toxicity.

By January 16, her dental work was still not completed. But her chest pain had stopped! DNA had been Negative at the lungs for three days. Did this mean the DNA-forming bacteria (*Clostridium*) were finally vanquished?

We tested: only one Clostridium species was Positive. Lactobacillus was Negative. All eight common food bacteria were Negative. The bacteria were gone both at the lungs and the parathyroids. This day phenylalanine was Positive, too; not merely tyrosine. Evidently, she could now convert it back from tyrosine. Had the enzyme block been due to bacteria?

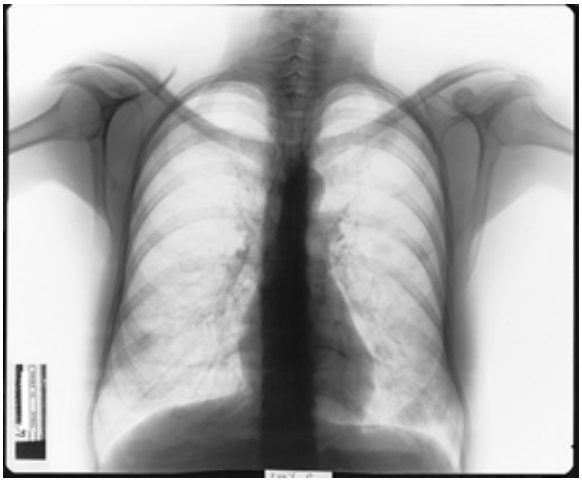
Four days later, January 22, she had bacteria back in her lungs; it was a setback. *Rhizobium* and *Lactobacillus* were both present. So was DNA. Where were they coming from? She had benzene in her lungs! This encourages every single pathogen to multiply. The situation would be hopeless unless the benzene source was found and cleared.

The bad impact could be seen immediately on her blood test done that day. Although the RBC rose further, the LDH worsened. The benzene source must have brought with it a carcinogenic dye. [*Bursting and draining of tumors would release both*]. Would this be the beginning of a run-away trend we could not stop? But calcium and iron were coming up.

We pushed. We encouraged. We hustled. We sympathized. Finally, all

extractions of teeth were done (altogether 12). A final panoramic x-ray still showed a tattoo. That would be removed at once too.

By January 27 she had a lot more energy than she could remember; she was sleeping better, too. Testing at her lung showed no copper, cobalt, vanadium, DNA. Besides this malonyl coenzyme A was Negative, and methyl malonyl CoA was Negative, too.



Jan 31 only six tumors remain

These malonyl compounds are Positive when malonic acid has been present very recently. They show how coenzyme A is harnessed for malonic acid utilization instead of allowing it to fuel the Krebs (energy) cycle.

She could tell her lungs were better and she could endure cooking odors now, like coffee. All bacteria tested Negative. She got impressions made for her new partials.

The next day she was feeling still better. Mental clarity had returned. Appetite was better. She looked lively and alert-almost happy!

A final blood test on January 30 showed the recent improvements. The LDH was back down-way down! As was alk phos. RBC was still rising, giving her even more energy. But uric acid had dropped drastically again.

Could she have the bacteria back? Indeed she could. A quick check at the lungs showed six Clostridium species Positive again. Glutathione was Negative. What caused this glutathione destruction? Searching our tumorigens, one was found in the lungs.

Ribonucleoside vanadyl complexes were Positive. These originate with vanadium. But vanadium itself was not. Could a mere trace of vanadium, as one would get sitting in traffic at the US border crossing cause this? It seemed unlikely. It remained unexplained. [*In hindsight she must have had leftover dental plastic or metal*.] She was due to leave for home in four days. A final chest x-ray was scheduled.

She returned with it next day.

It was almost too beautiful to behold. The radiologist had counted only six tumors now-out of that horde of 200! The texture was beautiful too, though not yet normal.

Summary: At this rate, only one more week would surely have dissolved the remaining six. But family matters pressed. Perhaps she was just one more dental cleaning away from life-saving success. Perhaps it sufficed.

44 Jessie Healy Lymphatic/Breast Cancer

Jessie Healy was a scientist herself with a Master's degree in biochemistry, specialized in the study of milk. This scientific bent, no doubt, explained her organized approach to all problems including her own health. She had returned to the clinic full of hope that something could be done for her creaky, painful knee and hip. This is taken from her own notes.

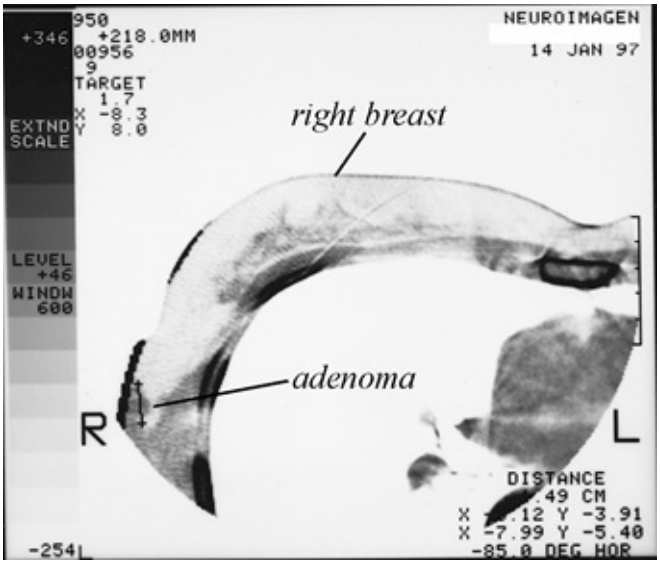
"January 10, first day at the clinic. Symptoms: 1) Hip pain, most important. Can't get up off chair using legs alone. 2) Right knee sore; knee pad swollen and tender. 3) Can't walk without pain. 4) Can't get out of car seat, chairs, without slow and careful maneuvering and hand pushing/lifting. 5) When in bed, painful to rest knees together to sleep on right side; painful to turn body in bed; can't rest left leg when flat on back."

Jessie had visited the clinic some years ago because of her eye disease, retinitis pigmentosa.[116] She had believed from the age of twenty, when it was diagnosed, that she would go blind eventually. And the time had come for her genetic fate to be executed. For 40 years the idea that an alternative approach was possible was branded quackery by her fellow workers, and she absorbed this disdaining attitude. But in her early sixties and about to trade her driver's license and her job for a course in Braille, she decided to investigate. To her surprise our alternative approach was entirely to her liking, being utterly scientific and begging her participation as a scientist.

Now, five years later, going blind was furthest from her mind, the disease was "in remission" and her driver's license had no restrictive clauses. She was pleased and hoped something could also be done for her decrepit condition. Personally, she believed she had done it to herself-by playing tennis-into her later years. And she was mighty proud of her athletic lifestyle. So she just took painkillers and played on. It kept her slim and trim, in touch with friends, and exhilarated with energy. I felt sorry for her as she carefully limped through the doorway.

In the first five minutes of our interview, her "arthritis" could already be explained. We tried to teach her a new kind of Bacteriology-based on Syncrometer® testing. This shows that ALL PAIN IS BACTERIAL. The bacteria are streptococcus varieties. All locations in the body that have pain also have streptococcus bacteria. Streptococcus bacteria make phenol. And phenol causes

pain. But that is not as important as its other effect. Phenol oxidizes you (although in regular chemistry it is considered a reducer), from top to toe, in places where you should never be oxidized. It oxidizes your vitamin C so that the molecule breaks apart to form "oxidation products", like xylose, lyxose, and threose. These cause aging: forming wrinkles, softening bones, making cataracts, causing diabetes. And without regular reduced vitamin C, your tissues cannot heal. Healing requires vitamin C. So not only did Jessie have pain in her joints, they could not heal! Bacteria can easily move around in your body, traveling from one pain location to another by swimming along in the blood. For Jessie, the clue was her painful teeth. From small colonies here, they could spread to any other location in her body that would let them gain a foothold-such as her frequently traumatized joints.



Jan 14 CT scan shows an "adenoma"

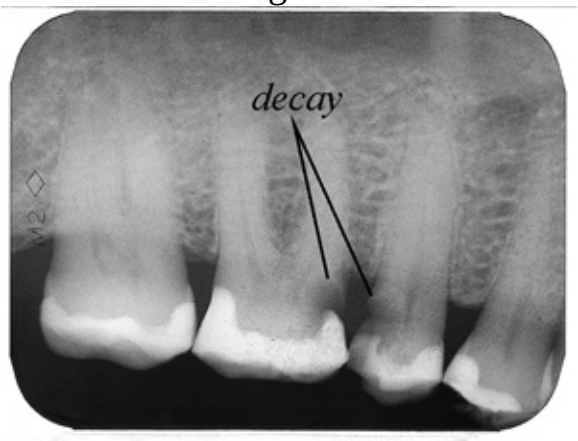
Jessie knew she had infected teeth-they were aching! But somehow this straightforward logic was easier to apply here at our clinic than by herself at home surrounded by dentists wishing to "restore" rather than extract teeth. A panoramic x-ray revealed the abscesses. But should she extract? Was there no other way? Couldn't she just try to zap the bacteria? Then a new development drove away any hesitation. When she arrived, she listed a lumpy armpit as one of her symptoms. One lump felt elongated and was about 1 inch long. Was it anything to worry about since both armpits had been "lumpy" for years?

We searched for tumors immediately. Within five minutes we had found that our DNA test was Positive at her lymph nodes and breast. She indeed had been

growing tumors in both places! We scheduled a CT scan immediately, since an ultrasound could miss a very tiny tumor. (On the other hand, a CT scan can miss something that an ultrasound can catch, too.)

Afterwards we reviewed it together. The radiologist had marked it, measured it, and called it an adenoma. A frightening word! Arthritis could certainly take second place to beginning cancer.

To her surprise, our method of stopping tumor growth was also largely dental. In this case, it was Clostridium bacteria hiding away under tooth fillings. The connection was rational. If tooth-infecting bacteria could also make DNA inside our cells, the infection must be cleared in a permanent way, not left to chance. Step one was to extract infected teeth (not repair them and hope they would not reinfect). Off she went to the dental surgeon.



Dental per apical x-ray shows decay under fillings

These are her notes:

"January 14, extracted three teeth with large fillings showing bacteria-lines at the base, going into the teeth. (When they reach the nerve they hurt.)

"January 22, extracted two painful, dying teeth showing bacterial infection."

Between these dates, Jessie hot-packed her face for hours each day, swished with hot water, brushed with white iodine, and suddenly became more limber. She surprised herself, getting up from a chair rather quickly now, since she was focused on her armpit and breast, not her hip and knee.

She was also hot-packing her armpit and taking the full regimen of supplements aimed at shrinking tumors. She was determined to win this new

kind of game, in dead-earnest.

She also needed to remove plastic fillings, unheard of in her experience. Yet, she could hear the "positive" test results as we checked her for copper, cobalt, malonates, urethane, and bisphenol-A. Bisphenol-A, a component of composite, is described as "estrogenic", meaning 'going to the breast'! It was going to her breast. And the conclusion was only logical. Take it out. She went to see the special dentist who did air-abrasion. If a minute speck of metal was exposed at the bottom of the plastic filling, it, too, could be abraded out. But it requires dexterity.

It was Saturday, January 25, and a new problem surfaced. Tooth #9 now had a big hole on the back side. She did not care to refill it for fear of making the tumor grow. It really ought to be extracted since it was simply too damaged, but no dental surgeon could be reached on Saturday afternoon. Her flight left on Sunday.

The day her plane left she could walk normally and didn't need hands to help her out of chairs. But her focus, as well as ours, was on the tumor. Was it shrinking or would it wait on completion of the last dental work? She agreed to get another CT scan a week after her arrival at home.

Such plans go awry easily. As rational as they sound at our clinic, no doctor at "home" wants to abide by anyone else's bidding. And often do not want to listen to a patient's request. The patient is powerless in the US. The doctor is following his or her own agenda for the patient. Jessie kept trying to get a new CT scan but each time got "postponed" by her doctor. The effort was just not worth it. So, she simply waited to return here. Besides, she had more aching teeth and her painful arthritis was back, too. This time, though, it did not panic her. The connection between infected teeth and skeletal pain was plain to see. But had all this delay stalled her tumor shrinkage? That was the gnawing question.

She returned on March 1, half full of anticipation and half full of anxiety. These were her initial test results: mercury and thallium, both Positive at teeth, breast and lymph nodes. Obviously she had an amalgam tattoo somewhere. Rhodanese enzyme Negative at the breast, should be Positive-it is a detoxifying enzyme. Glutathione Negative at the breast. 20-methylcholanthrene Positive at the breast.

She was being challenged continuously by this endogenous carcinogen (20-methylcholanthrene)! This was due to lack of rhodanese which otherwise might detoxify it. And rhodanese was absent for lack of iron. And iron was low due to competition with copper [*and germanium*] from a tiny bit of metal or plastic left somewhere in her mouth.

With copper present, glutathione would be absent. With glutathione absent, the bacteria could thrive. So metals and bacteria could go hand in hand, anywhere. They had chosen her armpit and breast. Clostridium botulinum, Clostridium sporogenes, Rhizobium leguminosarum, Rhizobium meliloti were all Positive at the breast.

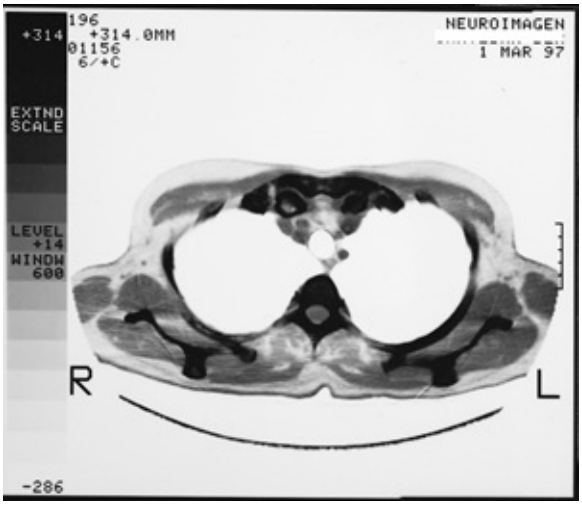
DNA was Negative at breast. At least the tumor could not be growing. This was a cherished result for Jessie. Did these bacteria not make DNA? In most other circumstances they do. What was different? Can bacteria switch on or off their DNA-making enzymes? This waits for more research.

Jessie had less than a week to stay this time; just long enough to extract, clean cavitations, and learn to drink raw milk once a week (properly sterilized) to get back the lactoferrin she was missing and long enough to get the new CT scan that was tantalizing her.

She brought it in for review, not quite believing the radiologist's Spanish comments which she thought translated to "He could not find it!" We taped it up to the window immediately. It was as the radiologist said. There was nothing there! The adenoma was gone.

Her arthritis was gone, AGAIN, too.

She accepted the idea of partial dentures with gratitude and so much joy (over the missing tumor), a little song leaped into her heart. She sang it quietly to the staff before leaving: "Not Only Smaller But Gone" to the tune of "I Wish I Were Single Again."



Mar 1 adenoma gone

Summary: we quietly agreed that some patients make it all worth while. The world IS waiting for a rational, that is, scientific, approach to medicine with patient input, patient-power, and an egalitarian relationship between all. This was a case of early discovery of a developing tumor, using Syncrometer® technology. No blood test results were available for this case history.

45 Chris Lantz Prostate Cancer

Chris Lantz, a civil engineer, age seventy, came from France for his prostate cancer. It was January 15, and he had already been on the herbal program for two weeks, as well as zapping.

In spite of this, he tested Positive for isopropyl alcohol when he arrived; he couldn't stop using his favorite supplements. He also tested Positive for asbestos, aluminum, cadmium, lead, mercury, thallium, and tartrazine (yellow food dye).

His symptoms actually began ten years earlier with frequent urination. In the last two years he was getting up six or seven times a night to empty his bladder. For the last three to four months he also had pain. He had been on the macrobiotic diet for two years, hoping his PSA would go down. But actually, it went up. In March last year it was 5. And in December last year it was 23.2.

The usual blood test and ultrasound of prostate were scheduled on his first day. He was given environmentally safe lodging with a restaurant nearby that could prepare malonate-free food and properly sterilized uncolored dairy products.

He had seven or eight root canals, at least four bridges, and some crowns in his mouth.

He was started on the supplements and cleanses on the first day of his stay. That very night he had no pain with urination. And there was no blood in the urine.

On his second day, January 16, we received his blood test and ultrasound. The size of his prostate was 5.1 x 6.0 cm and a small tumor was present, 1.8 cm long.

His blood test results showed he had serious under-nutrition. His triglycerides as well as cholesterol were much too low. They should have been closer to 150 and 250. We immediately stressed the importance of fat in the diet: eggs, avocados, sardines, fish, and poultry.

The RBC was rather low, explaining his fatigue. He had a lively personality, full of humor, but he could not express it due to low energy. His WBC was very low too, showing low immunity. Both problems stem from toxins in the bone marrow.

His LDH and alk phos were both elevated, showing there was active tumor growth [*now we know it is due to dyes*].

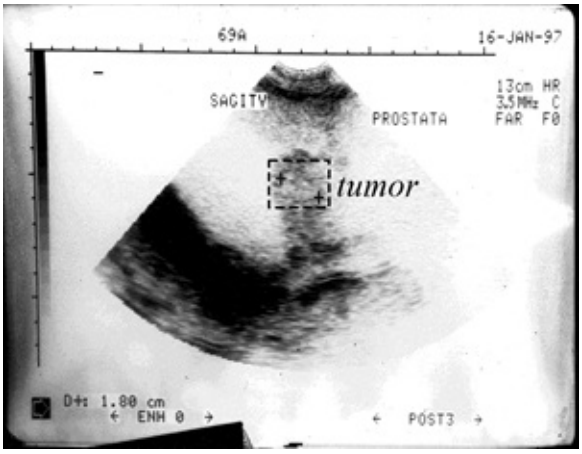
The calcium level was much too low, which is evidence of toxins in the parathyroid. Potassium was quite low, too, contributing to his fatigue!

But nothing was extremely high or low, and if we could improve his nutritional status while removing his body burden of toxins, he would be successful in dissolving his tumor.

He laughed with anticipation of new found health; he called the motel/restaurant his paradise, but he was happy to just rest!

On the first day too, we searched for DNA in all his tissues, to be sure there was no extra tumor growing anywhere. DNA was only Positive at the prostate

(and, of course, testes).



Jan 16 1.8 cm tumor in prostate

We scheduled him for dental work to extract every tooth that had a large metal or nonmetal filling. That would leave him only three lower teeth, but he was undaunted. Onward and upward was his motto. After ten years of a failing battle with prostate cancer, switching to dentures was not a big price to pay. He would remind me during office visits: "Teeth is not importante. Only your life este importante." Then he would ask "You think you can cure this cancer?"

"Everybody else cures theirs; so can you, Chris," was my usual answer.

By January 24 he had all his teeth except three lowers removed. He was feeling extra good after the oral surgery, rather than convalescent. His mouth was not even painful.

His new blood test on January 24 showed several improvements. The RBC, WBC, and platelet count were all up, implying that toxins were reduced in the bone marrow.

And his LDH had dropped as well as the alk phos. [This showed that *Sudan Black B and DAB dyes, which are in most plastic tooth fillings* were being removed.]

His liver could now make much more protein. And the calcium level had risen to normal, showing that toxins were now out of the parathyroid. The problem had now shifted to the thyroid which can be seen in the potassium level (5.0, too high).

His triglycerides and cholesterol had come up, showing better nutritional status. He was trying to eat fat and drink milk (carefully selected and treated) for the first time in years.

He was planning his trip home as soon as new partial dentures would be ready. But first he must do another panoramic x-ray to guarantee there were no leftover bits of amalgam in his jaws and mouth tissues.

He said he felt better than in years. He walked better. There was no pain with urination, but he still got up in the night every hour! He was started on kidney herbs, a half dose on the first day, full dose on the second, and double dose after that.

Lactoferrin was now testing Positive at the bone marrow; he was drinking raw milk that had been tested for dyes and sterilized.

All toxins, as well as DNA were now Negative at the prostate. But a search at the thyroid revealed *Staphylococcus, Shigella flexneri,* and *E. coli*. He had not been hot packing enough and was immediately helped with this important task.

Six days later on January 30, he got a new panoramic of his teeth. It showed a large plastic filling had been overlooked in a front lower tooth. There was also a small infection in the neighboring tooth.

Nevertheless, the new blood test showed great improvements, although the RBC did not rise (3.71). The LDH dropped further, as did the alk phos. Tumor activity was definitely waning. But uric acid was extremely low, showing that Clostridium bacteria were still swarming somewhere.

Potassium was normal now, showing that the thyroid had been freed. And triglycerides as well as cholesterol were still rising. His body was thriving on improved nutrition, malonate-free and safe from parasite eggs, unsanitary bacteria, and carcinogenic dyes.

On February 3, he pulled this last tooth. That night his old affliction returned, painful and difficult urination. He was crestfallen. But his airline ticket was for two days hence. Could he leave? He had been fitted for dentures and was waiting for them. Next day we tested for bacteria at the prostate, on the theory that his symptom return was due to release of bacteria from that particular tooth-the one extracted last. But no *Clostridia* were found, nor Lactobacilli,

Rhizobium, or Staphylococcus.

triglycerides	46	59	85	200
cholesterol	100	156	157	180
PSA				19.2

And all tumor toxins were now Negative at the teeth. Vanadium, cobalt, copper, five malonates, urethane, and bisphenol-A-all Negative at the tooth location. He was ready to start rebuilding the prostate gland. He was given flaxseed, raw, 1 tbs./day, soaked for 5 minutes first, then cooked with cereal.

It was February 5, his last day. There had been no more pain nor bleeding. His immune system had conquered the last release of bacteria. The final blood test, done February 3, was reviewed with him. At last, his red cell count had come up to 4.0. He was still anemic but much better. His kidney function was now perfect. The LDH had dropped further, but still wasn't low enough to feel totally secure. The alk phos appeared stable.

Calcium and uric acid were still too low, implying bacteria in the parathyroids; they should be searched for. He had not been doing enemas as he should. He was instructed to help his bowel function with Lugol's enemas once a day, just to get the bacterial level down. Triglycerides and cholesterol were now normal.

Only the new ultrasound remained to be seen. And the new PSA result. While he was attending to these, his new dentures were tested for tumor toxins. There

were none. He arrived with ultrasound in hand! The size of his prostate was now 4.45 x 4.65 cm and no tumor was visible.

He began to laugh with joy. He could hardly believe all his good fortune! His PSA result had arrived, too. It had dropped from 23.2 to 19.2 in three weeks.

But he was leaving prematurely, and he knew it. He tried on his new dentures; they needed adjustment. If the adjustment was not carefully monitored, the materials used could re-pollute the teeth. This is no small matter. Sucking on a carcinogen day and night is far more injurious than occasionally eating it. There would be no time left to re-test the teeth after adjustment. It would be wiser to leave them unadjusted. [*We now have a way of hardening "adjusted" teeth at home.*]

Prostate size reduced from 5.1x6.0 to 4.44x4.65 cm.

Feb 3 tumor gone, PSA dropping

Summary: With the tumor gone, why wasn't his PSA down to normal, less than 4? The PSA depends on the size of the prostate, as well, and this would take longer to reduce. But he had gotten started with that, too, and hopefully, will be completely normal, soon.

46 Arlene Miller Brain Cancer

Arlene Miller arrived on January 20 as an emergency case and was seen by the chief assistant first. She was slightly built, and only sixty-six. She had brain

cancer, called "aplastic astrocytoma," and responded to all recommendations with a resounding "NO". The need for dental extractions was raised and met with further "NO", and total irrationality. But there was no time to lose, not a single day. She was on dexamethasone to control edema in the brain, dilantin to control seizures, and hydrazine sulfate, possibly to prevent emaciation, and Axid to help digestion. It was explained to Arlene's son, her caregiver, that as soon as dental extractions were complete she stood a chance of recovering, but not sooner. And in a few days it could be too late if she refused to eat or went into a coma.

Arlene had no chemotherapy, radiation, or surgery; it all happened too fast. When she began to have symptoms, her regular doctor scheduled an MRI for her-and to the family's terrible surprise, a large brain tumor was seen, too large for surgery, too large for chemotherapy or radiation. Nothing could save her, so nothing was advised.

But our chief assistant did not give up. Against all odds, she decided to try a massive dose of black walnut tincture. There was nothing to lose. Her son was instructed to give his mother: 8 tsp. black walnut tincture extra strength, 7 capsules cloves, 7 capsules wormwood, 3 to 5 whole tsp. vitamin C, 10 capsules coenzyme Q10 (400 mg each), and 30 glutathione (250 mg each)!

And if he accomplished this, to do it again, and again! She slowly became more rational, until after seven days (of the above recipe), on a Monday morning, she sat at my office desk quite lucid, though speech was garbled.

She had insight into her own case now, could understand the explanations for dental extractions, and agreed to get it done the same day. "Who cares if you eat with dentures" she said briefly, "as long as you can eat." The humor of this remark even struck her. She must have had a great personality while she was raising her family-her son was here as living proof.

She was interested in her own blood test results. There was massive infection somewhere, in her brain, no doubt; that would explain the high WBC. And perhaps a minute bit of bleeding-inside the tumor-that would explain the high platelet count.

Both BUN and creatinine were much too low; there was obviously a blockage in their formation. We should have supplemented her with urea and creatine, but

in view of her great need for other things as well, I decided to wait and see first. In hindsight this was an error; urea can help the liver greatly, and the liver was already in considerable distress, judging by the elevated enzymes SGOT, SGPT, and GGT. [*Both LDH and alk phos were only slightly elevated so dye toxicity was not very intense*.]

The low uric acid reflected the imbalance between purines and pyrimidines caused by bacteria and the ammonia they excrete.

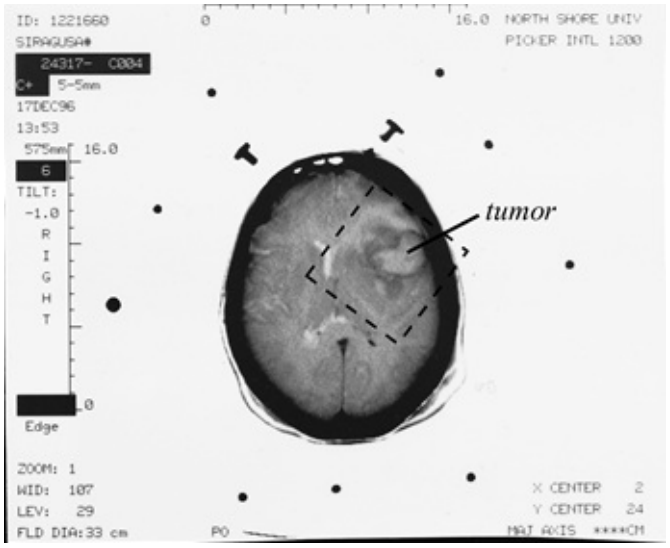
Calcium was much too low, but this was not beyond correction either. And the triglyceride and cholesterol levels were still high enough to give her an advantage in her race for survival.

She was instructed to take digestive enzyme capsules, 2 with each meal, instead of Axid. Also, hydrochloric acid drops at mealtime (10 drops of a 5% solution). She was to eat all the fat she could (eggs, avocados, cream) and take potassium gluconate powder, even though her potassium level was adequate. I suspected that as soon as better metabolism would "kick in," her body would consume potassium so fast, not even supplements could keep up.

She was given colloidal silver (home made) to take as an antibiotic before dental work and several days after. She was instructed to remove all the metal touching her; she removed all, including her two rings, without remorse. "Who needs rings?", she asked, breezily.

Then we searched electronically at her cerebrum for several more substances. Ortho-phospho-tyrosine Negative (malignancy was stopped); DNA Positive (there was still abnormal growth there); copper, cobalt, vanadium all Positive; nucleoside vanadyl complexes Positive (a mutagen made from vanadium responsible for p53 mutations); malonyl coenzyme A Positive (shows coenzyme A subverted by malonate); three Clostridium varieties Positive at brain; eight food bacteria Negative; but *Rhizobium leguminosarum*, *Lactobacillus acidophilus*, *Rhizobium meliloti*, and *Lactobacillus casei* were Positive. She had numerous bacteria in her brain that could make DNA in the human manner and fuel her tumor, also *Ascaris* larvae. Would we be able to stop it all in time?

After she left, we looked at the MRI she had brought with her; a very large tumor was easy to see.



Dec 17 MRI shows large brain tumor

The next days were spent with the dental surgeon. Five days later, she was a new person. Eighteen teeth had been extracted. She was hot packing and hot swishing her mouth correctly. She was more alert than before, could converse about herself, could laugh when her son once teasingly called her a "dummy", and wanted nothing so much as taking charge of her own life again.

The DNA, copper, cobalt, vanadium, vanadyl complexes, malonates, urethane, and bisphenol were all Negative now at the cerebrum. But *Clostridium septicum* was still Positive, the only bacterium left. Her blood test of January 31 was done just after the dental work.

The block on urea formation was removed; it was now 16. But creatinine formation was still blocked. [*We were unaware, at the time, of the huge shortages of amino acids in cancer patients, including those needed to make creatine.*]

Two of her liver enzymes (OT and PT) worsened. What could explain this? Other liver enzymes improved. Was it the anesthetic used by the dentist? Was she eating something toxic? Did she swallow a lot of mercury? No answer seemed correct. It was not explained. [*With hindsight we should have searched for lead in her drugs or supplements.*] Her iron level dropped significantly, as did her potassium, in spite of the supplement. It might have been advisable to supplement with iron.

Instead, I recommended eggs daily in her diet. All the iron tonics and syrups I

had tested in the past had either solvents or mycotoxins in them. Besides, the form of the iron might be critically important. Some reports in the literature warn practitioners that iron makes tumors grow! Iron supplements are respected yet feared. Her potassium powder was increased to ½ tsp. three times a day.

On February 3 she was so much better mentally that she was able to comment how unhappy she was that she couldn't remember names and other things the way she used to.

On February 5, she was completely aware and alert; taking care of herself, no longer incontinent if close to bathroom. All bacteria tested Negative at the cerebrum. But she again was Positive for dental metal at her teeth (where the teeth once were). How could that be? A new panoramic x-ray of her mouth was taken. Several tattoos were visible! By February 8, two tattoos had been removed. She was fitted for dentures. At this last appointment she used no inappropriate words; her brain was healing. Her blood test now showed many improvements: her liver enzymes were going back down.

We thought she had turned the corner to health, but three days later, February 11, she was dizzy. Walking was bad again. She had definitely deteriorated. And she was very sleepy. We quickly checked for bacteria in her brain. Two varieties of *Salmonella* and *E. coli* were there. She had not been getting enough Lugol's. Nor any Lugol's enemas. Nor any black walnut tincture extra strength for a week! Both Arlene and her son thought she was "out of the woods" and could be casual with her routines. She was put back on 10 tsp. black walnut tincture extra strength plus 9 capsules cloves and 9 capsules wormwood.

She got better immediately. But three days later, February 14, she was deteriorating again. Again, she was full of *Salmonella, E. coli*, numerous *Clostridium* types, and *Rhizobium meliloti*, the DNA makers. Again, she was incontinent. Why was her immunity so low again? There was mercury, copper, cobalt, vanadium testing Positive, but this time at a bone location, not tooth. Evidently, there was still another tattoo embedded in her jawbone, not at a tooth location. But how could it be found?

We decided to try a new radiologist; perhaps his x-rays were of higher quality. We got his full cooperation in trying to find this tattoo. Meanwhile, we raised her supplements of arginine, glutamic acid, aspartic acid, and ornithine to ward off coma from ammonia.

The new x-rays showed nothing; we even sent them to the University of California to a dental radiologist there. But time was passing and there was very little time. Her downhill trend was obvious on the February 14 blood test. The liver was toxic.

Was she eating something toxic, accidentally, in her food or supplements? I started her on silymarin. [*I should have taken her off all supplements because this is the usual source of lead.*]

Without x-rays, a dentist is at a loss where to search for a tattoo, unless it is plainly visible. Arlene's life was hanging by a thread now. We couldn't wait for the University's results. We persuaded her dental surgeon to simply go exploring. A quadrant at a time should be surgically opened and searched for bits of leftover metal.

He found it! It was stuck in the bone.

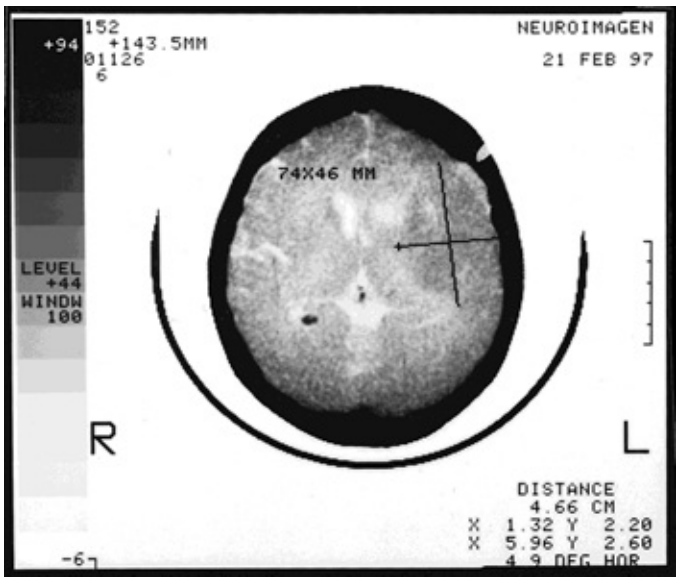
With a clear mind again, she brought in the bone fragment like the trophy it really was. She was as happy as we were. Did he get it all this time? She was praying for this. We could now turn our attention to her high GGT. We suspected mycotoxins. Aflatoxin was positive (at liver) and zearalenone was positive (at liver), but although they were present, I wasn't convinced that was all. She agreed to do a liver cleanse that same night.

The very next day, February 18, she was much better. In fact, no sign of illness was detectable. She could walk alone. We were all amazed. But she wanted to go home. We gave her lecithin to help heal her brain (theoretically at least).

Two days later, February 20, she said she was back to her normal self; absolutely no abnormality in speech or walk or personality. She agreed to repeat liver cleanses every two weeks. She was due to leave next day. We scheduled a CT scan of the brain and a blood test. She demonstrated how well she could walk, no pain in her leg or hip anymore but she was impatient for her new dentures.

Next day, we reviewed her brain scan with her. It was easy to see the improvement. The border of her old tumor could still be seen, but the density was reduced, it was healing.

She was thrilled. But the blood test results were ominous. Her GGT had doubled and evidence of bacteria (low uric acid) was still strong. The cause eluded me. Could it be due to her recent liver cleanse? Was she eating something toxic? We searched for bacteria. She did indeed again have three salmonellas and three shigellas and *E. coli* in the brain. Yet she felt so well. We lengthened our study of the cerebrum and persuaded her to lengthen her stay.



Feb 21 Tumor border faded, density reducing

DNA Negative at cerebrum. p53 gene mutation Negative at cerebrum. 20-methylcholanthrene Negative at cerebrum (a carcinogen made from one's own cholesterol if not detoxified first by rhodanese enzymes; always associated with Ascaris parasites). Glutathione Positive at cerebrum. Tumor necrosis factor Positive at cerebrum. RNA Positive at cerebrum. rhodanese Positive. No problem could be seen.

On February 24, she slept unusually well. On February 25, she was even sleepy during the day. Yet all bacteria were Negative, as were metals and toxins. If we couldn't solve this puzzle in the next few days we would fail. Perhaps she was simply getting too much ornithine. It was stopped. And a heaping teaspoon of arginine given to wake her up. But that wasn't it. Next day, February 26, she was still asleep from the previous day! Was she sinking into a coma? Had she been getting her dexamethasone? Without this, edema fluid would accumulate in her brain and put it under pressure to the point of coma.

All office personnel were on "top-alert". If we couldn't pull her out of this

emergency by the day's end, she might not come out at all and would begin her downward spiral to the infinite abyss. We prepared a urea solution (28 grams to a quart of water) to be drunk that day before leaving the office. Her dexamethasone was quadrupled. We gave special amino acids (leucine, iso leucine, and valine). We had mannitol and methylene blue on stand by. The emergency was averted. She could walk herself out of the office at day's end.

She could walk into the office next day but was still very sleepy. Obviously, the dexamethasone had not been the problem, nor done the trick.

Only one possibility remained: drug toxicity. Something was dreadfully toxic, now it was affecting the parathyroids, not just liver (calcium 7.8). She had been on dilantin and hydrazine sulfate throughout. It was an oversight. They are usually well tolerated. They were both stopped at once. We managed to feed her a cream eggnog, and a lemon oil drink for calories and nutrition in little bits throughout the day. A tsp. each of glutathione, arginine, glutamic acid (3 tsp.) and B_{12} (1 mg) and folic acid (25 mg) were her supplements, hand fed. Again, 28 grams of urea. We also gave her 1 tsp. leucine powder, 3 times a day for two days, to avert impending coma.

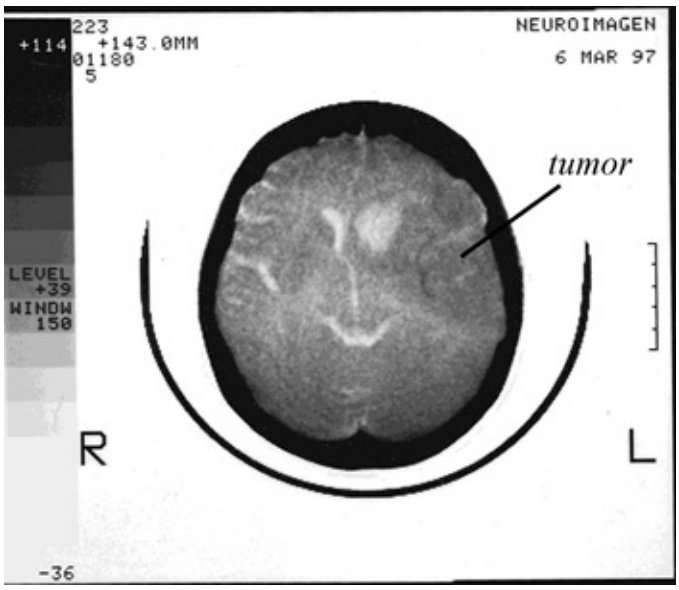
She was getting 2 eggs in the "shake" beverages, giving her much needed albumin. And 2 tablets of spironolactone, diuretic, since she was puffing up everywhere, even her eyelids.

After two days of force-feeding by the office staff, Arlene did not come back. I feared the worst. Her family had called from New York to ask if they should come here. I replied, yes.

We did not see her for six days.

On March 6, while glancing through my window, I saw her form pass by. Was it a mirage? It was Arlene, alive and well. And hale and hearty, too. She walked by herself with a strong stride. She said that even her memory was better. Her edema was gone, she was her old self. In fact, she wanted another CT scan to prove she was ready to go home. We arranged it. She had never been better. And this time she really could go home, in spite of the high GGT (1593). Perhaps her doctor at home could solve the mystery. Perhaps a change of brain diuretic was called for. She had not had any seizures either. Was she out of trouble at last? All her supplements were to be taken at half dosage for another month only at

home. We reviewed her scan. It was even better than before. She said her good-byes as the vivacious person she once was. Her transformation was as amazing as seeing a butterfly emerge from its cocoon. It gave us all renewed resolve to **never take defeat**. When all is lost, try something new. Life is too precious to let it slip away from lack of initiative or plain inertia. She was a towering inspiration.



Mar. 6 near normal brain morphology and density

Summary: Some conclusions are obvious: it is much easier to shrink a tumor than to recover from toxic damage. Secondly, you must never say "it's over" until it's over. This applies to patient, caregiver, and physician alike. And one question will nag and haunt us. What was the cause of the liver failure? And what will become of it? [*With hindsight, it was probably azo dyes-escaping from the very tumor we were shrinking!*]

47 Nancy Pendergrass Brain Cancer

Nancy Pendergrass, age seven, arrived with her parents from Australia. As she sat quietly on her mother's lap she tugged at her deep hat, pulling it down tighter over her bald head. She knew this visit was for her. Her mother told the story.

She had received immunization shots in early November of last year (it was now February 3). After this, she became ill. She had stomach pain, vomiting, cramps, loss of appetite, and hot flushes. The arm with the injection turned red. Soon afterward, by November 20, she complained of having a stiff neck. By this time, she was only urinating once a day and bowel movements had ceased. She was not getting out of bed.

One doctor thought she had encephalitis. She was taken for a CT scan and a large tumor was found in the cerebellum. It was about the size of a golf ball. She was given steroids, hoping to bring down the pressure from the tumor against the rest of the brain. The next day surgery was ordered-on November 26.

The surgery, in the neurosurgeon's opinion, was successful. However, there was a portion of the tumor, at its very base, that could not be removed. An MRI was done to see how much remained.

She was in the hospital for two weeks afterward. On December 16, she had her first chemotherapy treatment. It was given continuously, over a three day period through a "port" that was installed in her body, under her arm. After one course of chemotherapy, she became very ill. Her mother stopped it and decided to find an alternative method. The parents had been told the tumor would grow back. They decided to bring her to our office in Mexico.

She sat limply as we began our testing: DNA Positive at cerebellum (growth continuing); p53 gene (mutation) Positive at cerebellum; ortho-phospho-tyrosine

Positive at cerebellum (malignancy present); isopropyl Positive (contributes to malignancy).

The parents had read the book *The Cure for all Cancers* before coming and thought that all isopropyl sources had already been removed. But she had been on a vitamin pill, untested for isopropyl pollution. It was stopped. She had already been given the parasite program (2 tsp. of black walnut tincture extra strength plus 3 wormwood and 7 clove capsules) twice, a week apart. Evidently she was reinfecting with *Fasciolopsis* stages from dairy products or meats or other sources still unknown. We would immediately give her 10 tsp. black walnut tincture extra strength plus 9 cloves and 9 wormwood capsules. She did not object and did not need to be coaxed.

This would stop the malignancy the same day. We could next focus on tumor shrinkage. Which bacteria did she have, giving her the Positive result for DNA? And what was causing her mutation of the gene p53?

Five Clostridium varieties were Positive at the cerebellum. Two lactobacillus varieties were Negative. Two Rhizobium varieties were Negative. These were the only specimens in our collection that could make DNA in our cells. Clostridium is <u>always</u> found under tooth fillings, but Nancy had no tooth fillings. Perhaps she had a dead tooth, but no discoloration could be seen in any tooth. A panoramic x-ray was ordered. Her baby teeth looked beautiful and no infection could be spotted; her secondary teeth were growing as they should, in perfect order. But a tooth abscess can escape notice and a dead tooth looks no different on an x-ray than a live one.

Where were the Clostridium bacteria in her cerebellum coming from if not from teeth? We searched for dental material in teeth in case one small filling had been forgotten. The tests showed: copper, cobalt, vanadium Negative at teeth; 5 malonates Negative at teeth; urethane, bisphenol Negative at teeth; mercury, nickel, thallium Negative at teeth. We concluded their memory was accurate; no dental work had ever been done.

We continued our testing at the cerebellum: thallium, mercury, cobalt, vanadium, 5 malonates, urethane, bisphenol were all Negative (note vanadium in particular). CFC's were Negative, they had already moved their refrigerator out of doors two weeks earlier. But copper was Positive and very high; she needed to get into copper-free water immediately. At home, new plastic pipes would

need to be installed before returning! They were given an environmentally safe motel room at once. Our plan was to wait three days to let the copper drain naturally from the cerebellum. If it did not, we would use EDTA by mouth to chelate it out.

A blood test was scheduled; she started on the supplement program to shrink tumors and was instructed to zap daily. She had already been zapping at home, starting two weeks ago, to get her well enough to make the trip to Mexico.

Her blood test of February 3 looked quite good. The WBC was somewhat high, indicating a bacterial infection somewhere. Her liver enzymes were slightly high, particularly the SGOT, probably due to lead in the copper water pipes. The LDH was slightly elevated [*from Sudan Black B dye in foods*]. The potassium level was too high, showing that toxicity was affecting the thyroid gland.

Peculiarly, her lymphocytes (48%) were higher than neutrophils (43%), implying a viral condition. These 2 WBC varieties should be in a 20% (lymph) to 80% ratio. Could she have picked up Epstein Barre Virus or was this an aftermath of her DPT shot?

Two days later, she seemed to be in rather high spirits. She was clearly more active. But she complained of a digestive problem. We searched through our set of eight common digestive bacteria. Only *Salmonella* was Positive. She had not been getting her Lugol's iodine drops four times a day. We gave her some immediately. She drank it stoically. Best of all, her new copper test was now Negative at the cerebellum. We would not need to chelate.

Another two days later, the parents elaborated more about Nancy's past health. For two years already, Nancy had a lot of mucous in the back of her throat. She had been banged by a friend's head on her front (baby) tooth and lost it. She had frequent belly-aches for about a year. I decided to test additionally for *Ascaris* next day.

The search began at the cerebellum. Five Clostridium species Negative at cerebellum. *Clostridium tetani* Positive at cerebellum. (The DPT shot contains inactivated *Clostridium tetani*; was this somehow related?) *Lactobacillus casei* Positive at cerebellum. I knew these bacteria were <u>not</u> coming from her teeth, nor would they originate in the brain. Could they be hiding in her appendix? A

quick search found the appendix Negative for all. I was at a loss, and turned my attention to *Ascaris*. Stomach aches in children are usually caused by *Ascaris* or *Salmonella*, the former if chronic, the latter if accompanied by a temperature. The test results showed *Ascaris* Positive in the "whole body" test, Negative at cerebellum, and Positive at stomach.

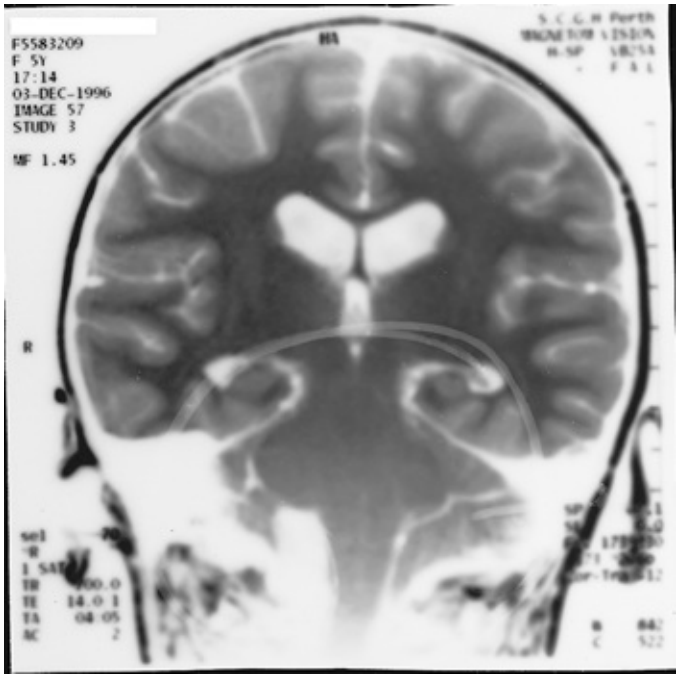
And all other food bacteria were Positive at the stomach too, in spite of Lugol's treatments! Evidently they were coming from the *Ascaris* worms and protected from the iodine. There was indeed a pet dog in the house (a source of *Ascaris* worms). Both parents were tested for *Ascaris*. They were both Positive. Such a parasite infection would be hard to eradicate in the whole family. They agreed to give the dog away immediately.

Nancy was given another 10 tsp. of black walnut tincture extra strength and 3 cloves plus 3 wormwood. The parents each did the same.

Had we found the source of her Clostridium bacteria in the cerebellum? Namely *Ascaris* worm? The copper present would have consumed the glutathione in the cerebellum so the bacteria could multiply unchecked, and DNA would accumulate. (Just a theory.)

Three days later she was very full of energy and was sleeping much more soundly, too. She had been getting 8½ tsp. black walnut tincture extra strength instead of 10 each day. *Ascaris* tested Negative now. Her dose was lowered to 3 tsp. black walnut tincture extra strength and 3 cloves plus 3 wormwood to be taken daily, still. Both parents tested Negative to *Ascaris*, too. But would this hold up at home after leaving the clinic? All bacteria now tested Negative at Nancy's cerebellum. TNF was Positive there. The tumor must be shrinking.

On February 14 her MRI arrived from home, taken post-surgically at end of November 1996. The tumor remnant was actually quite large; it was probably already growing. Contrast material (white area at reader's lower left) at the surgery space is easy to identify. There is considerable displacement of the midline (not shown). The two halves are not symmetrical.



Dec 3 brain with tumor zone (circled by radiologist) left over from surgery done in Nov

On February 17, the family was still Negative to *Ascaris*. They had been enjoying the tourist attractions and had been to the zoo!-a dangerous place for parasite-afflicted children. Nancy appeared entirely normal, climbing and jumping off our garden wall. Nobody scolded her; we were delighted to see her health return.

On February 19, a routine search for any other tumor was done (searching for DNA in 40 organs). One was Positive, the lung!

Indeed, her latest blood test showed elevation of alkaline phosphatase, implicating the lungs. [*Was she exposed to a dye unbeknownst to us?*] But a p53 test at the lung was Negative, showing that mutations were not occurring, at least not this common one. Something was growing there, though. A quick check showed all bacteria Negative at lung, but *Ascaris* larvae Positive.

We had found the problem. Fortunately, we had more than one *Ascaris* stage represented in the slide set. Were these larvae making DNA? Or was there yet another bacterium released by *Ascaris* that was not in my collection (I can't test without a sample)? And how was she getting reinfected with *Ascaris*?

Ascaris larvae were also found in the stomach now. Could there be live *Ascaris* eggs stuck in gallstones in her liver ducts to give her this recurrence? [*At*

that time we were not aware that raw vegetables from grocery shops carry the parasite eggs.] Some could be killed at once (we gave Nancy 7 clove capsules, twice, 1½ hours apart), but a liver cleanse would be needed.

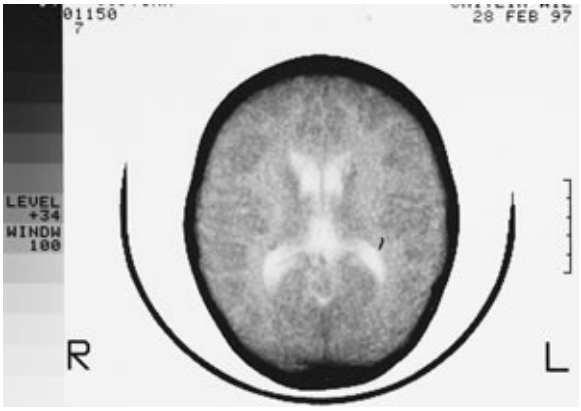
On February 22, her brain was free of DNA, and p53. RNA was plentiful, as it should be, but a routine check detected acetone! Acetone is the detoxification product of isopropyl alcohol! Soon isopropyl alcohol was found to be Positive, and high. A frantic search for the source ensued. Isopropyl will spur tumor growth faster than anything else-probably by leading to hCG formation. There was no time to lose. How long had it been going on without detection? Food (safe restaurant) products, our supplements were all tested immediately. It was in her hat! A new washable sun hat! It was snatched off and away. [*In retrospect this article of clothing would have given her azo dyes, too*.]

On February 26, all *Ascaris* and toxins and bacteria tested Negative. She no longer needed Lugol's iodine, she was staying clear of *Salmonella*. She could go home, <u>if</u> a new CT scan of the brain stem showed improvement. They went at once for the test.

With the trophy in their hands, just hours later, they announced that the radiologist had seen no tumor anywhere. Not even a vestige of one. Not a remnant.

Although this was a CT, not an MRI, the radiologist informed us that if there had been anything to see, he would have taken many more pictures. But there was nothing. They could schedule their flight home. A final blood test was ordered.

On February 28, the blood test was reviewed. It was disturbing. It wasn't perfect. The WBC was now normal, but the LDH had not gone down below 160 as it should for an adult. And the calcium level had dropped too low, implying a problem at the parathyroids.



Feb 28 no tumor remnant found

The lymphocytes had risen again, too: lymphs 44%, neutrophils 50%.

We decided to do some more searching at the liver and parathyroid glands. Imagine our surprise at this: *Ascaris* Positive at parathyroids; *Ascaris* Positive at liver; 6 Clostridium species Positive at liver; *Clostridium* and *Shigella* Positive at parathyroids! We had caught up with the infamous roundworms again. We could see there would be no end to the infestation unless bile ducts were cleared. They extended their stay for two weeks to get started with this.

On March 5, she had tried to do her first liver cleanse. But nothing could be coaxed down. Her indomitable spirit, now robust with energy, would let nothing down. Precious time was passing.

A week later, she accomplished the nasty chore, eliminating a great deal of "chaff" and one stone. She was advised to repeat the liver cleanse at home once a month. A few days later, a new blood test was scheduled. The LDH was finally normal. Some liver improvement was seen. Calcium was beginning to rise again.

But a peculiarity persisted in the electronic test results. Although all bacteria, heavy metals, solvents, and other toxins were Negative at the brain location, the nucleic acids were still not in correct amounts (inosine, uridine and thymidine were Positive, while adenine, guanosine, xanthine and cytidine were Negative). All these nucleic acid bases (or precursors) test Positive in healthy tissue. Even if they are Negative, they revert to Positive as soon as the noxious agent responsible is removed. And although vanadium was absent, nucleoside vanadyl complexes were Positive. (The complexes are only made if vanadium is present.) Were the vanadyl complexes causing interference with nucleic acid regulation? Or were there some unknown bacteria present? *Ascaris* infection brought to

mind *Bacteroides fragilis*, a bacterium that also builds up in the liver. We would test. *Bacteroides fragilis* Negative at the brain. Could it be a Coxsackie virus, always found with Bacteroides? We would test. Coxsackie Virus B4, Positive, and very high!

We had found a missing link in the whole chain of events. The bacteria had been killed but the viruses lived on. Probably they had given the picture of encephalitis to her first doctors. Perhaps the DPT shot had allowed hybridization of the Clostridium bacteria or lowered her immunity in other ways. Perhaps not. Steroid treatment afterward may have had some counter-productive effects too, but it was the best that could be done at the time.

Still, what was the source of the nucleoside vanadyl complexes? Was this the "trigger" for the virus? Triggers for other viruses are well known. Peanuts and other foods can trigger *Herpes* viruses. Cigarette smoke can trigger cold viruses. Was this vanadium connection keeping her Coxsackie virus activated and multiplying? [*We have since seen that the plastic used as shunts for the brain and as permanently implanted catheters shed vanadium*.]

It was their last day, March 14. Vanadyl complexes were still testing Positive at the brain, although the Coxsackie viruses (both B1 and B4) were now Negative. Could the vanadium source be car exhaust inhaled while crossing the US-Mexican border daily amidst a sea of traffic? There had been chronic car problems at home; could chronic pollution at home have sensitized her to vanadyl complex damage? The nucleic acids were still not correctly regulated,

they tested the same as before.

They had several chores to attend to immediately when they got home to Australia.

1. Change water pipes. Use water from a hose till job was done to avoid copper.
2. Change utilities to all-electric to avoid vanadium.
3. Avoid viral triggers such as benzene (off the benzene list).
4. Give away the pet.
5. Repair the car.

Summary: Not all the questions were answered in Nancy's case. [*We had not yet learned to test for Clostridium sources at colon and esophagus (rabbit fluke). And we neglected to ask whether Nancy's teeth had ever been "sealed," this could have been the source of vanadium*.] Another MRI would be done on schedule with her doctor at home. It was a happy leave taking and a Bon Voyage to Nancy. We heard that she passed her follow-up visits with her doctor at home-no growth could be seen on her next MRI.

48 **William Elliott Brain Cancer**

William Elliott was brought by his father for his bipolar depression, also called *manic depression*. He was diagnosed with it a year and a half ago. He was twenty-seven years old, a tall, sturdy, young man, and very strong. His grim look, as if teeth were clenched, suggested a powerful anger that needed constant control. Instead of lithium, he was on zoloft (100 mg/day). He chewed tobacco and also smoked cigarettes, which probably afforded some relief.

He was advised to stop using chlorinated water for all purposes-he had been an avid swimmer in childhood in heavily chlorinated pools. Chlorine "allergy" is always seen in our manic-depressive cases. This means the liver no longer detoxifies chlorine and chlorine-containing chemicals, such as bleach. It is free,

then, to circulate through the body, attaching itself in different places in different people. It affects the brain in manic depression victims. He was advised to take all metal off his body including his all-metal watch, to reduce nickel absorption; nickel feeds bacteria and it becomes part of their urease enzyme.

But William was not in a mood to listen, let alone comply. His father was helpless beside his strong defiant son. I tried stronger persuasion as we reviewed his blood test together. It was essentially that of a healthy person. But his RBC was slightly elevated, showing cobalt or vanadium toxicity coming from his tooth fillings. And his alk phos was slightly high from food dyes. Surprisingly, he had a low uric acid, revealing a *Clostridium* invasion somewhere, a situation always seen in tumor conditions. Stopping these bacteria was important since their by-products would affect brain function (hence the nickel restriction).

His calcium level was too low and potassium too high, showing both a parathyroid and thyroid problem. Both conditions would cause anxiety and hyperthyroidism, favoring a manic condition but not necessarily reflected in a high thyroxine level. His iron level was too high, showing some interference with its utilization.

It is true that all these disturbances except for the uric acid were of a minor nature, yet altogether, they resembled a tumor pattern. Meanwhile, William's patience and tolerance were wearing out. In another minute he would leave, simply by walking out. He wanted no information, no instructions and no delays! In desperation to get something accomplished, I began quickly to search for toxins at the cerebrum (brain). Here are the results: Positive for isopropyl alcohol, benzene, wood alcohol, rhodanese. Negative for 20-methylcholanthrene, glutathione.

Obviously, something was using up his glutathione in the brain. Without that, metabolism would not be efficient. He must have either metal or bacteria or malonate compounds in his brain. Much better to identify these now and remove them, than to go through life as an invalid from manic depressive disorder.

Only two weeks earlier, I had received the message about a former manic-depressive patient who had committed suicide. He too had been a strong, handsome, motorcycling young man. My memory was flooded with pain. Somehow this young man, standing before me-too impatient to sit-had to be saved. His slightly-built father could only pray and trust and search and persuade

and try.

Mar 6 CT of brain reveals approx. 4 cm tumor

William allowed one more test; I chose DNA. It was Positive at the cerebrum. He had a tumor. I said nothing. He permitted a few more tests. They were: Positive at the cerebrum, for urethane, bisphenol-A, and for gene mutation p53.

I explained that dental plastic was getting into the brain, perhaps starting a region of poor metabolism. I recommended an MRI of the brain. Somehow his father got him to the radiologist. A few days later they arrived, negatives in hand. A tumor of considerable size was present, pressing against the meninges, the brain's protective membranes next to the bone.

We were shocked. How very fortunate...to find it now.

Mar 6 CT profile shows tumor circled by radiologist

He was given the cancer program now, and instructions to remove all metal and plastic from his teeth.

Ten days later he was a different young man. He had stopped using any tobacco. He made conversation with us. He had a smile. He had removed all metal-containing teeth by extraction. He was actually taking his supplements, without resistance.

His plastic fillings still needed removal to get rid of the urethane and bisphenol source. He was sent for air abrasion to remove them on March 18.

After this, on March 19, both urethane and bisphenol tested Negative. But copper, cobalt, vanadium, mercury, silver, and riboside-vanadyl-complexes still tested Positive at his bone marrow. Evidently, he still had bits of amalgam (tattoos) left in his mouth. This was reflected in his second blood test, where the RBC was still too high. All the liver enzymes plus alk phos were up slightly, too, a transient effect that I didn't understand [due to tumor drainage]. But calcium was up and potassium down, both entirely normal now, showing that toxins were out of the parathyroid and thyroid glands, a nice step of progress.

Syncrometer® tests now showed DNA and p53 mutation Negative at the brain, so tumor growth and mutations had ceased.

By March 27, William said he felt "fantastic". We all noticed that he now had facial expression that had previously been missing in a mask-like appearance.

The new blood test, March 27, showed gratifying improvements. Most important were the significant drops in LDH and alk phos, suggesting no more tumor activity. (An extremely low LDH, though, can be due to cobalt toxicity.)

Yet the RBC was much too high, as were albumin and calcium, whereas the uric acid was still too low.

We searched the bone marrow, liver, spleen, and thyroid for incriminating evidence of toxins. The bone marrow search was remarkably clean. The spleen showed deficits: Negative for lactoferrin and transferrin. These should be Positive for correct handling of iron. He was instructed to drink raw milk, 1 glass per week, properly sterilized.

By April 1, his spirits were high; he was very anxious to go home and resume his home-building trade. But, obviously, there were still dental remnants of sufficient size to disturb thyroid function, and the RBC.

The uric acid level was still much too low; there were significant levels of Clostridium bacteria somewhere; we must find them. The thyroid was apparently under attack so we searched there. Mercury, silver, vanadyl complexes were Negative at the thyroid. DNA, p53 gene were Positive at the thyroid. The DNA-forming bacteria must be in the thyroid, though they had vacated the brain.

Clostridium bacteria, rhizobium bacteria, and lactobacilli were Positive there. All the DNA-formers were still there. A thorough cleaning of dental tissues was called for in hopes of clearing their source.

The cerebrum, though, had already tested clear of all these, so a new MRI was ordered.

Apr 7 brain tissue appears normal now

On April 7, a happy father and son arrived with their new MRI negatives. But not without some apprehension. They had learned to recognize the tumor on several frames of the first set of negatives and were unable to locate it now. But were they merely missing it, as lay persons might? No, the tumor was gone. The bulge remained where the tumor had been, but the tissue density and structure were the same as normal tissue. It was gone.

Of course, William's behavior had reflected this return to normalcy. He was his former helpful, communicative self. But could he go home? Not while the problem in his thyroid persisted.

We received the new blood test results: RBC was still much too high. We had searched the bone marrow without finding metal; we would next search the spleen. Albumin was still high; but the uric acid level was now normal; calcium was back to normal; iron was being properly utilized.

A small clue came from his eosinophil count (not shown), 4%. This is slightly high, implying *Ascaris* worms. William had a dog at home so he was probably quite infested when he arrived. He would not be able to have a house pet again, being much too susceptible to *Ascaris* parasitism.

We checked for the presence of *Ascaris*. There they were, in his Peyer's patches and appendix. (Peyer's patches are lymph nodes in the small intestine.)

Then we searched the spleen for evidence of amalgam tattoos in his mouth. We found that, too. Copper, cobalt, vanadium, vanadyl complexes, and mercury were all Positive at the spleen.

He was instructed to do a high-dose of the parasite-killing herbs: 8 tsp. black walnut tincture extra strength plus another 8 tsp. an hour later.

William was put on cysteine to "mop up" dead *Ascaris* worms, and in another week this could have been accomplished. He also had some tattoo searching to do. But it was not to be. He left for his job at home. He did promise to follow up in three months, and we look forward to seeing him.

Summary: It is always tempting to blame "bad" behavior on the patient if he or she is adult and "in control". Yet William's case clearly shows he was not in control. Parasites, bacteria, and metals were.

49 Maxine Naire Brain Cancer

Maxine Naire, age seventy, came with her daughter-in-law as her caregiver. Maxine had severe memory loss, getting worse rapidly. She was very pleasant and seemed normal "until you tried to live with her." She needed help in every way except physical. Six months ago, she had replaced all her metal tooth fillings with composite; since then her mental health had deteriorated quickly. Was it a coincidence? I thought not.

An extensive search at her brain (cerebrum) gave these results: cobalt Positive, isopropyl alcohol Positive. She believed she had already removed all sources of isopropyl alcohol from her lifestyle; this was frustrating and demoralizing for her. We suggested vitamins as a source. She produced a variety of supplements she had been using. Most tested Positive for isopropyl with my Syncrometer®. That finding would make the problem correctable in a day.

DNA Positive at cerebrum; was a tumor growing? p53 mutation Negative at cerebrum, Positive at bone (probably the skull). Copper Positive at cerebrum. Vanadium Positive at cerebrum. Riboside vanadyl complexes Positive at cerebrum. The Positive DNA result signified the presence of DNA-producing

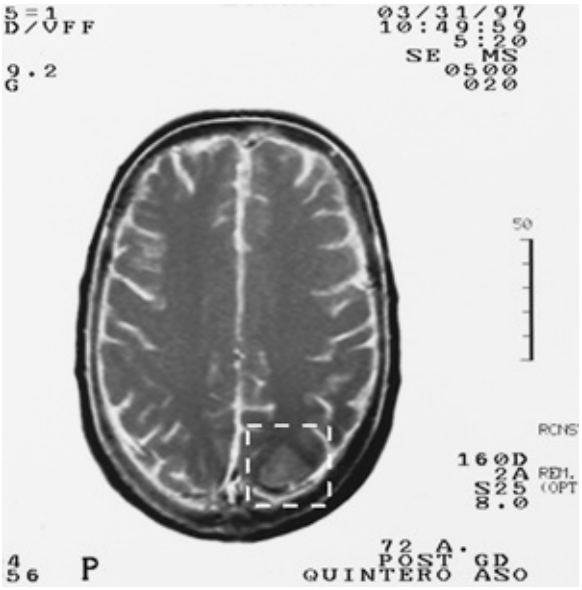
bacteria. The presence of excess p53 gene protein implied a mutagen. The vanadium was forming riboside vanadyl complexes to cause mutations. Copper and vanadium would consume her glutathione wherever these metals were accumulating; in this case, the brain. She would need to hurry with her treatment to stop any further bone involvement if this was a tumor.

Rhodanese Negative at cerebrum (should be positive to detoxify cholesterol derivatives). 20-methylcholanthrene Positive at cerebrum (mutagenic cholesterol derivative). Glutathione, reduced, Negative at cerebrum. Without reduced glutathione (and reduced iron), rhodanese isn't made and 20-methylcholanthrene can't be detoxified into the thiocyanate derivative.

What was happening at the spleen, bone marrow, and liver?

	at spleen	bone marrow	liver
rhodanese	N	N	N
There was considerable body depletion of this enzyme.			
glutathione	N	N	N (also very depleted)
20-methylcholanthrene	N	P	P

But 20-methylcholanthrene was only accumulating at bone marrow and liver. This whole picture suggested a beginning tumor in the brain; her memory problem might not be simply dementia or Alzheimer's. We requested an MRI of the brain.



Mar 31 abnormal brain tissue indicates beginning tumor

She was instructed to do a high-dose parasite treatment (10 tsp. of black

walnut tincture extra strength, plus 9 capsules cloves and 9 capsules wormwood). She was now started on the regular cancer program of supplements, including Lugol's iodine to prevent *Salmonella* invasion. All the plastic-filled teeth were to be extracted, since the holes would be too large after plastic was removed. They were eager to comply and checked into the environmentally safe motel, eating meals at the malonate-free restaurant.

Her first blood test showed no abnormality except a high RBC, implying cobalt or vanadium toxicity.

Two days later, her isopropyl alcohol was gone.

On March 31, she got her CT scan of the brain. The abnormal tissue was easy to spot. The side view, not shown, showed where it was pressing against the skull. Several frames of the top view showed how the new growth was beginning to push the midline over to the left. The triangle of abnormal looking tissue at lower right corner could be the beginning of a tumor.

We didn't know whether to be happy or sad; happy to have found it for Maxine so early; sad that it wasn't merely a dementia affecting her. They took the news in an accepting manner.

By April 1, thirteen teeth had been extracted. She was immediately more alert. But DNA and p53 were still Positive at the cerebrum. Cobalt and vanadyl complexes were still Positive. Glutathione and rhodanese were still Negative. Thyroid was added to her regimen, 2 grains daily.

Two days later, all her extractions were done. Her new test results at the brain showed:

Bacteria	Pyrimidine Bases	Purine Bases
Lactobacillus acidophilus Negative	uridine Positive	adenine Positive
Lactobacillus casei Negative	cytidine Positive	guanosine Positive
Rhizobium meliloti Negative	thymidine Positive	xanthine Positive
Rhizobium leguminosarum Posi-tive (implies Ascaris presence)	thymidine triphos-phate Negative	inosine Negative
Other "Bad Guys"		Other "Good Guys"
DNA Negative		glutathione Positive
20-methylcholanthrene Negative		RNA Positive
vanadyl complexes Positive (there must still be remnants of dental material or another source of va-nadium)	p53 Positive (still getting muta-tions)	rhodanese Positive

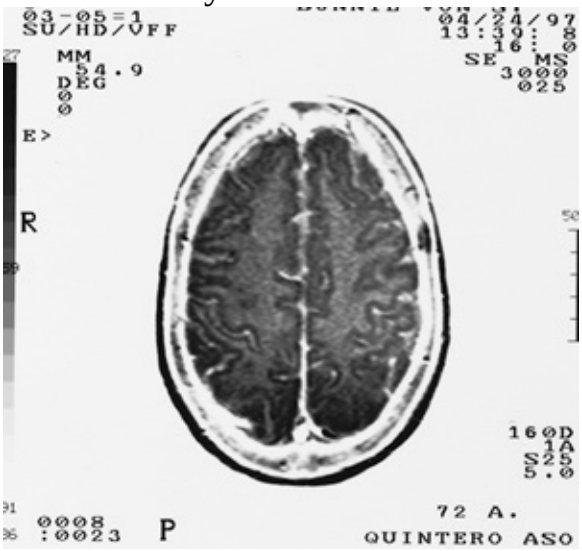
In spite of this good news-no more tumor growth (DNA) in the brain-she was much disheartened that she still had bits of amalgam or composite left in her mouth. She wanted to let her mouth heal a bit more before searching for them.

Perhaps by waiting, they would just go away.

We waited five days. On April 8, a repeat test showed: mercury Positive at brain; silver Positive at brain. Only amalgam (a tattoo) could be responsible for these.

Rhizobium leguminosarum Positive. The presence of this tumor-causing bacterium implicates left-over *Ascaris* parasites. They were tested next. Ascaris eggs Positive at brain, intestine, gall bladder, bile ducts. Other Ascaris stages Negative. [*At that time we had not yet perfected our cysteine/ozonated oil treatment for sheltered parasite eggs. Nor had we found the universal source of reinfection: raw greens and vegetables.*] We tried the 10 tsp. dose of black walnut tincture extra strength plus cloves and wormwood again. Within hours, all tests for *Ascaris* stages, their bacteria, and viruses were Negative. But even after three consecutive days of this treatment, *Ascaris* eggs reappeared at the bone marrow and spleen. Only eggs! And promptly, *Adenovirus* and *Rhizobium leguminosarum* reappeared also. We tried several doses of Levamisole, an exceptionally good drug for killing roundworms. By then the eggs had already hatched in the bone marrow. Soon they were also in the gallbladder; the liver was doing its job to gather them in and try to kill them.

On April 13, she was scheduled for tattoo removal. On April 17, she arrived, triumphantly holding a little bag with cotton gauze holding a collection of tattoos. The oral surgeon had finally found them! Not one-but a half dozen!



Apr 24 normal brain tissue, straight midline

We waited two days to see if metal or parasite eggs would return. They did

not. Perhaps healing of the brain tissue was excluding them now. We scheduled her second CT scan.

On April 24 she arrived with her new scan, apprehensive and hopeful.

Maxine Naire	3/27
RBC	5.1
WBC	7.2
PLT	280
glucose	135
BUN	12
creatinine	0.9
AST (SGOT)	28
ALT (SGPT)	10
LDH	98
GGT	12
T.b.	
alk phos	85
T.p.	7.4
albumin	4.5
globulin	2.9
uric acid	3.3
Calcium	8.7
Phosphorus	3.9
Iron	101
Sodium	144
Potassium	3.9
Chloride	107
triglycerides	156
cholesterol	230

The news was all good; no trace of the abnormal tissue remained. It was gone. The midline was absolutely straight. She could go home. A final check showed there

was still mercury present. Her last blood test showed there were still bacteria (too low uric acid). (She had three other blood tests during her stay, but none of them are shown because there was nothing else abnormal on them.) But Maxine's time was up. We would put her on some cysteine; perhaps this would detoxify the mercury and slow down its accumulation in the brain. [*This was our beginning cysteine treatment from which we learned its* Ascaris *killing ability*.]

Summary: A few weeks later, we heard from her daughter-in-law that she had gained some weight and was getting better. She was happy with her new teeth. Her memory had not improved significantly, though. Perhaps other things could be tried, now, such as a vasodilator (niacin) and herbs known to improve mental function. At least she has time now to improve. They deserved it.

50 Bruce Engevik Prostate & Bone Cancer

Aug 27 intense white regions show bone cancer dissolving (lysing) his bones

Bruce Engevik, fifty-five-ish, was a tall, handsome man who normally kept a twinkle in his eye, and still played tennis, racquet ball, was a swimmer, and long distance runner. Bruce had lived and worked in 80 different countries. Then his life crashed, and he was now wracked with pain. It had taken one and a half years for his doctors to diagnose his prostate/bone cancer since he also had been passing kidney stones, been extremely bloated, and suffered with stomach illnesses. When he was finally diagnosed, one year ago, it was much too late to do anything except palliative treatment; his entire skeleton was involved in bone cancer, although it had probably started as prostate cancer. His "total PSA" was 1250.0 ng/mL. It should not be over 4!

He was put on female hormone (cyproterone) at home, and was still on it (six

times a day). If he missed taking this, his intense bone pains would return at once. I assured him we would not make him suffer.

He brought a total bone scan with him; the "hot spots" were too numerous to count.

He had already done ten days of the parasite-killing program before arriving, having been given *The Cure For All Cancers* as he left the hospital in Australia. He arrived on September 18. The first two days were spent getting a blood test, a panoramic x-ray of teeth, acquiring the new nontoxic body products and settling into the environmentally safe motel. His diet came exclusively from the malonate-free menu at the restaurant nearby. He was first seen by me on September 20, his shuffling gait, and stooped shoulders betraying pain.

His blood test told all; the alkaline phosphatase (780) was in the top 10% of patients I had treated. A look at the bone scan put him in the bottom one percent of "chances of recovery." His first question was, "Can you save me?" I could not truthfully answer yes, on the basis of the high alk phos. I evaded the question, but stated that we would do our best, and that he certainly stood a chance. He tried to smile, but recognized the evasion. He had come ten thousand miles for what, promises?

The staff would see to it that he was capable of following our cancer program without a single mistake. His first Syncrometer® tests showed isopropyl alcohol Positive. He had not yet managed to rid himself of this elementary, and most important of all toxins. The tests also showed benzene Positive. This would destroy his immunity, including changing germanium (good organic kind that his white blood cells relied on) to toxic germanium. The benzene would also knock out a viral inhibitor that we all need. Benzene itself is detoxified by oxidation to phenol, which next oxidizes our vitamin C, cysteine and glutathione to useless items, besides causing pain.

The staff would help him by selecting his food, beverage, water, soap, shaving method, shampoo-all of it, in order to avoid benzene and isopropyl alcohol. He came prepared to extract bad teeth-not restore them. All six Clostridium varieties were Positive at his teeth, bones and stomach. We started him on betaine at once.

I next searched for toxins at the vital organs where mortality is determined. By now I had realized that cancer patients do not die from their tumors, directly, but

from the toxins responsible for creating them. I could then pick the sickest organs to watch most carefully. (N = negative, P = positive, asterisks denote exceptionally high values.)

	pancreas	bone	bone marrow	spleen	liver	parathyroid	thyroid	prostate	adrenals
ortho-phospho-tyrosine	N	POS	N	N	N	N	N	POS	*POS

p53 gene (mutation)	----	POS	POS	POS	POS	POS	N	----	----

Note that *Ascaris* stages themselves may be living only at the pancreas and adrenals but this results in lots of 20-methylcholanthrene elsewhere in the body. Beta propiolactone is also made by *Ascaris* and had a similar pattern of distribution. The M-family (malonic acid, methyl malonate, maleic, maleic anhydride, D-malic acid) was dispersed through his body, too. Sudan IV, a carcinogenic dye was highest at bone.

The next test was to see how badly the two main growth controllers were out of kilter. Pyruvic aldehyde and thiourea should each have a one minute cycle in

perfect alternation. For Bruce, thiourea, the growth stimulator, stayed on continuously (I stopped timing it after seven minutes) and pyruvic aldehyde, the "brakes" for cell multiplication, stayed off throughout this time.

The next test was for the presence of RNA which is necessary to make protein. RNA was Negative at muscle, lymph nodes, lung, joints, esophagus, diaphragm, colon, bone marrow, bone, adrenal, connective tissue, thymus, thyroid, stomach, spleen, prostate, pancreas, optic chiasma. This was a very poor showing. His body's metabolism was grinding to a halt; over half his tissues had a very serious shortage of enzymes and other proteins necessary to conduct life.

The next test was to see which amino acids (of a set of 22) were present at bone. They were all Negative, simply no trace of any, although he had been eating normally, he claimed. This is typical of the attrition that occurs in a tumor, then overtakes the tumorous organ, then affects the rest of the body. It is due, I believe, to the spread of streptomyces species through the body, releasing their numerous waste products and bacterial toxins. These include protease, streptomycin, actinomycin-D, and others. These are well studied inhibitors of protein formation. At the same time, Bruce's tissues were missing an enzyme, RNAse inhibitor, that would have protected him from digesting the proteins as soon as they were made. RNAse inhibitor was absent due to having vanadyl complexes everywhere. The streptomyces bacteria, though, are strictly dependent on tapeworm larvae and could be eliminated in a day. His RNAse inhibitor could be reinstated by getting the vanadium out of his mouth. And this was proceeding as fast as it could-dental work was already scheduled. A notable exception to the picture of absent RNA in his tissues was the skin. Here RNA remained high. Although streptomycin-like toxins could be detected at the skin, no protease was ever detected. Wherever RNAse inhibitor was missing, RNAse A had a runaway existence in his vital organs (not skin).

Parasites and bacteria were consuming his vital tissues as swiftly as caterpillars can strip an orchard tree. It had to be stopped at once.

His tests took two hours to complete. After this, his Day 1 instructions were begun. He had a lot to accomplish in the next two days, most important was killing his parasites thoroughly and getting the "restored" teeth extracted. Refilling them would run two risks: trapping Clostridium bacteria again and getting a new large dose of copper, cobalt, vanadium, maleic acid, and urethane. This would terminate his life, there would be no contest. After extracting the old

teeth, partial dentures could be made for him. We assured him he would look good and be able to chew. This had been discussed with him before he decided to come to our clinic. He was eager to get it all done, and was surprised to see how well he was recovering from the first extractions. He was doing the Dental Aftercare program carefully, "drinking" his food after "blending" it so that no nutrition was lost. He was water picking throughout the day to prevent infection since we could not risk the toxic action of antibiotics during these "final days." Final unless our program could be carried our correctly, without interference by infections or toxicity from drugs. The only additional supplement, other than the ones on the regular 21 Day Program, was zinc (30 mg per day) for his prostate.

This panoramic x-ray with many "restored" teeth is typical for cancer patients

Two days later he arrived at the office with a strong step, standing taller and with a smile. He was without pain, for the first time, although he had gone off his "estrogen" and painkillers for twenty-four hours. He was waiting for massive pain to return, but it did not. His mouth was still painful, and a spot over his left shoulder blade hurt, but this was probably liver-related, not bone.

The Syncrometer® tests now showed 6 Clostridium species Negative at bone; *Staphylococcus aureus* Negative at bone; 3 salmonellas Negative at bone; 3 shigellas Negative at bone; *E. coli* Negative at bone; 6 streptococcus species Negative at bone. Absence of bacteria at bone tissue explained his absence of pain. True healing is slower.

Then his parasite status was checked at the gallbladder. Stages are frequently collected here, so it is the first place to search for them. The Syncrometer® test showed *Rhizobium leguminosarum* and *Mycobacterium avium* Negative at

gallbladder. This negative result implies absence of all *Ascaris* and its stages.

Streptomyces and protease Positive at gallbladder. This positive result implies there are still tapeworm stages present somewhere.

Ferrous gluconate (the correct form) Negative at bone. Ferric phosphate (the wrong form) Positive and in high amounts. Inositol Negative at bone. Rhodizonic acid Negative at bone. Cysteine, methionine, taurine Negative at bone. I added inositol to his cancer program to help his metabolism make rhodizonic acid and ascorbic acid. He had a significant shortage of ferrous iron at the bones due to over-oxidation by phenol. The sulfur containing amino acids were still absent in spite of taking them. I doubled the dose.

A follow-up blood test was scheduled since it had been five days since the previous one. And an ultrasound of the prostate for the following day, September 23, 1997.

This must have been the best day in his life. From a one percent chance of survival, using our advanced method he had climbed to about a ninety percent chance of survival. His alkaline phosphatase had just dropped to one-half its starting value. In that one result, his life had been offered back to him. It was now 349. We had somehow caught and eliminated the dye that was destroying him; it was undoubtedly in some of his dental plastic. [*At this time we had not identified it as DAB yet*.]

The liver enzymes had all improved, too. His liver could make more protein, especially globulin (antibodies) which had been too low. His potassium level was adequate now. He could reduce his potassium supplement.

Testing for Clostridium species showed they were all Negative now at the teeth; he had cleared them up with water picking and hot packing.

Tapeworm stages were consistently testing Negative at gallbladder, liver, and bile ducts. Was he not reinfecting? There was no way of knowing except daily testing for about five days.

Rhodizonic acid was Positive at bone and prostate. He was making it now, from the inositol supplement. In spite of these glorious achievements, there was much more to do, as the 21 Day Program progressed. We added flaxseed. He could cook the flaxseed into his cereal after ozonating the seed to detoxify any

benzene.

It was time to check on his growth-regulators again: pyruvic aldehyde and thiourea. Pyruvic aldehyde had returned to its correct period: one minute being present, the following minute being absent. Thiourea was in perfect alternation with pyruvic aldehyde, as it should be. His bone tissue growth rate had normalized.

The enzymes arginase and ornithine decarboxylase were present only briefly, ten to fifteen seconds out of each minute. Spermidine was present only ten seconds out of each minute. These three substances are overproduced when a tissue is growing out of control. His were normal. It was a day of celebration for Bruce; we shared his enthusiasm for living.

The next day, he had an ultrasound (not shown) of the prostate done which he brought with him the following day, September 27. The prostate was considered normal by the radiologist, and indeed, there was nothing abnormal to be seen. The weight was estimated at 50 grams. This was hardly the gland that had produced the 1250 PSA; it had recovered considerably.

The last two pains, at the left thigh and left shoulder, were now gone though a lump could still be felt at the thigh. Clostridium species, *Fasciolopsis* flukes, and *Ascaris* were still gone, but there was evidence again of tapeworm larval stages at the bile duct. Reinfection could come simply from consuming one leaf of lettuce, a few strawberries, or a thimbleful of milk that were not sterilized. He had to learn to do this for himself. A liver cleanse with ozonated oil was advised just in case they were also stuck in his gallstones. All the amino acids tested earlier and found Negative were now Positive. RNA was now present at all organs, too.

Two days later, September 29, he exclaimed over his good appetite and lack of pain. He had done the liver cleanse and was again Negative for tapeworm larvae. We were waiting for Bruce's gums to heal over enough to permit cleaning his front teeth. Air abrasion cleaning would throw small particles in all directions. These particles would be made of alumina and baking soda, easily trapped in the gums if they haven't healed.

He was beginning to take short walks, now, on the beach. His energy was coming up.

Another four days later, October 3, he had painful spots here and there that moved from place to place; this is the hallmark of allergic reactions and bacterial infections. He was drinking grapefruit juice exclusively and was told to stop. Tapeworm stages and *Ascaris* were again Positive at the bile ducts and gallbladder. He had reinfected again! Their toxic products were reaching the bone. He was advised to do another liver cleanse with ozonated oil. And he was started on chromium to stimulate amino acid uptake by cells, as well as sugar. Yet his next tests showed 1, 10 phenanthroline Positive at bone; ferroin Positive at bone; 20-methylcholanthrene Positive at bone; beta propiolactone Positive at bone; hydroxyurea Positive at bone; phorbol Positive at bone. He had *Ascaris* and tapeworm stages, again. His iron supplies had been changed to useless ferroin by the phenanthroline produced by the parasites. Tapeworm stages and *Ascaris* reinfection put him right back at "square one."

All the amino acids were again Negative, no doubt due to the protein inhibiting action of the streptomycin-like toxins. He was not sterilizing all his raw food. He would begin at once. But RNA was still Positive, RNAse Negative, and RNAse inhibitor Positive. Vanadyl complexes were Negative.

Three days later, October 6, he had done his third liver cleanse with ozonated oil. He looked like a strong, healthy man again, no trace of illness could be guessed. He was restless and bored. He wanted to visit somebody, somewhere or have some adventure. His latest test results were 1,10 phenanthroline, ferroin, 20-methylcholanthrene, beta propiolactone, hydroxyurea, and phorbol all Negative at bone. All amino acids were Positive, so his bones were no doubt healing.

And he was ready to get plastic out of the front teeth if there was any.

Two days later, October 8, he seemed very well; his mouth had healed and the plastic had been removed from his front teeth. The dentist had found a large unsuspected filling and extracted the tooth, rather than risk Bruce's new-found life. His weight was 70.4 kilograms now (155 lb.), he had begun to gain weight and had already gained nine and a half pounds. This was the very best sign of all, we could move him to the ninety-nine percent chance of survival category now.

His blood test on October 9, showed a brief worsening of his condition, perhaps due to the encounters with parasite reinfection, perhaps due to dental anesthetics [*or perhaps the draining of another tumor location with dye*].

Bone health had immediately suffered. His nourishment remained good, though, with higher blood sugar (glucose), higher triglycerides, and higher cholesterol. His prostate was healing, too, with a PSA of 98.

Then he left for a vacation of three days, but stayed away for two weeks, not entirely unexpected. His health had returned. He promised to be cautious, stay on his supplements and diet, and live in moderation. But that was impossible. He had faced certain death for too long. He had to celebrate somehow. As it turned out, he fell in love. And threw caution to the winds-almost. He had chosen ready made food from a health food store, instead of totally safe home-cooked food.

When he returned, he was Positive again for benzene, isopropyl alcohol, and wood alcohol. hCG was Positive everywhere, but he did not have the *Fasciolopsis* fluke, so did not have ortho-phospho-tyrosine. Nor did he have *Clostridium* invasion-there was no tooth source (his partials came just in time for his vacation). He had taken betaine religiously, so no *Clostridium* had colonized his colon. But tapeworm stages were present again, this time at the bile duct and bone. He had been eating baked cheese dishes in Mexico-they were probably not truly sterile. He was advised to do an ozonated oil liver cleanse right away, besides the parasite program.

In spite of this set back, his cell division regulators pyruvic aldehyde and thiourea were not disturbed from their normal periodicity, no bacterial amines were present to disturb them, there was no *Clostridium*.

His new blood test showed further improvement. The alkaline phosphatase was now 262. It still needed to drop to 85. We advised him to stay until it was completely normal. The LDH had dropped back down. His liver was making plenty of blood protein. His body could make urea again.

In a day his solvents were gone again, hCG was Negative, but tapeworm stages had not cleared up. He was to repeat a liver cleanse on the weekend.

Instead, he chose to repeat it at once-since his flight home was just a day away, and he wanted to leave in perfect health. Another ultrasound of the prostate was scheduled, too. On his last day, the ultrasound showed that his prostate had shrunk to thirty-seven grams and was still quite normal.

His repeat liver cleanse had done away with tapeworm stages again. I advised doing a liver cleanse every two weeks.

Summary: It was a happy goodbye. And a mission accomplished. His bone scan was not repeated since bone density does not change significantly in five weeks. The alk phos was the best monitor for his case. His prostate ultrasounds, too, could not add any information. We had missed getting an ultrasound of his prostate on the day he arrived, and by the time it was done, there were no tumors visible. The numbers tell the whole story. Numbers and physical health.

51 George Hill Brain Cancer

George was a slender boy of 15 when he arrived with a brain tumor about the size of a plum. At age 15 he missed his mother and sister at home in Peru. But he had heard his doctor say, in front of him, to his parents: "If we don't do surgery, he will die. If we do surgery, if he survives, he will be paralyzed from the waist down and his brain will be a vegetable. Neither radiation nor chemotherapy will work." He remembered each searing word. He wanted none of these choices. So the surgeon implanted a shunt (plastic tube) in his brain to drain off edema fluid and lower the pressure in the brain-he had already lost significant vision in his left eye. The diagnosis was cystic astrocytoma. His two MRIs, brought with him from home, showed the tumor was slowly growing. It was part cyst, part cancerous, with a long beak-shaped point reaching forward. Beside this was a completely calcified pineal gland; it had turned into "stone" or calcium deposits and appears black on the print.

He was here with his father. We started on his first day to search for the toxins that came from their home so it could be made ready for George's return. His "whole body" test was Positive for lead, vanadium, aluminum, thulium, formaldehyde, asbestos, isopropyl alcohol, benzene, zearalenone, aflatoxin, and

all five malonates. To account for the lead, he was asked to get dust samples from each room at home. To explain the thulium, he was to get his old vitamin C bottle from home. And their sugar was to be tested for asbestos. His plastic glasses frames seeped vanadium; he was to soak and wash them, then re-test them. Other items were obvious; he had been living on "semi-food" (crackers and sandwiches, fat-free munchies), instead of meats and vegetables to avoid getting high cholesterol! All of which were laden with mold that made zearalenone. It accumulated in his skin fat and brain, there releasing benzene and phenol to lower the local immunity.

Our next search was at the brain, cerebrum. He was Positive for these mutagens: 1,10-phenanthroline, betapropiolactone, benzanthracene, hydroxyurea, cycloheximide, vanadyl complexes, 20-methylcholanthrene, and phorbol.

The tapeworm test showed five out of five types tested were Positive in his brain. It was full of microscopic eggs and cysticercus stages. He was also Positive for *Mycobacterium avium*/*cellulare*, 3 streptomyces species and their products: erythromycin, protease, streptomycin, mitomycin C, and actinomycin D.

Four out of four azo dyes tested were Positive, including Sudan Black B and DAB. Urethane and inorganic germanium were Positive. The urethane must be coming from his plastic shunt since there was not a single defective or repaired tooth in his mouth. Our cancer marker tests showed: Ortho-phospho-tyrosine, hCG, and DNA Positive. RNA and gamma interferon were Negative. Our first task was to stop this; he was started on Day 1 of the cancer program.

Three out of three *Clostridium* tests were Positive, as well as three out of three *Streptococcus* tests. It was a daunting situation. If only there was clinical support available at every minute, day or night, in case the tumorous cyst ruptured and flooded the brain, producing such huge seizures as to stop breathing! If it went unnoticed in the night, all would be lost by morning.

The safest approach was to kill everything, detoxify, and clear everything at top speed, but without bursting the cyst-tumor. George was up to it. He swallowed and drank and mixed and sipped as never before. He was eating for dear life and was surprised to learn that I considered his "low cholesterol-cracker" diet to be non-food, hardly to be offered to roaches. He was to sign up

for the special restaurant meals and consume nothing else. He would live in the environmentally safe motel with only borax water for personal and laundry chores. But he could consider himself lucky not to be on the list for dental extractions. He did. By the second day his cancer markers were corrected. And only 8 of 20 tumor tissue samples still tested Positive. Was he already showing the advantage of that mystery factor, called youth?

By the fourth day all the previous tests had become Negative that should be Negative and RNA and interferon were Positive, as they should be. Only Streptococcus and phenol were still Positive. And the dye Sudan Black B was still present intermittently. The cerebrum was now fairly clear. He was on 10 tsp. Black Walnut tincture daily and 2 capsules methylene blue powder daily (65 mg each). We could begin to examine the tumor (as distinct from the brain) electronically. First, we must identify it. It would surely still have its dyes locked inside while the neighboring brain tissues were already cleared.

Using a dye together with the cerebrum slide to specify the location where the dye was, we immediately found the tumor. Here DNA, *Ascaris* worms, zearalenone, patulin, aflatoxin, benzene, inorganic germanium, and other azo dyes were still Positive.

We next prepared his brain and liver to receive aflatoxin by giving him 30 capsules glutathione for 5 days and progressed him through Day 2 and Day 3 of the cancer program (he had been repeating Day 1 all this time). We were ready to give the tumor-opener, vitamin B_2. But it had already happened. At the cerebrum on his eighth day were all the same toxins and parasites we had originally cleared. He had a slight headache. There was no time to lose; the dyes were loose. For two days in a row he took the complete program together with 30 capsules B_2 each day. The cerebrum cleared up, but the cerebellum did not; would he suddenly buckle, never to walk again? Cysteine and ozonated oil were added; all items were taken at maximum dose and George made not a single complaint. Down it all went. He began to have diarrhea (from the large dose of glutathione), and strange green pea-shaped objects floated in his toilet bowl. He was getting out his liver gallstones without doing a liver cleanse! Possibly, the late evening ozonated oil was doing this.

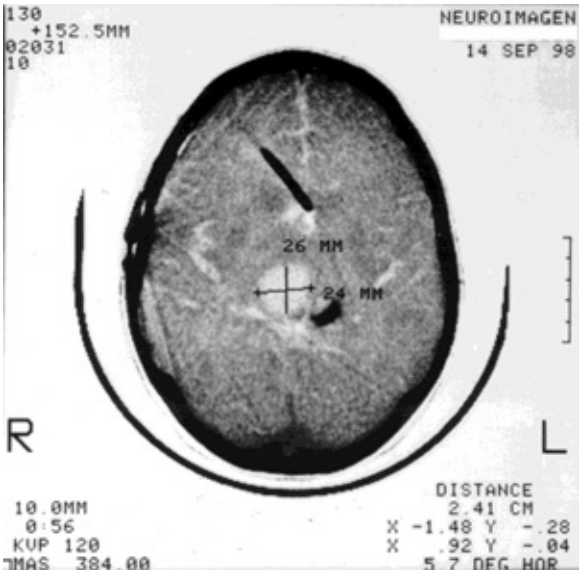
On his eleventh day he was switched to 2 freeze dried green black walnut hull capsules 4 times a day instead of 10 tsp. tincture. This would keep up with emerging parasites more efficiently. The next day his cerebellum was clean.

The 2-week program he had scheduled at our clinic was done, and the next week father and son did their own cooking. They had learned how to select, prepare, and sterilize their food. There would be no room for error. All George's food was tested before eating. He was encouraged to enroll in the Syncrometer® class so he could eventually do his own food testing. George's father cooked with absolute precision. But could he keep this up at home? What were George's chances of recovery if they left for home? Zero, I thought. They decided to stay. I estimated it could take six or more months before some reduction in size could be expected. This was not just a tumor but a cyst, also. And cysts are notoriously stable and unassailable. And dangerous because they can get re-colonized at any time. I had not attempted to shrink a cyst before, only tumors. Cysts are considered benign. But this was not benign; it was some kind of hybrid. Progress would depend on daily research.

At the next visit the entire toxic team that had once been in his brain was in his liver. He quickly did a liver cleanse; then it could all be seen at his kidneys. He drank 2 cups of parsley tea and 3 cups of the remaining kidney herb tea daily to produce 1½ gallons of urine daily. In two days the kidneys cleared.

He was scheduled for his first CT scan with us. Would the tumor-opening be apparent in some way? Even the small tumorous part of the cyst had never been clearly seen. George hoped it would all be gone; his father hoped it was slightly smaller.

A month had passed. The CT showed that a small portion, perhaps the tumor portion was missing, leaving the large cyst intact, like a small water balloon, 24 x 26 mm in size.



Sep 14 some reduction already

He had slight pain at the front of his skull. We searched at bone to identify any lesion at his skull. Rabbit fluke and asbestos were Positive there. Was he eating this accidentally? Yet, there were no rabbit flukes in his gallbladder; they must be emerging from the cyst. As was the asbestos. They had lodged in his skull. We searched in the white blood cells of his skull; they were ferritin-coated. This lowered immunity also allowed *Streptococcus* to grow in his skull, causing pain. *Clostridium* was getting started, too. Inorganic germanium was Positive, but "good" germanium was also Positive so no p53 mutations were spotted. He was given colloidal silver, 3 Tbs. in one dose daily to reach these far away *Clostridium* bacteria. But it was a sinister development. Unless his own white blood cells could be mustered, we might lose the battle. So George gulped papain (to digest the ferritin), MSM, and powdered hydrangea.

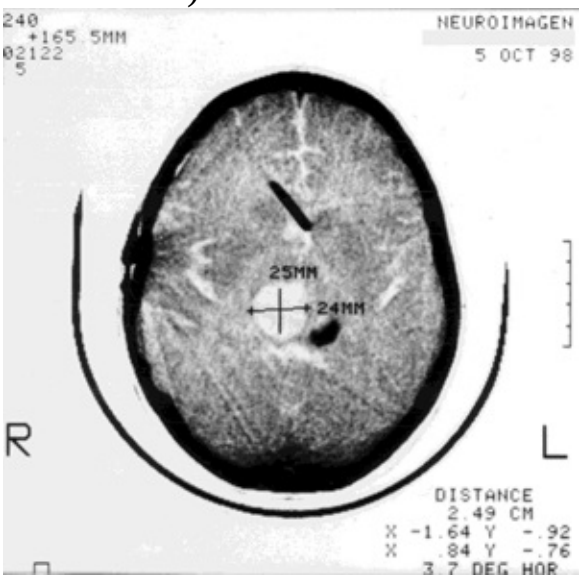
At the next visit things were only worse; the thiourea to pyruvic aldehyde ratios were already quite disturbed. And nothing had cleared. In fact, vanadium was now added to the list of toxins accumulating in his skull interior. I believed toxins were seeping out of the cyst to gain a foothold and create a new tumor site in his skull. The ferritin was still not off his white blood cells. It was too soon. We added Levamisole to speed it up (50 mg Decaris, one a day).

A new crisis loomed. Their visas would be up and there was some problem over renewal. They needed to find temporary work, too. I suggested George enroll in school to keep his mind off gloom and doom. This idea made him happy; he was eager to study again.

Two months passed. The (new) second CT scan showed a very small reduction of cyst size, but this could be questioned due to the angle of the shot. Yet, clearly it was not growing. They could report this to the oncologist at home. Their doctor believed he had stepped off a shelf into the abyss (of quackery) when he stated he was headed for Mexico.

Suddenly he tested Positive for rabbit fluke (which brings with it *Clostridium* and *Streptococcus*). His HCl drops were missing in some of his solid foods. He corrected this.

At each visit he was searched at the cerebrum. The plan was <u>not</u> to try to open the cyst for fear of cataclysm, but to simply keep the supplement protection in place to kill and detoxify everything as it slowly emerged. Fiberglass and Freon emerged in large amounts; silicone and more asbestos emerged. George used to spray silicone on his glasses without taking them off first, he said, just to clean them. And more and more vanadium. They were warned never to have a fossil fuel utility again (emits vanadium).



Oct 5 no definitive improvement

The papain was giving him stomach aches so he was switched to bromelain.

Now three months had passed. George's WBC had dropped to 3.5, suggesting that some of the emerging toxins were going to the bone marrow. There was rabbit fluke again in his cerebrum and ferritin still coated his white blood cells there. Would the asbestos outflow never stop? Yet we dared not speed it up.

Finally, impatience struck. George and his father went to a UCLA radiologist to review all their scans. Five "cysts" were noted in the optic nerve; the diagnosis was cysticercosis. He was offered the newest tapeworm treatment and warned he could become a vegetable, but it would be done in the hospital under critical care observation. They chose to be patient again. Then we checked the optic nerve location; both *Taenia solium* and *Taenia saginata* stages were present. Four additional tapeworm stages were present at his retina. I doubled his bromelain, MSM, and powdered hydrangea to 1 tsp. 3 times a day to bolster our containment strategy. Freeze dried black walnut was increased to 3 taken three times a day. (He later told me he was actually taking more.)

The very next day the ferritin-coating came off the cerebrum white blood cells.

And in another day all the tapeworm stages were gone, as well as *Clostridium* and *Streptococcus* from the skull location.

But the pineal gland white blood cells were still ferritin-coated and the gland was full of asbestos, silicone, and azo dyes. We felt relief to know we would be getting the assistance of George's own immune system at last. To reassure George, we tested his optic nerve for our entire tapeworm collection: only one was still Positive-a composite Taenia egg collection. It was also Positive at his optic chiasma. Did we dare hope that his vision would some day return? We searched for the toxic team that had so recently left his cerebrum and pineal gland. It was at the spleen. But the spleen white blood cells were loaded up with them, obviously eating and expelling them. So perhaps all would be well.

George was now testing himself regularly and could predict what I would find at his office visit. He could shape his own research. He was a scientist at age 15, coming on 16. His birthday arrived, but no suspect food passed his lips. He could still hear his doctor's words, "You will die." And his success with us was far from assured. The spleen proved difficult to clear. Right after the toxic team arrived at the bladder, they seemed to return to the spleen. We tried 40 capsules vitamin B_2 (12 gm) in a single dose plus glucuronate (3 x 250 mg) for 4 days running to capture the dyes. It worked. They finally cleared the bladder.

His third monthly CT scan, November 19, showed no further change in size of the brain cyst. They felt defeated, but I felt glad. Glad that the 4 doses of 40 capsules B_2 had not burst open his tumor cyst and wreaked havoc and disaster.

Nov 19 still the same

Meanwhile, I had obtained a made-to-order slide of the brain containing the globus pallidus. Our pathologist felt this was the true location of the tumor cyst. Perhaps now we could analyze its contents and monitor it correctly, instead of simply using the cerebrum slide. And we found the cyst at once. Even the tumor tissue types were still Positive somewhere inside. Asbestos, silicone, urethane, cobalt, vanadium, Sudan Black, and DAB dyes were all Positive. *Clostridium* was Positive, *Streptococcus* Negative. And the globus white blood cells were ferritin-coated. Zearalenone and benzene were very high, and their origin unexplainable.

George himself contributed the DNA findings, still Positive, as was *Taenia solium* cysticercus. He could find his own acrylic acid, zearalenone, and benzene, soon deducing they were all coming from the flaxseeds he was eating daily! He took himself off the flaxseed and was Negative for these a week later. He noticed that tapeworm stages regularly moved from the tumor cyst to his optic nerve. But his high doses of special supplements soon killed them here, only to be followed by another entry.

His latest blood test showed a high (nearly 1.0) ratio of segs to lymphocytes, implying a virus. It was the right time to catch Coxsackie virus on the loose. Indeed, both varieties A and B were Positive at the globus and cerebrum.

In mid-December, there was another burst of activity; his cerebrum was again full of all toxins liberated from the cyst. And the globus pallidus was now clean.

Its white blood cells were not ferritin-coated.

But this only meant that most of the globus pallidus was clean. The part that was not clean had first to be identified somehow.

Christmas was around the corner and thoughts of home and mother stirred impatience. The bad job opportunity and anxiety over the upcoming CT scan contributed. His doctor at home was also impatient to hear about results. They had been in touch with him and wanted to please him. What he wanted most was a "good" MRI, with contrast. George asked why I would not permit contrast. "Contrast," I nearly shouted, "And get all that dye back into the cyst we have been cleaning so carefully?" Its only gadolinium, he said, prompted, no doubt, by his oncologist. It must leave quite soon. I have had several already. Could you test for gadolinium at my cyst? I hesitated, for fear he would make his point, but agreed. Shockingly, gadolinium was Positive and still very high at cerebrum, liver, and bone marrow, places that had been cleared of other toxins long ago. Gadolinium was Negative at the white blood cells of these organs. So none of it was being removed. He still had the gadolinium in him from his first scan with contrast, nearly two years ago. But not only gadolinium. He was also Positive for ytterbium, scandium, yttrium, terbium, thulium, and lanthanum (others not tested). Was the contrast material so impure that all the other lanthanides came along for the ride? It seemed a distinct possibility.

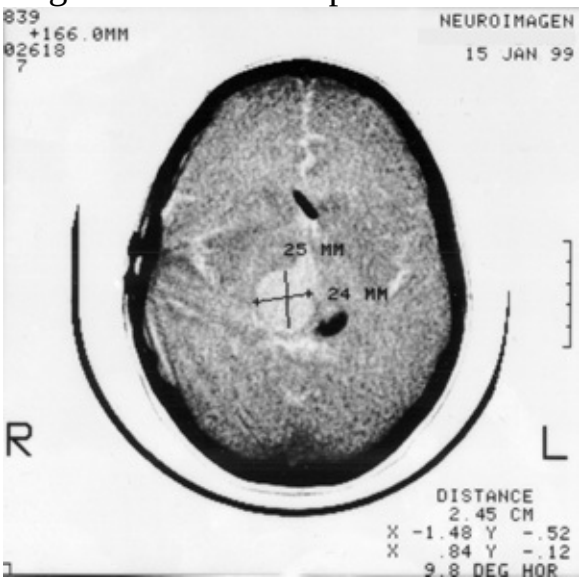
But why had I not discovered this sooner? This simple truth had waited for his boyish and creative mind to express itself.

I immediately noticed the disturbance in human (not *Clostridial*) DNA formation typical for lanthanides. It would start late and end even later so the total time of its production would be about 27 seconds, instead of the normal 20 seconds, as seen with the Syncrometer®. This was still going on at the cerebrum and globus, but not at the spleen. At the spleen, lanthanides were Positive, but the excess iron deposits were gone. At cerebrum and globus, the lanthanides came associated with both ferrous and ferric iron deposits, as is usual. I wanted to research this further at once, but George had cold sores to attend to, needed to go home, and gone was all inclination to request a CT scan with contrast.

A week later I searched for our set of 14 lanthanide metals. All were present in George's cerebrum, but none were present in the cerebrum white blood cells! Yet they were not ferritin-coated. They should have been able to "eat" the

lanthanides to remove them. They had one obvious abnormality; they had iron and calcium deposits. Somehow this interfered with their ability to eat toxins. We would soon see how.

At the end of his fourth month, the new CT scan (not shown) still showed no change in the size or appearance of his tumor-cyst. His cerebrum and globus (with the cyst location) were still filled with lanthanides and iron and calcium deposits, in spite of trying EDTA, a very strong metal chelator, very high doses of vitamin C, and DMSO, a penetrant. The cerebral and globus white blood cells were empty, were not eating the intruders. But a new fact had emerged. Wherever there were calcium and iron deposits the normal digestive enzyme pancreatin was missing. Could this be significant? All normal tissues were supplied with pancreatin which lasted for many hours after a meal. Normal tissues also had phosphatydyl serine, a molecule in the cell membrane that could declare the cell was ready for digestion. Calcium and iron-loaded cells did not. Yet there was no way to get the calcium deposits out.



Jan 15 no change

His fifth monthly CT, January 15, again showed no change. A search of the lanthanide research literature showed that they have long been known to cause calcium precipitation inside cells. And, in fact, this normally triggers cell division. But why were they present in the lysosomes along with iron deposits? (The Syncrometer® can detect the lysosomes and other cell compartments.) And why was DNA seemingly stuck to them and produced too long a time? There was a strange possibility; the lanthanides and iron could be attracting each other due to their magnetic properties. I searched the body for a susceptible spot where

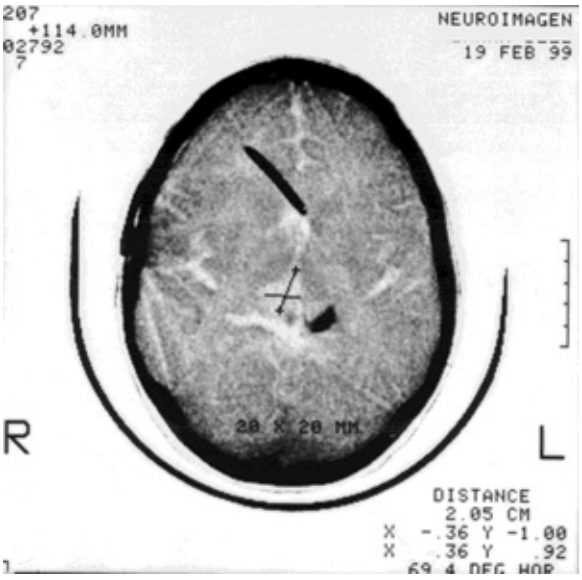
the DNA could be influenced using a small magnet. Indeed, the DNA abnormality could be corrected with a small "magnet patch", only 0.2 gauss, placed over the spine in a narrow (½ inch) band. We gave George such a patch, facing the North (by biological convention) side against his skin. He was taken off many other supplements since they were obviously not able to remove iron, lanthanides, and calcium deposits. But he was given pancreatin, 1 tsp. to take four times a day.

In three days most lanthanides were already out! At the globus, only thulium and lanthanum remained. A week later, there was still some thulium; even two weeks later there was thulium. Thulium sticks tightest inside cells.

Two weeks after starting to wear the tiny magnet patch, George's iron deposits had left the cerebrum as well as the lanthanides. As if by magic, the calcium deposits had left, too! And at the cerebrum all nucleosides were now gone. And in their place was ATP. A large supply of ATP! The cell-flag for digestion, phosphatidylserine, was now Positive, and with it pancreatin. Was the tumor cyst really getting digested? At the globus (his tumor-cyst) things were not as far along. In fact, nucleosides were still present, the digestion-flag was not up, and pancreatin was not there either.

But the main portions of the brain already had their immunity back. The nucleosides, iron and calcium deposits were now in the white blood cells. Was it safe enough to open the cyst? On the day we planned to try, *Ascaris* suddenly reappeared. We delayed again. Eggs and stages were everywhere. But the eggs could be seen in the brain white blood cells now. Immunity would save him. Coxsackie viruses were coursing about, but were found in the white blood cells, too, protecting him.

Days later at the globus, hydroxyurea (from some distant *Ascaris* eggs) was still Positive. We searched for them at many body organs, finding them at last in the bile ducts. Only gallstones could easily explain this; he must have the eggs in his gallstones, forever seeding his brain and cyst with them. He was instructed to do a liver cleanse-his fifth one, and the day after the cleanse to take 3 freeze-dried black walnut capsules four times a day to stamp them out.



Feb 19 reduced by half

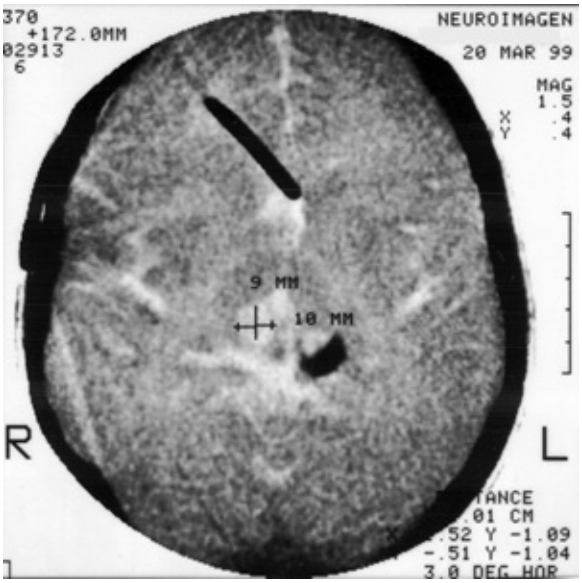
But two days after his cleanse he still had *Ascaris* eggs in liver, gallbladder, and bile ducts. He was raised to 6 freeze-dried capsules three times a day for 3 days in a row. Surely that would snuff them out, even inside his stones. (Actually, stones can be much too hard for anything to penetrate them.) He must do weekly liver cleanses till the bile ducts came clean.

It was February 19, the date for his sixth CT scan, and a day he will remember. It showed a huge reduction in tumor-cyst size-to less than half its previous dimensions. But he did not allow himself to believe the good news. It had all happened in the last 30 days. Was it due, finally, to the presence of pancreatin? Which enzyme <u>in</u> the pancreatin was responsible: trypsin, chymotrypsin, lipase, amylase, DNAse, RNAse, peroxidase?

A spot could still be found in his globus pallidus that harbored *acrolein*, a fat derivative similar to burnt grease and very carcinogenic by scientific standards. Was this not being digested? Of all the pancreatic enzymes seen there by Syncrometer®, only lipase was still missing, and also missing in our supplement of pancreatin. Lipase digests fat, but could it digest acrolein? We supplemented it separately (¼ tsp. three times a day) and raised his pancreatin to 2 tsp. three times a day. His daily supplements had been: vitamin B_2: 20 capsules (6 gm) to detoxify emerging dyes and benzene, Levamisole (50 mg three times a day) to prevent ferritin-coating as asbestos emerged and to help kill *Ascaris*; EDTA ($^1/_8$ tsp. in a cup of hot water) to chelate lead and other heavy metals as they emerged; freeze-dried green black walnut hull (three times a day); and vitamin C

(2 tsp. three times a day).

Ten days later the acrolein was gone. Did this mean it had digested? The next scan wasn't due for another week.



Mar 20 tumor still shrinking

The March 20 scan was also too good to be true. George had to be jolted into reality-that it was really happening for him-but still with cautious interpretation. Although the tumor-cyst was down to 9 x 10 mm, it could still easily fill up again if he were to get a dose of *Ascaris* or common food bacteria. He needed no warning. It was only on this day, seven months after his arrival, that he allowed himself to repeat the exact words of his doctor at home: You will die. Was his life scarred? I think not, for he was pursuing the hard sciences, studying English, doing very well at school, and looking forward to a university education.

April 24 brought further good news; the tumor-cyst was still smaller. But what about his blood tests? When he arrived August 3, his alk phos was clearly elevated, but was it due to his status as a young growing boy? His albumin and uric acid were slightly elevated, but nothing serious. More serious were his low triglycerides and cholesterol. His last blood test, Feb. 19, was not very different. His state of nutrition had not improved in spite of gaining height and weight. But his story was not yet done and this book must go to press.

Summary: George and his father get excellent grades. They were the first to try (and succeed) at lanthanide removal. But there is a cyst remnant remaining, a calcified pineal to rescue and, ultimately, a shunt to remove. Can it be done?

52 Katherine Morales(continuation) Bone Cancer

It was three years since we had last seen Katherine Morales. Her story begins

at the start of this chapter. We begged her to visit us. Finally, she agreed. It was April 3. Katherine walked in rather breezily for an earlier bone-cancer case. She had no cane or walker, and my impulse was to grab her before she might fall. But her family seemed unconcerned. This was a follow-up visit, solely for the record. She was not ill in any way. She was not on any pain medication-and not in pain. She had gained back 30 lb. and now weighed 110 to 112 lb. We had agreed to meet at the clinic's malonate-free restaurant. She was eager to talk and get updated on all developments. There was no hint of developing mental impairment, although she was eighty-five now. She walked with ease; in fact, she had fallen recently at home without the slightest injury-contrasting with the frequent breaks she used to endure in the past. What was her secret? Was she on a special supplement? Eating something special? Her answers were no and no again.

She had agreed to a follow-up bone scan even though bone density does not improve enough to show decisively on an x-ray, after bone cancer clears up. I thought that surely a little improvement in bone density would be visible, though.

Here are some of the questions I asked and answers I got.

Q. Are you on any supplements?

A. No, except vitamin C. I take ¼ tsp. powdered vitamin C in my water at meal time, not too much, just enough to give it a taste. (Her forthright, precise answers surprised me.)

Q. Are you on any medicine? Weren't you on heart medicine long ago?

A. Oh heavens, NO. I'm not taking any medicine.

Q. May I take your pulse, then? (It was a perfectly regular 72.) Why are you so healthy now? What's your secret?

A. I don't have any secret. Except that I zap every day. I haven't missed more than five days since I came to see you.

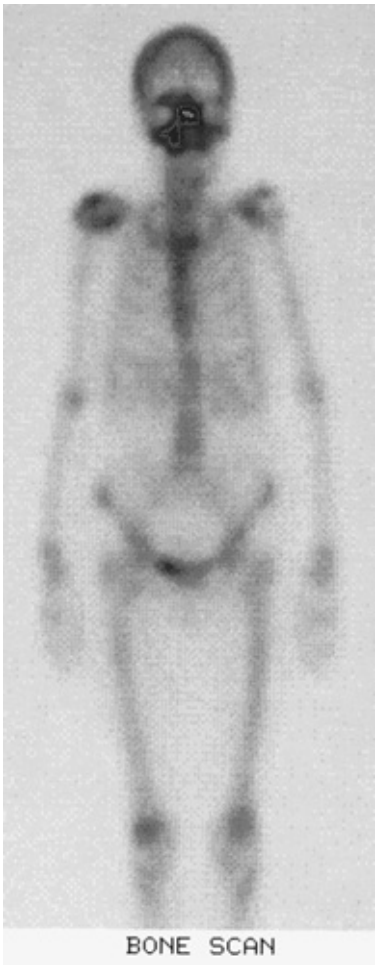
Katherine Morales three years later

Then we left the restaurant to meet at the office. There I did some Syncrometer® testing. I searched for all the amino acids in her brain, since she seemed so young in attitude. (As organs begin to fail in our bodies, they have fewer amino acids.) Twenty-two amino acids Positive at brain. This was most unusual. And without a supplement! NAD and NADP both Positive at brain (good). NADH and NADPH both Negative at brain (good).

She was oxidizing extraordinarily well at the brain. No hint of a respiration block such as begins to affect us as we age. She had indeed been on a shark cartilage supplement for one and a half years. She had been on rhodizonic vials for at least half a year. But this was all in the past. Did this have a long lasting effect?

I tested further. Rhodizonic acid Positive at cerebrum (brain); she was making her own, normally. Vitamin B_2 (riboflavin) Positive at cerebrum. Coenzyme Q10 Positive at cerebrum. Without taking these as supplements, she had these oxidizers in her tissue! I tested for phenol-our nemesis of aging. There was none

at the brain, but it was Positive at her joints. She had no pockets of streptococcus bacteria throughout her body to make phenol: only in her joints were they Positive. Without phenol, she would not oxidize her vitamin C into the "aging" causers, threose, xylose, lyxose. I tested her state of reduction at the brain.



Last bone scan

L-ascorbic acid Positive
dehydroascorbic acid (oxidized) Negative
glutathione Positive
glutathione (oxidized) Negative
ferrous gluconate Positive
ferric phosphate (oxidized) Negative
iron sulfide FeS Positive
iron sulfide FeS2 (oxidized) Negative
L-threose Negative
D-threose Negative
L-xylose Negative
D-xylose Negative
L-lyxose Negative
L-cysteine Positive
L-cystine (oxidized) Negative

She was not over-oxidized! Was she not aging at all? In fact, getting younger

somehow? But she had no magic answers for my questions. Finally, in frustration, I asked Katherine, "Well, what are you eating? What do you eat over and over, nearly daily?" "Chicken soup," she said. And there was the magic. Surely she was benefiting from this diet the way our patients benefit from the chicken broth that is part of their 21 Day Program. Some factor, perhaps RNAse inhibitor, perhaps not, was allowing her to have all the amino acids present in her tissues for whatever task her cells wished to accomplish. We wished her well and said our good-byes.

Next day, we received her new bone scan. The radiologist noted some regions of osteoporosis, nothing suggestive of cancer. We can see the reduced intensity of former hot spots. Especially along the back of the head and neck and upper spine; the bone appears entirely normal.

Summary: Katherine worked hard to recover from the bone cancer that gave her painful lesions, too numerous to count three years ago. But other patients did, too, without so much success. What was the difference? I believe Katherine had several advantages. She had dentures-she was not burdened with the extra toxicity of metal, plastic, or infections of the jaw that come with numerous restorations. Besides this, the extra high doses of rhodizonate she took initially surely would have detoxified the food dyes accumulated in her body. We knew nothing about them at that time; we now accomplish this with coenzyme Q10 and vitamin B_2. She did not use hair dye-another lucky break. After overcoming her bone cancer, she not only became well, but extraordinarily well. What was responsible for this? She had two unusual habits: zapping daily for three years and a diet rich with chicken soup. (She even saved chicken stock for use in cooking many other dishes during the week.)

Katherine kept us inspired through the three years we were developing the 21 Day Program. Thank you Katherine.

Long Term Follow Up

Curing yourself of mosquito bites or the common cold is not a serious challenge but it can be quite a frustrating task; they often last and last. Eventually, they are gone. Do you then heave a sigh of relief and say, "Great job, now they will never be back?" Chances are that a year later you will have them again.

Parasite or pathogen-caused diseases are bound to come at you again and again, so a long term follow-up by itself makes little sense.

The malignancy, being parasite-caused could come back at any time. The tumor growth, being part parasite, part bacterial, and part environmental toxin, could also return. The whole concept of Long Term Follow Up for cancer is faulty and should be abandoned. A follow up of parasitism and infection plus tissue levels of heavy metals, solvents, dyes and our sulfur reserves makes more sense.

But this is far from discouraging news! Seeing that cancer in all its forms has external causes and is not due to "degenerative disease related to aging" brings back hope. And I hope you got a good sense of how to accomplish the "impossible," and in some cases, how easy it can be!

Food Rules

1 tsp. (teaspoon) = 5 ml = 5 cc	1 tbs. (tablespoon) = 3 tsp. = 15 ml
1 cup ≅ 240 ml	1 pint = 2 cups ≅ 500 ml
1 quart = 4 cups ≅ 1 Liter	1 Gallon = 4 Quarts = 3½ Liters
1 ounce = 30 ml	1 pound = 454 gm ≅ ½ kg
°F = (°C x 9/5) + 32	°C = (°F - 32) x 5/9

Safety is our main concern. Safety from live parasites, safety from harmful bacteria, safety from solvents, carcinogenic dyes, and mold. Safety from live oncogenic viruses. Safety from asbestos. And from acrylic acid which turns into acrolein and malonic acid..

Yet making tasty food is important so you can truly enjoy it. To achieve this with ease and efficiency, you will need to equip the kitchen with:

- A stainless steel pressure cooker and glass bowls with lids to fit inside.
- A blender; an additional juicer/extractor is optional.
- An ozonator.
- A bread maker.
- A microwave oven for sterilizing (optional).
- Plastic cutlery.
- Glass or enamel pots and pans (not metal).
- Glass jars and bowls for food storage (not plastic). Some should have lids and fit inside the pressure cooker.
- A Full Spectrum fluorescent tube bulb and fixture/

To cook use glass or enamelware, not metal. To fry use glass or enamelware; occasional (once a week) use of Teflon or Silverstone is allowable. To bake use glass, enamel, or Teflon-coated ware. Do not use special sprays to grease; they contain silicone, which I detect in tumors. Use lard, butter, olive oil, or coconut oil which do not turn into acrylic acid. To microwave use low-wattage (600w)

with a rotating plate.

The principles to observe are:

1. Avoid asbestos, heavy metal, and silicone contamination.
2. Detoxify dyes, benzene and mycotoxins.
3. Sterilize everything.
4. Don't overheat unsaturated fats

All fruits and vegetables were grown in soil that was fertilized and had filth in it. Dust and dirt made contact with the food. This explains why the Syncrometer® finds rabbit fluke parasites on all of it. *Ascaris* eggs as well as tapeworm eggs and hosts of bacteria are all present. All meats, poultry and fish are similarly contaminated. Even chicken eggs, though shielded by bacteria-proof shells, have rabbit fluke within!

Only a few fruits are so safe they don't need extra caution: watermelon, cantaloupe, and honeydew melon. The thinner-peeled fruits, including bananas, avocados, and citrus require careful sanitizing.

Yet simple ways have been found to make food safe. Not merely cooking and baking the old-fashioned way. These fail to kill rabbit fluke and *Ascaris* eggs, although they do kill many pathogens. Not merely pressure-cooking, which kills more, but still fails to kill *Ascaris* eggs in hard foods. Not microwaving with its uneven temperatures. But with simple **stomach-like** chemistry!

Canned food is not safe either. The dust and dirt on the food prior to canning did not get sterilized. Even canned meat did not get sterilized, the temperature stayed too low. Roasted meats or turkey, even if oven-baked, are not safe; the temperature did not go high enough. Although the temperature may have been set at 400, the food in the oven is considered done at 185ºF and lower! Nothing goes beyond boiling point as long as water is present. Although microwave temperatures go much higher, it does not heat evenly.

Nothing presently employed in the art of cooking reaches the 250°F (121°C) that is considered minimum in a hospital to sterilize bandages or instruments.[117]

But an ordinary child can sterilize all the food it eats! Without heat or equipment and, while eating with dirt-laden hands, the food is sterilized. The stomach is left with no more bacteria than there were before eating; about 10 bacteria per teaspoonful of stomach juice. The amazing chemical is simple **hydrochloric acid**. It is called muriatic acid when it is used by plumbers to dissolve lime deposits. Plumbers must use this very carefully or it will dissolve sink, stool and cement! It could dissolve your teeth! It all depends on its concentration.

A child's stomach has 1000 times more hydrochloric acid (HCl) than most adults over 50 years old (pH 2 versus pH 5; every pH number smaller represents 10 times more acid).

It is not surprising, then, that 2 drops of hydrochloric acid kills all the rabbit flukes, *Ascaris* eggs, tapeworm stages, and bacteria in one 8 oz. cup of 2% milk. The HCl must be USP Grade diluted to 5% in strength (a little stronger than vinegar). And although one drop is sufficient, I prefer to err on the side of safety by doubling this. This is chemical sterilization at its finest-duplicating the body's very own chemistry.

Would it not be wiser, though, to stimulate the stomach's own production of HCl rather than adding it belatedly? Indeed it would. But a way of doing this must first be discovered. This discovery would surely be the closest to the "fountain of youth" ever imagined.

Meanwhile, we can make sure that we stop eating filth with our food for the first time since humans domesticated animals. Yet we must not dissolve our teeth nor disturb our body's acid/base balance by using too much HCl.

Our chloride levels and bicarbonate or carbon dioxide levels are regularly included in blood tests. If you are getting too much HCl, you could expect the body to be too acid; the chloride or CO_2 levels would be too high, while bicarbonate is too low. We easily see there is no tendency for chloride to creep upward after three months of use at the level of 45 drops daily, besides what was used in cooking. Nor did the urinary pH reflect greater body acidity; it remained at 6.0. Evidently, this amount of chloride (2.62 mEq) is negligible out of a blood
