Dr. Hulda Regehr Clark, Ph.D., N.D.

Cancer can now be CURED, not just treated.

We are not accustomed to thinking about a cure for cancer. We think of remission as the only possibility. But this book is not about remission. It is about a cure. This is possible because in 1990 I discovered the true cause of cancer. The cause is a certain parasite, for which I have found evidence in every cancer case regardless of the type of cancer. So lung cancer is not caused by smoking, colon cancer is not caused by a low-roughage diet, breast cancer is not caused by a fatty diet, retinal blastoma is not caused by a rare gene, and pancreatic cancer is not caused by alcohol consumption. Although these are all contributing factors, they are not THE cause. Once the true cause was found the cure became obvious. But would it work? I set a goal of 100 cases to be cured of cancer before publishing my findings. That mark was passed in December 1992. The discovery of the cause and cure of all cancers has stood the test of time and here it is!

You may not have time

...to read this entire book first if you have cancer and are scheduled for surgery, chemotherapy or radiation treatment. You may wish to skip the first pages, which describe how a parasite and a solvent cause cancer to develop. Go directly to the instructions on eliminating the parasite with herbs (Cancer Curing Recipe) or with electricity (Zapping Parasites). Using the herbal recipe along with the zapper is best. It only takes days to be cured of cancer regardless of the type you have. It does not matter how far progressed the cancer is—you can still stop it immediately.

After you have stopped the cancer, you can turn your attention to getting well (Part 2). Read the case histories to see how easy it is to stop even terminal cancers (Part 3). Learn from them to avoid mistakes.

Does this mean you can cancel your date for surgery, radiation, or chemotherapy? Yes, after curing your cancer with this recipe, it cannot come back. This is not a treatment for cancer: It is a cure! But if you do not wish to make your doctor angry, you could follow her or his wishes, too. Be careful not to lose any vital anatomical parts in surgery, though, because you may need them later when you are healthy!

Remember that oncologists are kind, sensitive, compassionate people. They want the best for you. They have no way of knowing about the true cause and cure of cancer since it has not been published for them. I chose to publish it for you first so that it would come to your attention faster.

Notice to the Reader:

The opinions and conclusions expressed in this book are mine, and unless expressed otherwise, mine alone. The opinions expressed herein are based on my scientific research and on specific case studies involving my clients. Be advised that every person is unique and may respond differently to the treatments described in this book. On occasion we have provided dosage recommendations where appropriate. Again, remember that we are all different and any new treatment should be applied in a cautious, common sense fashion.

The treatments outlined herein are not intended to be a replacement or substitute for other forms of conventional medical treatment. Please feel free to consult with your physician or other health care provider.

I have indicated throughout this book the existence of pollutants in food and other products. These pollutants were identified using a testing device of my invention known as the Syncrometer®. Complete instructions for building and using this device are contained in this book. Therefore anyone can repeat the tests described and verify the data.

The Syncrometer® is more accurate and versatile than the best existing testing methods. A method for determining the degree of precision is also presented. However at this point it only yields *Positive* or *Negative* results, it does not quantify. The chance of a false *Positive* or a false *Negative* is about 5%, which can be lessened by test repetition.

It is in the public interest to know when a single bottle of a single product tests *Positive* to a serious pollutant. If one does, the safest course is to avoid all bottles of that product entirely, which is what I repeatedly advise. These recommendations should be interpreted as intent to warn and protect the public, not to provide a statistically significant analysis. It is my fervent hope that manufacturers use the new electronic techniques in this book to make purer products than they ever have before.

Acknowledgements

I would like to express my sincere gratitude to **Frank Jerome, DDS**. for the loan of his parasite slide collection. If he had not made a slide of *Fasciolopsis buski* in his student years and if he had not stored his slides carefully for three decades, finally to loan them to me in a generous offer, none of these discoveries would have been made. Furthermore, most of these HIV/AIDS patients could not have regained their health without his development of a new metal-free dentistry. Thanks are also due to his wife, **Linda**, for her patience and willingness to listen to new ideas. And a very special thank you is due to **Mary L. Austin, Ph.D.** now deceased, for her daily support and who, up to the age of 97, had an amazing open-mindedness. Another special thank you goes to my son, **Geoffrey**, whose suggestions, computer expertise, help with instrumentation, and editing was indispensable and very much appreciated.

In 1996, the collaboration with **Patricia Connolly Gorzen** made possible our discovery of dental toxins and better dental practices. This led directly to improved survival opportunity for many terminally ill patients. Her contribution is greatly appreciated.

Preface

From Time Immemorial Healthy People Have Held Sick People Hostage.

The Witch Doctor, Medicine Man and Woman, Herbalist and Clinician are all alike in this respect. They wish to keep information surrounding illness and wellness to themselves and away from the common person so that a profession of medicine can grow and become lucrative. The Herbalist did not tell which herbs could relieve colds or bring on a woman's menstrual period (birth control) for fear that the people in need would get them for themselves and not need (nor pay) the Herbalist. The modern medical profession overlooks information on prevention; it tries to make self-help and simple treatments illegal. All for the same purpose: to build and aggrandize their profession. This seems inappropriate, especially where communicable or widespread illness is involved. This example is taken from a text on herbology:

> This [bath] is a safe and sane procedure and will prove most beneficial to those who are obese and desire to reduce safely. In combination with the internal treatment with decoction of *Fucus*, this course is worth considerable to very stout people, and should not be sold too cheaply. It is a grave mistake to put this scientific treatment in the same class as the many advertised nostrums on the market. It is also a mistake to let your patient know what you are using. If any do make this mistake, he will lose his client who will straight away go to a drugstore for supplies.[1]

I believe hostage holding of the sick is immoral, fundamentally unethical, and needs to be stopped.

Besides the moral issue, there is a practical issue. It would benefit society much more if the sick person were quickly rescued and helped back to productivity. A healthy society benefits each of us immensely. Likewise, an ill society injures us immensely, even when it is half a planet away. With this book, I hope to give away as many secrets as I can about the cause and the cure of all cancers, letting the truth come first and “professional concerns” come last.

The human species can no longer afford to make a business out of illness. Global travel reduces our planet to the size of our backyards. In order to keep our own backyards clean, the neighbors must keep theirs clean. So it is with keeping our bodies free of viruses, bacteria and parasites. We *all* must be free of

them. The concept of health as a narrow professional concern is obsolete.

This book is intended as a gift to humanity. I make a plea to the public and private sector of the medical community not to suppress this information but to disperse it regardless of embarrassment or liability from the simplicity and newness of the cure, provided only that it meets your standard of truth.

Abstract/Summary

The human species is now heavily infested with parasites, particularly the intestinal fluke *Fasciolopsis buski***,** the sheep liver fluke *Fasciola hepatica*, the pancreatic fluke of cattle *Eurytrema pancreatica*, the human liver fluke *Clonorchis sinensis* and the common roundworm, *Ascaris*. The increase in fluke parasitism is due to the establishment of a new “biological reservoir” in cattle, fowl and household pets. The increase in *Ascaris* parasitism is probably due to harboring of household pets.

At the same time, micro-contamination of the human food supply with derivatives of the petroleum industry has occurred; these include solvents, antiseptics and numerous products used directly in the food industry. In the presence of isopropyl alcohol, *F. buski* can complete its entire life cycle in the human body, not requiring a snail as an intermediate host, as it usually does. Other solvents contributing to parasitism include benzene, methanol, xylene, and toluene, which now occur as residues in our foods and pollute our body products such as toothpaste, mouthwash, lotions and cosmetics. These solvents are also contaminants of animal feed, and thus are responsible for establishing the new biological reservoir or source of infection of flukes.

Different solvents accumulate preferentially in different organs. Isopropyl alcohol accumulates in the liver, resulting in completion of the life cycle of *Fasciolopsis* in the liver. This establishes the malignant process, namely the production of the mitotic stimulant, orthophosphotyrosine. Orthophosphotyrosine and a variety of growth factors are produced in the human host organs, possibly for the parasites' own use, inadvertently including the human tissue in its sphere of influence. The presence of an adult fluke in the liver signals the production of orthophosphotyrosine in a distant organ. This organ appears to be chosen on the basis of DNA producing bacteria present there, as well as specific carcinogens.

The difference between persons who accumulate isopropyl alcohol and those who metabolize it promptly is the presence of *aflatoxin B* in the former. The coincidence of aflatoxin B and isopropyl alcohol in the liver results in the formation of *human Chorionic Gonadotropin* (hCG). HCG becomes widespread throughout the body and is followed by orthophosphotyrosine formation.

Aflatoxins are contaminants of our foods and may also be produced in situ by the growing mycelia of *Aspergillus* varieties. Such mycelial growths are only seen in the presence of copper!

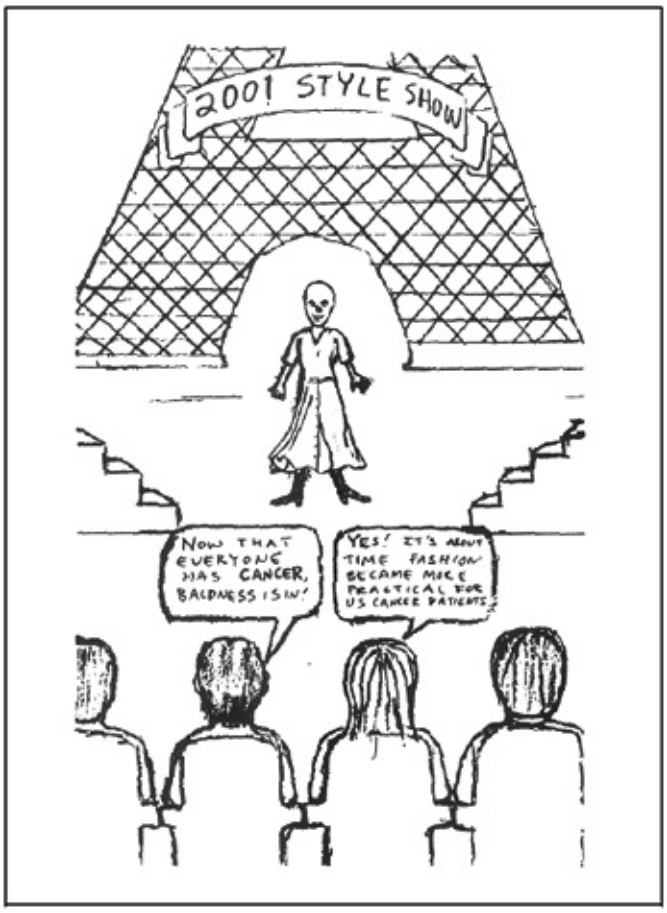
Vitamin C is oxidized and rendered useless in the presence of the parasite, *Ascaris*.

The killing of all parasites and their larval stages together with removal of isopropyl alcohol and carcinogens from the patients' lifestyle results in remarkable recovery, generally noticeable in less than one week. Cancer could be eradicated in a very short time by clearing our food animals and household pets of fluke parasites and by monitoring all food and feed for solvents. Stopping consumption of mycotoxins and ceasing exposure to copper, cobalt and vanadium is essential for tumor regression.

Since developmental stages of the intestinal fluke are found in blood, breast milk, the saliva, semen, and urine and can be seen directly in these body fluids using a low power microscope, it follows that this parasite can be sexually transmitted and also transmitted by kissing on the mouth and breast-feeding. However, the recipient would develop cancer only if isopropyl alcohol were accumulated in his or her body.

A common bacterium species, *Clostridium*, manufactures isopropyl alcohol in the digestive tract and under dental restorations. The use of betaine as a food supplement and removal of dental fillings clear these up.

All the technical information presented here can be obtained with a device called a Syncrometer®. The methods used are discussed in *How To Test Yourself*. A simple circuit is also described which can be built by a novice and allows anyone to reproduce my results.



Part of the tragedy of cancer is that we now accept it as normal.

Part One: The Cause

For many years we have all believed that cancer is different from other diseases.[2] We believed that cancer behaves like a fire, in that you can't stop it once it has started. Therefore, you have to cut it out or radiate it to death or chemically destroy every cancerous cell in the body since it can never become normal again. **NOTHING COULD BE MORE WRONG!** And we have believed that cancers of different types such as leukemia or breast cancer have different causes. Wrong again!

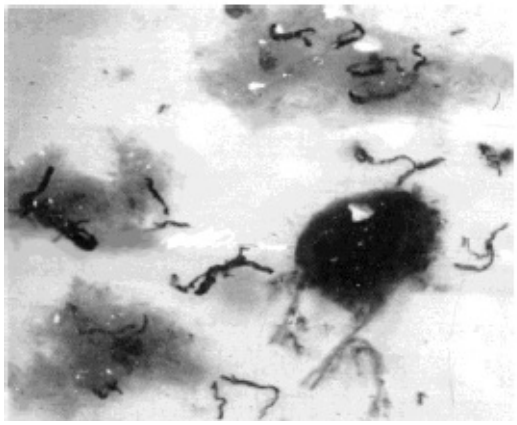
In this book you will see that all cancers are alike. They are all caused by a parasite. A single parasite! It is the *human intestinal fluke*. And if you kill this parasite, the cancer stops immediately. The tissue becomes normal again. In order to get cancer, you must have this parasite.

How can the human intestinal fluke cause cancer? This parasite typically lives in the intestine where it might do little harm, causing only colitis, Crohn's disease, or irritable bowel syndrome, or perhaps nothing at all. But if it invades a different organ, like the uterus or kidneys or liver, it does a great deal of harm. If it establishes itself in the liver, it causes cancer! It only establishes itself in the liver in some people. These people have *isopropyl alcohol* (often abbreviated IPA) in their bodies. All cancer patients (100%) have both isopropyl alcohol and the intestinal fluke in their livers. The solvent, isopropyl alcohol, is responsible for letting the fluke establish itself in the liver. In order to get cancer, you must have both the parasite and isopropyl alcohol in your body.

Flukes

To understand cancer you should understand the basic facts about the human intestinal fluke. Its scientific name is *Fasciolopsis buski*. Fluke means, "flat", and flukes are one of the families of flatworms. On the next page is a photograph of the human intestinal fluke, made from a preserved and stained specimen so all the details are visible. It is as flat as a leaf. The parasite is not unknown; it has been studied since at least 1925.[3]

Fig. 1 Human intestinal fluke typical size



"Black hairy legs" are strings of eggs.

Fig. 2 Five flukes, in various stages of decay, expelled from bowel. They float.

This Is The Cancer-Causing Parasite

This parasite has stages that it must go through to keep reproducing. The first stage is the *egg*. The adult produces millions of eggs. They pass out of us with the bowel movement. The adult, though, stays tightly stuck to our intestine (or liver, causing cancer, or uterus, causing endometriosis, or thymus, causing AIDS, or kidney, causing Hodgkin's disease).

Fig. 3 Human intestinal fluke (Fasciolopsis buski)

Most of us get little lesions in our intestines from time to time. These tiny sores allow the eggs, which are microscopic in size, to be pulled into the blood stream (other parasite eggs get into the blood this way too).

Size about 1/10 mm.

Fig. 4 Fasciolopsis egg

Some of these eggs actually hatch in the intestine or in the blood. The microscopic hatchlings are called *miracidia* and are the second stage. They swim about with their little swimmer-hairs. And of course, the liver whose job it is to dispose of toxins will receive them and kill them as the blood arrives from the intestine. They have no chance to survive in normal people.

Fig. 5 Miracidia hatching

Flukes and Isopropyl Alcohol

BUT SOMETHING SPECIAL HAPPENS TO PEOPLE WHO HAVE ISOPROPYL ALCOHOL IN THEIR BODIES. The liver is unable to trap and kill these tiny fluke stages. These baby-stages are actually allowed to make their home in the liver and other tissues. It is as if the immune system has no power to kill them. The flukes begin to multiply in people with isopropyl alcohol in their bodies! The miracidia (hatchlings) start to make little balls inside themselves, called *redia*[4]. But each redia (ball) is alive! It pops itself out of the miracidia and begins to reproduce itself. 40 redia can each make 40 more redia! And all of this out of one egg!

Fig. 6 Miracidia expelling "mother" redia

This parasite is laying eggs and producing millions of redia right in your body! In your cervix or lungs, wherever your cancer is growing! These redia are swept along in your blood, landing in whatever tissue lets them in. Smokers' lungs, breasts with benign lumps, prostate glands full of heavy metals are examples of tissues that give the redia their landing permits[5].

Multiplying continues at a hectic pace, generation after generation. Redia are nesting in the liver and other organs. Suddenly they change their shape. They sprout a tail and can swim again. Now they are called *cercaria*[6].

The cercaria only need to find a place to attach. After they glue themselves to your tissue, their tails disappear and they begin to grow a "cocoon".

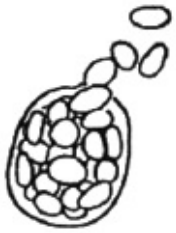


Fig. 7 "Mother" redia bearing "daughter" redia

Now they are called *meta*cercaria. Normally, this would happen on a leaf growing near a pond, so the metacercaria develop an extremely thick shell around themselves to withstand the winter. Does the presence of the solvent isopropyl alcohol in your body dissolve this tough shell? That would remove the last barrier to the fluke completing its entire life cycle anywhere in your body!

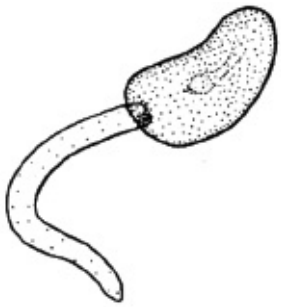

Fig. 8 Cercaria

After the shell is gone, they grow into adult flukes in your tissue. NOT IN THE INTESTINE BUT IN YOUR LIVER! Now the cycle is complete. From egg to miracidia to redia to cercaria to metacercaria and then the adults! And all of them eating and sucking and devouring your vital body fluids.

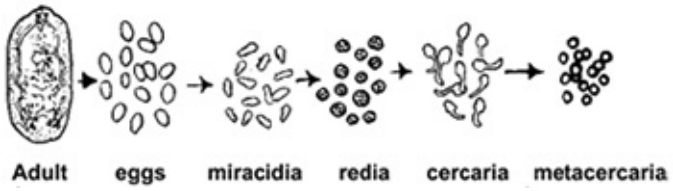

Fig. 9 Life cycle of a fluke

But this is not normal for flukes. Their normal life cycle goes like this:

Stage	Normal Life Cycle
1 Egg	Expelled with bowel movement onto soil. Washed by rain into ponds.

2 Miracidia	Hatches from egg in water. Has cilia, can swim vigorously and must find intermediate snail host in one to two hours or may be too exhausted to invade.
3 Redia	Develop inside miracidia as little balls until expelled. Those are "mother" redia, and each one bears "daughter" redia for up to 8 months, all still inside the snail, and living on the fluids in the lymphatic spaces. Similarly, daughter redia are continually developing cercaria.
4 Cercaria	Have a tail, use it to exit from snail and swim to a plant. If the snail is feeding on a plant, cercaria can latch onto plant with sucker mouth and start to encyst (form a "cocoon") within minutes. Tail breaks off and swims away to dissolve.
5 Metacercaria	Two-walled cysts . The outer wall is very sticky. But as you eat the plant it is stuck to, the least pressure will break it, leaving the cyst in the mouth. The "almost unbreakable" inner cyst wall protects it from chewing, and the keratin-like coat prevents digestion by stomach juices. However when it reaches the duodenum , contact with intestinal juices dissolves away the cyst-wall and frees it. It then fastens itself to the intestinal lining and begins to develop into an adult.
6 Adult	Lives in your intestine and can produce 1000 eggs per bowel movement and live many years.

Fig. 10 Fasciolopsis' normal life cycle

As you can see, humans typically are the host for just the adult stage, and then only in the intestine. But can you imagine the havoc in your body if you did the snail's job, too?

As if these parasites were not fiendish enough, as soon as there are adults in the liver something new happens. A *growth factor*, called *orthophosphotyrosine*[7] appears. A monster has been born! Growth factors make cells divide. Now YOUR cells will begin to divide too! Now you have cancer.

Now You Have Cancer

The presence of orthophosphotyrosine is the beginning of your malignancy. Unless you act quickly to kill this parasite-spawning machine, it will take over your body.

But first, let's sit back and think for a minute. Why is this parasite multiplying feverishly in your organs instead of living quietly in your intestine? Because having isopropyl alcohol in your body allows its development outside of the intestine. A parasite is simply doing what all living things must do: survive and reproduce. It is not the fiendish nature of this parasite that has given you cancer. It is the tragic pollution of your body with isopropyl alcohol that is at fault. And, of course, the infestation of our food animals and household pets with fluke parasites. But we will come to this later.

It is quite possible that the redia or cercaria produce the orthophosphotyrosine in order to help themselves divide while reproducing. Other growth factors are produced, too. There are: epidermal growth factor (EGF), platelet derived growth factor (PDGF), insulin-like growth factor (ILGF), fibroblast growth factor (FGF). These can also be made by bacteria. But only *Fasciolopsis* makes orthophosphotyrosine. These growth stimulants are not intended to make your cells multiply at all. Normally the parasite stages are developing in a pond full of snails! This parasite wasn't meant to go through its life cycle in our bodies. But since our bodies respond to orthophosphotyrosine (and other growth factors) the same way, our cells are forced to multiply and multiply and multiply along with the fluke stages and bacteria.

Purge The Parasite, Cure The Cancer

The good news is that when the fluke and all its stages have been killed, the orthophosphotyrosine disappears. In 24 hours all orthophosphotyrosine is gone! Your malignancy is gone. You still have the task of repairing the damage. But your cancer cannot come back. And you have won the battle for your life.

BUT WHAT ABOUT THE BATTLE FOR YOUR HEALTH? Let us step back again into the nightmare of cancer. Why do the microscopic fluke stages choose the cervix or prostate or lung in which to settle for reproduction? Perhaps it is because this organ has developed "safety islands" for them, namely, precancerous tumors. A benign tumor has lost its immune power for you, so that it cannot catch and kill the tiny invaders. After all, there is isopropyl alcohol present, and many other toxins as well. The heavy metals copper, cobalt and vanadium are there. Often mercury and nickel are there. Lanthanide metals like yttrium and thulium are there. These are known to cause mutations. Common toxins like arsenic from household pesticides are there. PCBs and Freon are there. Fungus is even growing there and producing *patulin,* a **carcinogenic mycotoxin** (*carcinogenic* means cancer-causing; a *mycotoxin* is a toxin produced by a fungus). Is it just a coincidence that the parasite survives and reproduces itself best in your most unhealthy organs?

Clearly, you must do 3 things:

1. Kill the parasite and all its stages.

2. Stop letting isopropyl alcohol into your body.
3. Flush out the metals, common toxins, and bacteria from your body so you can get well.

We have been taught to believe that every parasite is so unique that a different drug is required to kill each one. The better drugs, such as Praziquantel™ and Levamisole™ or even Flagyl™ and Piperazine™, can each kill several worm varieties. But this is just not practical when dozens of different parasites are present. We have dozens of different parasites in us! It would be best to kill them all together even though only the intestinal fluke is causing cancer.

Look at the case histories. It is not unusual for someone to have a dozen (or more) parasites out of the 120 parasites I have samples of (they are listed in *The Tests*). You can assume that you, too, have a dozen different parasites. We are heavily parasitized beings! Our bodies are large enough to provide food and shelter for lots of these free loaders. If they were settled on the outside where we could see them, like lice or ticks, we would rid ourselves in a flash. Nothing is more distasteful to the imagination than hordes of biting, chewing, crawling, sucking creatures on our flesh. But what about IN our flesh? We cannot see inside ourselves, so we mistakenly assume that nothing is there.

Herbal Parasite Remedies

The Native American peoples knew that humans are parasitized. Other native peoples from the Arctic to Antarctic knew that we are parasitized like other animals. They had frequent purgings that included diarrhea or vomiting to rid themselves of their slimy invaders. Many cultures continued such practices right up to my own childhood. I remember being forced to swallow a spoonful of sulfur and molasses and raw onion! How dreadful it seemed. But it reduced the body's burden of worms and other parasites that we all have. **Where have we gone astray? Why have we forsaken these wise practices?** I have seen that eczema is due to roundworms. Seizures are caused by a single roundworm, *Ascaris*, getting into the brain. Schizophrenia and depression are caused by parasites in the brain. Asthma is caused by *Ascaris* in the lungs. Diabetes is caused by the pancreatic fluke of cattle, *Eurytrema.* Migraines are caused by the threadworm, *Strongyloides*. Acne rosaceae is caused by a *Leishmania*. Much human heart disease is caused by dog heartworm, *Dirofilaria*. And the list goes

on.

Getting rid of all these parasites would be absolutely impossible using clinical medicines that can kill only one or two parasites each. Such medicines also tend to make you quite ill. Flagyl is used for amoebas and *Giardia*; when the correct dosage is used, it can cause extreme nausea and vomiting. Quinine for malaria is quite toxic. Imagine taking 10 such drugs to kill a dozen of your parasites! Good news, perhaps, for the drug makers but not for you.

Yet three herbs can rid you of over 100 types of parasites! And without as much as a headache! Without nausea! Without any interference with any drug that you are already on! Does this sound too fantastic? Just too good to be true? They are nature's gift to us. The herbs are:

- **Black Walnut Hulls** (from the Black Walnut tree)
- **Wormwood** (from the *Artemisia* shrub)
- **Common Cloves** (from the Clove tree)

These three herbs must be used together. Black Walnut Hull and Wormwood kill adults and developmental stages of at least 100 parasites. Cloves kill the eggs.[8] Only if you use them together will you rid yourself of parasites. If you kill only the adults, the tiny stages and eggs will soon grow into new adults. If you kill only the eggs, the million stages already loose in your body will soon grow into adults and make more eggs. They must be used together as a single treatment.

These three herbs, taken together, can cure all malignancies.

Fig. 11 Cloves, Black Walnut, and Wormwood

It is the green hull surrounding the nut of the Black Walnut tree that has this miraculous parasiticide. After it has turned black, it is useless. The large green balls fall to the ground early in the fall. In a week or two they will be black and decaying. Therefore, anyone wishing to make parasiticide must be careful not to let the critical time for harvesting pass. I encourage everyone to make their own parasiticides and to take back the responsibility for keeping themselves and their families free of these tiny monsters. The recipe for Black Walnut Hull Tincture Extra Strength is given in *Recipes*.

Note that it is a tincture (extracted using ethyl alcohol), not an ordinary extract (which uses water). The Black Walnut extract that is available from herb companies is not potent as a parasiticide. It is black, not pale green, indicating that the critical harvesting time had passed. Of course there is no time to make your own if you have fast growing or metastasizing cancer. See the chapter on *Sources*.

You will only need one 1 oz. (30 ml) bottle of the Extra Strength tincture to get started. If you have family members you will need more. While you are waiting for it to arrive, get your other two herbs ready: Wormwood and Cloves . Wormwood consists of the leaves of the *Artemisia* shrub. My recommendation is that you grow it yourself if you have any space to do so. Wormwood seed is available from seed catalogs, (see *Sources*).

The amount you need to cure a cancer is very small, yet you cannot do without it. But the Food and Drug Administration (FDA) has regulated it as toxic! It is therefore unavailable in concentrated form from herb companies. The evidence for toxicity accepted by the FDA must have been hearsay. I have never seen a case of toxicity, not so much as a headache or nausea[9]. The toxic level must be much higher than is needed to kill these parasites.

This shrub is called Wormwood for good reason: it kills worms! There is quite a bit of confusion over which *Artemisia* is the true Wormwood. Books and nurseries can be wrong, even though they assure you they are correct! Buy *Artemisia absynthium* for your garden. Wormwood goes back to antiquity and is mentioned in the Bible.

If you grow your own, dry the leaves when they are in their prime. The leaves are greenish gray and quite bitter. Nobody would accidentally eat too much of them. Adults may put them in capsules. For a child, crumble ¼ tsp. and stir into honey. I have not done experiments to be more precise than this.

Wormwood capsules are available as a combination of *Artemisia* and other herbs (see *Sources*).

The third herb necessary to cure cancer is Cloves . This is the common spice used in baking. It needs to be ground up in order to release its parasite-killing properties. You can buy a can of whole Cloves and grind them in a blender or grinder. Store-bought "ground Cloves" do not work! Their parasite-killing properties have evaporated long ago. Ground Cloves from a health food store or herb shop may not work either! They may have been ground years ago. If an herb company were to grind Cloves and fill capsules with them right away and store the capsules in closed bottles, the potency of the herb would be protected. Don't take these details for granted. You must question your source and get a satisfactory answer or grind your own (see *Sources*).

You will need about 100 capsules of Cloves. To make your own, purchase size 00 (double-zero) capsules at a health food store. (Don't try to mix Cloves straight in water! It is much too strong; you may try mixing with homemade yogurt or applesauce.) Size 0 capsules will also be acceptable.

You now have:

• One 30 ml bottle of pale green Black Walnut Hull Tincture Extra Strength. This is 1 ounce, or six teaspoons, enough for three weeks if you are not very ill.

• One bottle of Wormwood capsules (each capsule with 200-300 mg of Wormwood) or ½ cup of *Artemisia* leaves gathered from a friendly neighbor's shrub.

• One bottle of freshly ground Cloves (each capsule with 400-500 mg Cloves), or ¼ cup bulk powdered Cloves.

These are the only essential herbs you will need to cure your cancer. They will last through the first 18 days of the Parasite Program.

Two additional items, *ornithine* and *arginine*, improve this recipe. Parasites produce a great deal of ammonia as their waste product. Ammonia is their equivalent of urine and is set free in our bodies by parasites in large amounts. Ammonia is very toxic, especially to the brain.[10] I believe this causes insomnia and other sleep problems at night and anxiety by day. By taking ornithine at bedtime, you will sleep better.[11] Arginine has similar ammonia reduction effects but must be taken in the morning because it gives alertness and energy.

Do not try to substitute drugs for herbs. **Drug parasiticides can be extremely toxic, even in the small doses needed. Nor do they kill all the stages.** Here is a clipping I saw recently:

Common Drugs or Parasitic Infections

Infection	Drug	Adult Dosage	Pediatric Dosage
Amebiasis			
asymptomatic	Iodoquinol	650 mg tid x 20d	30-40 mg/kg/d, 3 doses x 20d
symptomatic	Metronidazole	750 mg tid x 10d	35-50 mg/kg/d, 3 doses x 10 d
	followed by Iodoquinol	650 mg tid x 20d	30-40 mg/kg/d, 3 doses x 20d
Blastocystis	Metronidazole	750 mg tid x 10d	
	or Iodoquinol	650 mg tid x 20d	
Dientamoeba	Iodoquinol	650 mg tid x 20d	40 mg/kg/d, 3 doses x 20d
Giardia	Quinacrine HCl	100 mg tid p.c.x5d	6 mg/kg/d, 3 doses p.c.x5d
	or Metronidazole	250 mg tid x 5d	15 mg/kg/d, 3 doses x 5 d

Names & Adverse Effects of Common Drugs

Drug: **Iodoquinol** Trade Name: **Yodoxin**.

Adverse Effects: Occ: rash, acne, slight enlargement of thyroid gland, nausea, diarrhea, cramps, anal pruritus. Rare: optic atrophy, loss of vision, peripheral neuropathy after prolonged use in high dosage (months), Iodine sensitivity.

Drug: **Metronidazole** Trade Name: **Flagyl**

Adverse Effects: Freq: nausea, headache, dry mouth, metallic taste. Occ: vomiting, diarrhea, insomnia, weakness, stomatitis, vertigo, aparesthesia, rash, dark urine, urethral burning. Rare: seizures, encephalopathy, pseudo-membranous colitis, ataxia, leukopenia, peripheral neuropathy, and pancreatitis.

Drug: Quinacrine HCl Trade Name: Atabrine

Adverse Effects: Freq: dizziness, headache, vomiting, diarrhea. Occ: yellow staining of skin, toxic psychosis, insomnia, bizarre dreams, blood

dyscrasia, urticaria, blue and black nail pigmentation, psoriasis-like rash. Rare: acute hepatic necrosis, convulsions, and severe exfoliative dermatitis, ocular effects similar to those caused by chloroquine.

Fig. 12 Some clinical parasiticides

Procedure For Cure

Start by taking ornithine, 2 at bedtime on the first night you get it. You don't need to wait for the rest of the program to start on ornithine. Take 4 ornithine on the second night. Take 6 ornithine at bedtime on the third night. After this take 4 or 6 ornithine at bedtime every night till you are sleeping soundly. Then go off ornithine and see whether your sleep is as good without it. Use as needed. It is not habit forming.

Taking ornithine at bedtime may give you so much energy the next day that you don't need to take arginine in the morning. But if going off caffeine (recommended) has you dragging yourself through the morning, take one arginine upon rising and another one before lunch and supper. It can make you a bit irritable. Cut back if this happens.

Ornithine and arginine, each about 500 mg, are available in capsules, in separate bottles (see *Sources*).

There are no side effects as you can see from the case histories.

There is no interference with any other medication. There is no need to stop any treatment that a clinical doctor or alternative therapist has started you on, provided it is solvent-free. (Over half the medications I test have traces of isopropyl alcohol, benzene or wood alcohol.)

How could you know whether a medicine is free of isopropyl alcohol contamination? Only the Syncrometer® method described later (page 436) can test for isopropyl alcohol in less than a minute. If you have friends with cancer, you could become their angel by learning to use this device.

Alternatives?

Are there any substitutes for the Black Walnut Hull, Cloves or Wormwood? I believe there **must be dozens** of plants that could kill the intestinal fluke.

While you are waiting for herbs, why not try all the vitamins and herbs that are presently available to you and that have been traditionally used to treat cancer? They may work by killing fluke stages, or have other value. Some of these are:

- Red clover blossoms[12] (2 capsules, 3 times a day)
- Pau D'Arco (2 capsules, 3 times a day)
- Vitamin C (10 or more grams per day)
- Laetrile (as directed by source)
- Grapes and grape juice (home-juiced, no meat in the diet)
- Echinacea (2 capsules, 3 times a day)
- Metabolic enzymes, take as directed
- The macrobiotic diet

Then, as soon as your herbs arrive, you can stop these. Or you may wish to continue them as well.[13]

Cancer Curing Recipe

Parasite-Killing Program

1. Black Walnut Hull Tincture Extra Strength (see *Recipes*, page 541, or *Sources*):

Day 1: this is the day you begin; start the same day you receive it. Take one drop. Put it in ½ cup of water. Sip it on an empty stomach such as before a meal.

Day 2: Take 2 drops in ½ cup water same as above.

Day 3: Take 3 drops in ½ cup water same as above.

Day 4: Take 4 drops in ½ cup water same as above.

Day 5: Take 5 drops in ½ cup water same as above.

Day 6: Take 2 tsp., all together in ½ cup water. Sip it, don't gulp it. Add

sweetening and flavoring to help it go down. Or you may stir the tincture into fruit sauce. Get it down within 15 minutes. (If you are over 150 pounds, take 2½ tsp. If you are over 200 pounds, take 3 tsp.)

This dose kills any remaining stages throughout the body, including the bowel contents, a location unreachable by a smaller dose or by electric current. The alcohol in the tincture can make you slightly woozy for several minutes. Simply stay seated until you are comfortable again. You may put the tincture in lukewarm water to help evaporate some of the alcohol, but do not use hot water because that may damage its parasiticide power. Then take niacinamide 500 mg (see Sources) to counteract the toxicity of the alcohol. You could also feel a slight nausea for a few minutes. Walk in the fresh air or simply rest until it passes.

For a year: take 2 tsp. Black Walnut Hull Tincture Extra Strength once a week. This is to kill any parasite stages you pick up from your family, friends, or pets.

Family members and friends should take 2 tsp. every other week to avoid reinfecting you. They may be harboring a few parasite stages in their intestinal tract without having symptoms. But when these stages are transmitted to someone who has had cancer, they immediately seek out the unhealed organ to continue multiplying.

You may be wondering why you should wait for five days before taking the 2 tsp. dose. It is for your convenience only. You may have a sensitive stomach or be worried about toxicity or side effects. By the sixth day you will have convinced yourself there is no toxicity or side effect.

Going faster. *In fact, if you are convinced after the first drop of the restorative powers of Black Walnut Hull Tincture Extra Strength, take the 2 tsp. dose on the very first day.*

Going slower. *On the other hand, if you cringe at the thought of taking an herb or you are anxious about its safety, continue the drops, increasing at your own pace, until you are ready to brave the decisive 2 tsp. dose.*

Extremely ill. *Terminally ill with cancer: Take a 2 tsp. dose every hour for 5 hours; in other words, a 10 tsp. dose. Follow this the same day or next day with the Mop Up program, page 49. If this gets you out of a hospital bed, repeat the*

10 tsp. dose (plus Mop Up) every other day for 2 more weeks before settling on the maintenance program once a week. Remember to include Wormwood *and clove capsules with each treatment, but increase the dose to 10 of each.*

2. Wormwood capsules (should contain 200-300 mg of Wormwood, see Sources):

Day 1: Take 1 capsule before supper (with water).

Day 2: Take 1 capsule before supper.

Day 3: Take 2 capsules before supper.

Day 4: Take 2 capsules before supper.

Continue increasing in this way to day 14, whereupon you are up to seven capsules. You take the capsules all in a single dose (you may take a few at a time until they are all gone). Then you do 2 more days of 7 capsules each. After this, you take 7 capsules once a week forever, as it states in the Maintenance Parasite Program. Try not to get interrupted before the 6th day, so you know the adult intestinal flukes are dead. After this, you may proceed more slowly if you wish. Many persons with sensitive stomachs prefer to stay longer on each dose instead of increasing according to this schedule. You may choose the pace after the sixth day.

3. Cloves:

Fill size 00 capsules with fresh ground Cloves; if this size is not available, use size 0 or 000. In a pinch, buy gelatin capsules and empty them or empty other vitamin capsules. You may be able to purchase fresh ground Cloves that are already encapsulated; they should be about 500 mg. Grocery store ground Cloves do not work! Either grind them yourself or see Sources.

Day 1: Take one capsule 3 times a day before meals.

Day 2: Take two capsules 3 times a day.

Days 3, 4, 5, 6, 7, 8, 9, 10: Take three capsules 3 times a day.

After Day 10: Take 7 capsules all together once a week forever, as in the Maintenance Parasite Program.

Take **ornithine** at bedtime for insomnia. Even if you do not suffer from

insomnia now, you may when you kill parasites. Take **arginine** in the morning and daytime.

L to R: pancreatic fluke (causes diabetes); sheep liver fluke (causes —universal allergy syndrome"); and human liver fluke.

Fig. 13 Three other parasites you may be killing.

Parasite Program Handy Chart

Strike out the doses as you take them.

Day	**Black Walnut Hull Tincture Extra Strength Dose** drops 1 time per day, like before a meal	**Wormwood Capsule Dose (200-300 mg)** capsules 1 time per day, on empty stomach	**Clove Capsule Dose (Size 0 or 00)** capsules 3 times per day, like at mealtime
1	1	1	1, 1, 1
2	2	1	2, 2, 2
3	3	2	3, 3, 3
4	4	2	3, 3, 3
5	5	3	3, 3, 3
6	2 tsp.	3	3, 3, 3
7	Now once a week	4	3, 3, 3
8		4	3, 3, 3
9		5	3, 3, 3
10		5	3, 3, 3
11		6	7
12		6	Now once a week
13	2 tsp.	7	
14		7	

15	7	
16	7	
17	Now once a week	
18		7

At this point you do not need to keep a strict schedule, but instead may choose any day of the week to take all the parasite program ingredients.

Continue on the *Maintenance Parasite Program*, indefinitely, to prevent future reinfection.

Tips on taking pills

Whenever taking capsules or pills, have a bit of bread within reach. If a pill should stick, swallow some bread. Bread pushes the pill along its way, so you are comfortable again. Never take a handful of pills together. They may clump together and give you lots of discomfort. Take them one at a time.

Maintenance Parasite Program

YOU ARE ALWAYS PICKING UP PARASITES! PARASITES ARE EVERYWHERE AROUND YOU! YOU GET THEM FROM OTHER PEOPLE, YOUR FAMILY, YOURSELF, YOUR HOME, YOUR PETS, UNDER-COOKED MEAT, AND UNDERCOOKED DAIRY PRODUCTS.

I believe the main source of the intestinal fluke is undercooked dairy products and meats. After we are infected with it this way, we can give it to each other through blood, saliva, semen, and breast milk, which means kissing on the mouth, sex, nursing, and childbearing.

Family members nearly always have the same parasites. If one person develops cancer, the others probably have the intestinal fluke also. They should give themselves the same de-parasitizing program.

Do this once a week. You may take these at different times in the day or together:

1. **Black Walnut Hull** Tincture Extra Strength: 2 tsp. on an empty

stomach, like before a meal or bedtime.

2. **Wormwood capsules**: 7 capsules (with 200-300 mg Wormwood each) once a day on an empty stomach.

3. **Cloves**: 7 capsules (about 500 mg. each, or fill size 00 capsules yourself) once a day on an empty stomach.

4. Take **ornithine** at night.

	Black Walnut Hull Tincture Extra Strength Dose	**Wormwood Capsule Dose (200-300 mg)**	**Clove Capsule Dose (Size 0 or 00)**
Day	1 time per day, on empty stomach	capsules 1 time per day, on empty stomach	capsules 1 time per day, on empty stomach
1	2 tsp.	7	7
2			
3			
4			
5			
6			
7			
8	2 tsp.	7	7
9			
10			
11			
12			
13			
14			
15	2 tsp.	7	7
and so	on...		

The only after-effects you may feel are due to release of bacteria and viruses

from dead parasites. These should be promptly zapped.

Children's Parasite Program

Black Walnut Tincture Extra Strength

Children follow the same parasite program as adults through day 5. On day 6, instead of 2 tsp., take the following:

Age	BWT ES	Niacinamide
Under six months	¼ tsp.	50 mg
Six months to five years	½ tsp.	50 mg
Six to ten years	1 tsp.	100 mg
Eleven to sixteen years	1½ tsp	500 mg

The niacinamide (not niacin) is to help detoxify the alcohol in the tincture. You may crush it and put it in a spoonful of honey, if necessary. Occasionally a bit of niacin gets into the niacinamide tablet and causes a hot flush. It is harmless and soon passes.

Even though the parasite program is very beneficial to children, who tend to pick up parasites more often than adults, it should not be continued on a maintenance basis due to the alcohol content. Have children deparasitize twice a year, or whenever ill.

In case of childhood cancer, however, a much more vigorous program should be followed. Give 2 to 10 tsp. tincture as quickly as the child can take it. Follow this, several hours later with the Mop Up program.

Wormwood and Cloves

Increase dosage one day for each year. For instance a four-year old would follow the adult program until day four, then stop.

Again, it is not advisable for children to be on a maintenance dosage of Wormwood and Cloves. Taking them during their routine deparasitizing, or when ill, is best.

In case of childhood cancer, it is <u>not</u> necessary to use increased dosages, as with Black Walnut Tincture.

Cleanse Pets Too

You may not need to get rid of your pet to keep yourself free of parasites. But if you are ill it is best to board it with a friend until you are better.

Pets have many of the same parasites that we get, including *Ascaris* (common roundworm), hookworm, *Trichinella*, *Strongyloides*, heartworm and a variety of tapeworms. Every pet living in your home should be deparasitized (cleared of parasites) and maintained on a parasite program. Monthly trips to your vet are not sufficient.

Your pet is part of your family and should be kept as sweet and clean and healthy as yourself. This is not difficult to achieve. Here is the recipe:

Pet Parasite Program

All dosages are based on a 10-pound (5 kilo) cat or dog. Double them for a 20-pound pet, and so forth.

1. **Parsley water**: cook a big bunch of fresh parsley in a quart of water for 3 minutes. Throw away the parsley. After cooling, you may freeze most of it in several 1-cup containers. This is a month's supply. Put 1 tsp. parsley water on the pet's food. You don't have to watch it go down. Whatever amount is eaten is satisfactory.

Pets are so full of parasites, you must be quite careful not to deparasitize too quickly. The purpose of the parsley water is to keep the kidneys flowing well so dead parasite refuse is eliminated promptly. They get quite fond of their parsley water. Perhaps they can sense the benefit it brings them. Do this for a week before starting the Black Walnut Hull Tincture.

2. **Black Walnut Hull Tincture (regular strength):** 1 drop on the food. Don't force them to eat it. Count carefully. Treat cats only twice a week. Treat dogs daily, for instance a 30-pound dog would get 3 drops per day (but work up to it, increasing one drop per day). Do not use Extra Strength.

If your pet vomits or has diarrhea, you may expect to see worms. This is extremely infectious and hazardous. Never let a child clean up a pet mess. Begin by pouring salt and iodine[14] on the mess and letting it stand for 5 minutes before cleaning it up. Clean up outdoor messes the same way. Finally, clean your hands

with diluted grain alcohol (dilute 1 part alcohol with 4 parts water). Grain alcohol is actually *ethyl* alcohol that has been made by fermenting grain. In some countries sugar cane is used to make ethyl alcohol. A common brand in the United States is Everclear. But be careful. The smaller flask sizes are polluted with solvents from the pumping and filling processes, no doubt. Choose the 750 ml or 1 liter bottle, which is, evidently, bottled differently. Be careful to keep all alcohol out of sight of children; don't rely on discipline for this. Be careful not to buy isopropyl (rubbing) alcohol for this purpose.

Start the Wormwood a week later.

3. **Wormwood capsules:** (200-300 mg Wormwood per capsule) open a capsule and put the smallest pinch possible on their dry food. Do this for a week before starting the Cloves.

4. **Cloves:** put the smallest pinch possible on their dry food. Keep all of this up as a routine so that you need not fear your pets. Also, notice how peppy and happy they become.

Go slowly so the pet can learn to eat all of it. To repeat:

- Week 1: parsley water
- Week 2: parsley water and Black Walnut
- Week 3: parsley water, Black Walnut, and Wormwood
- Week 4: parsley water, Black Walnut, Wormwood, and Cloves

	Parsley Water	**Black Walnut Hull Tincture Dose**	**Wormwood Capsule Dose**	**Clove Capsule Dose (Size 0 or 00)**
Week	teaspoons on food	drops on food, cats twice per week, dogs daily	open capsule, put smallest pinch on food	open capsule, put smallest pinch on food
1	1 or more, based on size			
2	1 or more	1		
3	1 or more	1 or more, based on size	1	
4	1 or more	1 or more	1	1
5 and onward	1 or more	1 or more	1	1

Pets should not stroll on counters or table. They should eat out of their own dishes, not yours. They should not sleep on your bed. The bedroom should be off limits to pets. Don't kiss your pets. Wash your hands after playing with your pet. NEVER, NEVER share food with your pet. Don't keep a cat box in the house; install a cat door. Wear a dust-mask when you change the cat box. If you have a sandbox for the children, buy new sand from a lumberyard and keep it covered. Don't eat in a restaurant where they sweep the carpet while you are eating (the dust has parasite eggs tracked in from outside). Never let a child crawl on the sidewalk or the floor of a public building. Wash children's hands before eating. Eat "finger" foods with a fork. If feasible, leave shoes at the door.

Solvents are just as bad for your pet as for you. Most flavored pet foods are polluted with solvents such as carbon tetrachloride, benzene, isopropyl alcohol, wood alcohol, etc. Don't buy flavored pet food.

Pets add a great deal to human lives. **Get rid of the parasites, not the pets, unless you are ill.**

Of the collection of pet foods shown, only two were NOT polluted; only homemade food is safe.

Fig. 14 Polluted and safe pet foods

Zapping Parasites

Although the herbal *Parasite-Killing Program* is highly effective against parasites, you should also kill them electrically. Each method has its own areas of greatest effectiveness.

You may build a zapper or purchase one. It is energized by a 9-volt battery. Some people can feel a minor tingling; others feel nothing. After seven minutes take 20 to 40 minutes off. During this time viruses and bacteria will emerge from

dead parasites. Zap a second time. Then take another break of 20 to 40 minutes. Finally zap a third time.

You have just killed all the viruses, all the bacteria, and all the parasites including flukes that the zapper current could reach. The few remaining are stuck in gallstones, kidney stones, abscesses, or in the bowel contents. Increasing the voltage does not help. Only a 2 tsp. dose of Black Walnut Hull Tincture Extra Strength reaches them in these locations.

That is why you should use both methods.

Triple-zap once a day until you are well.

Don't wait until you have everything to begin! Start as soon as you get each item! Consider your body like a flower garden. Tiny insects are eating your leaves and petals. They are laying eggs that hatch into hungry caterpillars, spinning cocoons and emerging into new adults continually. You can't wait for anything! You must kill whatever you can as soon as you can in order to save as many petals and leaves as possible!

Tapeworm Disease

We all have tapeworm stages in our bodies, probably going back to childhood when we ate dirt. Every tumor, benign or malignant, has a tapeworm stage in the middle of it, even including warts. Growing a tumor around a tapeworm stage may be Nature's way of protecting us from it! It is not normal for these stages to hatch and develop further. Their purpose is to stay dormant. And perhaps they do little harm this way.

But I have found, using the Syncrometer®, that tapeworm stages make malonic acid. This is a powerful inhibitor of your metabolism. It cripples your Krebs cycle, the high gear of your energy-producing machinery. Dr. Otto Warburg found, in the early decades of the 20th century, that inhibitors of the Krebs cycle caused tumors to grow.[15]

So it is very important to kill the tapeworm stages in your body—and in your tumors—even though they are responsible for the neoplasm (tumor), not the malignancy.

Cancer is a progression of developments. First, the mass is merely a benign growth, a **neoplasm**. It is instigated by a tapeworm stage. Later, the mass is

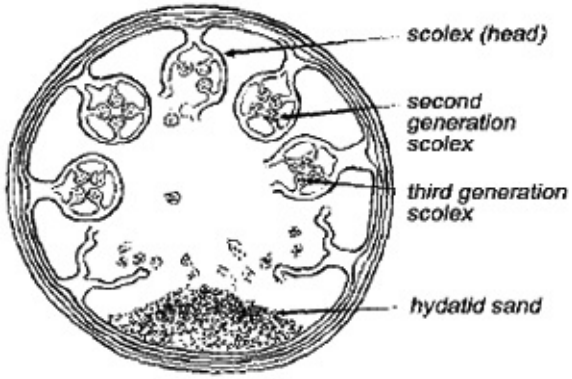
invaded by the intestinal fluke causing it to become malignant.

Tapeworm stages do not come unaccompanied, either. They bring some very harmful bacteria and viruses with them. In sufficient numbers, they can make you feel quite ill. *Streptomyces*, a fungus-like bacterium is one of the worst. Wherever I detect *Streptomyces*, a tapeworm stage is not far away.

The herbal parasite program, taken in a very high dose kills many tapeworm stages. You simply take 8 tsp. Black Walnut Hull Tincture Extra Strength, rest for an hour, and then take another 8 tsp. Black Walnut Hull Tincture Extra Strength. After each dose, take one tablet of niacinamide, 500 mg, to detoxify the alcohol. This treatment could make you woozy; do not drive a vehicle afterward. Also take 10 capsules of Wormwood and 10 of Cloves, slowly and carefully, to keep it all down. This treatment could save your life, if you are terminally ill.

Yet, even this very high dose parasite program is not effective against all tapeworms.

Tough Tapeworms



Echinococcus granulosis cysticercus is shielded by its numerous membranes but cysteine and ozonated oil penetrate them.

Fig. 15 Tough tapeworm stage

A few varieties of tapeworms, like *Echinococcus granulosis* and *Echinococcus multilocularis*, have larvae inside their larvae! And even these second generation larvae can have more larvae inside them. These internal larvae are shielded from all things that might harm them. That is undoubtedly why they are not eradicated by zapper current or the very high dose of parasite herbs. The innermost larvae are called *hydatid sand*. Testing with a Syncrometer® reveals

that in some persons, unfortunate enough to have these tapeworm varieties, hydatid sand is still present and alive after all these treatments. *E. granulosis* is the most common variety to survive it all. It is found the world over, infesting sheep, cattle, pigs, horses, goats, and dogs.

One scolex inside cysticercus multiple scolices inside cysticercus multiple scolices inside multiple scolices inside cysticercus

Each scolex will be turned right side-out when pressure is applied so the suckers can attach themselves to the host. But in humans the entire larva merely lodges in some organ, disturbing metabolism and spewing out bacteria.

Fig. 16 Various types of tapeworm larvae

But what harm would a few left over stages of tapeworms do? With most of them dead, surely your tumors should stop growing and your health should improve. Certainly there is much less malonic acid produced. But the filamentous bacterium, *Streptomyces*, which accompanies each larva, does a great deal of harm. *Streptomyces* can spread through your body like a virus; perhaps it even hosts a virus.

Streptomyces is not merely a nuisance-invader like *Candida*. *Streptomyces* uses up your nucleic acid bases, adenine and hypoxanthine. It makes nitrites out of nitrates, leading to nitroso compounds, which cause mutations. It makes a strong protease that can digest your tissues. It makes substances that stops protein manufacture by your cells. It makes ammonia out of your urea; just the opposite of what should be taking place. It has powerful immune suppressant action on T-cells. This is no ordinary bacterium although it is present in the soil everywhere.

Unless you kill every grain of the hydatid sand and other leftover shielded larvae, you cannot get well. But as soon as you succeed, all *Streptomyces* species disappear the same day.

To kill these larvae, the cyst must not be opened to let out the mischief-makers, but merely penetrated to kill the contents. Fortunately, we have found two substances that can penetrate a succession of membranes to kill the shielded larvae within, as well as any trapped eggs in other locations. They are **ozonated olive oil** and **L-cysteine**. We will discuss them shortly. But first, are there other

parasites besides some tapeworms that can survive our treatments so far? Yes. *Ascaris*.

The Curious Case of Ascaris

If you do not get well after the herbal parasite program and the zapper treatment, you can assume you have either leftover tapeworm stages or survivor *Ascaris* eggs.

Ascaris infests animals and humans from pole to pole of this planet. It is safe to say that all dogs and cats have it and all humans have it from time to time. Domestic animals and humans each have their own variety of *Ascaris*; yet can host the other varieties, too. Horses have *Ascaris megalocephala*. Pigs have *Ascaris suum*. The human variety is *Ascaris lumbricoides*. *Ascaris* does not attach itself to you, it hardly even moves. It simply lies still in your organs absorbing nutrients and eventually filling up with eggs.

When you kill *Ascaris* worms by zapping or with the herbal recipe, they are mortally wounded. They are dying, **but the eggs inside them are not**. They were sheltered. Within a day these trapped eggs begin to leave the dying worm. Soon hordes of eggs are dispersing in your body again!

And in another 24 hours they are beginning to hatch into larvae. You can detect this as it happens with a Syncrometer® and test-slides of eggs, larvae, and adults.

Of course, you are zapping and taking the herbal parasite killers. But again, these do not penetrate the *Ascaris* body to kill what is inside. It could take weeks for the dead *Ascaris* to be totally disintegrated so no more eggs are being sheltered within.

Surely, a few *Ascaris*eggs, still escaping into your body could not do much harm since the overall problem has been greatly reduced! This is not so. The eggs, even if unfertilized, may do more harm than the worms. *Ascaris* eggs bring three very important pathogens that spread throughout your body: *Rhizobium leguminosarum*, *Mycobacterium avium/intracellulare*, and the common cold virus, *Adenovirus*. A flood of these is responsible for night sweats and a general feeling of illness. As soon as the last *Ascaris* egg is gone, these pathogens are gone, too, and the following night becomes free of sweating. If your night sweats come back, you know *Ascaris* eggs are present again. And in 24 hours, unless

you kill them, they will hatch into larvae and start the whole cycle over again.

It takes about three weeks for large parasites like *Ascaris* and tapeworm larvae to disintegrate completely and be cleared from your tissues. If eggs or scolices are continually released during this time, the cycle of infection cannot be broken. Fortunately, the same two substances that can penetrate tapeworm larvae can also penetrate *Ascaris* worms and mop up after them, whether dead or alive!

Strangle The Stragglers

Here is the three week Mop Up Program for both tapeworm larvae and trapped *Ascaris* eggs:

- ozonated olive oil, 3 tbs. taken once a day.
- L-cysteine, 500 mg, 2 capsules, three times a day.

You can easily make your own **ozonated oil**. Purchase an ozonator (see *Sources*) and a small bottle of olive oil. Pour off an inch or so. Attach an aerator to the end of your ozonator hose and drop it to the bottom of the olive oil bottle. Choose a ceramic or wood aerator, available at any pet store; the plastic varieties release benzene! The bubbles may make the oil flow over the top. In this case, pour more of it off. Turn the ozonator on before dropping the hose in the bottle. Ozonate for 20 minutes or longer. When done, cap the bottle and store in freezer until you are ready to use it. It melts quickly when needed. Would other oils work? Possibly. I have not researched them, though, since they cannot be trusted to be free of benzene (petroleum) pollution.

Measure your dose accurately. You may put it on vegetables and have it with your meal.

Ozonated oil gives you no noticeable side effects, but it should not be taken more than necessary. One could expect the ozone to jump across from oil molecules to your fat molecules, aging them too soon. Fortunately, the dose is small and may be directed at the intruders before it is directed at you.

The **cysteine** should be L-cysteine, cysteine hydrochloride, or simply free cysteine. Do not get D-cysteine or DL-cysteine, which are unnatural.

Taking this supplement gives a few people side effects, perhaps due to its

penetrating anti-parasite property. You could have fatigue, nausea, and dizziness. If you have serious side effects, reduce the dosage.

On the other hand, cysteine may make you feel better than you have in many months! The cancer sufferer is quite deficient in cysteine and suddenly supplying it could put the body into a state of euphoria. In this case, you may even double the dose!

Cysteine has other important benefits for you. It counteracts the radiation we all get from living on this planet, called "background radiation." This might even explain why supplementing animals with cysteine had the effect of lengthening their lives substantially. Cysteine is a heavy metal detoxifier, perhaps through the formation of glutathione. It is a precursor to glutathione and deserves a permanent place on your supplement list.

Nevertheless, supplementing with cysteine should not be overdone. Even if you have good side effects, reduce the dosage after three weeks to one a day. If you had bad side effects, reduce the dosage after two days to whatever you are comfortable with.

After three weeks, you can assume that all leftover *Ascaris* eggs are gone. But you can't assume this for tapeworm stages—some are still locked inside your gallstones! These can be reached with a series of ozonated oil liver cleanses.

After three weeks of Mopping Up, you may stop; do the Mop Up once a week thereafter, on days when you are doing the maintenance parasite program or the day after.

To summarize:

What you'll need for killing ALL your parasites, including tough ones, and mopping up after them:

1. Black Walnut Hull tincture, an alcohol extract of the green hull (for alcoholics, a water recipe is given).

2. Wormwood, in capsules

3. Cloves, fresh ground, together with size 00 empty capsules

4. Zapper

5. Ozonator, to ozonate olive oil

6. L-cysteine

Optional: ornithine, arginine

Parasites Gone, Isopropyl Alcohol Next

Now that you have killed the intestinal fluke and cured your cancer, what's next? Two tasks remain:

1. Stop getting isopropyl alcohol into your body.

2. Get rid of the heavy metals and common toxins in your body, diet and home. (This is covered in *Part Two: Getting Well Again.*) This will heal the damaged tissues and start your tumors shrinking.

Isopropyl alcohol is the antiseptic commonly used in cosmetics. Check all your cosmetics for the word "propanol" or "isopropanol" on the label. It is usually put on the label, since it is not currently suspected of causing cancer.[16] I don't know if propyl compounds like propamide, propacetamide, isopropyl gallate, or calcium propionate could be converted by the body to isopropyl alcohol, so don't take chances. Do not use anything that has "prop" in the list of ingredients. Don't give your discarded cosmetics to anybody. Don't save them. Don't have them in the house anywhere. Throw them out.

Remember, 100% of cancer patients have the solvent isopropyl alcohol accumulated in the liver and in their cancerous tissues. People without cancer do not have isopropyl alcohol in their livers. Look at the case histories. Often one spouse has cancer: you can note that she or he has isopropyl alcohol and the adult fluke in the liver. Orthophosphotyrosine is present in an organ like the lung where the cancer is developing. But the other spouse does not have cancer although he or she shares the parasite. For him or her it is only in the intestine. There are no eggs or other stages anywhere. There is no solvent present!

Here is a list of common body products that may have isopropyl alcohol in them: cosmetics, shampoo, hair spray, mouthwash, mousse, body lotions, shaving supplies, and, of course, rubbing alcohol. **If in doubt, throw it out!**

Check all labels for "isopropyl alcohol, "propanol" or "isopropanol". Throw those products away!

Fig. 17 Some isopropyl alcohol containing products

Although body products give us our highest concentrations, isopropyl alcohol is in our food, too! One primary source is flavor or color. These are extracted with solvents! The concentrate extracted is called a "spice oleoresin." Naturally, the solvents should be removed before the final product is used. But nothing can be removed completely once it is added, so there are regulations governing the amount left. Amounts are stated in "ppm", or "parts per million." 50 ppm would be like 50 drops out of a million drops, or roughly one drop per quart (or liter).

This excerpt is from the Code of Federal Regulations (CFR):

21 CFR 173.240 (4-1-94 Edition) Isopropyl Alcohol

Isopropyl alcohol may be present in the following foods under the conditions specified:

In spice oleoresins as a residue from the extraction of spice, at a level not to exceed 50 parts per million.

In lemon oil as a residue in production of the oil, at a level not to exceed 6 parts per million.

[Discusses its use in hops extract.]

Here is a summary of other solvents mentioned:

Solvent	Allowable residue in spice oleoresins	Paragraph in 21 CFR
Acetone	30 ppm	173.210
Ethylene dichloride	30 ppm	173.230

Methyl alcohol	50 ppm	173.250
Methylene chloride	30 ppm	173.255
Hexane	25 ppm	173.270
Trichloroethylene	30 ppm	173.290

Fig. 18 Lawful uses of solvents in food.

Another reason for isopropyl alcohol pollution (and other pollutants) in our food is the chemicals used by manufacturers to sterilize their food handling equipment.

> 21 CFR 178.1010 (4-1-94 Edition) Sanitizing solutions.
>
> Sanitizing solutions may be safely used on food-processing equipment and utensils, and on other food-contact articles as specified in this section, within the following prescribed conditions:
>
> (a) Such sanitizing solutions are used, followed by adequate draining, before contact with food. [Note rinsing or drying is not required!]
>
> (b) The solutions consist of one of the following, to which may be added components general recognized as safe and components which are permitted by prior sanction or approval.
>
> [Now comes (1) through (43) permissible sterilizing solutions, including several with isopropyl alcohol, like:]
>
> (25) An aqueous solution containing elemental iodine (CAS Reg. No. 7553-56-2), potassium iodide (CAS Reg. No. 7681-11-0), and isopropanol (CAS Reg. No. 67-63-0). In addition to use on food processing equipment and utensils, this solution may be used on beverage containers, including milk containers and equipment and on food-contact surfaces in public eating places.
>
> [Then in paragraph (c)(19) the exact concentration of the iodine is specified. Nowhere is the concentration of the isopropanol specified. It can be as strong as desired.]

Fig. 19 US regulations on sterilizing solutions.

The good news is that isopropyl alcohol leaves your body, by itself, in five days after you stop getting it.

Even if there were regulations governing removal of sanitizing solutions, the overwhelming truth is missed: that **nothing can ever be completely removed after it has been added**. Or perhaps the lawmakers didn't miss this fact. Perhaps they believed that small amounts—too small to measure with an ultraviolet spectrophotometer—could surely do no harm.

Isopropyl alcohol is a pollutant in cold cereals. Stop buying all cold cereals. Even the most natural cold cereals are polluted. I haven't tested every cereal on the market, but I have tested so many that you should not take a chance on a

single one. See *Recipes* to make your own.

Why is it so important to get rid of isopropyl alcohol if you have already gotten rid of the intestinal fluke, and are on the parasite maintenance program? Because reinfection can occur so quickly! Dairy products and fast-food hamburgers are not heated high enough to kill metacercaria (the shelled stage that can survive extreme heat and cold in ponds). Even when you ask to have your hamburgers cooked very thoroughly, you run the risk of having your hamburger removed from the grill with the same spatula that just put the next batch of raw patties on the grill, defeating your efforts. Within 24 hours the fluke stages are in your blood, some of which are "hatching" into adults, and before your next maintenance dose of Black Walnut Hull tincture they are in your liver and your orthophosphotyrosine is back. But without isopropyl alcohol this doesn't happen. With isopropyl alcohol it is inevitable.

You should <u>not</u> stay on high doses of parasiticides as a substitute for avoiding isopropyl alcohol.

Read all labels on the body products you buy. Keep a lighted magnifying glass with you for this purpose while shopping.

All cold cereals I tested, including health-food varieties, are polluted with solvents such as benzene, carbon tetrachloride and isopropyl alcohol. DON'T EAT THEM.

Fig. 20 Some cold cereals

Isopropyl Alcohol Polluted Products

THROW THESE OUT...
even if isopropyl alcohol is not listed on the label!

- **shampoo**, even health brands
- store-bought **fruit juice**, including 100% natural and health store varieties
- store-bought and **bottled water**, including distilled, mineral, health store or self dispensed varieties
- **cold cereals**, including granolas and health food varieties
- **rubbing alcohol**
- **vitamin supplements and herb extracts** unless tested
- all **shaving supplies** including aftershave
- **prescription, and over-the-counter drugs** unless tested
- **mouthwash**
- **white sugar** (use confectioner's sugar or brown sugar, but add vitamin C to detoxify mold)
- **decaffeinated coffee**, postum, herb tea blends (single herb teas are OK)
- **hair spray** and **mousse**
- **carbonated beverages**
- **cosmetics** (see *Recipes*)

You can make many of these products yourself, free of toxins (see Recipes).

Remember that isopropyl alcohol is also called propyl alcohol, propanol, isopropanol, and rubbing alcohol.

Endogenous Isopropyl Alcohol Means Made-In-Your-Body

There is another, even more fiendish source of isopropyl alcohol. Certain bacteria of the *Clostridium* family make it! A portion of our colon bacteria are *Clostridium* varieties. It is considered "normal." Yet, children's bowel contents tested *Negative*[17] for the six *Clostridium* species I searched for. Instead they had *Bifidus* varieties (a "good" bacteria). I think absence of *Clostridium* and presence

of *Bifidus* is truly normal, even for adults.

Perhaps only a few varieties of *Clostridium* make isopropyl alcohol. I have found only one reference to this in the classical literature. It states that *Clostridium toacum* makes isopropyl alcohol in its metabolism. Perhaps this species is also present, although I cannot test for it yet. In any case, I usually see all six species of *Clostridium* in the intestinal tract of cancer patients. Only in cancer patients have *Clostridium* species invaded the upper parts of the intestine, too, not only the lower parts, so much more isopropyl alcohol may be made. In fact the esophagus and stomach are frequently colonized as well! The Syncrometer® easily detects the isopropyl alcohol being made in the intestines when *Clostridium* is present.

Evidently, the bacteria burrow through the walls of the intestine, find the tumor site, and colonize there, producing isopropyl alcohol. Is it any wonder that the body runs out of detoxifying capability for this antiseptic?

Aflatoxin B

Whenever isopropyl alcohol is in the liver, I find **aflatoxin B**, a mold by-product, in the liver as well. Aflatoxin B is known to be extremely carcinogenic. My interpretation of this coincidence is that aflatoxin B is inhibiting isopropyl alcohol detoxification. Of course the reverse may be true: isopropyl alcohol could be inhibiting detoxification of aflatoxin. Either way, if you stop eating moldy foods your aflatoxin B level will be zero.

Some foods with aflatoxin B are beer, nuts, bread more than a few days old, overripe fruit, and many bulk grains. Surprisingly, very moldy foods like cheese show no signs of aflatoxin B. Maybe removal of aflatoxin is the reason there are documented cases of freedom from cancer after changing to the "macrobiotic" diet.

Malignant tumors have both the fluke and isopropyl alcohol present. Before that, the tumor was benign. If you can prevent tumors from forming at all, you would never have to worry about malignant ones.

The Formation of Tumors

A tumor begins as a small overgrowth of tissue. You may notice it simply because it presses against its neighboring organ giving you strange sensations. When it is examined or scanned, the doctor may call it an "adenoma" or "neoplasm," or just plain "mass." Although scientists have worked for 100 years on the causes of such little growths, there is no conclusive explanation yet.

But by analyzing this little growth with the Syncrometer®, its composition can be determined qualitatively. When its composition is compared to that of other masses, in other persons, in other organs, common denominators can be found. And if removing these common denominators for patients' results in shrinkage of these benign masses, a recipe for curing your "tumor disease" can be formulated.

A brief sketch of how we see tumor disease progress will be given here so you can begin your healing and prevention program.

The Cause of Tumor Disease

These are the common denominators of all the masses or growths I have investigated, even including warts. There are only about a dozen, not hundreds upon thousands as we are told.

- tapeworm stages
- *Ascaris* worms
- *Clostridium* bacteria
- copper (the metal)
- cobalt (the metal)
- vanadium (inorganic)
- malonic acid and derivatives
- fungus species

This is not an unmanageable list. Compared to the thousands of chemicals on the "carcinogen" list compiled by anti-cancer institutions, this is simple.

What Do The Tapeworm Stages Do?

We have already stated that they produce malonic acid or somehow cause it to be made by the host, which is us. Malonic acid stalls the Krebs cycle (the major energy-producing mechanism going on within our cells) an event that leads to tumor formation. But that is not all. Tapeworm stages also host bacteria.

One of the constant companions of tapeworm stages are *Streptomyces*, fungus-like bacteria. There are hundreds of species; they are well known for making streptomycin, an antibiotic. But they should not be making such compounds in our tissues on a steady basis. The side effect of streptomycin is stopping protein formation. This is exactly what happens in the tumor. When *Streptomyces* are present, the Syncrometer® can detect no RNA, which is the nucleic acid that leads to protein building. Healthy cells make RNA constantly.

Ozonated oil plus cysteine is the best way to kill tapeworm stages because together they are also effective against *Streptomyces*.

What Does *Ascaris* Do?

The primitive metabolism used by *Ascaris* (and other parasites) is called the **glyoxylate cycle**. *Ascaris'* glyoxylate cycle commandeers our Krebs cycle. (The Krebs cycle is what humans use to burn food into energy.) Killing *Ascaris* stops this, and helps speed up our metabolism in a single day.

Another thing that *Ascaris* does is to destroy all the vitamin C in the organ with the tumor by oxidizing it (removing a hydrogen atom). To be useful, vitamin C must have reducing power (it must be able to pin a hydrogen atom onto other compounds). When *Ascaris* is killed, vitamin C is immediately present again, and in proper reduced form.

Ascaris harbors *Rhizobium leguminosarum*. We have been taught that *Rhizobium* is a rather lovable bacterium, busily changing nitrogen gas into nitrates in the nodules along the roots of legume plants. But in our bodies, the nitrate gets reduced to nitrite, nitrites form nitroso compounds, and these cause mutations. *Rhizobium* is also capable of making DNA, which is necessary for tumor formation. Fortunately, killing *Ascaris* with ozonated oil plus cysteine also kills *Rhizobium*.

Another bacterium harbored by *Ascaris* is *Mycobacterium avium/intracellulare* (two species are mixed on my specimen). Although I have not discovered any of its metabolic pathways, it is easy to notice the big improvements in health when it is killed. Night sweats are immediately gone!

Ascaris has still more tumor-related activities! To understand them you have to know about extensive studies done in the 1930's. At that time the structure of cholesterol was being discovered, and some of its byproducts were suspiciously similar to the coal tar products known to cause "cancerous tumors" in mice.

Hundreds of coal tar products were studied over a ten-year period, and one of the worst was **20 methyl cholanthrene.**

20 methyl cholanthrene is considered one of the most potent carcinogens ever discovered. One tenth of a milligram (approximately 1/10 of a flyspeck) injected into the skin of a mouse, only once, could produce tumors up to 8 months later, filling the mouse with big round balls that ended its life. Just one dose! To my amazement the Syncrometer® detects 20 methyl cholanthrene in tumor cells when *Ascaris* is also present!

How have we escaped our demise by this route for so many years? We have hosted *Ascaris* from our early beginnings as humans, although having household pets is probably a new lifestyle. I don't know the answer, but obviously eliminating *Ascaris* infestation is a most important task.

I believe it can be safely concluded that tapeworm stages and Ascaris, together with their associated bacteria, initiate our tumor disease. Later, Clostridium bacteria and various toxins and "carcinogens" make their deadly contribution.

What Does Copper Do?

There is no tumor, benign or malignant that does not have inorganic (toxic) copper, which is detected with the Syncrometer®. On blood tests, it is easily seen that non-food copper depresses the serum iron level. Ultimately copper is lethal because without sufficient iron (in a properly reduced state, kept that way by vitamin C) our detoxification systems fail, red blood cell formation fails, energy metabolism fails, we fail.

Metallic copper comes into our bodies with water that has run through copper pipes, from metal tooth fillings, and from plastic tooth fillings polluted with copper. Copper has a great affinity for sulfur and uses up our chief sulfur compounds: glutathione, cysteine, taurine, and methionine. And eventually the sulfur that must stay combined with iron in our most vital organs is used up. Fortunately it is easy to eliminate toxic copper from our bodies by removing it from your water pipes and your mouth.

Copper accumulation in cancer patients has been noted for a long time, but it was thought to be due to the cancer itself. My findings show the reverse, that

copper accumulation causes tumor growth. And in fact, the accumulation, far from being due to the cancer patient's genetic tendency, can be easily stopped just by changing the water pipes and getting copper-containing tooth fillings removed. Copper levels fall at once, letting iron levels come up in less than a week. Immediately blood building can resume. And as copper levels continue to go down, the invasive fungus growths also decline.

What Does Fungus Do?

Quite a few fungi and their toxic products, called *mycotoxins*, have been studied in connection with cancer. The Syncrometer® routinely detects **aflatoxin** and **patulin**, which are mycotoxins, at the tumor site.

Aflatoxin causes liver tumors. All cases of jaundice I have seen in liver cancer patients are due to aflatoxin. The only remedy I know of is to stop eating all grains and nuts, in any form. Other foods, especially fermented foods, could be contaminated with it, too, because the mycotoxin is not alive and is not damaged by cooking.

Patulin also has a history of scientific research and use (as an antibiotic!). I routinely detect it at a tumor site, but its preferred organ is the parathyroid. It plays a detrimental role in the body's defense against tumors.

Tumor Defense in the Body

Every person I have tested who is without tumors has **tumor necrosis factor** (TNF) in the parathyroids—but nowhere else. Every person with a tumor does not have TNF in the parathyroid glands. But the reason is clear. Patulin is in the parathyroids, somehow preventing TNF from being made. As soon as patulin disappears, and this could happen as soon as one day after killing the fungus and stopping eating it, TNF reappears in the parathyroids, ready to go to work. No sooner is it back in the parathyroids but it shows up at the tumor sites, too, doing its best to shrink the tumors there.

If you should eat or grow *Aspergillus* fungi again (the kind that make patulin), TNF immediately disappears. So it is rather a fragile system. Our habit of eating rotten fruit (not right off the tree) and letting fungus germinate in the intestine (constipation) keeps us inundated with patulin.

The bruised parts of apples may have as much as 1 ppm patulin.[18] Stopping

eating bruised fruit and clearing the bowel of fungus with Black Walnut Hull Tincture Extra Strength (two tsp. dose is effective) immediately eliminates patulin in the parathyroids.

Now the tumors can shrink. But the forces favoring growth may still be stronger.

What else is making them grow? Cobalt, vanadium, malonic acid, several bacteria varieties, and assorted carcinogens.

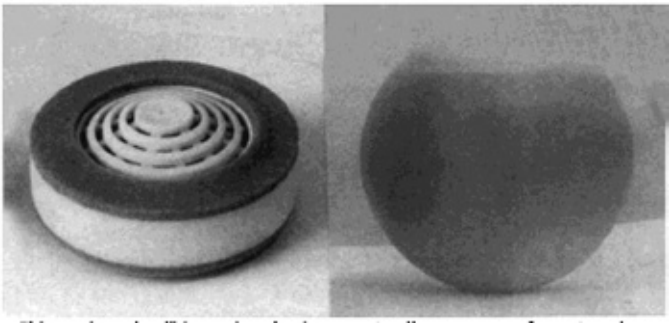
What Does Cobalt do?

Very little is known about cobalt toxicity. It was even given as medication in the past, for anemia. But the treatment was worse than the disease. Inorganic cobalt blocked oxygen utilization so that the body was fooled into believing it was at the top of a tall mountain, where the air is very thin (poor in oxygen). The body's adaptation to altitude is to make more red blood cells. This appeared to cure the anemia by making more red blood cells. But blocking oxygen utilization has the same effect as being anemic, so nothing was gained.

Long ago numerous scientists discovered an important fact. Any lowering of oxygen use by an organ favored tumor formation in that tissue. A steady trickle of cobalt to your tumor could be expected to support tumor growth.

Another toxic effect of inorganic cobalt is in the liver where the two main blood proteins are made: **albumin** and **globulin**. These two must be carefully regulated since they control the osmotic pressure in the blood vessels. They must add up to about 7 gm/dl. The total may get much too high, such as 10 gm/dl in multiple myeloma, or much too low (below 6) when terminal illness has progressed. Cobalt raises the albumin too high and keeps globulin levels too low. These derangements can be seen on a standard blood test.

The toxicity of cobalt to the heart has been known for decades; it was made illegal in nearly all uses then. But gradually it has reappeared in more and more products. By allowing it in dish detergent and laundry detergent we now get a steady dose of it as a residue on our dishes and from our clothing, which constantly massages cobalt into our skin.



"Non-chemical" laundry devices actually spew surface tension reducers into the water, including cobalt-containing chemicals.

Fig. 21 Laundry discs and spheres

A ridiculously obvious and preventable source of cobalt is metal tooth fillings. But by replacing the metal with plastic, we have frequently not removed the cobalt! It is usually present, either as a component or contaminant of the plastic restoration. When both metal and plastics are meticulously removed, blood albumin and globulin levels correct themselves—often in just three days! And a life-threatening situation is turned around to recovery.

What does Vanadium Do?

Vanadium, like cobalt, causes the red blood cell count to go up—much too high. In fact, polycythemia (a rare "blood disease") is primarily vanadium toxicity. How this happens is unknown. But when the red blood cell count is over 4.7, for men or women, the Syncrometer® always detects cobalt or vanadium in the bone marrow. Vanadium is asserting its toxicity in other organs, too; in the liver, and in the tumorous organ.

In the liver, vanadium toxicity has the opposite effect of cobalt toxicity. Now the albumin production is too low, while globulin goes too high.[19] Since globulin is less effective than albumin as an osmotic water attractant, water is allowed to leave the circulation and simply seep into the surrounding tissue. It is called **edema** and becomes a fatal condition.

Vanadium is also the cause of the frequent mutations seen in tumors—in the p53 gene. It does this by combining with nucleic acid to make **vanadyl complexes**. A healthy p53 gene is necessary for the gene's tumor suppresser action, which is to produce a substance that prevents tumors from forming.[20] By removing vanadium from your dentalware (both metal and plastic), the vanadyl complexes disappear and p53 gene mutations disappear, too.

Then how could a patient without any tooth fillings develop tumors? We have seen many children with cancers whose dentition was intact. But their tumors were filled with vanadyl complexes! And as the disease became terminal the additional toxic effects of vanadium were easily spotted: much too low albumin and high globulin, and an exceptionally high red blood cell count.

The children's vanadium came from 1) chronic exposure to car exhaust [a source that constantly invaded their home], 2) a household gas leak, or 3) leaking refrigerant [I suspect fossil fuel is often part of the refrigerant]. These are important sources of vanadium for adults, too.

Vanadium leaves the body, even from the vital organs, in a week after clean air is supplied and artificial materials are taken out of the mouth. These simple moves can turn around a terminally ill patient.

What Does Malonic Acid Do?

It is toxic, and a lot of research has been done on it. Malonic acid was found to inhibit the use of oxygen by animals (respiration) as early as 1900! By 1930, Otto Warburg had found that anything that inhibited respiration could cause tumor formation. But it was never suspected that tapeworm stages release malonic acid, or that plastic teeth seep it, or that we even eat it in certain common foods. The Syncrometer® detects it in every tumor (based on approximately 500 tests). New research is needed to clarify the exact role it plays in tumor growth.

What do Bacteria do?

We have seen that some of these common denominators of tumors suppress our oxygen use. Some cause mutations. Some interfere with iron availability. Some lower our detoxifying capability. Some destroy our vitamin C. Some drastically lower our immunity. Some prevent us from making tumor suppressers. But, in spite of all these tumor-promoting forces, a tumor could still not grow unless it had sufficient DNA to grow on. Imagine a garden. It has been tilled, seeded, fertilized, and is completely ready to grow. But each seed needs one more thing: water. For our cells to divide they must have DNA, the gene material with which each gene reproduces itself. Certainly, our cells can make their own DNA from RNA, but resources for this are limited. And it occurs only in the nucleus, at an appropriate time, at a pace that allows for

replenishment of the RNA.

In tumors, the Syncrometer® detects DNA all the time. This may seem normal, because all of our cells have DNA, but I consider it abnormal because DNA is typically not detectable by the Syncrometer®. Perhaps because it is buried in the cell nucleus. Only in tumors (and the ovaries!) does it show up, leading me to believe that when I do detect it, it is out of place and out of control.

How can DNA (the "water") be continually supplied for cell multiplication? The answer is **bacteria**.

Only a few bacteria varieties[21] out of the vast numbers inhabiting this planet are able to make DNA using vitamin B12 like humans do. These bacteria are certain species of *Clostridium*, *Rhizobium* and *Lactobacillus*. (There may be more, which I have not yet researched, but when these three are banished, DNA formation stops, and abnormal cell division must cease.) These bacteria have found their way into the human body, particularly the intestinal tract and dental crevices. And from there, when low immunity allows, they travel to the young tumor and colonize it.

Clostridium is the hardest to eradicate. Evidently it invades the tumor cells and is not killed. Perhaps immunity is too low. Once inside, I suspect its DNA-making enzymes seep out into the cytoplasm where our copious amounts of RNA are, changing it all to DNA. And with an ever-present supply of DNA, the last requirement for unrestrained growth is met.

So some bacteria can cause your "garden" to be "watered" in overabundance.

Another bad thing bacteria can do is to transport viruses into your cells. This is because bacteria themselves can be infected with viruses. So when the bacteria manage to invade your cell by penetrating the membrane (not an easy job), the virus gets a free ride. Periodically viruses get released from those bacteria inside your cell, putting them in position to attack your DNA. When foreign DNA joins yours, it is called *transformation*.

Scientists have studied transformation to determine when and how it causes tumor growth but don't have all the answers. To me, it seems likely that bacteria and their viruses, such as we discuss here, are probably the transforming agents sought by scientists.

Bacteria Implicated In Other Growth Factors

Although the DNA-making bacteria seem most important, other common bacteria contribute to tumor growth. For instance if an organ tests *Positive* to DNA, I assume tumorous growth is occurring. If that organ then tests *Positive* to CA-125 (a cancer marker), I know from experience the Syncrometer® will find *Salmonella typhimurium*. Always. The conclusion is that *S. typhimurium* is a causative factor for both CA-125 and the tumor. Here are other correlations I routinely find:

Bacteria	**Source**	**Growth Factors /Markers Detected By Syncrometer ®**
Staphylococcus aureus	Dental	Epidermal growth factor (EGF)
Escherichia coli (E. coli)	Bowel	Cancer associated antigen GI
Salmonella typhimurium	Dairy	Cancer antigens, CA 15-3 and CA-125
Salmonella paratyphimurium	Dairy	Platelet derived growth factor (PDGF)
Shigella flexneri	Dairy, tapeworm stages	Cancer antigen, CA 15-3, PDGF, Insulin like growth factor (ILGF)
Shigella sonnei	Dairy, tapeworm stages	Alfa Feto protein (AFP)
Shigella dysenteriae	Dairy, tapeworm stages	Cancer antigen, CA 72-4

Vanquish Tumor-Causing Bacteria

The *Clostridium* family can be stopped in the digestive tract by taking **betaine hydrochloride** (see *Sources*). 1500 mg a day is an average dose. Of course a dental source will re-colonize the digestive tract, so you must stay on this daily dose for protection until the dental source has been removed (see Dental Clean-up). This will also clear up *Staphylococcus.*

The *Shigellas*, *Salmonellas*, and *E. coli* can be cleared up with the *Bowel Program*. To prevent reinfection, observe safe dairy rules.

How Benign Tumors Turn Fatal

Tumor growth is a grand conspiracy between parasites, bacteria, fungi, copper, cobalt, vanadium, malonic acid, and assorted carcinogens! Yet the human body is big and strong. There are many mechanisms within our immune systems to fight these intruders. But if the tumor enlarges or new ones arise, we know these mechanisms are failing. We should be coming to our body's

assistance rather than shrugging it off as "merely benign."

At some time, the benign little mass may become malignant. This means that I observe orthophosphotyrosine is present. Plus, I always observe multiplying *Fasciolopsis* stages as well as isopropyl alcohol now. Did the *Fasciolopsis* stages suddenly discover the tumor the way a hermit crab discovers an unused shell?

My detection of growth factors in tumors and even the presence of a few fluke stages there suggests we should be much more concerned about them. Perhaps the distinction between benign and malignant tumors is deluding, like the distinction between a loaded and unloaded gun. When ammunition is available, no gun should be ignored.

We should really view tumor formation, or *tumorigenesis*, with the same caution as cancer, even though it is slow at first. It could begin to accelerate, doing more and more harm. Yet the body has coped with tumorigenesis a very long time, from the beginning of humanity, as evidenced by our body's ability to produce tumor necrosis factor (TNF), tumor suppresser genes, and to repair mutations. What has gone wrong in the last century to permit such a flurry of tumors and cancers?

Even though tumor growth is ancient, perhaps malignancy is a recent phenomenon. Perhaps this past century has produced the overload of heavy metals, solvents, and globetrotting parasites required to spark this epidemic.

Yet knowing what starts our tumors gives us the power to stop them, whether benign or malignant.

Preventing Tumors Will Prevent Cancer

Tumors are complex structures, which appear to be associated with fungi, metals, bacteria, tapeworms, *Ascaris* and toxins. Being complex, you would think they would be fragile, and removing just one building block would topple them. But the opposite is true: together they form a highly durable opponent for your immune system. The best way to beat tumors is not allowing them to start.

I have also neglected the concept of **raising immunity**. This is the practice of giving interferon, giving interleukin, giving thymosin, giving bacterial antigens, and giving many other entities to raise or stimulate the cancer patients' immune powers. The concept is excellent, and would certainly bear results if only the

setting were correct. But in a setting of continued parasitism, bacterial invasion, and metal toxicity, it is hopeless, or at best temporary.

Of the eight preventive measures, none is very difficult to carry out.

How To Prevent <u>All</u> Tumors

1. Kill tapeworm stages and *Ascaris* regularly and completely with your parasite-killing recipe plus Mop Up.

2. Stop eating foods that contain malonic acid.

3. Get away from coppered water.

4. Stop using cobalt-containing products.

5. Avoid vanadium in fossil fuel contamination of the air <u>in your home</u>!

6. Have only safe dentalware in your mouth since you must suck on this day and night.

7. Stop *Clostridium* invasion with a betaine hydrochloride supplement.

8. Don't eat moldy food.

Review

As a result of our civilized lifestyle we live in petroleum-heated houses, drink water carried in copper pipes, eat food stored to the limit of freshness, wash our clothes in cobalt-containing detergent, are exposed to parasites we disperse all over the globe, place toxins in our teeth to constantly suck, and anoint ourselves with unnatural chemicals. Carcinogens pervade our modern environment.

An overburdened liver gets an overdose of aflatoxin B, reducing its ability to detoxify isopropyl alcohol. *Clostridium* gain a toehold in your bowel, intensifying the isopropyl burden and causing it to accumulate. About this time human chorionic gonadotropin (hCG), one of the first cancer markers discovered, appears. Next *Clostridium* and other bacteria invade one of your weakened organs, and start producing DNA. A small tumor starts to form. It is benign.

The intestinal fluke, *Fasciolopsis*, facilitated by isopropyl alcohol, finds it can

leave the intestine for the liver. And, it can reproduce itself from beginning to end inside your body (not needing a snail). Miracidia and other fluke stages swarm in your body. They produce a super growth factor, orthophosphotyrosine, which makes cells multiply. The adult *Fasciolopsis* is in the liver but stages and growth factor are far away in the new tumor. It is now malignant.

If solvents other than isopropyl alcohol are consumed, *Fasciolopsis* follows a different, non-cancerous, path. Just how solvents facilitate the parasite's life cycle needs more research. Do solvents dissolve the shells of parasite eggs in the intestine, letting them all hatch? Do solvents disarm your immune system? Certainly, the tiny baby stages (miracidia) get into your blood and travel everywhere in your body. They land, become redia, and reproduce into thousands more. They finally turn into cercaria, metacercaria, and finally adults.

- Adults in your liver, if you have isopropyl alcohol in it, causing cancer!
- Adults in your pancreas, if you have wood alcohol in it, causing diabetes!
- Adults in your thymus, if you have benzene in it causing HIV disease!
- Adults in your brain, if you have toluene or xylene in it, causing Alzheimer's disease!
- Adults in your kidneys (Hodgkin's disease), uterus (endometriosis) or prostate (chronic prostatitis) if you have other solvents there!
- Adults in your skin if you have Kaposi's sarcoma.

I had to mention these diseases even though this book is just about cancer because you should know what a scourge this parasite is, and how deadly it is to have both the intestinal fluke and solvents. In every case (100%) of these diseases that I have seen, <u>both</u> have sbeen present.

Part Two: Getting Well Again

You are not transformed magically into a healthy person on the day the malignancy is gone. You must also shrink or dissolve the tumor somehow. Even this will not make you a healthy person. You need to clean up your adverse environment!

So when you have cancer you really have two problems: the cancer itself, and the contributory problems. In Part One we cured the cancer. Now the tumors aren't growing wildly, but they are not gone, either. They won't shrink until we remove the contributory problems. This will be a marvelous adventure.

Getting well will be the most exciting part of your recovery. You will see yourself heal. Healing has a magic about it that is unique. It is the body's secret. No physician can make your body heal. No human being understands healing. But if you remove all obstacles from your body, you can count on it, it will heal! Remind yourself of a wound you once had and how it healed. Splinters of glass or wood had to be removed; dirt had to be scrubbed out. Bacteria had to be killed. Then, by unknown magic, it healed!

Example of Healing

Let us suppose you had lung cancer. Six days ago you started the fluke-killing recipe and threw away everything that had isopropyl alcohol in it, including shampoo and bottled water. Today the fluke and orthophosphotyrosine and cancer are all gone. You are coughing, too fatigued to go shopping, you can't sleep and your mind dwells on the spots that were seen on your x-rays just recently. Can you heal them before your surgery date? Can you avoid chemotherapy? This is how you accomplish both these goals in record time.

1. Stop smoking. Nobody in your house may smoke indoors. Your poor brain may cry out for nicotine. Take ginseng for a calming effect. Chew herbal combinations instead. Eat candy. Enroll in a smoke-out program. Try hypnotism. Pray. Do whatever it takes to succeed. There is no halfway measure. You must stop smoking. Put a sign on the outside door: "Recovering Smoke-aholic, Please Help By Smoking Outside." Your lungs will begin to heal from the day you stop smoking. It takes 3 weeks of consistent healing for the tissue pathology to

improve enough to change the doctors' minds about your need for surgery and chemotherapy.

2. Change your copper water pipes to plastic. If you only have a short section of copper this is easy and inexpensive. If you have all copper pipes with no control over them, move quickly into a new motel, one that has PVC (plastic) plumbing. There is no halfway measure with copper. There must be none in the laundry water, shower water, or dishwater. Filters or distillers cannot remove the amount of copper coming from copper plumbing. Filters were meant to remove the amount in municipal water. Even if you connect three filters in a row, they will all be letting copper through in a week. All cancer cases have copper water pipes, often unbeknownst to them. The faucets themselves and water heater inlets need not be changed, nor any of the pipes lying outside the water meter. I'm not sure why these don't have more of an effect.

There is a new process available (see *Sources*) in which an epoxy compound is blown through your copper plumbing. It coats the pipe, stops corrosion, and best of all eliminates the copper contact. People say it makes the water taste so good they don't buy bottled water anymore! I tested this water and could find no harmful elements.

If you stop your copper exposure, you are removing one of the common denominators I find in all tumors.

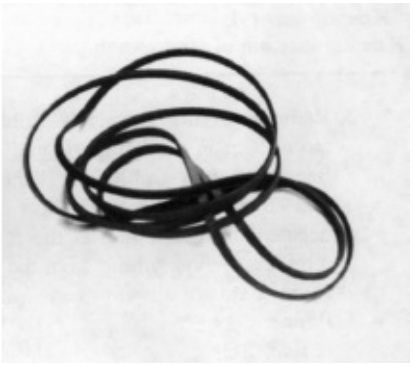
I also find copper in every case of leukemia, which means it is probably a factor in non-tumorous cancers also. (The only type of cancer that I have not seen a copper buildup with is Hodgkin's disease.) So I think this shows the importance of avoiding copper: do not have copper plumbing; do not wear copper jewelry; do not use copper cookware, and get the copper dentalware out of your mouth.

3. Remove all the chemicals from your house. You may store them in the garage if and only if there is no door between garage and house. If there is a door, you lock it and cover it with a large sheet of plastic so nobody can accidentally use it and let the fumes in from the garage. You remove everything from the basement, kitchen, and bathroom. Remove all paint cans, paint or varnish removers, thinners, brush cleaners, even though they are tightly closed. Remove all containers of floor wax or cleaner or polish, and carpet or furniture or window cleaner. Remove nail polish and remover, tile cleaner, rust remover,

wall cleaner. Every chemical must go. Keep only distilled white vinegar, borax, and baking soda as cleaning agents. I will tell you how to use them later.

Remove all fragrances from the house. You may store them in the garage in clear plastic bags. Nobody in your house may wear them. Remember, you have a deadline to meet to heal your lungs. To do this, you remove ALL chemicals. Fragrances are chemicals. This includes detergents, potpourri, colognes, candles, room fresheners, wall lamps, soaps, lotions, after-shave, and hair spray, anything that you can smell.

4. Board your pets with a friend. They should be started on a parasite program while at your friend's place. Pets carry *Ascaris* (roundworm), a parasite that goes to the lungs and the eggs are picked up by touching the pet's fur. Later on, when your doctor pronounces your lesions healed, you may give some serious thought to whether you should chance getting parasites again from a pet.



Clothes dryers are our biggest source of asbestos. Check your dryer belt. It should state: "Made in USA"

Fig. 22 Clothes dryer belt

5. Get rid of any possible asbestos sources. Put your hair dryer and clothes dryer in quarantine. There is asbestos, too fine to be measured by Public Health Department equipment, and therefore more dangerous, coming from two out of three hair dryers. Don't use one. Don't let the hairdresser use one on you. Don't sit inside a hair dryer or use hair curlers or you'll add tungsten as well as asbestos to your beleaguered lungs. Simply change your hairstyle. After you're in the clear with your health, buy a Conair Prostyle Mini 1250™, a 081.A 1600™, or a Vidal Sassoon Misty Tone 1500™; these tested *Negative* to asbestos. **Clothes dryers are our biggest source of asbestos.** It comes from the belt. I suppose our government agencies feel it is safe enough to blow asbestos around inside the machine. However, it comes out through the cracks along the sides and around the exhaust outlet. Install a new belt. How can you pick a replacement belt that

does not have asbestos? Choose a "Made in USA" belt. No belt that said "Made in USA" showed asbestos in my tests. All others did! Don't assume that because your clothes dryer is a U.S. brand name that your belt inside is also. Three belts that do not have asbestos are listed in *Sources*. Get a new exhaust hose for your clothes dryer, too, cleaning out all the dust in the machine while installing it; use duct tape around the outlets at both ends. Never exhaust the dryer into your house to save heat, even with a safe belt, because fresh air is best for your lungs. After this, have the whole house from basement to upstairs vacuumed and dusted while you are away for the day.

6. Have the house tested for radon. Buy a 5-day kit from a hardware store and put it in your bedroom. If there is any[22] radon, seal up the cracks in the basement. It is not very difficult to correct a radon problem. Since it takes weeks to get an answer back from the company measuring the radon from your kit, it would be best to go live somewhere else temporarily. Or just tackle the job of fixing cracks. **Your lungs will not heal if there is any radon.** Free pamphlets are available at drugstores to tell you how to seal your home against radon. They make the job seem more difficult than it really is. Get a quart of black roofing cement and dab it around plumbing pipes and gas pipes where they come through any walls. Dab it on cracks. After a few days, you can go over them with a more attractive caulk. Seal around plumbing pipes upstairs too. Open your crawl space vents and leave them open year round. Don't try to save on your heating bill by keeping them closed. Install a crawl space fan. These measures nearly always work but if a follow-up 5-day test still shows any radon, you will need to move.

7. Remove all possible formaldehyde. If your bedroom is paneled, move out of it and keep the door locked. Move your bed into the cleanest room in the house—no wallpaper, no carpets except the washable kind and no stuffed furniture. Your bedroom should not be above the garage or facing a parking lot. If you have a foam mattress, or pillows, throw them out. Move all new furniture into the locked room out of circulation. Wash all the new clothing hanging in your closets. Don't wear them until they have been washed to remove the sizing, it has formaldehyde.

8. Remove all possible arsenic. Throw out (in outside garbage) any ant killer compound, roach killer, mouse-bait, spray bottle or can, lawn chemicals, house plant spray, every bit of pesticide. Steam clean the carpets yourself (see *Recipes*); at the same time clean the cloth furniture (stain resistant treatments contain arsenic). If you have it done for you, specify no "stain resistant"

treatment and be present to check on the job being done. If there is new wallpaper, close and lock the door to these rooms or have it removed by someone else while you are away for the day. Wallpaper glue contains arsenic and must be carefully washed away. Don't do any painting or remodeling. Don't get new furniture, carpets, or cars. Much as you may love that new-car smell, it would be chemical suicide.

9. Check your home for exposed fiberglass. If your home is insulated with fiberglass, seal all holes in your ceilings or walls that lead to insulated areas. If your hot water heater has a fiberglass blanket, remove it. Also check for fiberglass insulation around fans and air conditioners.

10. If you have gas heat or a gas water heater or stove, ask your local Health Department to come out to check for leaks. Your gas company does not have sensitive equipment to find small leaks. Also have a furnace repair person check your furnace and flue. Better yet, switch to all electric. Fossil fuels bring with them vanadium. Gasoline and car exhaust similarly bring vanadium. Keep these vapors away from your home.

The biggest obstacle to all these changes is the feeling that you are not worth all this trouble. Of course, you are worth it! And what a fine example you are setting to family members by getting well. You are rewarding them for their efforts to help you. And you are teaching them a valuable lesson about the toxic pollution of our environment. Your recovery will be an inspiration to everybody. You may be saving lives!

Your total cost will probably be under $2,000. These changes will herald a new era in your life. I have seen every one of these tasks done in as little as one week when family and friends pitched in. Healing starts the day they are completed. Count how many times you cough in 5 minutes. It should go down to zero. If it does not go to zero, you have missed something. Go over the whole list. Be more meticulous. Or go on vacation. You may go to a friend or relative's house if they are willing to clean it up for you. This will get you away from asbestos, pets, Freon, copper, chemicals, and fragrance all at once (tell the maid not to spray for bugs, nor use air fresheners) .If you get better while on vacation, stay on vacation. Never come back to your tumor-causing house.

Healing In General

What about other cancer types? Most of the healing tactics for lung cancer apply to other types as well. But for each different organ affected you should focus on its special needs. For skin cancer, you would focus on laundry, soap, lotions and ultraviolet light. Clothing rubs into skin constantly and always has detergent residue in it. Soap and lotions are chemical soups with isopropyl alcohol antiseptic. There are simple replacements for all of these given in the *Recipes* chapter.

Getting well after any cancer depends on cleaning foreign things out of your body so it CAN heal. You have already removed all the parasites from your body and the isopropyl alcohol. That was critical, but don't stop there if you want to get your health back. I have seen people get well whose doctors told them they had only 10% of their lung, or liver, or kidney still functioning!

You can get all your health back from any kind of cancer by removing unnatural chemicals.

1. Remove all unnatural chemicals from your mouth.
2. Remove all unnatural chemicals from your diet.
3. Remove all unnatural chemicals from your body.
4. Remove all unnatural chemicals from your home.

That is all there is to it. Let us look at each step, the mouth, the diet, the body, and the home. Make a decision first: that you are worth the trouble. Now that the cancer is gone, your life is not in immediate jeopardy, but do you wish to get well? Do you wish to get rid of your bowel disease with its bloating and gas and discomfort? Do you wish to get rid of fatigue and feel like walking and working again? Do you want your strength back? What about pain? Do you wish to be free of foot pain, hip pain, low back pain, upper back pain, chest pain, knee pain, and other pain? Headaches, too, can be cured by cleaning up.

If you had these health problems before the cancer struck, then you will still have them after the cancer is gone. Getting well again means getting rid of all the problems that brought you to the cancer, such as breast lumps, enlarged prostate, as well as problems resulting from the cancer, such as weight loss.

1. Clean Up Your Dentalware

This section on dentistry was contributed by Frank Jerome, DDS with

comments added by the author. To get an even clearer idea of how to make good dental choices, read his book, Tooth Truth.

Dr. Jerome: *The philosophy of dental treatment taught in America is that teeth are to be saved by whatever means available, using the strongest, most long lasting materials. Long-term toxic effects are of little concern. The attitude of the majority of dentists is: whatever the ADA (American Dental Association) says is OK, they will do.*

A more reasonable philosophy is that there is no tooth worth saving if it damages your immune system. Use this as your guideline.

The reason dentists do not see toxic results are that they do not look or ask. If a patient has three mercury fillings placed in the mouth and a week later has a kidney problem, will she call the dentist—or the doctor? Will they ever tell the dentist about the kidney problem or tell the doctor about the three fillings? A connection will never be made.

It is common for patients who have had their metal fillings removed to have various symptoms go away but, again, they do not tell the dentist. The patient has to be asked! Once the patient begins to feel well they take it for granted, and don't make the connection, either. If everybody's results were instantaneous, there would be no controversy.

Dr. Clark: Some people are noticing that when they replace metal fillings with plastic they get tumors. It is too early to know if this is a coincidence. My recent tests show that most varieties of dental plastics contain known tumorigens as did amalgams, of course. In fact, I believe that toxic dental materials we suck on day and night are largely responsible for our cancer epidemic and the abnormal T-cell ratio in AIDS. So plastic fillings, at least the varieties in use now, are not the answer. They are very toxic, too.

Dr. J: *Isn't this somewhat of a bombshell?*

Dr. C: Not really, the fact was already known decades ago that even solid materials allow their water-soluble components to leach out. That's why fluoride is now added to tooth fillings: it is expected to leach out. When fillings have toxic pollutants or just plain toxic components, like urethane, maleic acid, or an azo dye they will leach out, too. And I find them in the tumors of a cancer sufferer.

Dr. J: *There is no perfect dental material. The best filling is never needing*

one. The question of toxicity is of degree. If a patient has a terminal disease, they will not be able to tolerate any contaminants. Fortunately, most patients are not in such dire circumstances.

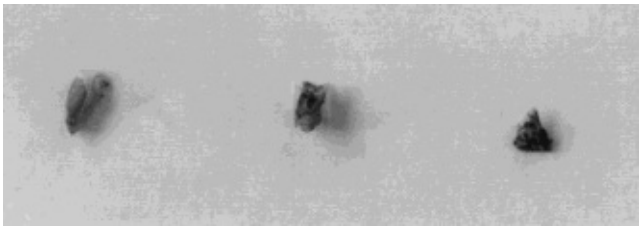
Finding the right dentist is your first and most important task. The alternative dentists have been leading the movement to ban mercury from dental supplies. Not only mercury, but all metal needs to be banned.

If your dentist will not follow the necessary procedures, then you must find one that will. The questions to ask when you phone a new dental office are:

1. *Do you place mercury fillings?* (The correct answer is NO. If they do, they won't have enough commitment to do removals properly.)

2. *Do you do root canals?* (The correct answer is NO. If they do, they do not understand good alternative dentistry.)

3. *Do you remove amalgam tattoos?* (The correct answer is YES. Tattoos are pieces of mercury left in the gum tissue, or that settled on the jawbone as it was temporarily exposed during dental work.)



Find the black dot on each bone fragment. That is the tattoo, although the rest of the bone fragment that was removed is also discolored by amalgam.

Fig. 23 Tattoos

4. *Do you treat cavitations?* (The correct answer is YES. By cleaning them.) Cavitations are simply holes (cavities) left in the jawbone by an incompletely extracted tooth. A properly cleaned socket, which is left after an extraction, will heal and fill with bone. Dentists routinely do NOT clean the socket of tissue remnants or infected bone. A dry socket (really an infected socket) is a common result. These sockets never fully heal. Thirty years after an extraction, a cavitation will still be there. It is a form of osteomyelitis, which means bone infection.

Dr. C: An x-ray showing a cavitation is on page 96. I often see osteomyelitis (bone infection) in the rest of the body, particularly in bone cancer.

It always starts in the jaw bones due to some dental problem. It spreads from the jaw to the rest of the body. Amazingly, when we clean up the jaw, other areas of osteomyelitis clear up, too! *Staphylococcus aureus* is always present in cavitations.

Dr. J: *It will be very frustrating for people to find a dentist who can answer all four questions correctly. Most mercury-free dentists still use many metals in crowns. Many of these metals are carcinogens, such as nickel, chromium, and cobalt. These are the least expensive metals so it is a purely economic decision for the dentist.*

Cavitations are done by very few dentists. Some state dental associations claim that they do not even exist and that it is malpractice for a dentist to treat them. There are few training courses available and even then, dentists are reluctant to try to treat them. If a dentist says "Yes" to the first three questions and "No" to the fourth, they may still be a good choice. The dentist may be able to refer patients to an oral surgeon for treatment for their cavitations.

Dr. C: Something else to be aware of when looking for a new dentist: be considerate of the dentist's feelings when you ask questions. Even the alternative dentist likes to "run the ship" his or her own way. If you can get answers more discreetly, as from a friend or the receptionist, you might get better service. You should also inquire if the dentist uses a magnifying viewer or a camera and monitor device to spot tattoos. The dentist will be delighted to answer this question. It puts the dentist into the class of a select few who aim at perfection in their practice.

Dr. J: *If you choose a dentist who does not understand the importance of these questions, you could end up with new problems. Find the right dentist first even if you must travel hundreds of miles. There are 6,000 to 10,000 dentists who should be able to help. Some can do part of the work and refer you to a specialist for the rest. Five hundred to one thousand of these dentists can do it all.*

Dr. C: What is the treatment for cavitations?

Dr. J: *To prevent a cavitation from forming in the first place, you clean the walls of the socket very carefully at the time of tooth extraction. They must be free of rough edges and bits of tissue; one must use tweezers to carefully remove every tiny bit that might still be stuck. For old cavitations that have become sealed into the jawbone, the simplest way is to make a small access opening. The*

cavitation is flushed with antiseptic then cleaned using hand and rotating instruments. Then it is flushed again. They heal and fill with bone with few problems for the patient. Larger ones may require a second treatment.

Dr. C: I recommend squirting in a dilute solution of Lugol's iodine to sterilize the socket instead of commercial antiseptic. Six drops in a quarter cup of tap water gives enough solution to clean up several cavitations or sockets.

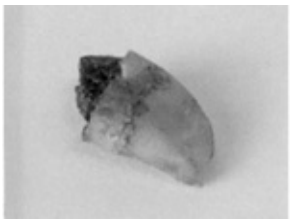
Dr. J: *US dentists use standard antiseptics or just salt water. Why not stay with that?*

Dr. C: Nothing is as effective as iodine. We are dealing with very vicious bacteria here, not just Staph, which is friendly by comparison. I often detect six varieties of *Clostridium* bacteria, and assorted *Streptococci*. They have very tough shelled capsules, or spores, inside them. The capsules survive even when the microbe dies. Later the capsules hatch again. But iodine kills the capsules, too. Tooth bacteria infect tumors; that's why I emphasize tooth bacteria so much. Lugol's iodine is easy to make and quite cheap (see *Recipes*). You don't feel any stinging sensation, of course, because your mouth is anesthetized.

Dr. J: *What about antibiotics? Dentists everywhere routinely use antibiotics to help after-procedure healing. It seems quite effective. Many use antibiotics to protect themselves legally, of course.*

Dr. C: *Clostridium* bacteria in the jaw bone do not respond well to antibiotics. They return as soon as the antibiotic is stopped. That is because the wound is rather deep, and there is very little oxygen deep down. This is the classical setting for *Clostridium*. Our "home remedy" antibiotic works better than commercial varieties. What often helps as much as antibiotics is just getting every iota of metal and plastic out of the mouth. This in itself restores the mouth immunity so suddenly that infections don't develop. It's quite remarkable.

Dr. J: ***The simpler the dental treatment, the better.*** *If the dentist says that he or she can remove your metal fillings but this would leave such a big hole it would be better to CROWN them, say "NO!" A crown is a prescription for disaster. The tooth has to be drilled down to a nubbin to fit the hollow cap (crown) over it.*



These teeth with their crowns removed reveal a black surface underneath and fine gray lines of further invasion of the tooth. It is invariably Clostridium at work.

Fig. 24 Black tooth under crown

Dr. C: The space between that nubbin and the cap is supposed to be completely filled, so no space exists for bacteria. But actually, that doesn't happen. Every crown I have seen removed revealed a gray to black tooth zone. This is where the *Clostridium* was growing right into the tooth. Since *Clostridium* is a "tumor microbe", that is, it can change RNA to DNA, such infected teeth must be quickly extracted for very sick patients. The infection is in the tooth, not on the tooth. You can assume that every crowned or capped tooth has gross infection underneath. The tooth cannot be cleaned up. Crowned teeth and capped teeth must be extracted.

Dr. J: *That's a lot of extractions for some people.*

Dr. C: Yes. A mouthful of caps or crowns must be exchanged for dentures or partials. They should not have had crowns put on in the first place. Of course, the hazard was not known at that time.

Dr. J: *Would you suggest different dentistry for healthy and sick people, then?*

Dr. C: I suppose we do this unconsciously, already. When we are sick we stop our bad habits and risk taking. Later, when we are well we return to them. But it isn't logical. It's only a matter of time when we must correct our mistakes. A sick person has only weeks to root out the sources of his or her body's infections, while those who still feel well may have years remaining, depending on body immunity.

Dr. J: *What do you do for yourself? Do you have metal or plastic in your mouth?*

Dr. C: All my large plastic fillings became extractions. I plan to fill the backspaces with partials. At present, there is no filling material safe enough to keep permanently in my mouth, but I am watching the dental marketplace in Germany. They are aware of the toxicity problem from plastics and may be the

first to solve it.

Dr. J: *What about the front teeth? Are you carrying plastic in them?*

Dr. C: No, I simply had the plastic taken out by air abrasion. This avoids enlarging the original hole. I am keeping the holes empty and very, very clean. Perhaps a new non-toxic plastic will be developed soon. In fact, I was hoping you would develop it.

Dr. J: *So you took out the plastic I so artistically put in 13 years ago?*

Dr. C: Yes, and I am happy to tell you I had no *Clostridium* infections under them. So it can be done! Maybe your technique was superior. Maybe no open dentine was involved, only enamel! The technique being used everywhere else, though, has to be much better before it is acceptable.

Dr. J: *Then why did you remove them?*

Dr. C: When I originally tested the composite you were going to use for me, I found it free of heavy metals but I didn't test for urethane and bisphenol-A. And I didn't test the base/liner and other little adjunctive materials a dentist uses besides the composite. These become part of the restored tooth and leach their toxins constantly. So my fillings were seeping copper, cobalt and vanadium, which I detected in my retina and optic nerve. In addition I detected mercury and silver that was stuck under the plastic fillings–the remains of my previous amalgams. But they came out with the air abrasion.

Dr. J: *Do you think that small amount matters?*

Dr. C: That tiny amount makes the difference between recovery and no recovery for the very sick patient. In healthier people you don't notice the health boost.

Dr. J: *Since you are now extracting mercury-filled teeth instead of refilling them with plastic, do you use any special precautions?*

Dr. C: Extractions should be done carefully, so the amalgam doesn't break up, letting little pieces get away to lodge in crevices in the gums, the bone or the hole itself. In Mexico we routinely refer the patient to an oral surgeon for extractions and to a dentist for air abrasion cleaning or temporary cement fillings.

Dr. J: *No dentist in the US would extract a tooth just because it has a large*

amalgam filling in it.

Dr. C: The amalgam is very toxic. The available plastic replacements are toxic, too. But to prove this, you would need Syncrometer® technology, searching for metals in the bone marrow, spleen, thymus, lymph nodes. That's where it's killing you by blocking iron metabolism. It doesn't chelate out. Your choice is to succumb to illness or extract. Extractions are life saving. Patients will need to go to foreign countries for their dental work.

Dr. J: *How could you convince a seriously ill patient to do that?*

Dr. C: Words are not convincing so I don't try too hard. But if an MS patient who is disabled sees another MS patient gain ground after tooth extraction it is quite convincing. The results come so quickly that there is no argument, likewise, for the cancer or AIDS patient. They may be concerned about the "stress" on their bodies from extractions. But when they see similar patients start to eat again, get dressed or go for a walk within days after getting their extractions, it doesn't take persuasion. It's seeing the miraculous recovery of others in the same hopeless situation that's convincing. In fact, I have heard patients say, "Who needs their own teeth in a wooden box?"

Dr. J: *What percentages of patients give such a dramatic response?*

Dr. C: All of them, 100%. Evidently, toxic dentalware was a large part of each person's problem. The patient has run out of detoxifying capability for heavy metals in certain vital organs, and the tiniest bit now tips the scales, even tattoos. The front teeth must be cleaned out carefully, as well, because the plastic still has metal (copper, cobalt, and vanadium). After this, all the teeth are polished clean with the same air abrasion device using baking soda (instead of aluminum oxide). Baking soda will combine with metal oxide in crevices and do a perfect job of cleaning up after amalgam. You do the same for plastic fillings. A dramatic response only comes after the entire job is completed.

Remember to wait until your gums are healed over before doing the air abrasion of front teeth, otherwise particles could lodge in the wound site. It takes four to six days.

Dr. J: *You advise using a rubber dam, don't you?*

Dr. C: Yes, a rubber dam plus a suction device to keep bits of loose amalgam from swimming away to other locations, hiding under gums and settling in extraction sites never to be found again. That's disastrous.

Dr. J: *How do you fill these new holes left after removing metal and plastic fillings?*

Dr. C: You don't.

Dr. J: *Don't they get infected?*

Dr. C: Not in half a year's time. That's plenty of time to get well in. After the patient is well, some risk-taking comes to their mind again and they are determined to fill the holes. After narrowly escaping death, though, would you risk putting anything even slightly suspicious back in your mouth to suck on continuously?

Dr. J: *The answer to that is easy, no, of course. But what about infection? Don't all the open teeth start to ache?*

Dr. C: No, they don't. Patients treasure these last teeth. They keep them squeaky clean by brushing with colloidal silver (five drops on toothbrush), or with white iodine; that saves them from infection. If a tooth does become infected, it becomes an extraction.

Dr. J: *Ultimately, do you fill them?*

Dr. C: Yes, with zinc oxide and eugenol, common ZOE cement.[23]

Dr. J: *That's really going back in time. If you don't mix the zinc oxide and eugenol in the right proportion it will crumble right out.*

The various ZOE supplies I tested were free of contaminants provided they were sets of powder and liquid, not the premixed varieties.

Fig. 25 Good ZOE varieties

Dr. C: We're doing it very well in Mexico. No problem at all. No crumbling. They look bright white, a little too white, but maybe a safe colorant will soon be

found. The good thing is that these ZOE fillings clean out easily; with air abrasion you don't even need anesthetic and you don't have to drill the hole bigger every time you exchange it for a new ZOE filling or for safe plastic when that becomes available. It was meant to be temporary, but is holding up very well, as long as enough powder is used in the ZOE mix.

Some people are allergic to ZOE, but this can be tested beforehand, and one of the other cements used instead.

Guidelines For A Healthy Mouth

If you have	**then...**
Metal fillings Inlays and onlays	Change them to zinc oxide and eugenol . The original powder and liquid come in 2 separate bottles. The ratio of powder to liquid determines the hardness. No premixed or faster setting varieties are safe. Caution, do not use base/liner, adhesive, bonder, primer or other preparatory agents except as discussed later.
Crowns (all types)	Extract tooth entirely.
Bridges	Change to methacrylate partials.
Metal partials	Change to methacrylate partials.
Dentures	Change to methacrylate dentures.
Porcelain denture teeth	Change to methacrylate denture teeth: they must come loose in a bag, not set in a wax bar. The wax adheres and pollutes the whole denture, unless you wash each tooth thoroughly and dry it.
Badly damaged teeth	Become extractions.
Root canals	Become extractions.
Braces and implants	Avoid.
Cavitations	Need to be surgically cleaned and disinfected with diluted Lugol's iodine .
Temporary crowns	Become extractions.
Temporary fillings	Same procedure as for metal fillings.

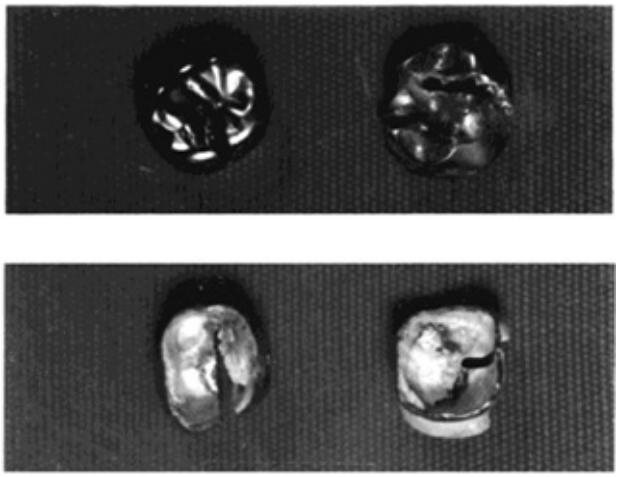
The guidelines can be summarized as:

1. Remove all metal and plastic from the mouth.

2. Remove all dead or infected teeth and clean cavitations.

Dr. C: Removing all metal and plastic means removing all root canals, fillings and crowns. Take out all bridgework or partials made of metal or plastic and

change them into methacrylate. But you may feel quite attached to the gold, so ask the dentist to give you everything she or he removes. Look at the underside. You will be shocked at the corrosion.



The top surfaces of tooth fillings are kept glossy by brushing (you swallow some of what is removed). Underneath is tarnish and foulness. Ask to see your crowns when they are removed.

Fig. 26 Tops and bottoms of some metal crowns.

The stench of the infection under some teeth may be overwhelming as they are pulled. *Clostridium* gases are particularly offensive. Bad breath in the morning is due to such hidden tooth infections, not a deficiency of mouthwash!

All metal must come out, no matter how glossy it looks on the surface. Metal does not belong in your body. It is toxic to your metabolism and your immunity. Do this as soon as you have found a dentist able to do it. Find a dentist with experience and knowledge about this subject. It is more than replacing acknowledged culprits like mercury-amalgam fillings. This is toxin-free dentistry. Only non-toxic plastic should be put back in your mouth. At present, only methyl methacrylate has been found to be safe, along with the cements, zinc oxide and zinc phosphate. More varieties could be on the "safe" list, like the silicates and carboxylates, if these compounds are ordered from a chemical supply company, rather than a dental supply.

These are a few of the dental supplies I tested. They contain one or more of the tumorigens: copper, cobalt, vanadium, maleic acid, malonic acid, urethane, or scarlet red azo dye.

Fig. 27 Dental materials

Dental plastic, to be safe, must not contain malonic and maleic acids, nor urethane or bisphenol-A, nor a carcino-genic "azo" dye, nor polluting heavy metals. Not only the restorative material, but the liner/adhesive, bonder, primer, etc. must be free of these toxins. An analysis for these toxins should be a requirement for all dental materials.

Dr. J: *If your dentist tells you that mercury and other metals will not cause any problems, you will not be able to change his or her mind. Seek treatment elsewhere!*

Your dentist should do a complete x-ray examination of your mouth to begin with. Ask for the panoramic *x-ray before starting dental work. The* panoramic *x-ray shows the whole mouth including the jaws and the sinuses. This lets the dentist see impacted teeth, root fragments, bits of mercury buried in the bone and deep infections. Cavitations are visible in a panoramic x-ray that may not be seen in the usual tooth by tooth "full mouth series."*

Dr. C: Here is a sample of a panoramic x-ray.

A print of an x-ray reverses the light and dark areas. Since you will be comparing this print with your own x-ray, you must convert light areas on the print shown here to dark areas on your x-ray.

Fig. 28 A print of a medium-good quality panoramic x-ray

To read your panoramic x-ray, tape it up on a window. First find the angles of your jawbone, noting left and right side and top and bottom. Use a hand magnifying glass to study it.

Next, look at the lower teeth: The root tips are on the print, but not very clear. The x-ray machine produced two dark vertical lines at the centers, obscuring the roots further (a good reason to get it redone on the spot). Under each end-tooth is a roundish white spot. On the x-ray film, which you would be examining, these would be dark spots. These are the holes in the jawbone that allow the nerve and blood vessels to pass through. Note that a tooth was pulled three months ago on the lower left side. The bone has already filled in almost to the top, so that a nearly flat line is seen to mark the ridge of the jaw bone from one side to the other.

You Be The Judge

It doesn't take an advanced degree in dentistry to judge whether it is a good or bad x-ray. Are all the root tips visible? If not, you wasted your money; you got the panoramic so you could see the root tips and beyond! Since the x-ray can be viewed right at the time it is made, you can request a retake (it costs very little extra).

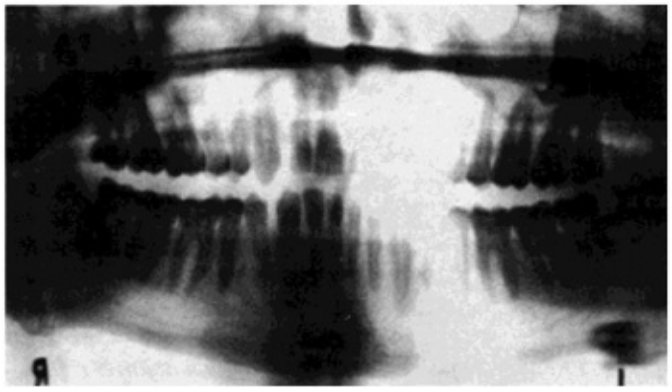
This particular x-ray should have been done over, because looking at the upper teeth no root tips are visible. The mouth was not correctly positioned for the x-ray. Also, the teeth at the ends are a solid black, so nothing can be deduced about them. The intensity setting on the x-ray machine was not correct

for them. A duplicate x-ray at a different setting would have been wise.

Locate the center. You have four small flat teeth in front on the lower side. The center is between them so two are on the left side and two on the right. The center on the upper side is easier to find; see the arrow.

The fifth tooth from the center at upper left has a black cloud emerging from the root tip like a swarm of gnats above it. This is an infection; the bacteria are parading up towards the brain. Brain tumors are made of such events. Trying to save such a tooth would be a bad mistake, even though it "looks good and was giving no trouble." Plastic (black edges) can be seen on the inner edge of the top center teeth; this was done for cosmetic purposes. A few more bits of plastic are seen here and there. No cavitations are seen in the bottom half where the visibility is good.

A large tattoo did not show up on this x-ray although the dentist spotted it easily while working on the mouth.



No fillings, no crowns, no cavitations, but perhaps a dead tooth led to the abscess at the white spot above the R. Drainage revealed mere mush, implying infection, as far as the probe could reach.

Fig. 29 Good quality panoramic

The second panoramic shows all the root tips. There are no cavitations seen. Notice the round white spot (black on the x-ray film) just above the R. This was an abscess, far removed from the teeth, but probably stemming from a dead or infected tooth. An x-ray cannot identify dead teeth. They should have been tested for vitality. A dead tooth always harbors *Clostridium*. Such a "silent" infection will reach vital organs such as thymus, bone marrow, and spleen, besides the tumor! All dead teeth should be extracted.

The last panoramic, although poor quality, shows a large cavitation at the lower right. One or two teeth extracted there long ago left a large hole with

infection (dark area) along the sides. Thorough cleaning would have allowed it to fill in with bone again and stop the chronic illness (including cancer) this patient suffered from. At the upper right, a solitary tooth is sitting in a bed of infection. The dark black areas are metal. Syncrometer® tests of this patient showed that the tooth bacteria, *Staphylococcus* and *Clostridium*, were both present at the breast, producing growth factors and turning RNA into DNA to spur the tumor there.

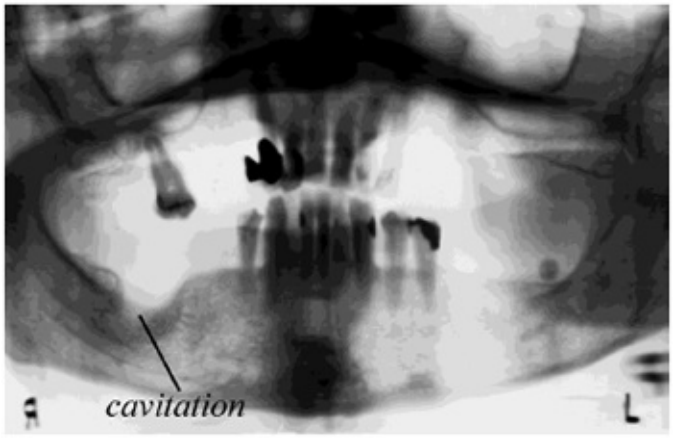


Fig. 30 Panoramic showing large cavitation at lower right.

Dr. J: *White areas on the print (black on the negative) are either overlapping teeth or plastic fillings. The dentist is the best judge of this. Ask the dentist to interpret them for you.*

Dr. C: We are accustomed to thinking that plastic is metal-free. This is wrong. Modern plastic contains metal both as components and as contaminants, even including mercury. A possible explanation is that manufacturers are using recycled chemicals. It is particularly important not to get copper,[24] cobalt, or vanadium seeping from the plastic since these cause bone marrow, liver, spleen, and thymus toxicity. They diffuse out into the saliva and from there to the tumor or other unlucky organ. Most of the time metals are purposely added to the plastic to make it harder and give it sheen or color.

Dr. J: *The chief reason is a frivolous one; so the fillings are visible on x-rays! Dentists are not given information on metals added intentionally. The information that comes with dental supplies does not list them either. Many are listed on the Material Safety Data Sheets (MSDS). Dentists are required to keep these in their office. The ADA, also, has a library full of such information.*[25]

Dr. C: There are many lanthanide (rare earth) metals used in dental plastic. Their effects on the body from constantly sucking on them have not been studied. Only metal-free plastic is safe. And of course it should not have urethane, bisphenol-A, or a carcinogenic dye, either.

Dr. J: *At present there is only one acceptable denture plastic; it can be procured at any dental lab and is used to make both dentures and partials.*

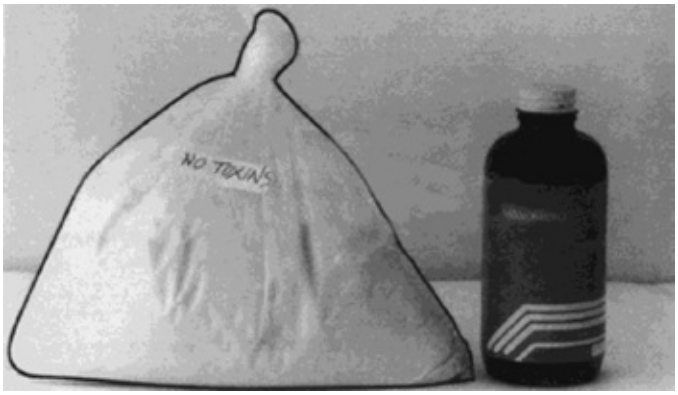
- *Plastic for dentures: methyl methacrylate. Available in clear and pink. Do not use pink.*

- *Plastic for partial dentures: methyl methacrylate. Available in clear and pink. Do not use pink.*

Dr. C: The pink color is from mercury, cadmium, or scarlet red dye, which is added to the plastic. This dye is also called **Sudan IV**, and is a potent carcinogen. It was used by surgeons in World War I. Rubbing it into the wound made it "heal" faster. Much later, it was noticed that tumors grew from the wound and the practice was stopped.[26]

Plastic teeth that are made from methacrylate do not have metal, maleic, bisphenol, scarlet red dye, or urethane pollution. I tested many with the Syncrometer®.

Dr. J: *I think the reason methacrylate products are not polluted is that the supplies for making them consist of only 2 bottles, one with powdered methyl methacrylate and one with the liquid "monomer". The monomer is a two-molecule bit of methacrylate, which forms the solution. Powdered methacrylate is added to the liquid according to the recipe and the whole thing polymerizes into a solid.*

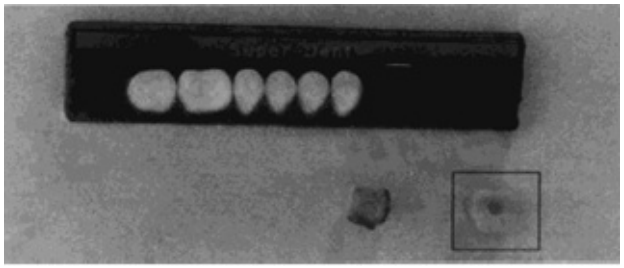


The bag contains methyl methacrylate powder, very cheap when purchased in bulk. The bottle contains the liquid monomer.

Fig. 31 How simple to make dental acrylic!

Dr. C: Teeth themselves come in many styles and sizes that the dentist or lab technician picks from a catalog. Make sure the dentist orders loose teeth in a bag for you, not teeth set in a wax bar (called a "card"). The wax from the bars I tested characteristically had nine tumorigens: copper, cobalt, vanadium, malonic acid, methyl malonate, maleic acid, maleic anhydride, D-malic acid and urethane in addition to bisphenol-A, an estrogenizer! Or ask for your teeth in advance so you can clean them up yourself (pay for them in advance, too, in case you lose one down the sink). After prying them out of the wax bar, wash with plain tap water; then dry very thoroughly until perfectly polished.

Methacrylate teeth, called "acrylic", bond very well with the methacrylate denture plate or partial, still it will be tempting for your dentist to apply "just a dab" of special adhesive. The adhesive has tumorigens and, once again, your efforts to have safe dentalware will be foiled. That little dab or touch-up is extremely important. Make sure no adhesive or anything else is used to stick the teeth in their places.



Two of the teeth have been removed and are shown in the foreground. The left one shows the adhering wax. The one on the right has been washed and dried.

Fig. 32 Wax card plus two removed teeth

If your dentist did not use anything but methyl methacrylate powder and monomer and did not use teeth straight from the wax card and did not use adhesive to stick them in their places, you will have safe dentalware.

But you cannot expect a dental lab to do all this. And dentists are accustomed to sending all dentures and partials to dental labs for manufacture. You are left with four options:

1. Your dentist gets into the business of making non-toxic dentures or arranges for a dental lab to do so.

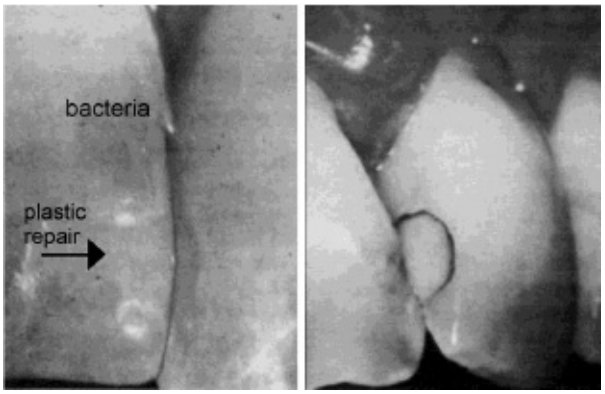
2. You take it up as a hobby yourself–take a course in dental technology.

3. You organize a co-op to do this work for the alternative dental trade.

4. You send your dental impression, "bite block", or old dentures to a specialized lab for denture making (see *Sources*). The bite block assures proper alignment, occlusion, etc.

The materials themselves are very cheap. If you change your mind about appearance of teeth or need a better fit, you could have them changed or even have a second "Sunday" set made.

Dr. J: *Many people (and dentists too) believe that porcelain is a good substitute for plastic. Porcelain is aluminum oxide with other metals added to get different colors (shades). The metal does come out of the porcelain! It has many technical drawbacks as well. Porcelain is not recommended.*



The left tooth has a plastic repair up to the faint wavy line. Above this is gray discoloration due to bacterial invasion. The plastic filling in the tooth on the right has a black outline of bacteria.

Fig. 33 Teeth with visible bacteria

Dr. C: The new glass ionomers are even more polluted than plastic. Yet, the underlying concept is a good one; simple glass is not toxic. Remember, though, that toxicity isn't the only problem with dentalware. Even if a perfect, non-toxic filling material is developed, we would still need a perfect, non-toxic bonding technique that solves the infection problem.

Dr. J: *"Micro-leakage" is the dental term used to describe the penetration by bacteria into the microscopically small space left under fillings, due to poor adhesion. This crevice shouldn't be there.*

Dr. C: In Germany, the dentists feel they have the micro-leakage problem solved for adhesion to enamel.

Dr. J: *That's the easy part. I had that solved when I filled your teeth—it's*

getting adhesion to the dentine that's the problem! The new bonding techniques are meant for the dentine as well as enamel.

Dr. C: But it's just not successful. The tiniest microscopic flaw in the bond between the natural tooth surface and the dental material gives *Clostridium* bacteria a chance to start. And they are present in **every patient with large fillings**. The adhesive technology must be improved to be safe.

Dr. J: *It's an old truth: If the public demands plastic restorations that don't leach toxins and that adhere to the tooth without micro-leakage, the industry will develop it. The secret is in the public being knowledgeable about the issues. People could organize their own safety groups and exchange information. People need to be protected by others like themselves, not corporate executives.*

Dr. C:I'd like to thank Dr. Jerome for his contribution to this section, and his pioneering work in metal-free dentistry. I hope more dentists acquire his techniques.

Horrors Of Metal Dentistry

Why are highly toxic metals put in materials for our mouths? Because not everyone agrees on what is toxic at what level. Just decades ago lead was commonly found in paint, and until recently in gasoline. Lead was not less toxic then, we were just less informed! The government sets standards of toxicity, but those "standards" change as more research is done (and more people speak out). You can do better than the government by dropping your standard for toxic metals in your mouth to zero! Simply remove all metal.

The debate still rages over mercury amalgam fillings. No one disputes the extreme toxicity of mercury compounds and mercury vapor. The ADA feels that mercury amalgam fillings are safe because they do not vaporize or form toxic compounds to a significant degree. Opponents cite scientific studies that implicate mercury amalgams as disease causing. Many dentists advocate mercury amalgam fillings simply because they are accepted by the ADA, which they believe protects them from malpractice litigation. Why risk your health and life on their opinions? Remember everything corrodes and everything seeps, so dental materials must too.

Amalgams also contain copper, cobalt, and vanadium. This combination at a steady slow trickle from our teeth poisons the liver, bone marrow, thyroid, thymus, spleen and parathyroids. These organs have regulatory functions: they

must regulate how much albumin or globulin is made, how high or low the calcium level goes, and so forth. These regulatory organs have active centers containing iron and sulfur. Evidently the heavy metals compete with these to knock out the regulatory center. When these organs fail we die. We die from anemia, heart failure, edema, uremia or sepsis, although technically it is called cancer or AIDS.

Often mercury amalgam tooth fillings also test *Positive* to thallium and germanium with the Syncrometer®. Inorganic germanium is extremely toxic, while thallium causes leg pain, leg weakness, and paraplegia. If you are in a wheelchair without a very reliable diagnosis, have all the metal containing teeth removed from your mouth. Don't try to restore them. Search carefully for tattoos. Even the tinniest speck makes the difference between getting out of the wheelchair or staying in it. Small fillings could be cleaned out by air abrasion. Don't refill them until your condition improves. Ask the dentist to give you the grindings. If you are curious, try to have them analyzed for thallium using the most sensitive methods available, possibly at a research institute or university.

I was astonished to find thallium in mercury amalgams! It couldn't be put there intentionally, look how toxic it is:

TEJ500 **HR: 3**

THALLIUM COMPOUNDS

Thallium and its compounds are on the Community Right To Know List.

THR: Extremely toxic. The lethal dose for a man by ingestion is 0.5-1.0 gram. Effects are cumulative and with continuous exposure toxicity occurs at much lower levels. Major effects are on the nervous system, skin and cardiovascular tract. The peripheral nervous system can be severely affected with dying-back of the longest sensory and motor fibers. Reproductive organs and the fetus are highly susceptible. Acute poisoning has followed the ingestion of toxic quantities of a thallium-bearing depilatory and accidental or suicidal ingestion of rat poison. Acute poisoning results in swelling of the feet and legs, arthralgia, vomiting, insomnia, hyperesthesia and paresthesia [numbness] of the hands and feet, mental confusion, polyneuritis with severe pains in the legs and loins, partial paralysis of the legs with reaction of degeneration, angina-like pains, nephritis, wasting and weakness, and lymphocytosis and eosinophilia. About the 18th day, complete loss of the hair on the body and head may occur. Fatal poisoning has been known to occur. Recovery requires months and may be incomplete. Industrial poisoning is reported to have caused discoloration of the hair (which later falls out), joint pain, loss of appetite, fatigue, severe pain in the calves of the legs, albuminuria, eosinophilia, lymphocytosis and optic neuritis followed by atrophy. Cases of industrial poisoning are rare, however. Thallium is an experimental teratogen [used to induce birth defects for study]. When heated to decomposition they [sic] emit highly toxic fumes of Tl [thallium]. See also THALLIUM and specific compounds.[27]

Fig. 34 Thallium excerpt

Even if you do not have cancer, it would make sense to have all your metal fillings out if you have several of the listed symptoms.

Thallium pollution frightens me even more than mercury, because it is completely unsuspected. Its last major use, rat poison, was banned in the 1970s. One current use for thallium is in Arctic/Antarctic thermostats. When added to mercury the mercury will stay liquid at lower temperatures. Are mercury suppliers then providing the dental industry with tainted amalgam?

Who tests for the purity of dental mercury? What is tested for? As recently as 1972, mercury was considered pure if you simply looked at it.

> The purity of dental mercury in the American Dental Association specification is defined by its surface appearance, its residue after pouring and its nonvolatile residues. The tests for surface appearance and pouring residue can determine the presence of 0.001 percent or more of base metal impurities. The addition of 0.001 percent of copper, zinc, tin, lead, bismuth, cadmium, arsenic or antimony caused an immediate change in the appearance of the surface of mercury. The mercury lost its mirror-like appearance and a film or "skin" formed on the surface. The contaminated mercury wetted the glass container and the container could not be completely emptied. The effect was very pronounced and could be readily detected in each case. However, the addition of 0.001 percent of silver or gold did not cause a change in the appearance of the mercury.[28]

Fig. 35 "Pure" mercury excerpt

The question is: how would you detect other, more toxic metals, like thallium or germanium, at lower concentrations? If they are present, why have they not been found? Either no one has looked for them or they are hard to find. (Thallium and mercury are next to each other in the periodic table of elements, meaning their mass is almost identical, which may contribute to the difficulty.)

The cancer-causing action of metals has been studied for a long time, although it doesn't get attention by our regulatory agencies. A scientific book on this subject was published in 1980.[29] We can see that chromium and nickel compounds are the most carcinogenic metals. Nickel is used in gold crowns, braces and children's crowns!

Note that the form of the metal is very important. Some metals have an essential/toxic duality. For instance, chromium is an essential element of *glucose tolerance factor*, but most of its other compounds are extremely toxic. In general, xenobiotic compounds (foreign) are to be avoided! Metal doesn't belong in our foods or in our bodies.

Dental Aftercare, Prevent Infection

One of the chief purposes of doing the Dental Clean-up is to kill all *Clostridium* bacteria that have invaded the deeper regions of the jaw bone. They come originally from the crevices under plastic tooth fillings. Antibiotics are not successful in such a task because they only inhibit the bacteria until your immune system has time to rally and mount a big response. In a cancer patient, this immune response never happens. And as soon as the antibiotic is stopped, new, more serious bacteria surface to bewilder and defy attack.

A very vigorous program is needed to clear up infection after the infected teeth are pulled because deep wounds are the preferred locations of *Clostridium*.

Just removing the tooth does not automatically clear up the small abscess at the tip of the root, even with antibiotics. Not when *Clostridium* is the inhabitant. Cleaning the socket thoroughly can prevent *Staphylococcus* invasion but does not prevent *Clostridium* invasion which is deeper down.

This Dental Aftercare program is successful in killing *Clostridium*, *Staphylococcus*, and *Streptococcus* bacteria all together. (*Streptococci* go to your joints to cause arthritis.) You will need:

- A water pick.
- Lugol's iodine solution (see *Recipes*) six drops in ½ glass water four times per day.
- Colloidal silver (see *Sources*), take as directed by provider.
- Inositol, a supplement, 500 mg, take two four times a day.
- Betaine hydrochloride, a supplement, about 300 mg (see *Sources*), take two three times a day.
- Baker's yeast cakes (keep refrigerated) ½ cake once a day with breakfast.
- Raw garlic, one clove a day, or germanium (carboxyethyl germanium sesquioxide only, see *Sources*) one a day.
- Hot water.

Acquire these before your dental appointment. Practice using the water pick and making the colloidal silver. The most important of all these is the hot water!

The immune power of your arterial blood is much greater than in your veins. How can you bring arterial blood into the jaw area to heal it faster after dental work? Simply by hot-packing it from the start!

The first day of dental work is critical. If you miss this, a massive spread of infection can occur because the mouth is always a "den of bacteria," and the abscessed teeth are themselves the source. As soon as you get home from the dentist you need to bathe your mouth with hot water. The heat brings in arterial blood. Swish gently. Keep the cotton plug in place for you to bite down on and reduce bleeding, even while swishing. Don't suction the water around your mouth, you could dislodge the clot that needs to form in the socket. Gently move the hot water about your mouth. At the same time apply a hot pack to the outside of your face where the dental work was done. Wring a washcloth out of the hottest water you can endure. Or fill a plastic baggie halfway with hot water, zipping it shut securely. Do this for 30 minutes four times a day, for a few days, then three times a day for a week—even when there is no pain. Don't suck liquids through a straw for 24 hours; the sucking force is especially risky, it could dislodge the healing clot. Don't allow your tongue to suck the wound site, either; and don't put fingers in your mouth.

As the anesthetic wears off there will be very little pain if the bacteria in the tooth sites have been killed. But you could introduce the bacteria yourself, by eating, and by putting fingers into your mouth. Consider your mouth a surgery site. Anywhere else on your body, the surgery site would be scrubbed first, then painted with iodine or other strong antiseptic, and later sprayed again and bandaged to keep everything out—certainly food particles and fingers!

But the mouth cannot be bandaged and you must eat! So eat a big meal just before your dental appointment. Afterwards, for the rest of the day, drink only clear liquids, such as tea with honey or confectioner's sugar. You may need a painkiller on the first night; choose a non-aspirin variety to minimize bleeding.

Take the supplements described above.

Bleeding should be considerably reduced by bedtime. The cotton plug put in your mouth by the dentist may be thrown away. However, if bleeding is still substantial, make a new plug for yourself by rinsing the fresh gauze the dentist gave you, then rolling it into a wad shaped like your finger. If the dentist did not give you any gauze, use paper towel. Place the wad on top of the bleeding gum and bite down hard.

The next day you need to be well fed, yet without eating solids or liquids with particles in them. The particles lodge too easily in your wound. Your choices are:

1. Chicken broth, strained, skimmed of fat.
2. Milk, boiled, cooled with vitamin C added.
3. Eggnog, made with boiled milk.
4. Plain ice cream made with boiled cream (see *Recipes*).
5. Pudding made with cornstarch or flour.
6. Fruit and vegetable juice, strained.

Immediately after "eating" (drinking), water pick your mouth with very hot salt water. Do not be afraid to start some bleeding; this could be expected and is desirable if an infection has already started. Water picking never dislodges the healing clot, only strong suction or infection dislodges it.

Continue taking the supplements described above.

If pain increases instead of decreases on the second day, you have an infection. Water pick continuously for an hour! If the pain subsides, the infection has cleared. Water pick until the pain is completely gone. It could take four hours!

On the third day you may drink blended food (particulate); do not try to chew solids. Water pick after each meal. Floss the front teeth and brush them with white iodine or colloidal silver (hydrogen peroxide is not strong enough).

Continue taking the supplements described above.

If the pain level is increasing and water picking has not succeeded, you must hurry back to the dentist to search for food particles. He or she will open the wound and clean it out again.

Continue to hot pack, hot swish, water pick, floss, brush, and take the supplements for one week. If you detect an odor from your mouth, at any time, it is *Clostridium* making a comeback, even without pain. Try water picking for a half day, if that doesn't help, hurry back to the dentist. Assuming no problems, however, you may reduce the supplements by half and stay on them for three

more weeks.

It is common for dentists to recommend cold packing to reduce swelling after dental work. I recommend hot packing because I consider swelling less important than infection or pain, especially if you are not on an antibiotic.

If your dentist carefully cleans the sockets and rinses them by squirting Lugol's solution into them, and if you are doing the *Dental Aftercare* program conscientiously, you will not need an antibiotic or extra painkiller. This conclusion is based on over 500 cases of dental work, all free of antibiotics and infection. In every case of failure (infection), trapped food particles were the cause.

Antibiotics are too unreliable for cancer patients, with one exception, heart disease. Here, *Staphylococcus* plays a major role, and antibiotics should always be added. Typically, however, you can look forward to your jaw healing stronger than ever, a boost of health, and no antibiotics or side effects!

Dental Aftercare, Heal The Jaw

To heal your jaw bone after dental work you need extra **calcium**, **magnesium** and **vitamin D**. Because most supplements are highly processed, and therefore contain trace amounts of solvents and heavy metals, it is wiser to use the food nature intended for growing bones. Namely baby food. Mother Nature provides milk for this purpose. Goats' milk or cows' milk has the extra calcium (one gram per quart) you now need. But milk can not be consumed as it arrives from the grocery store. Many harmful bacteria ride along from the dairy barn, through the milk tanks and into your milk container. *Salmonellas* and *Shigellas* are two very harmful bacteria always found in every milk sample I test. *Clostridium* and *Rhizobium* are other common types. Besides bacteria, one can find eggs of parasites, such as tapeworms and flukes in milk. And since cheese, yogurt, ice cream and butter are made from milk; they too are contaminated, in spite of pasteurization. Of course, you could test your dairy products with a Syncrometer® to try to find a good one.

But there is a simple way to correct this sanitation problem. Boil the milk with a pinch of salt. Ten seconds is minimum. This would not be long enough for some exceptionally hardy bacteria, but it is enough to kill the tapeworm cysts and bacteria varieties I commonly detect. The salt raises the

boiling temperature just enough to kill *Rhizobium leguminosarum*, too, which is extra hardy.

Milk also has traces of malonic acid, a strong metabolic inhibitor, and boiling does not detoxify it. It must be detoxified with a small amount of vitamin C powder, 1/8 tsp. per pint. This could curdle some milk, so an equal amount of baking soda may be added first. These treatments actually improve the flavor.

Persons with anemia should buy raw milk in order to obtain the factor, *lactoferrin.* Raw goat milk is best because it has some of the same factors as shark cartilage in addition to lactoferrin. It must still be boiled. (More on lactoferrin and treating milk under *Clean Up Your Diet*.)

Besides milk, canned salmon or other fish also have extra calcium you need to heal dental work. It is in the bones. There are numerous tiny bones, too small to see or taste throughout fish.

So, to upgrade your dental health, begin by increasing your calcium intake with milk and fish. You need one to two grams of calcium (elemental) per day. One quart of milk has one gram. For canned fish, read the label. Make up any deficit with a safe calcium supplement (see *Sources*).

Get the extra **magnesium** you need from leafy green vegetables plus a supplement (magnesium oxide, 300 mg daily). Eat a green vegetable every day, during and after dental work. You may need to blend it in a blender until your dentures or partials are ready.

There are three hazards with eating greens: pesticides, *Ascaris* eggs and sprays. If you are not sure whether pesticides have been used, then only buy Swiss chard, cabbage, collards (large leafed greens) that can be easily washed. Eat them every day or make coleslaw or raw salad.

To kill *Ascaris* eggs and any other live parasite stuck to the greens, you must briefly soak the greens in iodine-water. One drop of Lugol's iodine in one quart of water is strong enough to kill on contact. If you leave this out you will have wasted the *Mop Up Parasite Program*. (It would be better not to eat greens!) All the lettuce, cabbage, and strawberries I tested had live *Ascaris* eggs, even after washing. Evidently, the fertilizer used on these crops is raw manure! A one-minute soak in Lugol's kills everything.

If you see spray nozzles in the produce section, you must detoxify any benzene that may be present with ozone. Rinse your greens and put them in a

plastic bag. Insert the air hose from your ozonator. After 20 minutes the benzene is changed to phenol. To get rid of the phenol, soak the greens for five minutes in a bowl of water with a pinch of baking soda added.

The extra **vitamin D** you need can be made by your own kidneys! The very dental work you are doing helps the kidneys make it. The *Kidney Cleanse* also helps. Commercial supplies are too polluted to risk.

Dental Aftercare Summary

You are hot-packing, hot-swishing, and water picking many times a day. You are flossing and brushing your remaining teeth with white iodine or colloidal silver.

You are taking Lugol's, colloidal silver, inositol, betaine HCl, baker's yeast, and garlic or germanium.

You now have the extra calcium, magnesium and vitamin D you need to heal your jaw bone.

You will return to take out stitches on time, as your oral surgeon advises. If bleeding and pain do not stop by the third day, you will return to your doctor before your stitch-removal appointment day.

The M-Family

As if avoiding metal were not enough, we must also avoid toxic plastic. The toxins I am referring to I call the "M-Family" and consist of **malonic acid** (also called **malonate**), **methyl malonic acid**, **maleic acid**, **maleic anhydride**, and **D-malic acid**. Malonic acid is widely used in organic chemical manufacturing[30] and most dental plastics test *Positive* to it, too, making it a common pollutant. Maleic acid is a component of some bonding agents[31] (meant for bonding the plastic to the tooth). You could be jumping from the frying pan into the fire if you trade your amalgams for plastic that contains malonic acid or any one of the M-family.

Malonic acid also occurs in certain foods.

Malonic and maleic acids, seeping from composites, glass ionomer or porcelain teeth, soon reach the tumor where metabolism is then slowed down, and *glutathione* is used up in order to detoxify them. Glutathione is critical, because without it bacteria and viruses grow unchecked in your cells, making

you sick. (The M-Family has many other bad effects, too.)

Wherever I observed any of the M-Family to be present, glutathione was absent. And where all of the M-Family was absent, glutathione was present (provided heavy metals were absent, too). Evidently, glutathione sacrifices itself to detoxify the M-Family.

To spare glutathione, your body has other detoxification mechanisms. Using vitamins and minerals, your body detoxifies malonic acid by converting it to methyl malonate. Then methyl malonate to maleic acid. Then maleic to maleic anhydride. And maleic anhydride to D-malic acid. That is why I call them a "family," and there are more family members I haven't researched yet.

Only dental materials known to be free of the entire M-Family as well as copper, cobalt, vanadium, urethane,[32] and scarlet red dye, are safe in your mouth. Having something in your mouth has the same effect as sucking on it constantly. Things like that should be as safe as food.

How would you know which dental materials are free of these? Don't expect your dentist to understand this problem. You can test electronically for them, like I do (Lesson 2 in particular), or use only the materials that I have found to be reliably safe, listed in the previous table.

One Step At A Time

As stated above, if you have a mouth full of metal or plastic and are ill with cancer, get it all removed. Extract teeth with large fillings. Don't put back anything. You will have holes and gaps in your teeth. But those holes could save your life!

It's hard to believe, but removing a dab of plastic or tiny speck of amalgam can mean the difference between getting well again or sinking.

After removing everything, get a new panoramic x-ray. Search the x-ray for tattoos and plastic again using a hand magnifier. Tattoos appear as tiny specks of light. Some specks are merely artifacts from dust on the cartridge. Plastic is hard to identify. Your dentist can tell the difference. These are very important findings.

After searching the new x-rays, also have your mouth searched by a dentist

who uses a magnifier. I have seen that a meticulous visual search for leftover bits of metal or plastic can reveal some that were missed on x-ray and change a deteriorating trend to recovery. Just one bit!

Always keep your final x-rays. Your earlier ones are obsolete, of course. If your dentist refuses to give them to you, offer to pay to have a copy made.You might want to take your copy to another dentist to study. Even several dentists could miss something important on your x-rays. This is not the dentists' fault; x-rays are an inadequate tool in many ways.

Choose a dentist who uses **air abrasion technology** for the final cleanup of leftover traces of amalgam and plastic. Don't refill the holes. Only after you are well and have regained strength and weight should you begin to plan your restorations.

If you are extremely ill...

and have little time left, but have only a few natural untouched teeth, extract all your teeth. Don't bother with x-rays, removing fillings, or finding safe materials. Get general anesthesia to minimize the trauma. Don't try to "save" those few good teeth because you risk your life missing just one unsuspected filling. Dentures are much safer than fillings, and a complete set fit better than partials. (Get fitted for dentures before the extractions.)

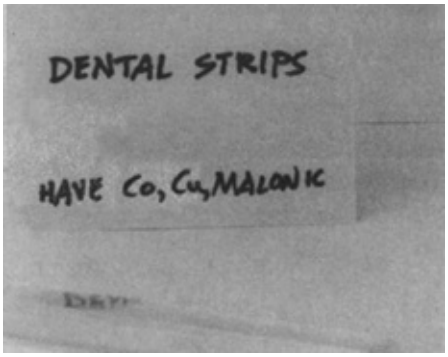
Follow the *Dental Aftercare* program diligently. You will notice an immediate improvement in appetite and blood building ability. The stress of the surgery is negligible compared to the benefit of removing the toxicity.

Unfilled cavities in remaining teeth require you to keep your mouth perfectly sanitary. Sterilize them before going to bed by putting one drop of straight Lugol's or white iodine on each "open" tooth and then brushing it around. If you are worried about staining, use white iodine although it is only half as strong as Lugol's. Open teeth treated this way are surprisingly resistant to infection. Rubbing baking soda on Lugol's-stained teeth removes stain. Alternatively, you may brush with colloidal silver (five drops on toothbrush).

If you feel yourself getting better, don't rush to put back some kind of filling. Wait until you have maximized your improvements, at least six weeks. Get used to how this feels, so you can judge if your new fillings will harm you. Keep

notes so you can be objective. Get a new complete blood test so your doctor can assess your overall health improvement.

Don't chew at an extraction site; drink as much of your food as possible (blend it). Rinse your mouth after eating anything. Before going to bed inspect your mouth for bits of food that got lodged. Flush them out with a water pick.



Wash the plastic strips your dentist plans to use.

Fig. 36 Dental strips

When going to the dentist to get teeth filled, beware of the plastic "strips." These are just strips of plastic the dentist places between your teeth to keep the goop and chemicals off neighboring teeth. They also give a smooth finish to your filling. But, commercial strips I tested were polluted with cobalt, copper, vanadium and the M-family! Perhaps they were dipped into a chemical solution to make them spot-free. These toxins do wash off. You could use the dentist's supply of strips if you took them to the washroom, washed them under the cold faucet and dried them. Don't neglect this detail.

Because there are no safe plastic restorations at present, your cavities are best refilled with a temporary material, zinc oxide and eugenol (ZOE) cement. It is safe to use pure calcium hydroxide Ca(OH)2 solution in the raw cavity first. It is painted over the nerve and the open ends of the dentine; it seals the cavity.

Don't be surprised or annoyed if a zinc oxide filling drops out. It wasn't meant to hold up to great pressure. Just have another one put in. At least the hole doesn't have to be made larger and no anesthetic is needed. Your dentist will soon master the new (in reality, old) skill.

If your dentist wishes to use additional substances like phosphoric acid or calcium phosphate, they should be ordered only from chemical supply companies (see *Sources*), dental sources are too polluted. But so far, I have not

found pollutants in zinc oxide, eugenol, zinc phosphate or methyl methacrylate ordered from dental supply companies. If there is no way to test the supplies, stick with chemical supply companies.

If you have a Syncrometer®, there is a way to test your present plastic teeth to see if they really do contain copper, cobalt, vanadium, the M-family, urethane, bisphenol-A, or scarlet red dye. You simply get emery boards used for filing nails. Then brush your teeth with plain water first. File one of your teeth, straight across the top and on the side. File hard. Then break the tip of the emery board where the filing marks are and place it in a reclosable plastic bag. Add a tsp. of filtered tap water. Test for these toxins electronically using pure standards (like Lesson Seven in *How To Test Yourself*). Do these tests in triplicate; that is, make three emery board samples of each tooth to be sure you are correct in identifying "bad" teeth. Don't be surprised to find all of them bad. Dentists regularly put a dab of plastic here and a dab there, just to "fix them up" as an extra favor to you while other work is being done. The toxins from all bad plastic are accumulating in your thyroid, liver, spleen, tumor, and bone marrow. You cannot tolerate these little "beautifications." Fortunately, air abrasion with baking soda removes it all in seconds.

Naturally, you would not deliberately eat malonate-containing food when you are going to a great deal of trouble to clean it out of your teeth.

Dental Rewards

After your mouth is free of metal and toxic plastic, notice whether your sinus condition, ear-ringing, enlarged neck glands, headache, enlarged spleen, bloated condition, knee pain, foot pain, hip pain, dizziness, aching bones and joints improve.

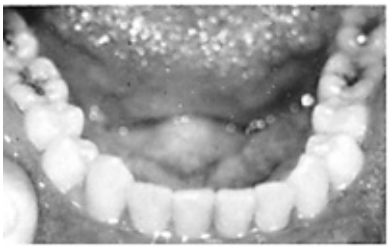


Fig. 37 Ugly metal in mouth

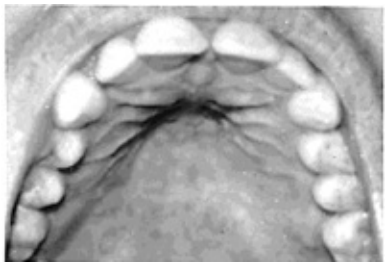
Keep a small notebook to write down these improvements. It will show you which symptoms came originally from your teeth. Symptoms can come

back! So go back to your dentist, to search for a hidden infection under one or more of your teeth, or where your teeth once were! That infection can be the cause of tinnitus, TMJ (Temporal Mandibular Joint), arthritis, neck pain, loss of balance, and heart attacks! Most importantly, these tooth bacteria easily find their way to your tumor. Pull infected or dead teeth. Do not try to save them.

Dentures can be beautiful. Of course, methacrylate plastic isn't natural, but it is the best compromise that can be made to restore your mouth. At least it isn't positively charged like metals; it can't set up an electric current nor a magnetic field in your mouth, nor cause tumors to grow.



Which are plastic teeth?

Fig. 38 Beautiful plastic mouth

Do not be swayed by arguments that "noble" metals like gold and platinum and silver are OK, that they are "inert" and do not tarnish or seep. Nothing could be more untrue. **Everything tarnishes and everything seeps.** You may be keeping them glossy by the constant polishing action of your toothpaste. But if you look at the underside of metal crowns, the view is frightful. Your mouth is quite corrosive! You wouldn't expect a handful of metal, even noble metal that was dropped in a well 50 years ago, to be intact. As it corrodes your body absorbs it!

In breast cancer, especially, you find that metals from dentalware have dissolved and accumulated in the breast. They will leave the breast if you clear them out of your mouth (and diet, body, home). **The cysts will not shrink until the metal is gone.**

You now have accomplished 5 things:

1. You have killed the intestinal fluke, and all of its stages, and cured the cancer.

2. You have killed all your other parasites, done the Mop Up program, and have yourself on a maintenance program to keep killing them. Your pet has been loaned to a friend.

3. You have gotten rid of all isopropyl alcohol sources.

4. You are attacking the causes of tumors.

5. You have started getting well by cleaning up your dentalware and eliminating bacteria, especially *Clostridium*. You have also partially eliminated copper, cobalt, vanadium, malonic acid, urethane, and scarlet red dye. You are measuring your progress against a list of all your symptoms.

Getting well is the magic you can expect from removing unnatural chemicals. To do this for your mouth, get started immediately, since your dentist may need more than one day to complete it. Get started the day you read this book! Don't wait until the parasite program is completed.

One final tip: many dentists are now offering intravenous (IV) treatments. Do not accept them unless you can test the IV injectable and the IV bag for isopropyl alcohol and bacteria. Over half of the injectables and about a tenth of the IV bags I have tested (over 1,000) are polluted! The injectables are bottles of vitamins or ampoules of various health factors. These are injected into the IV bag, which contains either salt (saline) or blood sugar (dextrose). Then it is injected into you. The effect of any pollutant is much greater when it is injected than if taken by mouth. You are mainlining!

The injectables and IV bags are manufactured using the same antiseptics used for foods. Bottles and tubing are sterilized with isopropyl alcohol and not necessarily rinsed! Pumps that fill bottles and bags are greased with food lube containing benzene. I often find wood alcohol and heavy metals, too. Some injectables have live bacteria in them, most often the albumin and vitamin C. Persons who "get a reaction" to their IV are reacting to *Salmonella* or *E. coli*, not some mysterious "allergens." Of course, the bottles state "Do not use if contents are cloudy"—but should one ever expect bacteria?[*1]

2. Clean Up Your Diet

This is the easiest part of your get-well program because YOU are completely in charge.

The fundamental rule is:

EAT CHEMICAL-FREE AND MALONATE-FREE FOOD.

Why Is Malonic Acid Bad?

Malonic acid is not natural for humans; nothing in the scientific literature indicates that it is a metabolite. It is natural for plants. Certain plants, about 24 families of them, make malonic acid as a step in making their oils! Higher plants pack their seeds with a little oil; some, like the avocado plant, make a lot of oil. But animals only make *malonyl Coenzyme* A (a relative of malonic acid). There is never any free malonic acid in healthy animals.

There is a very important reason for never having free malonic acid in our bodies anywhere. Malonic acid is an extremely potent metabolic inhibitor. In whatever organ it is found, your metabolism is slowed down. In fact it almost grinds to a halt. Then this organ can't use as much oxygen, nor make as much energy (body energy is called **ATP**) as it should. Consequently we make fewer amino acids and can't make as much protein as we should. This leads to lowered immunity by reducing glutathione. The organ is extremely handicapped. There is even a direct effect of malonate on immunity.[33]

Although the malonate forming food plants have other fine properties and are otherwise nutritious, the presence of malonate puts them off limits to anyone trying to improve their health. Fortunately, plants without malonates are in the majority!

Malonate-Free Foods

Here is the malonate-free food list; stick to it; do not eat foods that are not listed. The fastest way to recover the health of the tumorous organ, or any other organ, is to stop poisoning it with malonic acid. You may notice the difference in a few days.

There is an extra benefit for persons who switch to a malonate-free diet. You may notice a higher body temperature after a few weeks, which brings with it a rosier complexion. Overweight persons may experience a slow, steady weight

loss!

Eat Only These

Remember, that a food may be malonate-free and still not be good for you for other reasons. Remember, too, that this is a plant list, since animals do not make it. But milk is an exception; it has traces. So dairy foods are listed as safe, but only with special treatment.

acorn squash (with peel)
allspice
almonds (including brown skin)
aloe vera
amaranth
apples (red delicious, golden delicious, green)
apricot kernels
artichokes
avocados
bananas
banana squash (without peel)
bean sprouts
capers
cardamom
carob powder
cauliflower
cayenne pepper
chayote squash (with peel)
cheese (add salt, boil, add vit. C)
cherries (Bing)
chili peppers (California, jalapeno, pasilla, serrano, yellow)
chili peppers - red (dried)
cilantro
cinnamon
currants
coconut (without the milk)

beans, adzuki
beans, pinto
bee pollen
beet tops
beets, red
bell peppers (red, green)
black pepper
black-eyed peas
blueberries
bok choy
brazil nuts
brewers' yeast
Brussels sprouts
buckwheat
butter (add salt, boil, add vitamin C)
butternut squash (without peel)
cabbage (purple, white)
cactus (Nopales)
cantaloupe (and seeds)
fenugreek
figs (dried)
flax seed
flour (unbleached white)
garbanzo beans
garlic cloves
ginger capsules
collards
corn (yellow & white)
cornmeal
cranberries
cream (add salt, boil, add vitamin C)
cucumbers
cumin
dairy products (add salt, boil, add vitamin C)
dandelion (greens)
dill (fresh)
dulse (sea vegetable)
eggplant
eggs (wash, do not store in original carton)
extract of wintergreen
eyebright herb (dried)
mushrooms (common white)
nectarines
nutmeg
oats
olive leaves (for tea, see *Sources*)
onions

ginger root (inside only)
goldenseal
grains and legumes from India (see *Sources*), chana dal, split urad chilka, split moong chilka, whole urad, moth, whole moong USA green with skins, masoor, chori, kabu fee chana, whole val, moong zib, whole moong dal, toor dal, yellow peas, split val, oily toor (the dals are legume-like)
grapefruits
grapes (green, red & purple)
green bean thread
green beans
green olives (in jar)
grits
hazel nuts
hominy (white canned)
jicama
kale

(white, yellow, green)
paprika
parsley
Pau D'Arco
peaches
peanut butter
peanuts (without red skin)
pears (Bartlett, Bosc)
peas (green)
peas (split green)
peas, black-eyed
peas, green (in shell)
peas, snow
peppermint
pimentos
pineapple
plums (red and blue)
pomegranate
potatoes (russet, red, sweet)
psyllium seed husks
pumpkin
pumpkin seeds
quassia
quinoa

Kamut (grain)
kiwi
kumquats
leeks
lemon grass tea
lemons
lentils
lettuce (iceberg, green leaf and red leaf)
loquats
maple flavoring
maple syrup
masala (spice)
millet
mint leaves
miso (sweet)
mullein flowers
tahini
tapioca (pearl)
thyme
tomatillo
turnip greens
Uva Ursi capsules
walnuts
radishes (red)
raspberries
rhubarb
rice (white, cooked in pressure cooker)
salsa picante hot sauce
sesame seed
shave grass
soy lecithin
soybean (whole)
spearmint (dried)
spinach
strawberries
sunflower seeds
sweet basil
Swiss chard
watermelon (ripe inside portion only, including seed)
wheat berries, flour
yellow split peas
zucchini squash (yellow, pale green, mottled, with peel)
zucchini

squash blossoms

The presence of malonic acid in plants was reported as early as 1925.[34] Yet, it has never been suspected that we are eating it daily in significant amounts! Here are some popular foods that contain it.

Foods That Contain Malonic Acid

Be aware that in packaged foods, the processing could contribute the malonic acid.

alfalfa sprouts	green zucchini (dark)
apricots	Kombo (seaweed)
araica (dried)	limes
beans (black)	mangos (large, small yellow)
beans (great northern)	Nori seaweed, packaged
beans (lima)	onions (purple)
beans (mung)	oranges, all kinds
beans (navy)	papaya (Mexican)
beans (red kidney)	parsnips
black olives (canned)	passion fruit
broccoli	persimmons (Fuji, regular)
butternut squash peel	radish (daikon)
carrots	red skin of peanuts
chaparral (dried)	Tamari soy sauce
chocolate	tomatoes
ginger root skin	turnips, rutabaga
grape jam, commercial	wheat grass

Note: these lists were made using the Syncrometer®. I have not found any similar lists in the scientific literature. A short list published in 1952 only tested leaves.[35] But the parts you eat are often roots. So when I discovered malonic acid in carrots (root portion) I was so unhappy I searched to find a confirming study. It was reported as early as 1964.[36] Malonic acid in fruit juices, including orange juice, was also reported in various scientific articles.

What happens to malonic acid that you eat? It must be used by the body (metabolized), detoxified, excreted, or left alone to create havoc!

Toxic Effects Of Malonic Acid

The need to detoxify any free malonic acid quickly is obvious when you read the effects it has.

A lengthy and excellent review of malonate research has been published in Enzyme And Metabolic Inhibitors.[37] Here is a partial list of topics reviewed.

◊ Malonate inhibits uptake of glycine and alanine.

◊ Malonate may chelate iron so it can't be incorporated into hemoglobin.

◊ Malonate inhibits healing.

◊ Motility of sperm is reduced by malonate.

◊ Bacterial phagocytosis by human neutrophils is depressed by malonate.

◊ Malonate chelates calcium.

◊ Malonate drops the resting potential of muscle.

◊ Malonate causes air hunger (dyspnea).

◊ Methyl malonate is toxic to the kidney.

◊ Acetoacetyl Co A can transfer its Co A to malonic acid to make malonyl Co A. This could lead to acetoacetate buildup, namely ketonuria and possibly a block in fat utilization of even numbered carbon atoms, leaving odd numbered carbons to predominate.

◊ Malonic acid reacts with aldehydes.

◊ Thallium is chelated by malonic acid into a stable compound. (This could explain accumulation effect in a tumor.)

◊ A color test for malonates is tetra hydroquinoline-N-propinal to form blue-violet compounds. It is sensitive to 0.01 mg malonate.

◊ Malonate complexes with zinc and magnesium, thereby depleting them.

◊ A fall in malate concentration due to malonate causes depletion of NADP.

◊ Malonate induces ketonemia.

◊ Malonate reduces oxygen uptake. Coenzyme Q10 is required to make ATP.

◊ Malonate raises cholesterol.

◊ D-malic acid complexes with malic dehydrogenase and NADH, but is enzymatically inactive.

◊ Maleic acid is competitive inhibitor of succinic dehydrogenase.

◊ Synergism between rotenone and malonate occurs in mitochondria.

◊ Malonate causes oxidation of NADH and cytochromes.

◊ Rats can convert malonate to acetate in the presence of malonyl Co A.

◊ Malonate reduces survival of infected animals.

◊ Malonate fed to dogs is recovered as methyl malonate in urine.

◊ Malonate can pick up an amino group from glutamine, thereby destroying it.

◊ Hemolysis of red blood cells may be caused by malonyldialhyde (MDA), a derivative of malonic acid.

◊ Malonate catalyses renal glutaminase; with less glutamine, uric acid levels fall.

◊ Malic acid (apple juice) may be an antidote to malonic acid. (But commercial sources contain patulin, which depletes cellular glutathione.)

◊ Malonic acid is present in urine.

◊ Malonate depresses the reduction of GSSG to glutathione.

◊ Malonate inhibits protoporphyrin formation 32%.

◊ Malonate inhibits insulin stimulation of muscle respiration.

◊ Malonate inhibits acetylcholine synthesis.

◊ *Mycobacterium phlei* respiration is stimulated by malonate. (All schizophrenia cases I see test *Positive* to this bacterium in the brain!)

◊ Malonate is put into soy sauce in Japan.

◊ Malonate stimulates *Entamoeba histolytica* growth.

◊ Malonate inhibits phosphate entry into cells.

◊ Potassium transport into cells is inhibited by malonate.

◊ Malonate causes systemic acidosis.

◊ Calcium and iron transport by rat duodenum is severely reduced by malonate.

◊ Malonate inhibits pyruvate oxidation.

◊ Malonate causes increased utilization of glucose due to the Pasteur effect of a blocked Krebs cycle.

◊ Lactic acid formation is increased with malonate inhibition of respiration.

◊ Glycolysis is stimulated by malonate.

◊ Malonate has different effects on different tissues.

◊ Much less glucose goes to form amino acids and proteins in the presence of malonate.

◊ Malonate induces the appearance of the pentose phosphate shunt. (This is the pathway to nucleic acid formation.)

◊ Malonate diverts fatty acid metabolism to acetoacetate.

◊ Malonate increases the formation of fatty acids up to 10-fold.

◊ Maleic acid is a potent inhibitor of urinary acidification.

◊ Malonate inhibits oxidation of fatty acids.

◊ Malonate fed to dogs produces acetoacetate, acetone and alcohol.

◊ Malonate can reduce the concentration of magnesium and calcium to 25% or 50%.

◊ The methyl derivative of malonate depresses renal function.

◊ Malonic acid can form malonyl coenzyme A, which is very stable, thereby depleting the system of coenzyme A. (Coenzyme A has a nucleic acid base, adenine, plus pantothenic acid and sulfur in its makeup. You will have an increased need for these nutrients.)

◊ Malonate inhibits urea formation by reducing the supply of oxalacetate.

◊ Malonate inhibits cell cleavage (the formation of a wall between 2 dividing cells; multinucleate cells are the hallmark of cancer).

◊ Benzaldehyde reacts with malonic acid.

It's no wonder that the body tries frantically to detoxify malonic acid that reaches the tumorous organ, or any other part of the body.

Detoxifying Malonate

One way the body detoxifies unwelcome substances is called *methylation*. But it is costly to the body's resources, requiring large amounts of vitamin B_{12}, folic acid, methionine, betaine, glycine, taurine, cysteine, lecithin, and vitamin C. Keeping up the supply means depleting the rest of the body.

Not only the organ under siege, but also the rest of the body is becoming very malnourished.

The actual amounts of vitamins needed to replenish your body will be given in the section on supplements. What is needed most is to stop stealing these nutrient factors from your body just to detoxify malonic acid.

With your new malonate-free food list in hand, you are ready to shop for breakfast supplies.

Breakfast

Cook your cereal from scratch. Don't eat cold cereal; it has numerous solvents and added chemicals. Even the hot cereals can be polluted with mercury and thallium from the cardboard box. Evidently it was contaminated or sterilized with mercury compounds, and mercury products bring with them thallium pollution. Select a cereal that you have tested or see pictured. Cook it with milk to add nutritive value. Add salt while cooking in order to reach a higher temperature that will kill *Rhizobium leguminosarum*. Later add vitamin C, not so much that it spoils the flavor.

Fig. 39 Unpolluted breakfast cereals

Make granola from a recipe, there are three in this book. Use honey or confectioner's sugar. Add raisins that aren't sulfited and cook them with the cereal to kill mold. Don't use nuts; they carry aflatoxins. Use whipping cream or half and half if you need to gain weight. These are very easy to boil and de-malonate with vitamin C. Isn't this a delicious way to start your day! Use ground cinnamon to flavor, or frozen fruit and honey.

Or start your day with fried potatoes and an egg and glass of milk. Don't worry about cholesterol while you are recovering.

The biggest obstacle to eating natural food is time. Find a friend who has the time to cook for you, if you are not up to it.

Eat the simplest dairy products you can find, not flavored milk, not whipped butter, not cream cheese, not kefir. Choose milk and butter without coloring added. **Always sterilize the milk, first** and later, after cooling, add vitamin C. Try to find raw certified milk at a health food store. It has a special blood-building factor in it, called *lactoferrin.* Cooking does not destroy it but – and I can't explain this – pasteurized varieties do not contain it. If you could find goat milk, you would also get some of the same rare and valuable factors that are found in shark cartilage. But these factors are damaged by heating, so count the ten seconds for boiling carefully. Milk should be 2% or more butterfat because the calcium in milk cannot be absorbed without at least this much fat. Eat homemade yogurt and add honey or homemade preserves yourself. You need 3 cups of a milk product each day. If you don't tolerate milk, and get diarrhea from it, try a milk digestant tablet to go with it, or cook your milk into your foods. Start with only ¼ cup at a time. Do not choose chocolate milk.

Most dairy products found in supermarkets or natural food stores were polluted with copper, cobalt, vanadium, urethane, tartrazine,[38] and scarlet red dye. Those pictured were free of them. Of course, they must still be boiled and vitamin C-ed. Unless the chemicals used in processing milk are carefully evaluated for purity, such widespread pollution cannot be stopped. Test your local varieties with a Syncrometer®.

Fig. 40 Good dairy products

Cheese can be used in baked dishes with vitamin C added.

Butter can be treated like milk (boiled ten seconds, then add vitamin C).

Yogurt is not easily boiled, but it can safely be made from boiled milk.

No food is perfect.

You don't have to be perfect in food selection to get well.

It can be difficult to know which chemicals are unnatural. This book can't go into a long discussion of different definitions of "natural" and "unnatural." What counts for a cancer patient is whether the immune system will be called upon to remove something from the food you eat. Your immune system is precious. You have (or had) 5000 white blood cells in every little dot of blood.[39] They have the job of keeping you clear of parasites, bacteria, viruses, fungi, and unnatural chemicals. Even if the unnatural chemicals you eat do not do great harm, they must still be removed. White blood cells that are busy removing aluminum, nickel, mercury, copper, flavors, fragrance, or even soap are not free to fight bacteria, viruses, parasites, and fungi.

Give your immune system a chance to heal your body by removing the burden on it: the burden of countless, frivolous cleaning-up jobs. Clean yourself up so your immune system does not have to.

Lunch

Cook your food from scratch. Don't start with cans or packages or frozen items to make some recipe. In fact, don't bother with any fancy recipes. Just cook two or three vegetables for lunch and eat them with butter[40] and salt (use pure salt, see *Sources*). Bread and milk rounds it out, plus fruit. Soup is a nice change. Cook it with all the vegetables you can find that don't have malonate. Don't start with a packet or cube. Use a bit of onion and genuine herbs to give it zest.

If all this is too much work, select the easiest to prepare items from the menu given and have that with bread and yogurt or milk.

Never try to lower your cholesterol while regaining your health from cancer.

This is a rule based on common sense. Synthetic eggs, margarine and cholesterol-reduced products are extremely "chemical" foods.

Bake your own bread! I found aflatoxins in commercial bread after just four days in my refrigerator, but none in homemade bread stored in a paper bag even after two weeks! Aflatoxin is extremely toxic; it is made by mold. **Zearalenone** is another very toxic substance found on grains and produced by mold. In fact, zearalenone is the toxin that keeps the liver from clearing benzene from your body! Bread goes moldy easily. Don't ever eat moldy food, whether it is fruit, breads or leftovers in the refrigerator. Throw them out. Buy a bread maker. It can do everything, including baking the bread. Use unbleached (unbrominated) flour; I never found aflatoxin or zearalenone in packaged flour. And add ½ tsp. vitamin C powder per loaf to help retard mold further. (It also helps the bread rise!)

Do not toast your bread! This makes 4,5 benzopyrene, which inhibits benzene detoxification. Pan fry in butter to toast.

One big advantage of making your own bread, ice cream, and beverages is that you avoid the commercial machinery that stirs, pumps, kneads, holds, and scoops it all. All machinery requires regular lubrication, and "food-safe" lubricants are well defined by US regulations. They are petroleum products! This is a sample regulation.

21 CFR 178.3570 (4-1-94 Edition) Lubricants with incidental food contact.

Lubricants with incidental food contact may be safely used on machinery used for producing, manufacturing, packing, processing, preparing, treating, packaging, transport, or holding food, subject to the provisions of this section:

(a) The lubricants are prepared from one or more of the following substances:

(1) Substances generally recognized as safe for use in food.

(2) Substances used in accordance with the provisions of a prior sanction or approval.

(3) Substances identified in this paragraph (a)(3).

Substance	Limitations
Here you find 39 chemicals like BHA, BHT, Polyethylene, 2-(8-Heptadecenyl)4,5-dihydro-1*H* -imidazole-1-ethanol, and also :	
Mineral oil	Addition to food not to exceed 10 parts per million.
Petrolatum	Complying with §178.3700. Addition to food not to exceed 10 parts per million.

(b) The lubricants are used on food-processing equipment as a protective antirust film, as a release agent on gaskets or seals of tank closures, and as a lubricant for machine parts and equipment in locations in which there is exposure of the lubricated part to food. The amount used is the minimum required to accomplish the desired technical effect on the equipment, and the addition to food of any constituent identified in this section does not exceed the limitations prescribed.

(c) Any substance employed in the production of the lubricants described in this section that is the subject of a regulation in parts 174, 175, 176, 177, 178, and §179.45 of this chapter conforms with any specification in such regulation.

Fig. 41 "Safe" lubricants that could be in your processed foods, but not on the label of the product

Notice the mineral oil and petrolatum which are petroleum oil products. How was it decided that they "may be safely used"? Safe for the machinery, but not for you.Petroleum products should not be in our food, not even in minutest amounts. This is because there would always be tiny traces of benzene and other

petrochemicals left in them. These are not negligible even though test instruments can't find them. Even our best test instruments are very crude compared to our body's ability to detect. Benzene is very difficult to detect, costing thousands of dollars for a single test. Manufacturers would resist such added expense. Yet, the cancer epidemic is upon us. We must demand new, more sensitive testing for toxins in our foods. Wouldn't it be wonderful if our lawmakers required only chemicals that didn't show up in our immune systems to be used in manufacturing foods? Lubricants would then be things like olive oil, beeswax and cornstarch. And under "Limitations" would be "none."

Fig. 43 Example of "food oil"

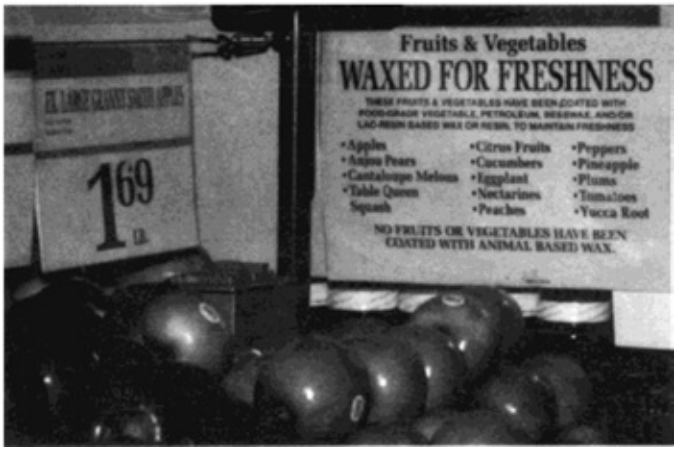
"Food lube" for heavy-duty machinery like ice cream and dough mixers and "food oil" for light-duty equipment like cheese and meat slicers are petroleum products that introduce benzene into our foods.

Fig. 42 Examples of commercial "food lube."

Supper

Cook your supper from scratch. Emphasize fish for animal food, not beef, pork, turkey or chicken. Do not grill, broil or barbecue (it makes benzopyrene); instead, fry, bake, poach or boil. Don't buy breadcrumbs, use your own. Don't

buy batter, make your own. Use genuine eggs, not substitutes. Wash your hands after handling raw eggs or meat. Cook real potatoes, not instant varieties. Always peel them so you can see any potato fungus underneath and cut it away (red skinned potatoes have less fungus). Make your own salad, not prepackaged or from a salad bar. Make salad dressing out of olive oil, lemon juice, white distilled vinegar (not apple cider vinegar which has aflatoxins) honey, salt, and herbs to flavor.



If the apples seem shinier than usual in your grocery store, inquire if they have been sprayed.

Fig. 44 Glossy produce

If your digestion isn't strong enough for raw vegetables or fruit, make juice. Get a sturdy juicer and make your juice from any vegetable that is malonate free. First dip for one minute in Lugol's iodine water. Avoid greens that have been sprayed in the grocery store to keep them fresh looking. Shop at small, local grocery shops that do not spray their produce. The spray contains petroleum products. Add herb seasoning. Make lemonade in the blender leaving it whole, but peeling it first with a sharp knife to remove the sprayed surface; then strain. Scrub the lemon carefully first, just with water. Lemon peel and seeds have **limonene**, useful for weight gain. But don't overdo it. Use only one lemon a day. Exact instructions are given in *Recipes*.

Find dairy products that do not list color as an ingredient–not even annatto seed. Evidently a company that uses both artificial and natural colors cannot keep them totally apart.

Fig. 45 Good butter and cheese

Make mashed potatoes from scratch—not box potatoes, nor chips, nor French fries. Box potatoes have added chemicals. Chips and fries were made in chemical grease called "hydrogenated vegetable (or other) oil." There is a large amount of nickel in hydrogenated fats.[41] Fry your potatoes in butter, lard or olive oil. Find butter that is not wrapped in foil and is not salted.[42] Salt your own butter, using pure salt. Add salt to the butter while you're boiling it; this raises the temperature of boiling so the hardy bacteria, *Rhizobium leguminosarum*, are killed. Butter should not have color added. Even the annatto seed (a natural colorant) varieties tested *Positive* on the Syncrometer® to tartrazine (a yellow food dye), and scarlet red dye (a red food azo dye)! Do not eat dairy products that list color as an ingredient.

Eat no meat that hasn't been cooked as thoroughly as if it were pork.

Other animals are as parasitized as we, full of flukes and worms and *schistosomes* in every imaginable stage, and since the blood carries many of these, would we not be eating these live parasites if we eat these animals in the raw state? We have been taught to cook thoroughly any pork, fish or seafood. Now we must cook thoroughly any beef, chicken or turkey. It must be at cooking temperature (212°F or 100°C) for 20 minutes after salt has been added. Freezing is not adequate. Canned meats are safe from living parasites, but are not recommended due to added chemicals.

Of course, you are protecting yourself with a parasite-killing maintenance program. But killing a parasite AFTER it is IN your tissues will not keep you healthy; you must avoid parasites.

If you have been very ill, the best advice is to be a "seafood vegetarian" eating fish, eggs and dairy products to supply you with protein.

Beverages

Drink 6 kinds of beverages:

- milk
- water
- herb teas
- malonate-free fruit juices
- malonate-free vegetable juices
- homemade (see Recipes)

This means getting off caffeine. And if you are already fatigued, this means you might be even more fatigued for a short time. You might have headaches from withdrawal, too. But they will only last 10 days. Mark your calendar and count off the days. Headache medicine, like all medicine, is likely to have benzene pollution from the colorant used; avoid it. For energy, to replace caffeine, take one arginine (500 mg) upon rising in the morning and before lunch. Soon you won't need it.

Cutting down on coffee, decaf, soda pop and powdered drinks won't do. You must be completely off. They contain very toxic solvents due to the processing.

Although grain (drinking) alcohol is the recommended antiseptic for household use, that doesn't mean you may safely drink it. It is inadvisable to drink any form of alcohol at least until you are fully recovered (two years). This is why Black Walnut Hull tincture, which is 20-50% grain alcohol, is taken in a lukewarm beverage (to evaporate some of the alcohol) and followed by a dose of niacinamide.

1. Milk: 2%, in plastic container (paper containers tested *Positive* to dioxane, which is a well studied carcinogen). Drink three 8 oz. glasses a day. Homemade yogurt is fine. Goat milk is better. Start with ¼ cup and increase gradually, if you are not used to it. If you do not drink milk because it gives you more mucous, switch to a different kind. If you have other reactions, like diarrhea, try milk digestant tablets (available at health food stores). Milk is too valuable to avoid: there are many unwanted chemicals in most brands of milk, but it is

solvent-free and very nutritious. The only exception should be for serious symptoms, like colitis, bloating, flu, or chronic diarrhea. Do not use powdered milk; it is heavily polluted with solvents. All milk should be sterilized, then cooled and vitamin C-ed.

Pasteurization is not sterilization.

Milk goes sour after the expiration date on the carton even when refrigerated and unopened. Although souring isn't caused by Salmonella or Shigella (other bacteria are responsible), my point is that it is obvious that milk isn't sterile.

Boil milk for 10 seconds with a pinch of salt to kill Salmonellas and Shigellas. It will also kill the tumor causing bacteria species, *Clostridium* and *Rhizobium*.[43] Then refrigerate. But what about the malonic acid in milk? You must do one more thing. Add vitamin C (1/8 tsp. per pint). If your taste buds detect this or you are afraid the milk might curdle, add baking soda first (again 1/8 tsp. per pint). If you are making yogurt, buttermilk or cottage cheese, you do not need baking soda. Treat butter and whipping cream the same way. Do not undercook or you will reinfect with parasites! Many people prefer the taste of such "treated" milk. And many people can tolerate dairy products for the first time after making this change.

Of course, milk is not a plant food. How does malonic acid get into milk? I have preliminary evidence that tapeworm stages make malonic acid and killing these by boiling does nothing about the malonate already present. Perhaps the vegetable matter of the feed brings it into the milk, too. More research is needed here.

If you simply cannot tolerate dairy products, try making cottage cheese (see *Recipes*). Separate the curds and whey. Whey is a traditional, delicious beverage with all the calcium of milk in it.

There is no substitute for milk; calcium tablets are not satisfactory. Vegetable matter, although high in calcium, does not give you <u>available</u> calcium either. Eating fish can give you a lot of calcium, but it is in the tiny bones hidden in the fish. Don't try to remove them. Canned salmon has a lot of calcium. On a day that you eat fish, you would not need milk. Goats' milk is better for you than cows' milk because it has beneficial factors in it that are similar to shark cartilage and speeds up your ability to make amino acids. It needs to be boiled and vitamin C-ed, too. Dairy products are <u>too important</u> to your recovery to

abandon. But cheese varieties are too difficult to sterilize; avoid unbaked cheese completely.

2. Water: 2 pints. Drink one pint upon rising in the morning, the other pint in the afternoon sometime. The cold water faucet may be bringing you cadmium, copper or lead, but it is safer than purchased water, which usually has solvents in it. Let it run before using it. Filters are rather useless because water pollution comes in surges. A single surge of PCB contaminates your filter. All the water you use after this surge is now polluted, so you will be getting it chronically, whereas the unfiltered water cleans up again after the surge passes. Until you can test your own water for solvents, PCBs and metals, no expensive filter is worth the investment.[44]

Fig. 46 Water pitcher with filter.

An inexpensive carbon filter that is replaced every month may improve your tap water, though. Plastic pitchers fitted with a carbon filter pack are available. Never buy filters with silver or other chemicals, even if they are "just added to the carbon." If you have copper or galvanized pipes, switch to PVC to be safe from cadmium, copper and lead. (See the section on Cleaning up the Environment.)

3. Herb tea: fresh or bulk packaged if available. If only tea bags are available, cut them open and dump out the tea. Throw away the bag; it is full of antiseptic. Buy a non-metal (bamboo is common) tea strainer. Sweeten with confectioner's sugar or honey. Honey obtained from the bulk tank in a health food store never had solvent pollution when I tested it. Be careful not to buy foil packs of tea or tea blends. Tea blends are mixtures of herb teas; these have solvents in them from the extracts used to improve flavor!

4. Fruit juice: fresh squeezed only. Some stores make it while you wait. If they freeze some of it, you could purchase the frozen containers. Bottled fruit juices have traces of numerous solvents; as do the frozen concentrates, as do the refrigerated ones, don't buy them. You have to see it being made, but watch carefully: I recently went to a juice bar where they made everything fresh, before your very eyes. And I saw them take the fruit right from the refrigerator and spray it with a special wash "to get rid of any pesticides" then put a special detergent on it to clean off the wash! So instead of getting traces of pesticide, I got traces of isopropyl alcohol![45] More recently I stepped into a San Diego juice bar for a "smoothie." The banana that was going into it was half black, and I expected the black part to be cut off, but the whole thing was thrown in the blender! You can not trust commercially prepared food, even if it is a health food store or juice bar. Best of all, buy a juicer, peel the fruit and make your own juice (enough for a week—freeze it in half-pint used plastic bottles). Try pineapple, pear, peach, nectarine, cantaloupe, and grapefruit. For stronger flavor add a bit of fresh lemon to each variety to give it more zip.

5. Vegetable juice: Buy a juice-maker. Start with head lettuce and other broad-leafed greens. Fine-leafed greens cannot be washed free of spray and regularly test *Positive* for benzene! If you cannot test for benzene, and are not sure if the greens have been sprayed, ozonate them. Wash greens and place in a plastic bag. Ozonate for 20 minutes. Rinse again in water with a pinch of baking soda and a drop of Lugol's iodine to kill *Ascaris* eggs. Drink ½ glass of vegetable juice a day. After you are accustomed to this, add other vegetables to double the amount. Use cabbage, cucumber, beet, pale zucchini, squash, anything malonate-free. But never anything with soft spots! And peel everything that has a peel. Add herbs and fruit for extra zest.

Jazz up your favorite homemade juice with seltzer water. It is not harmful to you.

Fig. 47 Seltzer maker

6. Homemade beverage. If you will miss your coffee or decaf, try just plain hot water with whipping cream or lemon. Sweeten with honey. See *Recipes* for many more suggestions.

Horrors In Commercial Beverages

Commercial beverages are especially toxic due to traces of solvents left over from the manufacturing process. There are solvents found in decaffeinated beverages, herb tea blends, carbonated drinks, beverages with artificial sweetener, flavored coffee, diet and health mixes, and fruit juices, even when the label states "not from concentrate" or "fresh from the orchard," or "100% pure."

Some of the solvents I have found are just too toxic to be believed! Yet you can build the test apparatus yourself (*How To Test Yourself*), buy foods at your grocery store, and tabulate your own results. I hope you do, and I hope you find that the food in your area is cleaner than mine! Remember that the Syncrometer® described later can only determine the presence or absence of something, not the concentration. There may only be a few parts per billion, but a cancer patient trying to get well cannot afford any solvent intake. For that matter, none of us should tolerate any of these pollutants:

- **Acetone** – in carbonated drinks
- **Benzene** – in store-bought drinking water, store-bought "fresh squeezed" fruit juice
- **Carbon tetrachloride** – in store-bought drinking water
- **Decane** – in health foods and beverages
- **Hexanes** – in decafs
- **Hexane dione** – in flavored foods
- **Isophorone** – in flavored foods
- **Methyl butyl ketone** and **Methyl ethyl ketone** – in flavored foods
- **Methylene chloride** – in fruit juice

- **Pentane**– in decafs
- **Propyl alcohol** – bottled water, commercial fruit juices, commercial beverages.
- **Toluene** and **xylene** – in carbonated drinks
- **Trichloroethane**(TCE), **TCEthylene**– in flavored foods
- **Wood alcohol** (methanol) – in carbonated drinks, diet drinks, herb tea blends, store-bought water, infant formula.

If you allowed a tiny drop of kerosene or carpet cleaning fluid to get into your pet's food every day, wouldn't you expect your pet to get sick? Why wouldn't you expect to be sick with these solvents in your daily food? These solvents are just tiny amounts, but tiny amounts are nevertheless billions of molecules! Your body must detoxify each molecule.

Flavors and colors for food must be extracted somehow from the leaves or bark or beans from which they come and I suspect benzene-contaminated solvents are used for this. Until safe methods are invented, such food should be considered unsafe for human consumption (or pets or livestock!).

Fig. 48 Unsafe beverages

Food Preparation

Cook your food in glass, enamel, ceramic or microwavable pots and pans. Throw away all metal ware, foil wrap, and metal-capped saltshakers since you will never use them again. If you don't plan to fry much (only once a week), you might keep the Teflon™ or Silverstone™ coated fry-pan, otherwise get an

enamel coated metal pan. Stir and serve food with wood or plastic, not metal utensils. If you have recurring urinary tract infections, you should reduce your metal contact even further; eat with plastic cutlery. Sturdy decorative plastic ware can be found in hardware and camping stores. Don't drink out of styrofoam cups (styrene is toxic). Don't eat toast (many toasters spit tungsten all over your bread besides making benzopyrenes). Choose baked goods sold in paper or microwavable pans, not aluminum. Don't run your drinking water through the freezer, fountain, or refrigerator. Don't heat your water in a coffee maker or metal teakettle; use a saucepan. Don't use a plastic thermos jug —the plastic liner has lanthanides, which break up your RNA and DNA molecules. The inside must be glass.

Why are we still using stainless steel cookware when it contains 18% chromium and 8% nickel? Because it is rustproof and shiny and we can't see any deterioration? **But all metal seeps!** Throw those metal pots away.

Many bacteria and yeast(!) varieties have a requirement for nickel so that their enzyme **urease** will work for them. Urease attacks urea, present in all our body juices, and makes ammonia from it. Ammonia is a utilizable nitrogen source (food) for bacteria and yeasts. If our bodies weren't polluted with nickel, many of our yeast invaders couldn't grow! Why do we take in nickel and supply our bacteria and yeast? Nickel is in the soil, where bacteria and fungi belong, too. But if we insist on keeping plenty of nickel in our tissues, we have only ourselves to blame for our invasion.

It is hard to believe that metals we handle every day in our coinage, food and beverage containers, body products, and home and garden products could be hazardous. Yet this has been well studied. The real question is: why don't we heed our own research that we funded so dearly?

An Index Of Carcinogenicity Among Metal Carcinogens

By C. Peter Flessel et al. From *Carcinogenicity and Metal Ions*, volume 10 of a series called *Metal Ions in Biological Systems*, edited by Helmut Sigel.

	Human Studies		**Animal Studies**		**Short-term Bioassays**			
Metal	Posi-tive results	Pts.	Posi-tive results	Pts.	Posi-tive results	Nega-tive results	Net Pts.	Total Pts. (a)
Arsenic	>3	12	0	0	4	0	3	15
Beryllium	~1	6	3	6	4	1	3	15

Cadmium	1	6	3	6	5	0	3	15
Cobalt	0	0	2	5	3	1	2	7
Chromate	>3	12	>3	6	5	0	3	21
Iron (Fe)	~1	6	~1 (b)	3	4	2	2	11
Nickel	>3	12	>3	6	4	1	3	21
Lead (Pb)	~1	6	~2	5	4	1	3	14
Titanium	0	0	~1	3	0	0	0	3
Zinc	0	0	2	5	3	1	2	7

(a) See pp. 41-43 [not shown] for scoring rules.
(b) A number of studies have confirmed that only iron -carbohydrate complexes, among a variety of iron compounds tested, are carcinogenic in animals.

Fig. 49 Metal carcinogenicity

Again, I want to emphasize that the amount and the form of the metal is very important. For instance, zinc metal is carcinogenic (cancer producing). However an appropriate dose of zinc sulfate is anti-carcinogenic.[46] **Get your essential minerals from foods, not cookware.**

Never, never drink or cook with the water from your hot water faucet. If you have an electric hot water heater the heating element releases metal. Even if you have a gas hot water heater, the heated water leaches metals from your pipes. If your kitchen tap is the single lever type, make sure it is fully on cold. Teach children this rule.

Food Guidelines

It is impossible to remember everything about every food. In general do not buy foods that are highly processed. Here are a few foods, see if you can guess whether they should be in your diet or not.

breads	Yes, but not fancy varieties that have flavor listed in the ingredients, nor "day-old", or "cholesterol-reduced" bread.
cheese	Yes, in baked dishes only. It must have no mold (throw it out if you see any). Trim away the outside ¼ inch, in case petroleum products or azo dyes were used on the exterior. Rotate brands. Add vitamin C.
chicken	Only if cooked for 20 minutes at boiling point, as in soup, or canned (never prepare raw chicken yourself).
wine with dinner	No.
peanut butter	Yes if you grind it yourself, adding vitamin C (¼ tsp. per pint) as you grind to remove aflatoxins.
cottage cheese	Yes if sterilized by baking or cooking. Add vitamin C.
desserts	Yes, but again, only if not flavored with extracts (maple and vanilla are OK).

rice	Yes, white rice if cooked in pressure cooker to kill bacteria. Add vitamin C.
pasta	Yes, with homemade sauce (tomato free) and vitamin C.
jello	No, it has artificial flavor and color.
egg dishes	Yes, but not "imitation", cholesterol-free or cholesterol-reduced varieties.
popcorn	No, it has zearalenone, a mold toxin. (If you have an ozonator, you can put the air hose in the bag of kernels for five minutes and detoxify the zearalenone!)
soy foods (tofu)	No. It's the extensive processing that taints it.
soup	Yes, if seasoned only with herbs (no bouillon cube) and malonate free.
cheesecake	Yes, if homemade and baked thoroughly. Add vitamin C to recipe.
rice cakes	No. Processing pollutes them.

Fig. 50 Some good foods

Other guidelines are: choose brands with the shortest list of ingredients. Alternate brands every time you shop.

If friends are cooking for you, give them a copy of these pages about the diet. The support of your family and friends is very valuable to you, but don't eat with their dishes (dish detergent is on them). You can always eat off paper plates, use plastic cutlery and a plastic cup you wash yourself under the tap. Keep a set of everything handy to take out with you. Carry your own pure salt and vitamin C. Your friends are not made ill by these pollutants—YOU ARE. They can excrete them efficiently—YOU CAN'T. They go to your tumor.

Fig. 51 Solvents found in bakery bread too

Fig. 52 Many of these breads had solvents

Because you cannot supervise restaurant chefs, many normally safe foods should not be ordered. Here is a list of things that are generally safe to order:

pancakes, French toast, waffles	But ask your waiter to bring the syrup to boiling. This kills mold spores. Add vitamin C to any natural syrup.
eggs	Not scrambled—the added milk or cheese does not get sterilized, and not soft boiled—the white should be solid.
hash browns	If lightly fried, not deep-fried.
soup	Only if nothing else is available. (It probably came in a can and was cooked in an aluminum pot. Do not order soups made from items on the malonic list, like tomato soup or cream of celery.)
vegetarian sandwiches	But no soy products, cheese, or tomatoes.
baked or boiled potatoes	With olive oil, bring your own salt, don't eat the skin if it was wrapped in foil or has black spots.
cooked vegetables	Cauliflower, Brussels sprouts, beets, corn, squash, and so forth.
vegetable salads	You must kill *Ascaris* eggs. Add one drop Lugol's to your water glass. Pour over salad to immerse for one minute. Drain.
vegetarian dishes	Especially Chinese food, but no soy ingredients.
bread and biscuits	But not "cholesterol-free" varieties.
fish and seafood	Anything but deep fried (the oil may have benzene) is fine: baked, steamed, fish cakes with tartar sauce.
fruit cup	With honey, no whipped cream.
fruit pies, cobblers	But not with ice cream (it has not been sterilized and flavoring has benzene).
lemon	Indulge yourself.

meringue pie

Fig. 53 Good restaurant foods

The only beverages you should order in a restaurant are water and boiled milk (not just steaming). Add the vitamin C yourself (just a pinch). Herb teas are all right if they are single herbs, if you dump the bag, and make sure the hot water comes from a non-metal pot.

If you order food "to go", ask the chef to line the aluminum or styrofoam containers or cups with plastic wrap. Clear plastic containers are OK, but do not store leftovers in them.

This sauce is not made with tomatoes and repeatedly tested free of the M-family, benzene, isopropyl alcohol, and wood alcohol, a tribute to the manufacturer.

Fig. 54 Good sauce

Check Your Progress

You now have accomplished 7 things:

1. You have killed the intestinal fluke and cured your cancer.

2. You have Mopped Up all your other parasites. You are zapping regularly and are on the parasite program.

3. You have removed all products with isopropyl alcohol in them from your house and are eating no foods with isopropyl alcohol pollution.

4. You have taken out all the metal and plastic from your mouth and are waiting (patiently?) for safe partials or dentures. Teeth with large fillings or crowns have been extracted. You are hot packing.

5. You have switched from eating food concoctions to eating simple foods, free from solvents and malonic acid. You are starting to strike symptoms off your list.

6. You no longer have any tumor-forming common denominators.

7. You have found a new home for your pet.

As you see your symptoms disappear, one after another, you will feel the magic of healing. Most cancer patients have 50 or more symptoms to start out! They could fill two sheets of paper, one symptom to each line. It can be quite shocking to see a list of all your symptoms.

Sometimes a new symptom appears as fast as an old one disappears. The coincidence makes it tempting to believe that one symptom turns into a different one. But it is not so. If a new symptom appears, it is because another pathogen has become activated due to a new toxin. Try to identify the new item. Stop using any new food, supplement, or body product, even if it is a health variety, and see if it goes away.

3. Clean Up Your Body

We are living in a very fortunate time. We are not expected to all look alike! The 60's brought us this wonderful freedom.

Freedom to dress in a variety of styles, use make-up or no make-up, jewelry or no jewelry, any kind of hair style, any kind of shoes.

You will need to go off every cosmetic and body product that you are now using. Not a single one can be continued. They are full of titanium, zirconium, benzalkonium, bismuth, antimony, barium[47], strontium[48], aluminum, tin, chromium, not to mention pollutants such as benzene, PCBs, and azo dyes.

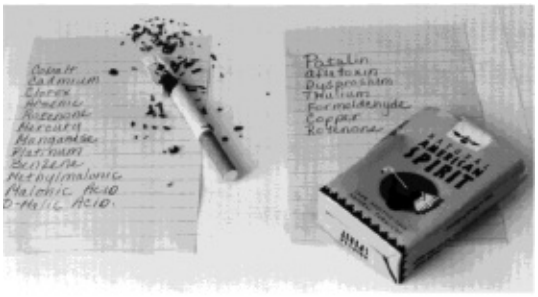
Do not use any commercial salves, ointments, lotions, colognes, perfumes, massage oils, deodorant, mouthwash, toothpaste, even when touted as "herbal" and health-food-type. See *Recipes* for homemade substitutes.

People are trying desperately to use less toxic products. They seek health for themselves. So they reach for products that just list herbs and other natural ingredients. Unfortunately, the buyers are being duped. The Food and Drug Administration (FDA) requires all body products to have sufficient antiseptic in them for your "protection." Some of these antiseptics are themselves substances you must avoid! But you won't see them on the label because manufacturers prefer to use quantities below the levels they must disclose. And by using a variety of antiseptics in these small amounts they can still meet sterility

requirements. The only ingredient you might see is "grapefruit seed" or similar healthy-sounding natural antiseptic. This is sad for the consumer of health food varieties. Here are some problems I have seen:

Rocks sold as "Aluminum-Free Natural Deodorant". You rub the rock under your arms. It works because the rock is made of magnesium-aluminum silicate.

- Men's hair color with lead in it.
- Lipstick with barium, aluminum, titanium, scarlet red dye.
- Eye pencil and shadow with chromium and cobalt.
- Toothpaste with benzene, tin, and strontium.
- Hair spray with isopropyl alcohol and PCBs.
- Shampoo with isopropyl alcohol!
- Cigarettes with lead, mercury, nickel, benzene[49] and
- Tobacco Mosaic Virus.
- Chewing tobacco with ytterbium.
- Marijuana with benzene.



The list of pollutants in these "natural" cigarettes was obtained with a Syncrometer®. Use a magnifying glass to read them.

Fig. 55 Health food store cigarettes

Some of the unnatural chemicals listed were detected with the Syncrometer® and are probably present because of residues from the manufacturing process, but others you will actually see listed on the label!

How can isopropyl alcohol in shampoo get into your body in significant

amounts? The skin is more absorbent than we realize, and time and time again I see clients who have gone off every body product except their favorite shampoo. They have isopropyl alcohol until they make that final sacrifice. It is better to switch shampoos than to not need any due to radiation and chemotherapy!

See *Recipes* for easy-to-make, natural substitutes. But you might consider just stopping them all, especially if you're going on vacation.

Use nothing that you wouldn't use on a newborn baby. This is a permissive age. You will be the only one feeling "naked." Others won't even notice. Don't forget advertising is aimed at you, even if other people's eyes are not!

Don't even use soap unless it is homemade soap (see *Recipes*) or borax[50] straight from the box. Borax was the traditional pioneer's soap. It is antibacterial and can be made into a concentrate. It is also a water softener and is the main ingredient in non-chlorine bleaches. Borax has excellent solvent power for grease. But even borax is not natural to your body and it is therefore wise to use as little as necessary. See *Recipes* for antibacterial natural borax soap.

homemade soap 2 homemade liquid soaps pure borax

Fig. 56 Three safe soaps

Don't use toothpaste, not even health-food varieties. To clean teeth, use salt —but dissolve it in water first, otherwise it is too abrasive. Or brush with hydrogen peroxide food grade, not the regular variety (see *Sources*). To floss before brushing, use unwaxed, unflavored floss that has been soaked in plain cold water for half an hour, then wash. If you don't do this, you could be getting a meal of all 9 tumorigens plus solvents! Throw away your old toothbrush—solvents don't wash out (see *Brushing Teeth*).

Don't use mouthwash. Use saltwater (pure salt) or food grade hydrogen peroxide (just a few drops in water).

Don't use hair spray.

Don't use massage oils of any kind. Even olive oil occasionally has benzene pollution, probably due to adulteration with other oils. The varieties never tested *Positive* for benzene.

Don't use bath oil. Take showers, not baths, if you are strong enough to stand. Showers are cleaner.

Don't use perfumes or colognes.

Don't use lotions or personal lubricants except homemade.

Our household, health, and body products, and drugs were found to be polluted with solvents, heavy metals, PCBs and lanthanides using the Syncrometer®.

Fig. 57 Some body care products

Banish Benzene

Benzene deserves special attention not only because it is the AIDS-related solvent, but because it is presumed to be absent from our consumer environment. Yet I have found traces in everything from bottled water to toothpaste! It is so toxic its concentration is even regulated and tested in gasoline and dry cleaning fluid to reduce exposure to it in the air. Can you imagine eating it or putting it on our bodies, even in minute quantities?

Fig. 58 You can't even trust many health-store brands.

It is commonly believed that all petroleum products, including benzene, are carefully kept away from the food industry. And under no circumstances would solvents like benzene be allowed near food. This is wrong. The Code of Federal Regulations (CFR) in the United States specifically allows petroleum products to be added to food. Mineral oil is an example; it is made from petroleum.

The Syncrometer® detected PCBs in most popular detergents, making dishes, water and clothing our primary source of PCBs.

Fig. 59 Detergents

21 CFR 172.878 (4-1-94 Edition) White mineral oil.

White mineral oil may be safely used in food in accordance with the following conditions:

[Paragraphs (a) and (b) describe purity levels]

White mineral oil is used or intended for use as follows:

Use	**Limitation** (inclusive of all petroleum hydrocarbons that may be used in combination with white mineral oil)
1. As a release agent, binder, and lubricant in or on capsules and tablets containing concentrates of flavoring, spices, condiments, and nutrients intended for addition to food, excluding confectionery.	Not to exceed 0.6% of the capsule or tablet.
2. As a release agent, binder, and lubricant in or on capsules and tablets containing food for special dietary use.	Not to exceed 0.6% of the capsule or tablet.
3. As a float on fermentation fluids in the manufacture of vinegar and wine to prevent or retard access of air, evaporation, and wild yeast contamination during fermentation.	In an amount not to exceed good manufacturing practice.
4. As a defoamer in food	In accordance with §173.340 of this chapter.
5. In bakery products, as a release agent and lubricant	Not to exceed 0.15% of bakery products.
6. In dehydrated fruits and vegetables, as a release agent	Not to exceed 0.02% of de-hydrated fruits and vegetables.
7. In egg white solids, as a release agent	Not to exceed 0.1% of egg white solids.
8. On raw fruits and vegetables, as a protective coating	In an amount not to exceed good manufacturing practice.

9. In frozen meat, as a component of hot-melt coating	Not to exceed 0.095% of meat.
10. As a protective float on brine used in the curing of pickles	In an amount not to exceed good manufacturing practice.
11. In molding starch used in the manufacture of confectionery	Not to exceed 0.3% in the molding starch.
12. As a release agent, binder, and lubricant in the manufacture of yeast	Not to exceed 0.15% of yeast.
13. As an anti-dusting agent in sorbic acid for food use	not to exceed 0.25% in the sorbic acid.
14. As release agent and as sealing and polishing agent in the manufacture of confectionery	Not to exceed 0.2% of confectionery.
15. As a dust control agent for wheat, corn, soybean, barley, rice, rye, oats, and sorghum.	Applied at level of no more than 0.02% by weight of grain.

Fig. 60 Lawful uses of white mineral oil in food.

All of the following petroleum products are also "safely used in food" subject to similar conditions of purity and use: petrolatum (21 CFR 172.880), synthetic isoparaffinic petroleum hydrocarbons (21 CFR 172.882), odorless light petroleum hydrocarbons (21 CFR 172.884), petroleum wax (21 CFR 172.886), petroleum naphtha (21 CFR 172.250).

There is even one food that benzene can be used with directly:

21 CFR 172.560 (4-1-94 Edition) Modified hop extract.

The food additive modified hop extract may be safely used in beer in accordance with the following prescribed conditions:

(a) The food additive is used or intended for use as a flavoring agent in the brewing of beer.

(b) The food additive is manufactured by one of the following processes:

(1) [describes a hexane extract]

(2) The additive is manufactured from hops by a sequence of extractions and fractionations, using benzene, light petroleum spirits, and methyl alcohol as solvents, followed by isomerization by potassium carbonate treatment. Residues of solvents in the modified hop extract shall not exceed 1.0 part per million of benzene, 1.0 part per million of light petroleum spirits, and 250 parts per million of methyl alcohol. The light petroleum spirits and benzene solvents shall comply with the specification in §172.250 except that the boiling point range for light petroleum spirits is 150°F-300°F.

[(3) through (8) go on to describe other allowable manufacturing processes using methylene chloride, hexane, methyl alcohol, sodium hydroxide, butyl alcohol, ethyl acetate, potassium carbonate, ethylene dichloride, isopropyl alcohol, trichloroethylene, palladium, hydrochloric acid, sulfuric acid, peracetic acid, sodium borohydride and other chemicals.]

Fig. 61 Lawful ways of making hop extract for use in beer.

Ironically, the law mandates the purity of the benzene used (§172.250). It's hard to imagine what worse chemicals the government agency is concerned about! And if you think one part per million doesn't sound like a lot, keep in mind that the government maximum allowed level in drinking water is five parts per billion, 200 times less concentrated. Of course it's assumed that by the time the hop extract is added to the rest of the beer ingredients, the concentration will be much less. But what really counts is the total amount consumed, over days, months and years.

Allowing the use of petroleum products (whose raw form contains benzene), in food has undoubtedly led to the worldwide lowering of immunity that is so apparent. The immune lowering effect of benzene has been studied for many years by scientists. We just didn't know that we were eating it!

I find benzene is present in foods and products that have been colored, flavored, stabilized, conditioned, defoamed, coated, or preserved. Although our regulatory agencies have been vigilant in checking gasoline, dry cleaning fluid, and outdoor air for benzene, the most toxic route, food, has escaped detection. The present extent of benzene pollution is unthinkable and overwhelming.

These are the foods and products which I have found to be polluted with benzene. STOP USING THEM IMMEDIATELY. DO NOT FINISH UP ANY ONE OF THEM. THROW THEM OUT NOW! Throw them into the garbage and take the garbage out of your house.

Benzene Polluted Products

THROW THESE OUT

Your health is worth more than the fortune you spent on them!

- **Flavored food,** yogurt, jello, candies, throat lozenges, store-bought cookies, cakes
- **Cooking oil** and shortening (use only olive oil, butter and lard)
- **Vaseline products** (Noxzema, Vick's, Lip

- **Toothpaste**, including health brands
- **Baking soda and cornstarch** (see *Sources*)
- **Rice cakes,** even plain ones
- **Bottled water**, whether distilled, spring, mineral, or name brand. Bottled fruit juice.
- **Cold cereal**, including granola and health brands
- **Ice cream**, frozen yogurt
- **Soaps, hand creams**, skin creams, moisturizers therapy), chap stick, hand cleaners.
- **Personal lubricant**, including lubricated condoms
- **Bird food** made into cakes
- **Flavored pet** food, both for cats and dogs
- **Pills and capsules**. At least a third of all I test are polluted. This includes herbal extracts and prescription drugs. Test yours and switch brands until you find a safe one.
- **Chewing gum**
- **Vitamins** and other **health supplements**, unless tested.

It is impossible for me to have tested every batch of every food and product, but so many test *Positive* you simply can not risk <u>any</u> of the foods and products on the list.

BEWARE! Most of our household products, body products and even foods have benzene pollution in them.

Fig. 62 Some products are benzene-polluted

Tear out the benzene list, put it on your refrigerator, and make a copy to stick on your medicine cabinet.

Learn to use the Syncrometer® to do your own testing. While you are learning, observe the rules perfectly. There is no half-way measure with benzene.

Stop using benzene-polluted products as soon as you read this. **This includes health brands!** Don't wait until you have low immunity. If you can't believe this extensive pollution with benzene and wish to have this verified by our government agencies first, set the items aside. Use other products while you are waiting!

Fig. 64 Pollutants are in unlikely places

You could also check your benzene consumption by doing a urinary phenol test (request one from your clinical doctor, see *Sources*). Choose the test that is meant to identify chronic benzene exposure, not acute. The normal range will be included with your test results. If yours is high, let this galvanize you into action.

Make your own replacements from our recipes!

The body rids itself of benzene in three to five days after stopping the use of polluted products.

Why do only some people accumulate benzene although we all use benzene-polluted products? The answer, of course, lies in how much benzene we get. But is that all? Since aflatoxin causes isopropyl alcohol build up could another mycotoxin cause benzene buildup? A search of 13 mycotoxins showed that one was 100% correlated with benzene buildup.

Fig. 65 Lubricated condoms have benzene.

Zearalenone, a corn mold toxin, is responsible. It is in corn chips, popcorn and brown rice. Persons with benzene buildup have been eating these foods. Stop eating them. Eat white rice. The toxicity of zearalenone is much more important than the nutritional difference.

Because benzene accumulates in the thymus and bone marrow, our two most important immune building organs, we would expect a drop in immunity. All persons with AIDS have a benzene buildup. As benzene pollution worsens, many more people must experience immunity loss.

Vitamin B_2 specifically helps the body detoxify benzene to phenol. If your immunity is low, that is, your white blood cell count is below 5000 per mm^3, take 300 mg with each meal. If you already have AIDS take 600 mg with each meal. And don't visit tanning booths. Ultraviolet light destroys the B_2 already in your body.

Stop Using Supplements

Stop using your vitamin supplements. This is the saddest, most tragic part of your instructions. They, too, are heavily polluted with the same solvents used in food processing: benzene, isopropyl alcohol, wood alcohol, xylene, toluene, methylene chloride, methyl ethyl ketone, methyl butyl ketone, and others. I also see **heavy metals** and **malonic acid** in 90% or more of the popular vitamin and mineral capsules and tablets I test. These substances will do more harm in the long run than the supplement can make up for in benefits.

Supplements are a gamble. The most recent tests using the Syncrometer® unfortunately showed that many popular varieties of vitamin C now are polluted

with **thulium** (a harmful lanthanide). Similarly, all homeopathic medicines had traces of benzene, isopropyl alcohol and wood alcohol. Even some newly organized companies selling Black Walnut Hull tincture had isopropyl pollution. And a Self Health product was found polluted in 1995 and immediately removed from the shelves. All supplement manufacturers should do Syncrometer® testing of their final product.

Fig. 66 Assorted supplies

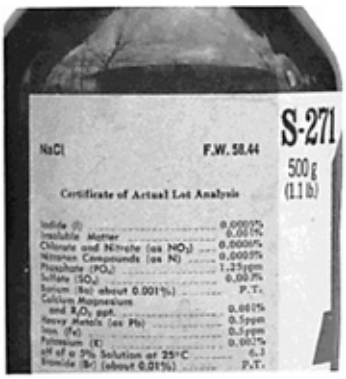
Until all vitamins and minerals and other food supplements have been analyzed for pollutants, after they are encapsulated or tableted, they are not safe. We need processing disclosure on our products. No manufactured product is absolutely pure. We can't expect that. But at least we should be able to tell what impurities we are getting, and how much. We should be able to choose between a vitamin tablet that has less than 0.5 ppm lead pollution and one that has less than 0.05 ppm lead.

The source of a pollutant can be easily traced by anyone who has mastered the Syncrometer®. Manufacturers should avail themselves of this new technology. The future belongs to the ethical business that discloses the chemicals they use to sanitize, lubricate, defoam, release tablets from the tablet punch, seal capsules, or use as release agents for baked goods (to keep them from sticking to pans), etc. They should be willing to send samples for testing.

Fig. 67 Pure salt

It is possible to do detailed analysis of foods or products at a reasonable price. Look at the bottle of common table salt, sodium chloride, which is used by beginning chemistry students to do experiments. It had to be thoroughly analyzed for them because minute impurities affect their results. (Those minute impurities, like lead, affect you, too.) Look at all the information given in the label on the bottle in the picture. Even after all these tests, the cost of laboratory salt is only $2.80 per pound.[51]

It is most important not to be fooled by ingredient claims, like "made from organically grown vegetables". That's reassuring, but the analysis *I* trust would be done on the final, cleaned, cooked and packaged product on the shelf. The package itself is a major unlisted ingredient when it leaches pollutants into the food.



Common table salt for student use is thoroughly analyzed for pollution. The label gives you the final "Actual Lot Analysis" of the product. It is not expensive.

Fig. 68 Laboratory salt label

Toxic solvents like decane, hexane, carbon tetrachloride and benzene will get more flavor or fat or cholesterol out of things than non-toxic grain (ethyl) alcohol. Of course, the extraction process calls for washing out the toxic solvent

later. But it can't all be washed out, and a detailed analysis on the final product would give the public the information they need to make informed choices.

Use NO supplements

...unless they are tested for solvents. Those listed in Sources at the end of this book have been repeatedly tested up to publishing time. What we really need are manufacturers who are committed to using ethyl alcohol or old-fashioned steam to extract and sterilize.

Safe Supplements

There are, no doubt, lots of safe supplements to be had. The problem is knowing which are polluted. The nature of pollution is such that one bottle might be safe, while another of the same brand is not. In view of this, as I found a polluted bottle, I stopped using any more of that brand. Only safe ones are listed in *Sources*.

The De-malonating Supplements

The following supplements have been divided into two sets. These in the table are related to malonate consumption. The remainder, below the table, has other purposes.

Supplement	Dosage
Biotin, 1 mg	Take one a day
Calcium, 500 mg	Take one a day at beginning of meal. Replaces calcium lost by chelation with malonic acid.
Coenzyme Q10, 400 mg	Take in morning upon rising.
Cysteine, 500 mg	Take one three times a day
Folic Acid, 0.9 mg	Take one a day, but see text.
Glutamic acid, 500 mg	Take two three times a day
Glutamine, 500 mg	One a day.
Glutathione, 500 mg	You only need one a day if not ill. If you are very ill, take 2 three times a day before meals. Glutathione is particularly important to restore immunity.
Glycine, 500 mg	Take 1 three times a day
Lecithin	½ Tbs. daily. Supplies methyl groups, also choline.
Methionine, 500 mg	Take one a day

Pantothenic acid (as calcium pantothenate, 500 mg.	Take three a day, makes coenzyme A
Taurine, 500 mg	Take 1 three times a day. Detoxifies cholesterol, formaldehyde.
Vitamin B_6 , 250 mg	Take 1 a day. It is inactivated by malonic acid.
Vitamin B_{12} , 1 mg	Take 1 three times a day if ill, once a day if not ill.
Vitamin C, 1000 mg (1/4 tsp. powder)	Take 6 a day until all malonic acid has been removed from your diet and the dental plastic is out of your mouth. Then reduce to three a day. Take only one a day with food if diarrhea is present.

The dosage of folic acid supplements is regulated by the FDA to be no more than 1 mg. This is because higher doses could mask a B12 deficiency. Of course, when using both together, this could not happen. There is considerable research evidence that much higher doses of both B12 and folic acid would benefit us all, perhaps even prevent multiple sclerosis and Parkinson's disease. A better regulation would be to require that they always be sold together. Much higher doses than a few mg are needed to detoxify malonic acid. Typically, it takes 25 mg of folic acid to detoxify the malonic acid seeping from plastic tooth fillings. Even higher doses are needed if it is seeping into the brain. This happens in Parkinson's disease and brain tumors.

As soon as dental plastic is gone and the diet is free of malonic acid, the requirement for B_{12}, folic acid, and vitamin C drops dramatically. Perhaps even all the way down to the recommended daily allowance (RDA). After you are well, you could cut all dosages of all supplements in half or less.

The remaining supplements in the list are for other purposes.

General Health Supplements

Vitamin C in powdered form, is a must in your lifestyle. It helps the liver, and possibly other organs, detoxify things. I have not seen it help to detoxify benzene, though. It does help retard mold. Keep some next to your refrigerator so it is handy when you put away groceries. Add 1/8 tsp. to maple syrup, vinegar, cooked cereal, pasta, and leftovers. Have at least ¼ tsp. (1 gram) with each meal. This much can be stirred into milk without changing the flavor. If you take it straight, it can give you diarrhea.

Vitamin B_1, 500 mg per meal, is essential for the cancer patient to help restore health to the tumorous organ. It also improves appetite and liver function.

Vitamin B_2, 300 mg per meal. All B vitamins help oxidize food, something

for which cancer sufferers have reduced capability, causing fatigue. B_2 also detoxifies benzene to phenol.

Magnesium oxide, **300 mg**, is another must. It can detoxify phenol to magnesium phenyl phosphate, allowing it to leave through the kidneys. Take one a day, but not during a bout of diarrhea. It is a major mineral; all of our cells need lots of it. Only leafy vegetables provide it. The green drinks can supply some and do not pose a pollution risk nor aggravate diarrhea.

Choline, too, is easily obtained from food, so there is no need to risk taking a tablet or capsule. It is plentiful in eggs, lentils, lecithin granules and milk. It supplies methyl groups.

Ornithine and Arginine, both 500 mg, are very important detoxifiers of ammonia via the *urea synthesis cycle*. But they do much more. We have seen them specifically help to eliminate *Clostridium* bacteria.

Hydrogen peroxide, food grade. It is advantageous to kill bacteria and viruses to some extent every day. Hydrogen peroxide lets you do this. It should never come in contact with metal, including its container or metal tooth fillings. If you get a few drops on your skin it may turn white and sting, but does no harm, so simply wash it off.

Herbs. These are excellent supplements, in bulk. There are many books that describe their medicinal properties. If the herbs are in capsules you must test for petroleum pollution (benzene and other solvents). Don't purchase extracts or concentrates because they are invariably polluted (unless you can test them, of course). The powdered form is also frequently polluted. Buy "c/s", which means cut and sifted.

Lugol's Iodine Solution (see *Recipes*) is made of potassium iodide and plain, pure iodine. It is made this way because plain iodine does not dissolve well in water; it dissolves much better in potassium iodide. Potassium iodide dissolves well in water and stays clear; for this reason it is also called "white iodine." By mixing the two, we can get stronger concentrations of iodine than either can provide by itself. Commercially available Lugol's was polluted with isopropyl alcohol and other solvents when I tested them with the Syncrometer®. Make it yourself from scratch. Be careful not to use bottled water or you will pollute it yourself!

DO NOT TAKE LUGOL'S IODINE IF YOU ARE ALLERGIC TO IODINE. IT COULD BE FATAL.

How do you know if you are allergic to iodine? You can become allergic from having a large amount of iodine poured into you during a special clinical thyroid or kidney procedure. Your doctor or nurse will already have told you if you became allergic. If in doubt, call your doctor.

Iodine has a distinctive trait: it hangs up on anything and everything. In fact, it attaches itself so quickly we consider everything it touches as "stained." This is just the property we want to make it safe for use. The amount you use is immediately hung up, or attached, to your mucous and can not be quickly absorbed into the blood or other organs. It stays in the stomach. And for this reason it is so useful for killing vicious bacteria like *Salmonella*.

Salmonella and *Shigella* are two stomach and digestive tract bacteria. They can give you terrible bloating and gas, which is often misdiagnosed as *lactose intolerance*. Younger persons often have a fever when *Salmonella* attacks. "Summer flu" or "24-hour flu" is really *Salmonella* getting you. It comes into you with deli food, chicken, dairy food, not to mention picnic food that has stood around for a while. Hands carry these two bacteria; so always wash hands before eating and after shaking someone's hand. People can have chronic *Salmonella* and *Shigella* infections. Every new strain they eat or drink evidently forms hybrids with the old strain they already had in their stomachs. This results in much more vicious strains which actually make you feel sick. *Shigella*, especially, makes you feel angry, irritable, and short-tempered as a mule. *Shigella* goes to your nervous system. All cases of multiple sclerosis I have seen had rampant *Shigella*!

Six drops of Lugol's solution can end it all for *Salmonella*. If you have gas and bloating, pour yourself ½ glass of water. Add 6 drops of Lugol's (not more, not less), stir with wood or plastic, and drink all at once. The action is noticeable in an hour. Take this dose 4 times a day, after meals and at bedtime, for 3 days in a row, then daily at bedtime. This eradicates even a stubborn case of *Salmonella*. For prevention use one drop in a glass of water at mealtime.

Notice how calming 6 drops of Lugol's can be, soothing a manic stage and bringing a peaceful state where anxiety ruled before.

Lugol's is perfectly safe (if not allergic) to take day after day, when needed,

because of its peculiar attaching property. It arrives in the stomach, reattaches to everything in proximity. Doomed are *Salmonella* and other local bacteria; doomed also are eggs (cysts) of parasites that might be in the stomach.

Naturally, one would not leave such medicine within the reach of children. Also, one would not use anything medicinal, including Lugol's, unless there was a need, like digestive distress. Store it in a perfectly secure place. In the past, 2/3 of a teaspoon (60 drops) of Lugol's was the standard dose of iodine given to persons with thyroid disease. Six drops is small by comparison, but you need no more.

Shigella is not killed by Lugol's after it leaves the stomach to reside in the bowel.

Amazingly, the two-teaspoon dose of Black Walnut Hull Tincture Extra Strength used in the *Parasite-Killing Program* is also effective against many bacteria, including *Salmonella, Shigella,* and *Clostridium*.

If the tincture doesn't bring total relief in 24 hours, search for a source of reinfection. Then eliminate it. Don't just keep taking the tincture. These bacteria come to us in dairy foods, or perhaps you are self-infecting by putting your fingers in your mouth.

A traditional, more gradual method of conquering digestive bacteria is with two herbs (which are also common spices!): *turmeric* and *fennel*. Follow the *Bowel Program*.

Another traditional treatment for digestive problems is yogurt and acidophilus beverages. But modern commercial varieties are actually contaminated with *Salmonella* and *Shigella* strains. Test them yourself. It is just too hazardous to risk using them.

Other supplements. The concept of supplementing the diet is excellent, but the pollution problem makes it prohibitive. In *How To Test Yourself* you learn how you can test any product, including supplements, to make sure they are safe.

4. Clean Up Your Home

There is only one job left. Clean up your environment. This is an easy task because it mostly involves throwing things out, so it was left to the last. But don't delay for a minute to get this done. Hopefully your family and friends will

jump to your assistance.

- The refrigerator gets changed.
- The basement gets cleaned.
- The garage gets cleaned.
- Every room in the house gets cleaned.

Special Clean-up For Freon

Your refrigerator is the most sinister toxin in your home!

In the past, various refrigerants were used. Ammonia was especially efficient. And the tiniest leak alerted you by its odor. The mechanics were engineered to be foolproof.

But switching to **Freon** as a refrigerant, which is nearly odorless, brought a new threat: unsuspected leakage. Cancer patients all have especially high levels right in their tumorous organs!

Wheel your refrigerator outside the same day you read this. You may leave it on an extension cord and use it until you find a new non-Freon variety.

What is so damaging about Freon in your body? After all, it is non-biodegradable. If it has no biological interactions, how could it hurt us? By being non-degradable, however, the liver has no chemical reactions with which to detoxify it so it can leave the body! It builds up, therefore. Healthy people accumulate it in their skin. Sick people accumulate it in their sick organ.

I call this phenomenon *morbitropism*. "Tropism" means there is an attraction. "Morbi" means sick. Toxic things are attracted to sick organs. Although everybody in the health professions knows this, it is never discussed in scientific circles. Perhaps morbitropism has a magnetic or electronic explanation, and will soon be a legitimate subject for study.

Freon's contribution to carcinogenicity has been studied.[52] I find the damaging effect of Freon is that it can act like a trap for other fat-soluble items like PCBs, metals, and dyes. Particularly, copper is seen at Freon sites. Water that has run through copper pipes carries copper. Your body absorbs the copper, which gets

trapped by the Freon already there. Obviously, you must remove Freon from your body. But how?

Only one useful reaction with Freon comes to mind. Freon is thought to be responsible for the ozone "hole" at the South Pole. Would Freon react with ozone supplied to your body and thereby become biodegradable? Indeed, it does, but only if you drink it as ozonated water. Other ozone routes, as intravenous or rectal, have not been observed to be as effective.

If you have cancer...

buy a small ozonator (see *Sources*) as suggested earlier. Drop the hose into a glass of cold tap water. Two or three minutes are enough to be effective. Drink three glasses a day for the first week, then two glasses a day for six more weeks.

If you are following your progress with the Syncrometer®, you will see that Freon now appears in the liver for the first time. Before this, it was marooned in several organs. You may also detect a feeling like indigestion. You must come to the assistance of your liver. Even ozonated Freon is extremely burdensome to the liver.

A combination of herbs (Liver Herbs in *Recipes*) rescues the liver from its plight, and prevents the indigestion. Drink one to two cups over the course of the day. After drinking liver herbs you will see that the Freon now appears in the kidneys. Yet it is marooned there unless you assist them. Take the kidney cleanse to assist the kidneys so they can finally excrete the Freon into the urine.

It's an elaborate detoxifying program of ozonated water, liver herbs, and kidney herbs taken together for six to eight weeks. This gets most of the Freon out. Afterward, continue the program at one-third dosage for half a year.

Forane is one of the new refrigerants. Although toxic, at least I observe it in the liver directly, suggesting that your body is capable of handling it. Remember your new refrigerator will still be using a toxic coolant, and it would be best to keep it outside or at least vented to the outside.

Another source of Freon is the air conditioner in your home or car. You must test a dust sample taken from a flat surface in your car or home (after changing your refrigerator) to find out if it is leaking. Fortunately, the success rate on fixing air conditioners is quite good, in contrast to fixing refrigerators.

If you are very sick, find a home without air conditioners and move the refrigerator outside.

Special Clean-up for Fiberglass

Fiberglass insulation has microscopically small bits of glass that are free to blow into the air. When house drafts pull it into the air you will inhale them. They cut their way through your lungs and organs like millions of tiny knives, spreading through your body, since there is no way out for them. You smell nothing and feel nothing. This makes it a very sinister poison. Your body, though, recognizes these sharp, pointed bits and tries to stop their spread by sequestering them in cysts.

Most solid malignant tumors contain fiberglass or asbestos, another glass-like particle. In nearly all cases a hole can be found in the ceiling or walls, leading to fiberglass insulated parts of the house. When these holes are sealed in an air-tight manner the house air no longer is *Positive* for fiberglass. Covering with paneling is not sufficient. Check your dwelling for uncovered fiberglass. Repair immediately. Search for small screw holes intended for pictures, or electric outlet plates that are missing.

Also remove fiberglass jackets from your water heater and fiberglass filters from your furnace and air conditioner. Replace with foam or carbon. Best of all, hire a crew to remove it all from your home, and replace insulation with blown-in shredded paper or other innocuous substance.

Never build a new house using fiberglass for any purpose.

Clean Basement

To clean your basement, remove all paint, varnish, thinners, brush cleaners, and related supplies. Remove all cleaners such as carpet cleaner, leather cleaner, rust remover. Remove all chemicals that are in cans, bottles or buckets.

You may keep your laundry supplies: borax, white distilled vinegar, chlorine bleach and homemade soap. You may keep canned goods, tools, items that are not chemicals. You may move your chemicals into your garage. Also move any car tires and automotive supplies like waxes, oil, transmission fluid, and the spare gas can (even if it is empty) into your garage or discard them.

Seal cracks in the basement and around pipes where they come through the

wall with black plastic roofing cement. In a few days it will be hard enough to caulk with a prettier color. Spread a sheet of plastic over the sewer or sump pump.

Clean Garage

Do you have a garage that is a separate building from your home? This is the best arrangement. You can move all the basement chemicals into this garage. Things that will freeze, such as latex paint, you may as well discard. But if your garage is attached, you have a problem. Never, never use your door between the garage and house. Walk around the outside. Don't allow this door to be used. Tack a sheet of plastic over it to slow down the rate of fume entrance into the house. Your house acts like a chimney for the garage. Your house is taller and warmer than the garage so garage-air is pulled in and up as the warm air in the house rises. See the drawing.

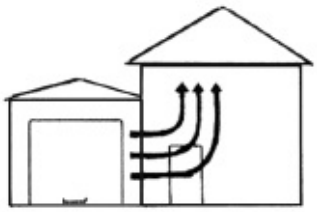


Fig. 69 Garage fumes

In medieval days, the barn for the animals was attached to the house. We think such an arrangement with its penetrating odors is unsavory. But what of the gasoline and motor fumes we are getting now due to parked vehicles? These are toxic besides! This is even more benighted.

If your garage is under your house, you cannot keep the pollution from entering your home. In this case, leave the cars and lawnmower outside. Remove cans of gasoline, solvents, etc. Put up a separate shed for these items.

Clean House

To clean the house, start with the bedroom. Remove everything that has any smell to it whatever: candles, potpourri, soaps, mending glue, cleaners, repair chemicals, felt markers, colognes, perfumes, and especially plug-in air "fresheners". Store them in the garage, not the basement. Since all vapor rises, they would come back up if you put them in a downstairs garage or basement.

Next clean the kitchen. Take all cans and bottles of chemicals out from under the sink or in a closet. Remove them to the garage. Keep only the borax, white distilled vinegar and bottles of concentrated borax and 50% vinegar you have made. You may also use homemade soap. Use these for all purposes. For exact amounts to use for dishwasher, dishes, windows, dusting, see *Recipes*. Remove all cans, bottles, roach and ant killer, mothballs, and chemicals that kill insects or mice. These should not be used anywhere in your house. They should be thrown out. Remember to check the crawl space, attic and closets for hidden poisons also. To wax the floor, get the wax from the garage and put it back there. A cancer patient should not be in the house while house cleaning or floor waxing is being done.

To keep out mice, walk all around your house, stuffing holes and cracks with steel wool. Use old-fashioned mousetraps.

For cockroaches and other insects (except ants) sprinkle handfuls of boric acid[53] (not borax) under your shelf paper, behind sink, stove, refrigerator, under carpets, etc.

Use vinegar on your kitchen wipe-up cloth to leave a residue that keeps out ants. Pour vinegar all around your house outside, using one gallon for every five feet, to deter ants. Do this several times a year. Keep foliage trimmed next to the house. You may also use an electronic pest deterrent (see *Sources*).

Remove all cans and bottles of "stuff" from the bathroom, to the garage. The chlorine bleach is stored in the garage. Someone else can bring it in to clean the toilet (only). Leave only the borax-soap, homemade soap, and grain alcohol antiseptic. Toilet paper and tissues should be unfragranced, uncolored. All colognes, after-shave, anything you can smell must be removed. Family members should buy unfragranced products, which must not contain isopropyl alcohol. They should smoke outdoors, blow-dry their hair outdoors or in the garage, use nail polish and polish remover outdoors or in the garage.

Do not sleep in a bedroom that is paneled or has wallpaper. They give off arsenic fumes and formaldehyde. Either remove them or move your bed to a different room. Leave the house while this is being done. If other rooms have paneling or wallpaper, close their doors and spend no time in them.

Take taurine and cysteine to help your body recover from formaldehyde damage.

Do not keep new foam furniture in the house. If it is less than one year old, move it into the garage until you are well. It gives off formaldehyde. Wash new clothing for the same reason. And do not sleep on foam pillows or a foam mattress.

Turn off radiators and cover them with big plastic garbage bags, or paint them, or remove them. They give off asbestos from the old paint.

Do not use the hot water from an electric hot water heater for cooking or drinking. It has tungsten. Do not drink water that sits in glazed crock ware (the glaze seeps toxic elements like cadmium) like some water dispensers have. Do not buy water from your health food store or any other dispensing place. All holding tanks, all stills, all pumps, must be periodically cleaned, sterilized and greased. Petroleum derived products are used for this. These pollute the water. You can identify them with a Syncrometer®. It would be interesting to find out who is servicing your health food store's supply and with what.

Change all the galvanized or copper water pipes to PVC plastic. **All cancer patients have a buildup of copper.** If you are already anemic, this is your top priority. Copper prevents iron from being used by the body to make hemoglobin. Copper uses up your glutathione. Copper causes mutations. It would be wise to switch to plastic plumbing before anybody in your home develops illnesses. Although PVC is a toxic substance, amazingly, the water is free of PVC in three weeks!

If you have a water softener, by-pass it immediately and replace the metal pipe on the user side of the softener tank. Softener salts are polluted with strontium and chromate; they are also full of aluminum. The salts corrode the pipes so the pipes begin to seep cadmium into the water. After changing your pipes to plastic, there will be so little iron and hardness left, you may not need a softener. If the water comes from a well, consider changing the well-pipe to PVC to get rid of iron. While the well is open, have the pump checked for PCBs. Call the Health Department to arrange the testing. If you must have softening after all this, check into the new magnetic varieties of water softeners (although they only work well when used with plastic plumbing).

Another option is to coat the inside of your copper pipes with epoxy (see *Sources*). The coating hardens in a day; it did not appear in the white blood cells later when I tested with the Syncrometer®.

Metal from your water pipes can not be filtered out or distilled out. Filters

were only meant to remove the amount of metal in city water. Corrosion overburdens it. A new filter may work well for only the first 5 days! Filters even add to the water pollution unless they are made of only carbon. Reverse osmosis water usually contains ytterbium and thulium!

The cleanest heat is electric. Go total electric if possible. If you must stay with gas, have a furnace repair person check your furnace and look for gas leaks before the heating season starts. Don't call the gas company even though it is free. The gas company misses 4 out of 5 leaks! The Health Department does not miss any; call them!

Don't stop because you are already feeling better. Illness can return with a vengeance. Get every clean-up job completed so you can feel secure for your next doctor's checkup and for your future.

It is possible to get most of this house cleaning done in one day. Do all you possibly can. The more difficult jobs may take a week. This is a week of lost time if you are scheduled for a biopsy.

Suppose you have nobody who is willing to clean up the house, basement, and garage for you, or take on your pets for a month while you find them a new home. Don't delay for a minute if you should be invited to stay with a friend or relative who is willing to clean up their place for you and take you to the dentist. Remember it is your own home that is the most toxic place for you. If there are no invitations, go on vacation or put yourself into a non-paneled, smoke-free motel room (bring your own soap, sheets, and pillowcases, and ask that they not "clean" your room or spray it). If you have a camper, remember to clean it up first. Foam and paneling must be out of it. Gas lines should be checked or closed off. Simply being outdoors is your safest place. A sunny beach, with shady places, where you can rest all day is ideal. Remember not to use any sunscreen or suntan lotions; make your own (see *Recipes*) or simply wear a hat.

Unnatural Chemicals

...and where I found them

in ant & roach hives, grains of pesticide

ARSENIC

in carpet & furniture"treated" for stain resistance

in wallpaper

BARIUM

Visit Your Doctor Again

NOW YOU HAVE DONE IT ALL!

Look forward to your next visit with your cancer doctor!

- Your parasites are gone. Without *Fasciolopsis* stages you cannot have a malignancy. Without *Clostridium*, *Ascaris*, and tapeworm stages your tumors can shrink.

- You have cleaned out the isopropyl alcohol from your body and surroundings. Without this solvent you can't get cancer again. Notice from the case histories how isopropyl alcohol disappears from the body simply by removing the sources.

- You have changed your copper plumbing.

- You have extracted the teeth with large metal or plastic fillings and have

replaced them with methacrylate partials. Small fillings have been removed by air abrasion. You are keeping them squeaky clean. You are no longer sucking on copper, cobalt, vanadium, malonic and maleic acid, urethane or scarlet red dye.

- You have switched to foods that are malonate-free and not moldy or processed. This means foods that are fresh and have not been chopped, ground, extracted and mixed with other chopped, ground, extracted foods to create concoctions. You have stopped using supplements unless you know they have been tested for isopropyl alcohol pollution. You are using only safe supplements.

- You have stopped putting chemicals on your skin, in your mouth, on your hair, in your armpits, on your eyelids, on your teeth, on your scalp, on your nails, in your nose, or lungs.

- You have cleaned the house of all the chemicals that your body considers toxic.

- You have gotten rid of your Freon-containing refrigerator.

- You are zapping every day.

Congratulations, this is a big accomplishment!

I hope you did all this in the first week after you bought this book and started on the *Parasite-Killing Program*. You stand an excellent chance of turning your surgeon's verdict around!

If you have had three weeks of this healthful lifestyle, you should ask your doctor for a fresh evaluation of your situation. The three weeks is counted from the time you finished all the clean-ups. Most patients are too intimidated by their doctors to speak up for themselves. Always take a family member or friend with you to give you courage. If lumps are going down or pain is reduced, tell your doctor about this, so he or she has some basis for giving you a postponement. If a new specimen is taken from you for testing it may be evaluated by the lab as "questionable" or "indeterminate" or "atypical" but not "definite", like before. As more time passes for healing to take place, the tests will get even better. Wait for this to happen rather than approving a surgery that could handicap you for life. Yet you must have tangible evidence of improvement. Time is limited and the battle is for your life. Choose wisely.

Stay Clean

Here are a few more facts on where we are getting the human intestinal fluke stages. Since the infective stage in nature is the metacercarial[54] stage, are we eating metacercaria from vegetation like lettuce? I have not seen evidence for this but it must be researched, thoroughly, as a possibility.

You will see in the case histories how some people test YES (*Positive*) for parasites in spite of having completed the *Parasite-Killing Program* and being on the *Maintenance Program*. This is possible because a reinfection can occur in as little as one hour! Of course, your own bowel is the most likely source of reinfection. Keep hands sanitary by rinsing with grain alcohol solution. And never, never put your fingers in your mouth. Observe the best sanitation rules. Zap daily and stay on the maintenance parasite program and Mop Up. In cases of persistent reinfection the patient either had family members who were infected (although symptom-free), or they had repeatedly indulged in fast foods or delicatessen meats. Parasites can make good progress in two days (eating you up and reproducing in you) if given the chance.

Unfortunately for fast food lovers, the solution is not to make a daily routine out of the maintenance program. Herbs powerful enough to kill parasites probably are not advisable on a daily basis.

You must avoid parasites in daily life!

Meat Could Be A Source

Are we getting metacercaria from eating animals that have the parasite[55]? Suppose we eat the raw blood of an animal that has this parasite. The animal's blood has eggs, miracidia, redia, cercaria and metacercaria in it. We swallow those live eggs, miracidia, redia, cercaria and metacercaria.

The metacercaria are meant to attach themselves to our intestine and grow larger, into adults that lay more eggs. But could the eggs, miracidia and redia that we eat also survive and develop in us? The miracidia and cercaria with their tails could simply swim away into our bodies. The eggs could hatch into more miracidia. Isopropyl alcohol will let the stages develop in the liver as well as other tissues that have toxins in them. This causes a population explosion and orthophosphotyrosine production, namely cancer.

When would we eat raw blood? In raw beef such as rare hamburger or steak! In raw turkey as in turkey burgers! And in raw chicken as in chicken burgers! Just handling these raw meats would put the infective stages on your hands! What a terrifying risk this gives us!

ground beef ground turkey chicken

Fig. 70 Meat sources?

Some flukes are large enough to be seen with the naked eye, although their various stages usually need a low powered microscope. Therefore it should be possible to examine any meat sample from the grocery store to verify this source, and I did!

Look at the photos of ground meats. There are objects that look identical to the stages of flukes. Research needs to be done to culture them in order to classify them accurately.

This raises the possibility, in fact, the probability, that our meat animals are the "biological reservoir," namely source of infection, by the cancer-causing parasite! The human intestinal fluke was first studied in certain snails in ponds in China. Are our farm ponds similarly infested? If so, our animals have an obvious source of metacercaria.

The best advice is to become a seafood vegetarian immediately.

The second best advice is to cook all meats for at least 20 minutes at the boiling point, as in baking. Roast it until the meat falls off the bone. Don't eat any meat except fish and seafood in a restaurant. Restaurants cannot be entrusted with so important a cooking rule. Don't eat delicatessen meat. Are there other sources of this parasite? We need to search our food supply for other possible sources.

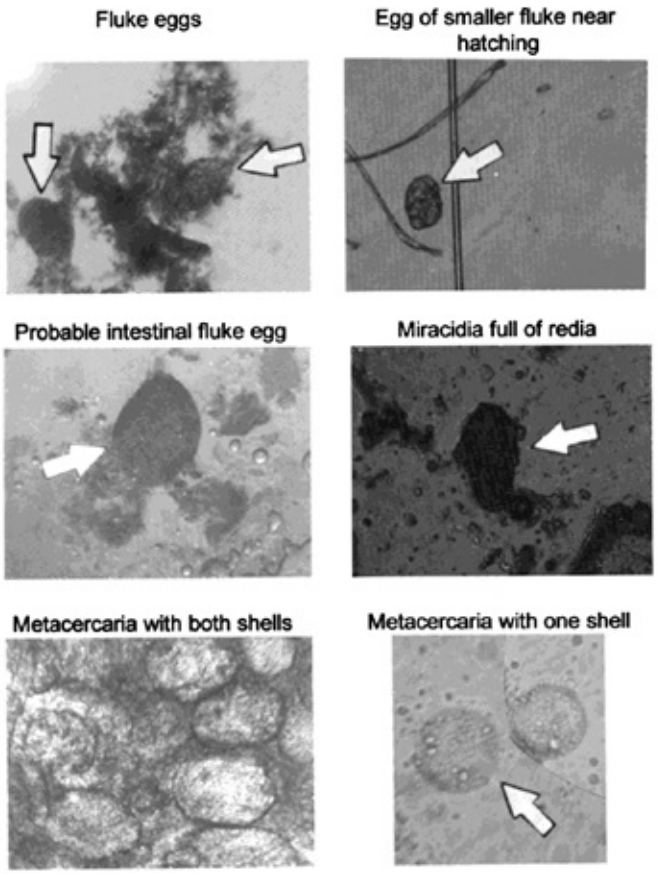

Fig. 73 Likely fluke stages in meat (100x)

Animals could not always have been infested with these fluke parasites. Cows, chickens and turkeys are not the natural hosts of the *human intestinal fluke* (although swine are). And parasite stages, should never be found inside these animals. But their feeds are now full of solvents, which promote abnormal parasitism in them, just as it does in us.

All animal feeds tested, except simple grain mixtures, were polluted with solvents such as benzene, carbon tetrachloride, isopropanol, wood alcohol, etc.

Fig. 72 Some polluted animal feed

Even bird feed was found to have benzene and other solvents in it. Buy seed only.

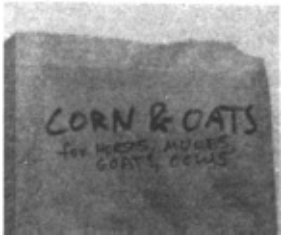

Fig. 74 Bad bird feed *Fig. 73 Solvent free*

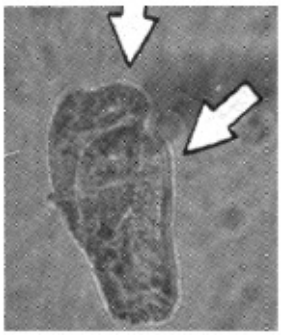
Milk Could Be A Source

Because milk is a body fluid, dairy cows with fluke parasites would be expected to have fluke stages in their milk. Everything made from milk would likewise have fluke stages. This includes butter, cream, and products that contain whey, like acidophilus cultures. Boiling kills them. Pasteurization does not!



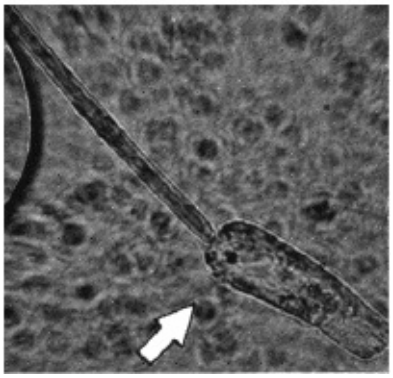
Two overlapped miracidia. (100x)

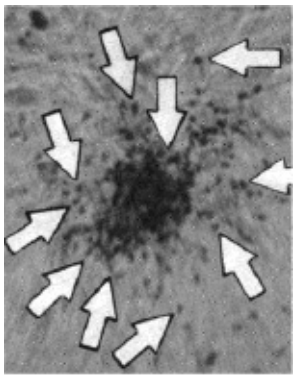
Fig. 75 Miracidia in urine

Sex Could Be A Source

Since the infective stages of the intestinal fluke are microscopically tiny and can travel throughout the body in the blood, it is possible that some may get into the genital tract and genital fluids. It would be wise to practice protected sex. However, if both parties go through the parasite-killing program, there is no risk of constant reinfection through unprotected sex. See the photos of parasite stages

in urine. This is certainly evidence for sexual transmission.





Cercaria seen in urine (400x) Sperm for comparison (400x)

Fig. 76 Cercaria in urine vs. sperm

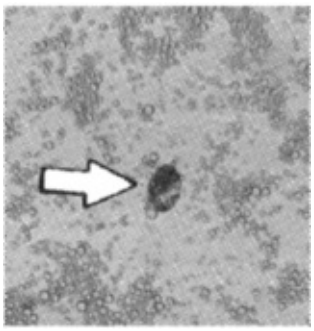
Cercaria resemble sperm, which you might expect to see in urine from a male. However the size difference makes them easy to distinguish.

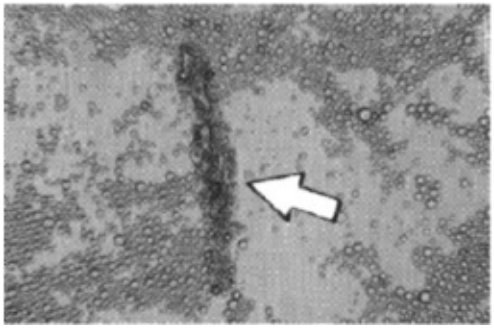
Blood Could Be A Source

The blood carries the infective stages of the intestinal fluke. Until the public blood supply can be searched for them[56], it is not safe. If you need surgery, use your own blood or get it from someone who has gone through the parasite-killing program. Of course, without isopropyl alcohol in your body, such an infection could not give you cancer but it is still very undesirable.

Mother's Milk Could Be A Source

If your body is teeming with very tiny fluke stages because of the solvent in your tissues, could they be transmitted through mother's milk? See the photograph of mother's milk. It shows a fluke egg almost ready to hatch. The mother was full of benzene. The baby was full of benzene from drinking the mother's milk. The family was using cooking oil polluted with benzene.





Egg (100x) **Miracidia developing redia (100x)**

Saliva Could Be A Source

Saliva is another body fluid that carries the tiny developmental stages of the fluke parasites. This means that kissing on the mouth could transmit the cancer parasite. But would you eventually get cancer? Only if you had isopropyl alcohol in you!

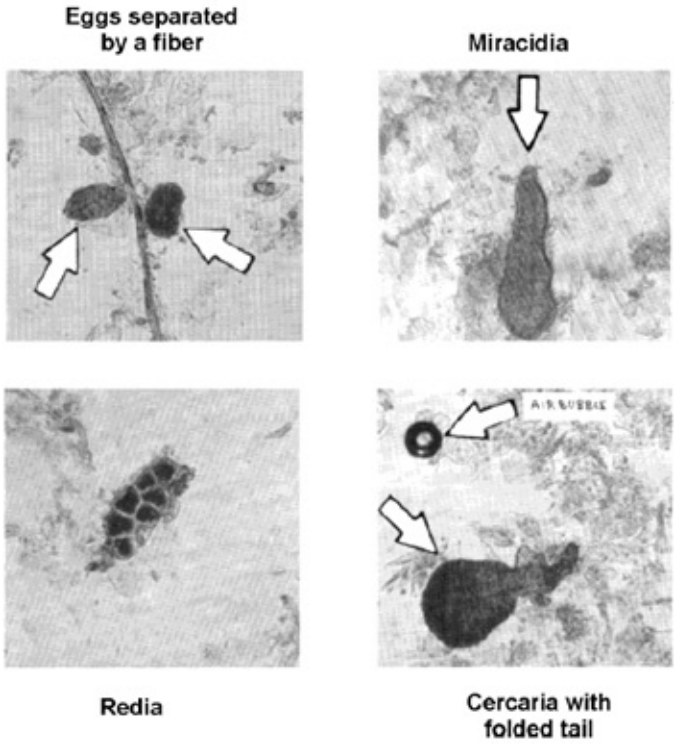


Fig. 78 Parasites in human saliva (100X)

Pets Could Be A Source

Because pet food is heavily polluted with aflatoxins and solvents, including

isopropyl alcohol and benzene, is it any wonder that they, too, get the human intestinal fluke? Fluke stages are plentiful in the saliva. Never kiss your pet. Feed your pets home made food as our grandparents did. Keep all your pets on the Pet Parasite Program.

To summarize:

1. We are eating the infective stages of the intestinal fluke in beef, chicken, turkey and dairy products.

2. We then transmit it to each other by kissing on the mouth and sex.

3. Even if we pick it up in these two ways, we would not get cancer from it unless we have isopropyl alcohol in our bodies.

Biological Questions

My tests show me the close association between parasites, solvents and carcinogens. And that mycotoxins and bacteria are also crucially involved in cancer. But many questions remain.

Since there is never a case of cancer without adult human intestinal flukes being present in the liver,[57] do the adults make orthophosphotyrosine, namely cause cancer? Obviously not, because in many of us it is in its normal "home", the intestine, and we do not have cancer. **Only when it is in the liver** do I find orthophosphotyrosine in the body, but usually in a tissue far away from the liver. It is found where the baby stages and carcinogens (copper, fungus, etc.) are. Do the stages make the orthophosphotyrosine?

Why must there be isopropyl alcohol in the liver and cancerous tissue for cancer to develop? Is isopropyl alcohol part of the chemistry of orthophosphotyrosine formation? Are the eggs and cercaria attracting the isopropyl alcohol or is the isopropyl alcohol damaged tissue attracting the parasite stages? Or is isopropyl alcohol simply force-hatching the eggs or metacercaria?

We have found a bacterium, *Clostridium*, to be present in every tumor. And, indeed, a bacterial theory has been worked on in the past. Dr. Livingstone-Wheeler believed the bacterium to be *Progenitor cryptocides.* A book has been published about her findings.[58]

Could there be a *virus* that is really doing all this instead of the fluke? Again, if the virus belonged to a fluke-bacterium or to the fluke itself, it would be plausible. The virus theory has quite an impressive amount of research behind it.

Why do some people have isopropyl alcohol in their livers, intestine and white blood cells after using shampoo or shaving chemicals while others do not? Evidently, many people can detoxify it quickly so it doesn't build up. Is this a liver problem, caused by the fluke, or a toxin such as aflatoxin B? I never see isopropyl alcohol without aflatoxin B being present. Or do other known carcinogens act by inhibiting isopropyl alcohol detoxification?

If aflatoxin B is the culprit, why does it accumulate in some of us but not others, since we all get plenty of it in our diet? I have evidence indicating vitamin C protects against aflatoxin B. There are documented cases of large doses of vitamin C being effective against cancer.

Because I always see *Aspergillus* fungus growing in the cancerous tissues, is aflatoxin being produced right then and there? Or are we merely eating too much aflatoxin? I also see *Penicillium* fungus with its mycotoxin, patulin.

What is the role played by human Chorionic Gonadotropin (hCG)? It is always found in the liver, at the same location where the isopropyl alcohol is found, but only after isopropyl alcohol builds up there. And I see hCG before orthophosphotyrosine is made. hCG quickly spreads itself throughout the body (notice how often it is found "everywhere" in the case histories). Does hCG tag the tissue that will become cancerous and begin to make orthophosphotyrosine? Is it being made by a mutant gene?

What is the role played by other growth factors? What about tumor necrosis factor? Why don't cancer patients have this like others do? Are they eating more patulin?

Why does only *Fasciolopsis* cause cancer when many other flukes are also multiplying? Production of orthophosphotyrosine can be stimulated by NMDA receptor activation.[59] Perhaps the intestinal fluke alone possesses a virus, a bacterium, or an antigen epitope that fits in the NMDA receptors.

Fortunately, these questions don't have to be answered before you cure yourself of cancer.

A Look On The Bright Side

- Fluke parasites are very easy to kill, much easier than many roundworms or tapeworms (tapeworms survive the parasite herbs).

- Not everything is polluted. Only the processed foods are, and not even all of them. If we eat natural food, we will be safe. (And if we eat malonic-free natural food we will be healthy!)

- I have never seen a case of mercury toxicity from eating fish. It is always amalgam tooth fillings.

- PCB pollution is not in everything (but they are prevalent in detergents).

- I have never seen a case of lead, arsenic or pesticide toxicity from eating fruit or vegetables. Pesticides used on foods haven't penetrated them, as far as my tests show. Simply cut away the blossom and stem end, and wash thoroughly. But don't eat food sprayed to keep it fresh! Such food must be peeled or ozonated, not just washed.

- Municipal water is still the safest source. I found no cases of lead, asbestos, aluminum, or any solvent toxicity due to city water, and only a few cases of arsenic or PCBs. Evidently, the immune system can keep up with this small concentration even with constant use.

- Solvents, PCBs, aflatoxins, and 4,5 benzopyrene leave the body in a few days after you stop getting them into your body, not a few years! Only Freon and copper persist—for weeks.

- Lead is not coming from paint; it is mainly coming from lead solder joints on copper water pipes.

- Asbestos is not coming from municipal water or building materials; it is mostly coming from your own clothes dryer belts (imported varieties) and hair blowers.

- Although milk (or buttermilk) is a much maligned beverage, it is still unpolluted with metals, solvents, or aflatoxins. But it should be bottled in plastic containers to avoid dioxane contamination, and have no dye added. Boil it briefly to rid it of bacteria and parasite stages and have vitamin C added to rid it of malonate. This would protect all the butter and cheeses made from it later.

- Benzene and other solvents are not coming from widespread gasoline pollution. Instead, benzene is coming from our foods and products, due to the mistaken belief that we can use petroleum products in the manufacturing of food. This is an easier problem to correct.

Part Three: Case Histories

The case histories you are about to read are NOT picked out of the files because they got cured, leaving other cases behind who did not get cured. These 138 cases are ALL the cancer cases that walked or were helped into the office over a sixteen month period.

Although not all of them were diagnosed as having cancer by their clinical doctor, I considered them to have cancer if they tested YES (*Positive*) for *orthophosphotyrosine* (the abnormal growth stimulant). See *The Tests* for more information on cancer markers. Similarly I considered them "cured" when they tested NO (*Negative*) to orthophosphotyrosine, even though other symptoms did not immediately abate.

The names have been changed to ones of the same sex picked at random from a telephone directory. Ages have been changed by up to five years. Some personal characteristics have been changed in non-essential ways.

All of them got cured if they carried out the instructions. 35 did not carry out instructions or could not be followed or had special circumstances that prevented them from carrying out the instructions. This leaves 103 who did get cured. As you will read, the method is 100% effective in stopping cancer regardless of the type of cancer or how terminal it may be. It follows that this method must work for you, too, if you are able to carry out the instructions.

Types Of Tests

Cancer We test for orthophosphotyrosine. HCG is tested occasionally as a pre-cancer indicator. As the correlation between cancer, *Fasciolopsis* (human intestinal fluke) in the liver, and isopropyl alcohol became clearer, I often tested those next.

HIV We test for Protein 24 antigen. Remarkably, HIV/AIDS is caused (and cured) very similarly to cancer and is the subject of another book by this author.

Parasites About 120 varieties, including intermediate stages

Toxic elements About 70 varieties

Solvents 27 varieties

Pathogens (bacteria and viruses) About 80 varieties

Kidney stones Seven varieties

Blood (which includes urine) This testing is done by a commercial laboratory, and depending on the panels selected, could be 50 or more tests.

Obviously most of these tests are not part of eliminating orthophosphotyrosine and curing cancer. They are essential for learning how to get well, however.

We have the capability of testing each of the above 300 substances in any of the body's 100 tissues for which I have samples. It is unrealistic to even attempt to accomplish these 30,000 possible tests. Typically about 30 tests can be completed in an average office visit, and I select the most useful ones for the client. Only the YES (*Positive*) results and significant NO (*Negative*) results are shown in these case histories.

See *The Tests* chapter for more information about each test.

Not all of the cases are roaring successes, but there are lessons in all of them that can put you on the road to recovery.

1 Lydia Hernandez Breast Cancer

Lydia Hernandez is a 62-year-old school teacher, developing cataracts and suddenly losing her hearing. She has seen an Ear, Nose and Throat doctor and had a CAT scan and MRI. She is aching all over. The purpose of her visit was her laryngitis, which she has had 4 days. Cannot speak at all.

☒ Arsenic (Toxic Element) YES (present in her white blood cells)

We will test home air and schoolroom air for arsenic. She will collect a dust sample in a jar of water. After finding arsenic we did not complete the toxic element test or do other tests because this is not a scheduled visit. She will make an appointment.

Five days later

Both breasts are hot and tender with the nipple affected. Throat still raspy. Ear bothering her.

☒ **Orthophosphotyrosine (Cancer) YES**

☒**Fasciolopsis (Parasite) YES at liver**

She will start on Parasite-Killing Program.

☒ **Cobalt (Toxic Element) YES at breast**

Stop detergent.

☒ **Chromate (Toxic Element) YES at breast**

Stop cosmetics.

☒ **Antimony (Toxic Element) YES at breast**

Stop cosmetics.

☒ **Copper (Toxic Element) YES at breast**

Has no metal tooth fillings but has copper water pipes.

☒ **Asbestos (Toxic Element) YES at breast**

☒ **Bismuth (Toxic Element) YES at breast**

Stop cosmetics. She has brought in a sample of school air where she teaches. It was YES (*Positive*) for arsenic and asbestos. She is on antibiotics, cortisone, and sinus medicine from her clinical doctor. She is getting sick leave from teaching.

Four days later

Breasts are feeling better.

☐ **Fasciolopsis (Parasite) NO**

She will continue *Parasite-Killing Program* as on the instruction sheet.

☐ **Asbestos, Bismuth, Antimony, Cobalt (Toxic Elements) NO**

☒ **Copper (Toxic Element) NO at breast, YES at liver**

☒ **Chromate (Toxic Element) YES**

Will disconnect water softener. She went off detergent and cosmetics. She is not in the school building. She has brought water samples from her faucets: hot water is YES (*Positive*) for chromate.

Three weeks later

Throat feels bad. Head is congested. Breasts OK.

☒ **Asbestos (Toxic Element) YES**

From school room air – would like to retire from school teaching rather than go to school office with the news about asbestos.

☒ **Copper (Toxic Element) YES**

From water pipes; husband unwilling to change pipes.

☒ **Fasciolopsis eggs (Parasite) YES**

By some oversight she has not taken Cloves in the parasite program, will start immediately. She can find no solution to the copper and asbestos problem.

Two months later

She reports her doctor found a 2½ cm cyst in left ovary. She will repeat parasite treatment.

Two months later

☒ **Arsenic, Copper (Toxic Elements) YES**

She will take 2 thioctic capsules (100 mg) three times a day and change metal glasses to plastic frames to reduce metal absorption.

☐ **Fasciolopsis (Parasite) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Solvents (ALL) NO**

She will stay on parasite maintenance program and avoid rare meats in her diet.

Five months later

She had a cavitation cleaned by dentist and two wisdom teeth pulled. Her fibrositis is suddenly gone, groin pain gone, TMJ gone on one side. Arsenic still YES. She will steam clean her carpets, drapes, upholstery. Overall, she feels much better.

Summary: This was a case where cancer was not suspected until she had the breast symptoms. Note how the breast had collected three toxic elements from her cosmetics. The water softener is a toxicity source as well as the copper water pipes. Lydia was fortunate to regain her health but the arsenic is relentless. Hopefully she will get it removed from her home and also retire from school teaching. There are many sources of pesticide (wallpaper, carpet/drape/upholstery treatments, pesticides), but the most likely source at her school would be pesticide in the lunch room and kitchen. Pesticides are generally odorless, so we don't suspect them.

2 Janet Chapman Carcinoma at thymus and lung

Janet Chapman is a 45-year-old pleasant woman whose main problem is carcinoma. At the age of 24 she had hepatitis. It took her several months to get over it. Then, after a few years, she had a partial hysterectomy for numerous cysts in the ovary and uterus. She has one ovary left.

She started having a heavy feeling in her chest and getting tired. Her doctor put her on Premarin™ and Provera™ for energy. She took that for 1½ years. She got some energy out of it. Recently, her doctor took a chest x-ray and found a tumor in the thymus gland. They did a biopsy of the tumor, which came back *Negative* to cancer. They did surgery, to remove the tumor, and found it was indeed cancerous with many other “fingers” all over the chest and a couple of spots on the right lower lung. Part of the diaphragm was cut during this surgery; a nerve to the vocal cord was also injured. The thymus gland was removed, but “fingers of thymus” were not.

She also had 36 radiation treatments over a 7-week time period. Then everything showed up OK until about two months ago when she had tightness of chest again.

Last week fluid was taken off [from] her chest. A tumor is in her left chest cavity. Her worst symptom is “terrible tightness over stomach.” She started to feel bad soon after the fluid was taken off her chest.

- ☒ **Orthophosphotyrosine (Cancer) YES at thymus, lung**
- ☒ **Fasciolopsis (Parasite) YES at liver,** and unknown location (couldn't find)
- ☒ **Fasciolopsis redia (Parasite) YES at thymus, lungs, bone marrow**
- ☐ **Sheep liver fluke (Parasite) NO**

She will start on parasite program although swallowing is difficult. Her

brothers brought her to the office because husband is skeptical of alternative therapies. Janet coughs a lot and holds her mid-abdomen due to pain. But she is interested and willing to try to get well. I suggested they coax her husband to come along next time.

One week later

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☒ **Formaldehyde (Toxic Element) YES and very high**

They will test house air and she will sleep out of house, in RV.

Five days later

She is still coughing and very weak. Formaldehyde YES, even higher than last time. The RV has foam and paneling in it. House air tested YES to formaldehyde in one bedroom only. They have a water softener (will ask husband to disconnect). She has lost 5 pounds in the last 3 weeks. They will move the new furniture in the house into the garage so she can safely sleep in the house. Her brothers are planning to take her on vacation.

Three weeks later

Her cough is worse. She has been on vacation with brothers and did OK while away from home but got worse immediately after getting home. Her husband came with her this time.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **Formaldehyde (Toxic Element) YES and very high**

New foam furniture has not been removed from her bedroom – was a gift; husband didn't want to hurt relatives' feelings.

- ☒ **Dog heartworm (Parasite) YES**

Dog heartworm also causes coughing (husband critical of this finding). Note: she is simply dying of heartworm and formaldehyde. The cancer was stopped weeks ago.

Summary: it has been several months and I am afraid we will get a telephone call soon, telling us that Janet died. It would have been so easy to clear the house of formaldehyde just by removing

certain pieces of furniture. The heartworm, too, could have been eliminated in a week. But the supportive part of the family lived far away. And the non-supportive part lived with her. Was it because she is a woman, or because she was sick, that kept her from asserting herself enough to follow the treatment she wanted to follow? I fear another wonderful young person has paid the price that dogmatic belief in purely clinical concepts exacts. The husbands, in either this case or the last case, are not to blame. Ignorance is.

3 Ida Birdsall Cervical Cancer

Ida is middle-aged, recently remarried. She has blood in her urine. She has seen her gynecologist who did a PAP smear. In the hospital she had chest x-ray, blood test, EKG followed by a D & C. One week after D & C, her regular doctor told her the tissue removed from her uterus during D & C showed moderate carcinoma.

☒ **Orthophosphotyrosine (Cancer) YES at cervix**

☒ **Arsenic (Toxic Element) YES at cervix, uterus**

☒ **Tellurium (Toxic Element) YES at cervix, uterus**

Usually from metal in tooth fillings, but she has complete dentures—no metal!

☒ **Fasciolopsis (Parasite) YES**

Start on parasite program. They have a water softener. Will bypass it immediately. We will test dentures for tellurium by soaking in distilled water overnight and testing the water.

Three days later

☒ **Arsenic, Tellurium (Toxic Elements) YES**

☒ **Tellurium (Toxic Element) YES in denture water, YES in lower denture white plastic, NO in lower denture pink plastic, NO in upper denture, white or pink.**

The tellurium is apparently in the lower denture, white part. She needs new metal-free dentures. They will steam clean carpets and furniture to get rid of arsenic. They had been commercially cleaned and treated for stain resistance last summer; this is the probable source of arsenic.

Four months later

She has had a complete hysterectomy.

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis cercaria and eggs (Parasite) YES in blood**

Start again on parasite program in spite of loose bowels Note: the hysterectomy did not clear her of cancer.

Two weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis cercaria (Parasite) YES in blood, still!**

Continue parasite program - increase dosage.

Summary: We had been seeing this happy pair of middle-age newlyweds for about a year before the cancer struck. Each time I found arsenic in Ida's white blood cells. They just couldn't seem to get it out of their home. They took such pride in remodeling their home that they just couldn't believe anything like arsenic could be lurking in the carpets. Suddenly it was too late. She had to have a hysterectomy. They were crushed. And they were perplexed when the cancer wasn't gone after the surgery. But they carried out the instructions and took on new living habits and became completely free of it. Maybe they'll live "happily ever after" now with that important lesson behind them.

4 Pamela Charles Breast Cancer

Pamela Charles is a middle-aged woman who had just been discharged from the hospital. She had a lump removed from left breast, also 8 lymph nodes, two of which were cancerous. She is in middle of radiation treatment. The cancer was discovered by mammogram. Three years ago she had a heart attack for which she got angioplasty.

☒ **Orthophosphotyrosine (Cancer) YES at bone, edge of breast**

☐ **Protein 24 (HIV) NO**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Isopropyl Alcohol (Solvent) YES**

☐ **Remainder of solvents NO**

She will search for all sources of "prop" (propyl alcohol, isopropyl, etc.) and remove from her house. She will start parasite program.

Eight weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Toxic Elements (All) NO**

☐ **Solvents (All) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

BLOOD TEST	Result	Comment
phosphate	high	she is dissolving her bones

She will drink three cups 2% milk, reduce phosphate foods; take a magnesium oxide tablet daily (300 mg). Continue parasite program. Client released.

Summary: Note that Pamela still had the cancer in spite of the recent surgery. In fact, it was spreading to the bone. Since she was sandwiched into a 15-minute time slot, I didn't do complete testing. Her finances don't allow her to come back to improve her heart condition.

5 Brenda Rasmussen Breast Cancer

Brenda Rasmussen is 43, came from three states away for a large, malignant lump (size of hen's egg) over right breast. She has not accepted the doctor's diagnosis, does not wish to talk about cancer. Her friend asked us not to mention cancer! She also has high blood pressure and nervous anxiety. She is using no caffeine, alcohol, nicotine. Her chiropractor is concerned. She gets very little sleep.

☒ **Orthophosphotyrosine (Cancer) YES at breast, with some spreading**

☒ **Antimony (Toxic Element) YES at breast**

Suspect perfume.

☒ **Cobalt (Toxic Element) YES at breast**

Suspect detergent.

☒ **Copper (Toxic Element) YES at breast**

Suspect tooth fillings.

☒ **Aluminum Silicate (Toxic Element) YES at breast**

Suspect salt.

☒ **Nickel (Toxic Element) YES at breast**

Suspect tooth fillings. She will go off salt (buy Hain Sea Salt™ only). She

was given ornithine, 4 at bedtime, to sleep. Also thioctic acid, 1 every waking hour to remove heavy metal. She will go off her perfume, lipstick, sunscreen, lip balm, eye cleansing cream, other cosmetics, detergents, and massage oil. She will buy new socks and underwear and use only borax to wash her hair and do laundry.

Next day

We pursued her intestinal problem, which she didn't mention yesterday.

PARASITES: No adult flukes found. Didn't test for parasite stages. Giardia and pinworms only. She has been getting colonics. Start parasite program.

☒ **Tungsten (Toxic Element) YES very high at colon!**

Eats no toast, does not use a wok, or drink electrically heated water; suspect water for colonics - will get sample.

Next day

Received sample of colonic water. It was YES (*Positive*) for tungsten (stop colonics). Her urinalysis showed oxalate crystals, blood, etc.

☒ **Asbestos, Cerium, Europium, Tellurium (Toxic Elements) YES in urinary tract**

☐ **Orthophosphotyrosine (Cancer) NO**

Summary: Brenda was one of those fortunate people who can find a friend in time of need. This friend, although older than Brenda by 10 years at least, drove her 800 miles to our office only to hear Brenda say she couldn't do dental work, couldn't give up cosmetics and couldn't change detergent. Her friend coaxed her through some of these obstacles and 6 months later called to say she was doing OK but still had her lump. She had not stopped the colonics nor was she sticking to her new rules of living. We thanked her kindly and wished her well.

6 Louise McAleer Colon Cancer

Louise McAleer is a woman in her late 40s who has a number of physical problems: 1) Lower back pain. She went to a neurologist who said pain was caused by scar tissue pressing on a nerve. Pain is unbearable; she can hardly sit or stand. 2) Cannot think straight, trouble concentrating. This is probably due to the pain. 3) Diarrhea, severe for about a year. Colonoscopy did not find anything in the colon. She has not been able to go to church since December. Her legs get numb. They were cold as ice in the office. She shakes inside and gets very sick with diarrhea. 4) Pain syndrome in shoulders and arms. 5) Pain and numbness in her hands and arms. 6). Chest pain. 7) Ulcer. She reported a history of digestive problems. 8) Sleep problems. 9) Pain in left ear, running down left side of her

neck.

☒ **Dibasic Calcium Phosphate (Kidney Stone) YES**

She does not tolerate milk. Carrot juice and vegetable juice, ½ cup/day was recommended. She does not tolerate much of anything now. She was started on kidney herb recipe.

In a brief review of her blood test, her urinalysis showed bacteria, blood, and crystals. Her estrogen level was too high. It was suggested that she cut her estrogen replacement (Premarin™) dosage in half. She was also to go off caffeine, tea and benzoate preservative.

12 days later

She felt that her lower back was slightly better. All other pains persisted. She feels nauseous after eating. She reported that she could urinate better. She has a lot of pain at left lower abdomen and says she is very gassy.

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis eggs (Parasite) YES at colon**

Other parasites not tested.

☒ **Orthophosphotyrosine (Cancer) YES**

Start immediately on parasite program. Digestive program: take Digestive Enzymes (Bronson's) 2 with breakfast, 4 with small meal and 6 with dinner.

One week later

She still has been sick all week with diarrhea, nausea, all the same symptoms. She did not take Cloves . She will take them as soon as she is able.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Platinum (Toxic Element) YES**

Needs metal tooth fillings replaced.

Two weeks later

She is focused on TMJ (pain at hinge of jaw) today. Other pains gone, except for left ear pain and neck pain.

☒ **Clostridium (Pathogen) YES at tooth #21**

See dentist for abscess.

Summary: this youngish woman came in with a long list of severe problems. It came as a shock to her, though, that she actually had colon cancer. In spite of her severe stomach problems, she managed to get down the Black Walnut Hull tincture and Wormwood (in the parasite-killing recipe). She didn't take any Cloves. But she was lucky and all intestinal fluke stages were gone one week later. This cleared up the colitis and many other pains, too, so in 2 more weeks she was nearly free of the whole list she came with. I hope she completes her dental work and rids herself of her last remaining pains.

7 Mark Pelsuo Acute Lymphocytic Leukemia

Mark Pelsuo is eight years old. He was diagnosed with acute leukemia, in April 1989. Since then he has been on chemotherapy. He has had radiation. He had testicular involvement and got radiation to testicles. He has responded well and looks and feels good.

His parents installed R.O. (reverse osmosis) water shortly after diagnosis. They got interested in nutrition and added brown rice to their diet. Also lots of soup, macrobiotic diet, also lots of fresh vegetables. Also added vitamins; spirulina, selenium and magnesium. Now on immune pack and vitamin C (powder).

They will bring a copy of his file. He is being monitored with blood test every three weeks.

☒ **Holmium (Toxic Element) YES at all tissues**

☒ **PCB (Toxic Element) YES at all tissues**

☒ **Ytterbium (Toxic Element) YES at all tissues**

They have well water, 25 year old well. They moved into this house 5 years ago. No industry has ever been in their neighborhood. Their pump went out two years ago because lightning hit the house which was grounded to the pump. Pump blew out at that time and was replaced. Well is about 40 feet deep and water was tested after that. Conclusion: I believe PCB source might be the well-pump that blew apart two years ago.

When they first moved into the house, the mother got very sick (in bed). For the next year she had arm numbness, dizziness, could not go up and down stairs. They tested with MRI for multiple sclerosis, brain tumor, and found nothing. She has gradually gotten better. A year later, her oldest daughter got very sick. About six months before diagnosis, Mark fell out of

tree and broke both elbows.

- ☐ **Kidney Stones (ALL) NO**
- ☒ **Fasciolopsis (Parasite) YES in bone and liver (remainder untested)**

Start on parasite program.

My present theory is that the pump (a submersed type) in their well was damaged by lightning so that it spilled its PCB into the water. Since the PCB would rise to the top, their water would get much more polluted when the water level was low. The pump was replaced with another submersed kind. The father is interested in proving this theory. They agree to not use well water for any purpose and bring sample for testing next time.

Two weeks later

Cough is nearly gone. Right knee pain persists. He is due for a chemo treatment (Vincristine™) next week. They will send results from a previously done blood test and a new one to be done next week. He is on 6 MP™ (1 tab/day, 50 mg tab) daily. No side effects. He is on Methotrate™ 1 time/week. They have brought in water specimen to test for PCBs.

- ☐ **PCB, Holmium (Toxic Elements) NO**
- ☒ **PCB (Toxic Element) YES in well water**
- ☐ **PCB (Toxic Element) NO in reverse osmosis filtered water**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **Pancreatic fluke (Parasite) YES**
- ☒ **Fasciolopsis (Parasite) YES in mother**
- ☒ **Fasciolopsis (Parasite) YES in father**

They need to solve their water problem and finish parasite program for whole family.

Summary: This was a health conscious family. They were intensely interested in how their PCB pollution had come about. They all promised to rid themselves of parasites and stick to some new health rules. Since they were from 2 states away, they did not plan to return unless Mark's health shows signs of deterioration. We have not heard from them for eight months.

8 Nevita Thompson Hodgkin's Disease

Nevita Thompson is a middle-aged school teacher, very vivacious, lives on handfuls of vitamins, all carefully organized. She spends a lot each month on supplements and is happy with it. She has had Hodgkin's for several years and also has extremely high triglycerides. We saw her April, 1992. Both palms were tender and painful. She had numbness and stinging in various fingers. Her doctor diagnosed it as neuropathy.

☒ **Fasciolopsis (Parasite) YES in kidneys, bladder, colon**

☐ **Fasciolopsis other stages (Parasite) NO**

Start on *Parasite-Killing Program*. We will test toxins next time.

Two months and one week later

Hands are more numb. Her doctor says her Hodgkin's seems to be gone.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Diplococcus (Pathogen) YES in all tissues**

Must see dentist for abscess.

Four months later

☒ **Acetone (Solvent) YES**

Probable cause of neuropathy, along with bacteria —is planning to see dentist)

Summary: Nevita had Hodgkin's disease for about 4 years when she came to us. She saw her medical doctor regularly throughout that time. But after ridding herself of the intestinal fluke this spring, her doctor noted that, for the first time, he saw no evidence of Hodgkin's anymore. Her spring visit was not a regular visit, nor were her later ones. She only came in to restock her vitamin supply. That is why her visits were so short. At her first visit, I told her about the propanol/cancer connection and she took herself off cosmetics. So when the solvent test was done later on, no isopropyl alcohol was found in her.

9 Paula Erickson Breast Cancer

Paula Erickson is a healthy looking person, age 58, with metastasized breast cancer to lymph nodes. The lymph node was found in August, 1987. Mammogram suggested that it was non-malignant. She has had three mammograms - all non-malignant. Biopsy done in Jan. 1988 showed it<u>was</u>malignant. First breast was removed. Then she took chemotherapy for six months.

Later that year a doctor put her on Tamoxifen™; it worked for a while, then it went “haywire.”

Then she was put on Megace.™ On Oct. 1989 she was started on radiation in right neck and shoulder area. That did not seem to "do anything." She went to Mayo Clinic and they did nothing more; said she was on the right course. Then she went to Ellis Fischel Clinic in Columbia, Missouri, they found a blood clot; they used heparin in hospital (plus chemo) for eight days. She has had eight rounds of chemo. End of July 1990, second breast was removed. Finished chemo Nov. 1991. Then she was put on Halotestin™.

Her right arm is very swollen and tight. She has put on 10 pounds of water in the last month. Soreness in left shoulder since the surgery. She is not on any morphine yet. She has a cold and is on antibiotic Erythromycin™. She is still coughing.

☒ **Fasciolopsis (Parasite) YES at liver**

I could not test others because of exceptionally high body resistance, obscuring resonance. Probably due to PCB. Start on parasite program.

Four days later

Can still do only minimal testing.

☒ **Antimony (Toxic Element) YES**

She is rubbing some kind of ointment into her skin.

☒ **Chromate (Toxic Element) YES**

They have a water softener. They will bypass it and bring in water sample for testing.

☒ **Arsenic (Toxic Element) YES**

Living in a new house; no drapes or wallpaper. Baffling.

☒ **Silver (Toxic Element) YES**

Has dentures; suspect glasses frames.

☒ **Rhenium (Toxic Element) YES**

Will stop using spray starch.

☒ **Thallium (Toxic Element) YES**

They are not using well water—has full dentures—knows of no pesticides.

☒ **Titanium, Radon (Toxic Elements) YES**

This house is built on a slab: no crawl space or basement. They will fill

cracks around plumbing. Start on thioctic acid, 100 mg, take 2, 3 times/day. Continue parasite program.

Eight days later

They coated her glasses frames instead of getting plastic frames. Her shoulder pain is much worse, she is back on morphine. Her daughter recalled that the yard was “treated” last fall, this could be her source of arsenic.

☒ **Fasciolopsis (Parasite) YES**

They had stopped the parasite program because of increased bowel movements (8/day). She must go back on parasite program immediately.

☒ **Arsenic, Thallium, Antimony (Toxic Elements) YES**

☐ **Titanium, silver (Toxic Elements) NO**

Not wearing glasses.

☐ **Rhenium (Toxic Element) NO**

☐ **Chromate (Toxic Element) NO**

Disconnected water softener.

☒ **Radon (Toxic Element) YES**

Nobody is now smoking in the house. They have plug-in air fresheners, possible source of antimony. Told her to remove these. They will work on cracks. Thallium is probably in the jawbone from an old polluted filling.

Four days later

Feeling OK, some pain in shoulder, off morphine.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Uric Acid, Mono, Di-Calcium Phosphate (Kidney Stones) YES**

Start on kidney herbs.

☒ **Arsenic, Thallium (Toxic Element) YES**

☐ **Antimony (Toxic Element) NO**

Stopped using fragrant tissues.

☐ **Radon (Toxic Element) NO**

Sealed cracks. Note: her cancer is gone; she will probably recover if arsenic source is found.

Ten days later

Telephone call from son - mother in hospital, terminal.

Summary: Paula was very willing to make all the changes necessary to recover. At her last visit, she was planning to go home and live by herself again. She thought this might get her away from the arsenic, which must be coming from her son's home (she was staying with her son during this illness). But the son had taken her to her medical doctor for a last follow up before a happy leave-taking. The doctor, seeing her improvement, felt she could tolerate more radiation and chemo. This was a sincere effort on the doctor's part to prolong her life. She never got out of the hospital. No more details were given. How sad it was to see her miss her chance to finish out her life in her own home in a normal way.

10 Ananda Bareno Cancer At Kidney and Bladder

Ananda Bareno is a 69-year-old woman with a respiratory problem. Her tonsils have been removed three times. Her nose is congested. She also has allergies. She gets allergy treatments often from her doctor. Extreme allergies, asthma - her eyes are itchy, etc. She needs her voice to sing. She is a famous singer.

☒ **Scandium, PVC (Toxic Elements) YES at lungs**

☐ **Kidney Stones (ALL) NO**

She will bring in blood test from doctor. We will test house air for PVC.

Two weeks later

She brought in the blood test along with her allergy test and house air samples.

☐ **PVC (Toxic Element) NO in air samples**

She has lost 7 pounds. She is on Premarin™ and Provera™.

BLOOD TEST	Result	Comment
1. Urinalysis	shows trace of blood	check kidneys
2. Seg/Lymph	is low	virus

3. Eos	very high (10%)	parasites
4. Ferritin	is very high (613)	cancer risk; has been taking iron tablets [Feosol™]
5. FBS	is slightly low (74)	pancreas problem
6. Phosphates	is slightly low	Vitamin D [A and D 1000] take 1 a day for 3 months only
7. Alk phos	is slightly high	
8. GGT	is high	gallstones, needs liver cleanse
9. LDH	is slightly high (180)	check for cancer
10. Iron	is very high	stop taking Iron
11. Triglycerides	is high (225)	kidney

(Blood tests and abbreviations are described more fully in *The Tests*.)

☒ **Orthophosphotyrosine (Cancer) YES at kidney, bladder, liver**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis miracidia (Parasite) YES at kidney, bladder, blood**

Start on parasite program.

One month later

☐ **Orthophosphotyrosine (Cancer) NO**

Has never used the word “cancer”; her friend shields her.

☐ **Fasciolopsis and all stages (Parasite) NO**

She says she feels “like a new person.” This is usually the time of year she suffers most and gets shots.

☐ **PVC (Toxic Element) NO**

☒ **Scandium (Toxic Element) YES**

Probably in tooth fillings. She is not planning on coming back for a while. She will stay on parasite maintenance program.

Summary: This is another one of those cases where it is impossible for the client to discuss cancer. Although I referred to it plainly, her responses were on a different subject as though she didn't hear me. Her friend (who was extremely concerned about her) played this pretend game with her, probably to get her compliance. Fortunately, she did comply with all instructions, and she regained her health in a short time.

11 Ruth Stang Colon Cancer

Ruth Stang is a young woman in her 20's with lots of pain in neck, right arm, shoulder, chest, and

ovary. Also tachycardia and mitral valve prolapse. She passes out without a cause. Recurrent kidney infection and blood in urine. Fatigue. Too thin. Can't gain weight. Works in doctor's office.

☒ **Orthophosphotyrosine (Cancer) YES in colon**

☒ **Fasciolopsis (Parasite) YES in colon and liver**

☒ **Fasciolopsis miracidia (Parasite) YES in colon only**

I suspect heart parasites, gallstones and kidney stones. She was to start on parasite program.

Summary: It was heartbreaking to see such a young person so disabled due to no fault of her own. She appreciated the encouragement we could give her that she would be completely well in a few months. A few days later the bank had returned her payment check, saying a "stop-payment" order was given on it. She did not keep her follow-up appointment, and we have heard nothing since. A particularly sad case! Probably her family or friends were angry, in a well-intentioned way, that she was "wasting" her money on alternative therapies.

Six months later

Ruth returned with a friend. She explained her absence and paid her old bill. She has had no more dizziness or passing out since she was last seen. Her whole family has stopped eating beef. She says she feels well and did not need to come back. She was bringing in a friend with cancer; that is why she returned. She wanted to be tested for cancer again, herself.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Protein 24 (HIV) NO**

Marilyn Werdick Pancreatic Cancer and HIV Illness

Marilyn Werdick came with a diagnosis of pancreatic cancer at age 50. It happened suddenly, with stomach trouble two months ago. She thought it was due to her pain medicine for lower back pain. CAT scan showed area of pancreas that was suspicious. Biopsy showed pancreatic cancer. Surgery was begun but they just sewed her back up. She is on morphine. She is still smoking but promised to stop.

☒ **Protein 24 (HIV) YES at thymus, vagina, pancreas**

☒ **Orthophosphotyrosine (Cancer) YES at pancreas**

☒ **Fasciolopsis (Parasite) YES at liver and thymus**

☒ **Fasciolopsis eggs (Parasite) YES at thymus, NO elsewhere**

☐ **Sheep liver fluke (Parasite) NO**

She has no sensations over the breast bone.

☒ **Gardnerella, Flu, Plantar Wart, Strep pn, Trichomonas, Adenovirus, Campylobacter, Alpha Strep, Proteus v, Papilloma 4, Bacillus cereus, Norcardia, Staph aureus (Pathogens) YES**

☐ **Bacteroides fr, Haemophilis inf, Herpes 1, CMV, Borellia, EBV, Shigella, Histoplasma, Chlamydia, Coxsackie B4, Salmonella, Resp Sync V (Pathogens) NO**

Stopped here (this is less than half the test). This shows AIDS-like lost immunity. Too many pathogens are growing in her. Her body must be full of solvent.

☒ **Benzene, Wood Alcohol, Hexane, Pentane, Isopropyl Alcohol (Solvents) YES**

She was started on *Parasite-Killing Program*. She will be off all commercial beverages and cosmetics and benzene sources.

Four days later

She missed her appointment.

Twelve days later

She died (telephone call).

Summary: Marilyn had none of the risk factors associated with HIV. She was just an ordinary middle-age woman who didn't drink alcoholic beverages. If she had acted quickly, she would most certainly have survived and gotten reasonably well again. Perhaps she missed her appointment because of embarrassment over not being able to stop smoking. Maybe I was too hard on her about it. We did not hear any details surrounding her death. Notice the adult fluke in the thymus where T-cells are made. The thymus is a small gland and the fluke is a large parasite; it is like having an elephant in the kitchen. How could the thymus do its work? People often feel strange sensations at the top of their breast bone when flukes are in it, but she didn't. Cancer and HIV illness are first cousin diseases. Cancer results when propanol builds up in the body. HIV develops when benzene builds up.

12 Jean Barish Cancer At Uterus and Kidneys

Jean Barish is a 31-year-old woman. Years ago she had a liver problem: she was throwing up bile.

She solved that with herbs. She also had migraines. Now she has these problems: 1) Chronic respiratory problems (a bout of bronchitis every year). 2) Constipation; normal movement only once in two or three days. 3) Chronic fatigue. 4) Colitis for the past ten years, diagnosed by doctor. 5) Uterine polyps in 1986 for which she had a D & C.

☒ **Nickel, Silver (Toxic Elements) YES**

☐ **Toxic Elements (All The Rest) NO**

Needs metal tooth fillings replaced.

☒ **di Calcium Phosphate (Kidney Stones) YES**

☒ **tri Calcium Phosphate (Kidney Stones) YES**

☒ **Oxalate, Uric Acid (Kidney Stones) YES**

Needs kidney herb recipe.

☒ **Orthophosphotyrosine (Cancer) YES at uterus, kidneys; NO at ovaries, breast**

☒ **Fasciolopsis (Parasite) YES at kidney and liver**

☒ **Fasciolopsis cercaria (Parasite) YES at kidney, blood, NO at breast and liver**

☒ **Fasciolopsis miracidia (Parasite) YES at kidney, liver, blood, NO at breast**

The discovery of cancer in Jean came as a surprise. She was put on the parasite-killing recipe immediately while the kidney cleansing waited and dental work was to be scheduled. She did not bring a blood test but she will bring a copy since she had a recent one done.

Three weeks later

BLOOD TEST: Thyroid and WBC slightly high. Others OK.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Cryptocotyl (Parasite) YES**

☒ **E. Hist (Parasite) YES**

☐ **Parasites (remainder of box 1) NO**

Continue parasite program.

Five weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

Colitis: GONE.

☒ **Onchocerca (Parasite) YES**

☒ **Taenia pis (Parasite) YES**

☐ **Parasites (remainder of box 2) NO**

Continue parasite program.

Summary: Jean did not come into our office because of cancer. She was very shocked but not frightened away, fortunately. She dug right into her tasks. Her finances probably won't allow her to return. So I hope she abides by the meat-avoidance rule and the cosmetics and beverage avoidance rules. Notice that her colitis disappeared as well as the cancer and parasites. She felt very well at the third visit.

Four months later

I was wrong. Happily, Jean came back and brought her husband, too. She has no problems now but wants her husband to get checked out.

Jean

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Wood Alcohol, Hexane (Solvents) YES in pancreas**

She has been drinking Celestial Seasonings herb teas.

☐ **Fasciolopsis, Sheep Liver Fluke, Clonorchis (Parasites) NO**

☒ **Pancreatic fluke and stages (Parasite) YES in pancreas**

She will promptly kill these with a 5-day high dose parasite program and stop drinking tea blends or any commercial beverage. Note that only the

pancreatic fluke was multiplying in her, although she must be picking up the others at the same time - from rare meat. Only the pancreatic fluke survived and is multiplying - because of the solvents in the pancreas!

13 Sally Corson Ovarian Cancer

This 70-year-old woman had a partial hysterectomy 35 years ago, with the remainder removed 5 years ago. She also reported that she has some urinary tract infection for which she is taking Macrodantin™ at bedtime. Her main problem is ovarian cancer, which started about 5 years ago. It was OK until one year ago when it came back. Ca 125[60] test was up to 115; now she is on chemotherapy by mouth, Alkeran™, and Ca 125 is down to 75. Her clinical doctor said that present chemotherapy would not cure, but only "hold it back" for a while.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver, ovary (very high), stomach**

Her clinical doctor had also told her she had cancer in the liver, ovaries, stomach.

☒ **Fasciolopsis (Parasite) YES at liver, colon, ovary, stomach**

☐ **Fasciolopsis other stages (Parasite) NO**

Chemo is probably killing the stages.

☐ **Sheep liver fluke (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES at liver**

Remove propanol sources from the house. Start on parasite program.

Summary: This woman was given a minimal test at our office, just to remove her cancer. Hopefully she can afford to come back and work on her arthritis, back pain, etc. The cancer had indeed spread as her medical doctor had told her. Fasciolopsis was present in adult form at all these locations. Her chemo seems to be killing the stages which otherwise would be present. Hopefully, she has removed the propanol from her lifestyle and carried out the parasite program. Perhaps we will see her soon, free of cancer.

Six weeks later

What a joyful occasion. Sally came in for a 20-minute follow-up.

☐ **Orthophosphotyrosine (Cancer) NO**

She feels "a lot better," her Ca 125 is down further, her stomach is no

longer enlarged and hard.

☒ **Fasciolopsis all stages (Parasite) NO**

☒ **Sheep liver fluke all stages (Parasite) NO**

☒ **Pancreatic fluke (Parasite) NO**

☐ **Pentane, Styrene (Solvents) YES**

The propanol is out of her body. She will stop eating out of styrofoam. And she will stop drinking decaf and switch to 2% milk. She will start on our kidney herb recipe, only half a dose because of her age, in order to cure her frequent urination and low back pain.

14 Lenora Wilson Colon Cancer

Lenora Wilson is a 55-year-old woman whose main problem, she said, was ovarian cancer. She had a complete hysterectomy in 1980. After that she was given chemotherapy. In 1991, Ca 125 marker was 60 (should be 0-35); in September Ca 125 was up to 70. She was told to repeat chemotherapy. Instead she went to Ann Wigsmore Foundation for 2 weeks and changed diet to vegetarian. After this her Ca 125 went down to 61. For the last year she has done nothing, not even vitamins.

☒ **Orthophosphotyrosine (Cancer) YES at colon only**

☐ **Protein 24 (HIV) NO**

☒ **Fasciolopsis (Parasite) YES at liver, colon; NO at other sites**

☒ **Fasciolopsis redia (Parasite) YES at liver, blood**

☒ **Isopropyl Alcohol (Solvent) YES**

Start on parasite program. Eliminate commercial cosmetics.

Summary: This woman's cancer history goes back ten years. She had conventional treatment at this time. But it came back recently; her doctor used the cancer marker Ca 125 to monitor it. My test showed it present in the colon, now. There was a Fasciolopsis in the liver and a stage in the liver and blood. There was propanol in her white blood cells. Hopefully, she has eliminated the propanol and cleared up her new cancer. She has not followed up. Her first visit was too brief to do more testing.

15 Mary Emerson Cervical Cancer

Mary Emerson is a 39-year-old woman who described her main problem as follows: In about 1986 a Pap smear showed inflammation of the cervix. Two years later a different doctor found it quite abnormal, and she got cold knife conization. Six months later it was OK. Six months after that

it was not normal again. In March 1992, a laser ablation was done. She went financially broke, but saw the doctor anyway. Follow-up showed 5½ on a scale of 6. Doctor wants to do a complete hysterectomy. She began to get hairy, skin greasy; depression hit. Little warts grew everywhere. She was working in a chemical plant. Allergies began, and she gained 150 pounds!

☒ **Orthophosphotyrosine (Cancer) YES at cervix**

Her regular doctor diagnosed pseudo tumor cerebri although he couldn't see it. Hercerebral pressure was elevated without visual effects.

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis miracidia (Parasite) YES at cervix and pancreas**

☒ **Fasciolopsis redia (Parasite) YES at cervix and blood**

☐ **Fasciolopsis remaining stages (Parasite) NO**

She was put on parasite program.

6 days later

☐ **Orthophosphotyrosine (Cancer) NO**

Cancer cleared! She had a major headache on one day. A joint on right big toe has been hurting.

☐ **Fasciolopsis all stages (Parasite) NO**

☒ **Europium, Silver (Toxic Element) YES**

Root canal, fillings.

☐ **Toxic Elements (Remainder) NO**

Remove metal from mouth. Start on thioctic - 2/day (100 mg capsules).

Five days later

BLOOD TEST	Result	Comment
1. Calcium	slightly low	Drink 2% milk, 3 glasses/day; magnesium (300 mg) 1/day; Vit D (by prescription from dentist 50,000) 1-2/week forever.
2. SGOT, SGPT	very low	B6 500 - 1/day for a while, then 250mg.
3. LDH	high (190)	cancer not yet cleared at the time of test
4.	very low	cancer risk

Cholesterol		
5. Iron	very low	parasites
6. Urinalysis	shows urinary tract infection and crystals (stones)	Start on kidney program.
7. Platelet count	very high (403)	cancer
8. WBC	slightly high	infection
9. Lymphs	very low	toxin in bone marrow
10. Eos	high	parasites

☒ **Pancreatic fluke (Parasite) YES**

☒ **Cysticercus (Parasite) YES**

☒ **Echinococcus granulosus (Parasite) YES**

Continue parasite program.

5 days later

She has not been able to do dental work yet.

☒ **Cysticercus, Pancreatic fluke (Parasite) YES**

☐ **Echinococcus granulosus all stages (Parasites) NO**

Increase Wormwood to 16 for 3 days. Then 16 capsules 2 times a week for 3 months. Then 16 capsules 1 time a week.

☒ **Uric Acid, Phosphate (Kidney Stones) YES**

Continue kidney recipe. Client released.

Summary: Mary came from several states away and had only 16 days to accomplish her goal: to avoid a hysterectomy. After 6 days her cancer had disappeared. We hope she will eventually do a liver cleanse to lose the weight she suddenly gained. She planned to return at her next vacation to get dental work done.

16 Mona Moon Cancer

Mona Moon, about 70 years old, was worried that she might have cancer and this was her purpose in coming to us. She was not ill. I tested her right away.

☒ **Orthophosphotyrosine (Cancer) YES in her WBCs (cancer location not found)**

I immediately tested for the intestinal fluke.

☒ **Fasciolopsis (Parasite) YES in one side of the liver**

☒ **Fasciolopsis eggs (Parasite) YES in blood and the same side of the liver**

Her husband had died of bone cancer in legs and spine; this made her anxious. I was out of Wormwood so I started her on Quassia (see *Recipes*), rather than have her merely wait until it arrived. Note that I did not try to locate cancer. She was to return in 3 days to get Wormwood.

Three days later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

Wormwood has not arrived yet.

Three weeks later

☒ **Endolimax, Rabbit Fluke, Onchocerca (Parasite) YES**

☐ **Parasites (Remainder) NO**

Note: apparently Quassia is effective in killing all stages of Fasciolopsis, like Wormwood . She will switch to Wormwood and the usual *Parasite-Killing Program* now that it has arrived.

☒ **Calcium Phosphate (Kidney Stone) YES**

I instructed diet changes: decrease bread, increase fruit and vegetables and milk 2%. Take magnesium oxide (300 mg) one/day.

Three weeks later

☐ **Parasites (ALL) NO**

☐ **Kidney Stones (ALL) NO**

Note: She did not need our kidney stone recipe to dissolve away her phosphate crystals. A change in diet was sufficient.

Summary: This woman did not come in for health problems but only because she was worried about cancer, since her husband had died of it. Indeed, her intuition was right, but very quickly she removed all of the cancer, even though she substituted Quassia for our regular parasite recipe. Even

her kidney stones disappeared with a simple change in diet. She has probably not returned for financial reasons (she lives on Social Security). Her good attitude will probably bring her back quickly if she has a health problem.

17 Dorothy Larson Breast Cancer

This 56-year-old woman reported her main problems as: 1)High blood pressure. She has not been on a blood pressure medication. 2)Ringing in head (more than just in ears).

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at breast, colon**
- ☒ **Isopropyl Alcohol (Solvent) YES at breast, colon**
- ☐ **Solvents (Remainder) NO**
- ☒ **Fasciolopsis (Parasite) YES at liver, colon; NO elsewhere**
- ☒ **Fasciolopsis miracidia (Parasite) YES at breast**

She uses no cosmetics. She will switch shampoo to ours. She will start on parasite program.

Summary: A routine check for cancer and HIV showed the cancer present in the breast and colon. The intestinal fluke was in the liver as usual, with a stage present in the breast. The first priority was to eliminate the cancer, although her purpose in coming to the office was her high blood pressure and ringing in the head. She had propanol in the breast and colon, but the source was not obvious. Hopefully, she will return free of her cancer, so we can pursue her other health problems.

18 Andrew Kelly Lung Cancer

Andrew Kelly is a 49-year-old man who reported that his main problems were: 1) tinnitus; 2) respiratory drainage; 3) tendonitis in wrists; 4) kidney stones - he had an attack once.

BLOOD TEST old test he brought with him	Result	Comment
1. FBS	112 slightly high	need to cleanse liver
2. Calcium	(8.8) very low	Drink goat's milk - 3 glasses/day; Magnesium 300mg - 1/day
3. Cholesterol	(148) very low	cancer risk; use butter - no margarine
4. Total protein	(6.3) low	liver problem
5. Platelet count	(449) very high	parasites, cancer?
6. Urinalysis	shows trace of blood and ketone	start on kidney herbs

He drinks about 6 beers/night. He also takes honey + orange juice + bee

pollenHe does not tolerate cow's milk.

☒ **Gadolinium (Toxic Element) YES at pancreas; NO at lungs**

Glasses frames need to be changed to plastic.

☒ **Holmium (Toxic Element) YES**

We will testhand cleaner.

☒ **Tin (Toxic Element) YES**

He will start on kidney herbs and go off toothpaste (stannous fluoride in toothpaste is a tin compound).

Three weeks later

He has not changed his glasses frames yet.

☒ **mono-Calcium Phosphate (Kidney Stone) YES**

Continue kidney herbs.

☒ **Pancreatic fluke (Parasite) YES**

☒ **Fasciolopsis (Parasite) YES at liver, intestine**

Suspect cancer.

☒ **Fasciolopsis miracidia (Parasite) YES at, liver, intestines, blood**

☒ **Fasciolopsis redia (Parasite) YES at liver, intestines, blood**

☒ **Sheep liver fluke (Parasite) YES at intestines; NO at liver**

☒ **Orthophosphotyrosine (Cancer) YES at lungs**

As suspected.

☒ **Holmium (Toxic Element) YES and in Zepo™ hand cleaner**

He will use olive oil to clean hands. He will start parasite program.

Three weeks later

He has cut smoking down to half, or less.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Holmium (Toxic Element) NO**

Has stopped using Zepo™ hand cleaner.

BLOOD TEST (new test)	**Result**	**Comments**
1. WBC	slightly high	infection
2. Eos	(4%) high	parasites
3. Atyp lymphs	(3%) high	cancer risk
4. Ferritin	(392) very high	cancer risk
5. Uric acid	(5.7) slightly high	kidney
6. SGOT, SGPT	low	take B6 500mg, one a day
7. Iron	(212) very high	liver problem

Two weeks later

He is still smoking.

☒ **Dog heartworm (Parasite) YES**

Has typical pain over heart occasionally. Increase parasite herbs. Do a 5-day high dose program.

☐ **Orthophosphotyrosine (Cancer) NO**

His tinnitus persists.

☒ **Staph aureus (Pathogen) YES at lung and tooth #1**

He should see dentist for cavitation at #1.

Three weeks later

He has had top right wisdom tooth pulled (#1), it had an abscess.

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Dog heartworm (Parasite) YES**

Increase parasite herbs. He is still smoking.

☐ **Holmium (Toxic Element) NO**

A month later

His tinnitus comes and goes now, much less than before.

☐ **Dog heartworm (Parasite) NO**

☒ **Pneumocystis carnii (Parasite) YES**

☐ **Orthophosphotyrosine (Cancer) NO**

He has good energy now.

Three weeks later

Some return of symptoms.

☒ **Fasciolopsis (Parasite) YES in colon only; other stages NO**

☐ **Solvents (ALL) NO**

He picked up intestinal fluke but it stayed in intestine. Should stop eating meat. Go on 5 day high-dose parasite treatment again.

Summary: Andrew came into our office because of a history of kidney stones; he did not want to pass another one. His blood test suggested parasites (high platelet count) and Fasciolopsis was found. Then the cancer test was done and, indeed, he had a cancer started in the lungs. He was a heavy smoker but couldn't quit. But he very promptly cleared himself of parasites. He also had dog heartworm, which can cause coughing. He acted quickly to clear up his Staph aureus infection by having a wisdom tooth pulled. This began to help his tinnitus. Later we noticed a common lung infection, Pneumocystis, but he still could not stop smoking. At the last visit he had picked up the intestinal fluke again, probably from eating rare meat but he had no solvents in his body. This explains why the parasite stayed in the intestine and did not move to his liver or lungs. This bout with lung cancer was missed by his medical doctor whom he continues to see regularly. Perhaps if his medical doctor had also seen the cancer, he would have quit smoking. Maybe not!

Four months later

Andrew is still smoking.

☐ **Protein 24 (HIV) NO**

☐ **hCG, Orthophosphotyrosine (Cancer) NO**

He is very relieved. He and his wife have been neglectful of the parasite program and other restrictions.

☒ **Mothballs, Carbon Tetrachloride, Benzene (Solvent) YES (others not tested)**

He will go back onto parasite maintenance program, go off the benzene list,

and try to stop smoking.

19 Richard England Lymphoma In Bone

Richard England has 2 preschool children and a wife who brought him here. He is not really interested in my approach. He was diagnosed two years ago.

☒ **Strontium (Toxic Element) YES at bone marrow**

Off toothpaste.

☒ **Scandium (Toxic Element) YES at bone marrow**

Tooth metal.

☒ **Beryllium (Toxic Element) YES at bone marrow**

Gasoline ?

☒ **Radon (Toxic Element) YES at bone marrow**

☐ **Toxic Elements (Remainder) NO**

☒ **Oxalate (Kidney Stones) YES**

He will stop drinking tea. They will fill cracks around plumbing. He will stop toothpaste. They will bring in an air sample from home to test for beryllium.

One week later

☐ **Strontium, Radon (Toxic Elements) NO**

☒ **Beryllium, Scandium (Toxic Elements) YES**

☒ **Beryllium (Toxic Element) YES in home air sample, garage air sample**

Conclusions: He is getting beryllium from garage. The furnace is built into garage. They must IMMEDIATELY change this furnace setup or move. His wife is willing, he is not. He has utmost confidence in bone marrow transplant scheduled soon.

Nine months later

He had his transplant and did OK for a while. His wife is very anxious but

he is not very concerned. He lost 30 pounds since last fall but regained 10. Now he weighs 162 pounds. He is getting 10 units irradiated platelets every 4th day, 3 units of packed RBC's every 12-14 days. He has a strep infection in the blood. He has been on heavy antibiotics for several months. Due to his resentment at being "dragged" in by his wife, I tested only for *Fasciolopsis* and Sheep liver fluke.

☒ **Fasciolopsis (Parasite) YES**

☒ **Fasciolopsis miracidia (Parasite) YES in bones**

☐ **Sheep liver fluke (Parasite) NO**

I explained to him that this infestation could be eliminated rather quickly and gave him the parasite-killing items and recipe.

Five days later

He missed his follow-up appointment. We called his home. His wife said the herbs nauseated him so he didn't take them.

Ten days later

His wife called to say he had passed away. She and the children would take a vacation with a friend.

Summary: This was a particularly tragic case. His young children sat quietly in their chairs during the appointment, sensing the grave danger their father was in. But he made jokes about my technical competence and devices instead of listening. A friend who had gone through our cancer program successfully tried to encourage him at home. He could have saved himself even at the last visit. He had such great hopes for the bone transplant. He was always talking about his exceptional oncologist and the great rapport and team work in the hospital. It was as if he couldn't see that he was dying, although his preschool children saw it clearly. His wife would have gladly moved from their fossil fuel contaminated home or turned the furnace off and put in an electric space heater till they could sell the home. But she had no influence over him.

20 Margaret Barnes Multiple Myeloma

Upon arrival at the office, the husband explained that due to her pain, we should discuss as much as possible with her seated in the car. So I began with a conversation with her husband in the office instead of with her.

The chronology of her illness was: 6 months ago she had arthritis; 3 months ago it became more serious; 1½ months ago walking was very painful; 1¼ months ago she needed a walker; 4 weeks ago she could not walk. Her clinical doctor diagnosed rheumatoid arthritis and treated her with a steroid. Her pain did not alleviate.

On January 2, 1992, she was re-diagnosed and confirmed with an MRI as having multiple myeloma. On January 6, 1992, she had surgery. They put steel reinforcement in one leg and cut out the cancerous part in the other leg. Radiation was begun one week ago. She will have another week of this but her doctor let him know they could only expect a short remission, if any. They are thinking of going to a doctor in Philadelphia who does mega dose chemo IV. I discussed my approach with her husband, reassuring him that I did not controvert any clinical treatment. I persuaded him to bring her in briefly to verify existence of parasites. She was using a walker and had visible pain, but she was interested in my approach.

☒ **Fasciolopsis (Parasite) YES at liver and colon**

I did not search further. She will start on the *Parasite-Killing Program*. They took a blood test form with them.

Four days later

☒ **Tin (Toxic Element) YES at bone marrow**

Off toothpaste

☒ **Lanthanum (Toxic Element) YES at bone marrow**

Suspect using a copy machineWe will test house air. They have a lot of electronic equipment in house, but no copier; computer is on porch.

☒ **Zirconium (Toxic Element) YES at bone marrow**

She will be off deodorant, toothpaste, all lotions and body products. She purchased a plastic watch. She will go off cosmetics.

☒ **Kidney Stones (ALL) YES**

Start on kidney herbs.

Six days later

☐ **Oxalate, Urate, Dibasic Calcium Phosphate(Kidney Stone) NO**

☒ **Tribasic Calcium Phosphate (Kidney Stones) YES**

Continue kidney herbs.

☐ **Lanthanum, Tin, Zirconium (Toxic Elements) NO**

☒ **Fasciolopsis (Parasite) YES in liver**

☒ **Orthophosphotyrosine (Cancer) YES bone, bone marrow**

Continue on parasite program.

Three days later

She says she is feeling much better. She is coming in with a walker, rather laboriously. She is sitting on 1 pillow plus 1 behind her back.

☐ **Tribasic Calcium Phosphate (Kidney Stone) NO**

She will continue on kidney herbs at half dose for 3 months.

☒ **Orthophosphotyrosine (Cancer) YES at bone, NO at bone marrow**

It is receding. She is wearing a metal partial denture; she will not wear it at night and change this to plastic soon. She will wrap her walker with masking tape to avoid touching aluminum. “It's a whole new way of life,” she sighed. She has been using Efferdent™ for cleaning her teeth; she will switch to grain alcohol. She likes our shampoo very well and will start using citric acid instead of hair conditioner. She is not on any supplements except magnesium (300 mg) 1/day and Vitamin B6 (500 mg) 1/day. We will start her on dairy food (2%). Aim at 3 cups milk or plain yogurt a day. She has no appetite. Her friend who is cooking for her said she would eat only noodles with any enjoyment. She is rubbing her thigh more or less constantly for pain. She will make her own hair spray. We are adding Vitamin D, prescribed by dentist (50,000 u) 1/day for 30 days for pain and to help healing.

Three days later

Legs are not as painful. She saw her surgeon yesterday. She thinks the kidney herbs were instrumental in her suddenly feeling “like my old self.”

☒ **Fasciolopsis (Parasite) YES but not in liver**

☒ **Orthophosphotyrosine (Cancer) YES at only a small area of bone**

She is still sitting on a pillow and using a walker. She dressed herself this morning, she says. She usually needed help. She is going on vacation since she feels up to it.

Three weeks later

She is back from vacation. She is walking better. She has tried walking with

a cane “but it's not as secure as the walker.”She can take a shower by herself now.

- ☐ **Fasciolopsis (Parasite) NO**
- ☒ **Fasciolopsis cercaria (Parasite) YES in liver**
- ☒ **Fasciolopsis miracidia (Parasite) YES in colon**
- ☒ **Orthophosphotyrosine (Cancer) YES at same location in bone**

Continue on parasite program. Start thioctic acid (100 mg capsules) 3 a day. She has been on 20 days of Vitamin D (50,000) once a day. We are now starting a regimen of: 6 caps per week only; then 5 days/week; then 4 days/week; then 2 caps per week indefinitely. Thioctic acid is a metal chelator, acting where the cancer is at work.

One month later

She has been traveling. Seems rather well. She is not using any assistance with walking and sits down easily on a chair by herself without discomfort. No walker or cane or cushion!

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis (Parasite) NO**
- ☒ **Fasciolopsis redia (Parasite) YES, remaining stages NO**

Increase Wormwood from 8 to 12 capsules a day, then 12 Wormwood twice a week plus 30 drops of Black Walnut Hull tincture once a day.

- ☐ **Zirconium, Lanthanum (Toxic Elements) NO**
- ☒ **Tin (Toxic Element) YES**

She is using a health brand deodorant; will stop. She is using 2 tablets of Tylenol™ about once a week only; she's not using any other drug.

One week later

She is not using her cane and is sitting comfortably on a chair without a cushion. Seems to have normal energy and health.

☐ **Fasciolopsis (Parasite) NO all stages**

☒ **Fischoedrius, Eimeria, Echinococcus granulosus (Parasites) YES**

Increase Wormwood to 14 capsules once a day for 3 days.

☒ **Tin, PCB (Toxic Element) YES**

☒ **Tin, PCB (Toxic Element) YES in NuSkin™ products**

She will go off these. Continue on Thioctic - 3 a day.

☐ **Orthophosphotyrosine (Cancer) NO**

Next: liver cleanse. Start on 07 (a commercial preparation of chlorine dioxide) and peroxy (17½ % hydrogen peroxide).

Three weeks later

She says she feels wonderful. She has been to a week-long convention. Her regular doctor says her hemoglobin is up to 11 and she is "doing great."All CBC counts are correct.

☐ **Fasciolopsis (Parasite) NO**

☒ **Nickel (Toxic Element) YES**

Probably coming from a rod implant from hip prosthesis on both sides.

BLOOD TEST	Result	Comment
1. WBC	5.7	
2. RBC	2.88 - low	
3. Hemoglobin	11.0	
4. MCV	105.2 - high	add B12 500mg, use as lozenge
5. Platelet count	244	
6. Lymphs	18.5 - low	toxin in bone marrow: Tin, PCBs, Nickel

Increase calcium, magnesium, zinc (she is on iron), manganese. Increase salmon orsardines in diet. Add zinc 60 mg 1/day.

One month later

She says she feels “wonderful.”Her oncologist appointment is in a few days. She has felt “great.”She has had energy, feels much better than even before surgery (for a year she had not had energy).

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Nickel, Vanadium (Toxic Element) YES**

Has no gas appliances, but has candles - will remove candles from house.

One week later

She says she is “great.”She has been vacationing on a houseboat for two weeks. She is due for a check-up and blood test soon.

☒ **Silver (Toxic Element) YES**

She is using her retainer again and it needs to be changed to plastic. She will use her spare plastic retainer. All her utilities are electrical. Her candles are in closed containers.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis (Parasite) NO**

She had a spasm in her upper back that frightened her. We need to clean the liver. She will go back on 07 and Peroxy. She will clean the liver. She says she feels better than she has in years. She will go on Bronson's Vitamin C 500 mg.

Summary: Margaret was considered terminal at first. Fortunately for her she did not go east for more clinical treatment. She was only in her early 50's and had been a dynamic, active person. She had friends willing to help her husband with transportation to the office. She did everything promptly without complaining. Her husband and friends supported her and were not negative about alternative therapy. She had a particularly difficult time killing all the parasite stages but pursued the program diligently without being discouraged and quitting. She seemed to enjoy life enough to make the effort worthwhile. She was an inspiration for all of us in the office. At the last visit she was her former busy self.

21 Martha Zendel Ovarian and Bone Cancer

This is a very pleasant middle-aged woman from a neighboring state who was diagnosed with ovarian cancer about ten years ago. However, she did not do any treatments except wheat grass, herbs, etc. on her own. She now has a pain syndrome over most of her body, especially her lower body. She has a lot of dizziness. She had a PAP smear recently, but she did not go back to the doctor to learn the results.

☒ **Orthophosphotyrosine (Cancer) YES at ovary and bone**

She aches through whole lower half of her body.

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis eggs (Parasite) YES at bone, liver, blood**

☒ **Fasciolopsis miracidia, redia (Parasite) YES at bone, liver**

She will start on parasite program.

Nineteen days later

☐ **Fasciolopsis (Parasite) NO, all other stages NO**

☐ **Orthophosphotyrosine (Cancer) NO**

Cancer is gone.

☒ **Molybdenum (Toxic Element) YES**

She will be cautious about automotive chemicals in the house. She will bring wheat grass sample for me to see. She is enthusiastic about doing a liver cleanse.

☐ **Kidney Stones (ALL) NO (remarkable)**

Her joints are stiffening up. Terrific pain in her arms. She has had kidney infections (pain over kidney, frequency of very yellow urine, dizziness, ears are shut). She was started on our kidney herbs in spite of absence of stones. This is probably a dental problem.

☒ **Babesia, Capillaria, Dipylidium (eggs and adult) (Parasites) YES**

☒ **Sheep liver fluke (Parasite) YES at liver**

☒ **Sheep liver fluke cercaria (Parasite) YES at liver, blood**

☒ **Sheep liver fluke miracidia (Parasite) YES at blood**

She will continue the parasite program.

Two months later

She is not feeling well today. Itching. Poor bowel movements. She has

problems breathing all the time. Heart palpitations scare her (probably dental).

☐ **Babesia, Capillaria, Sheep liver fluke (Parasites) NO**

☒ **Moniezia tape worm, Notocotylus (Parasites) YES**

☐ **Parasites (Remainder) NO**

Continue parasite program.

☒ **Histoplasma (Pathogen) YES**

☐ **Molybdenum (Toxic Element) NO**

Three months later

She feels much better.

☐ **Orthophosphotyrosine (Cancer) NO**

Summary: This super-intelligent woman could see that current clinical treatment of her cancer would give her very little chance of survival. She studied alternative treatments and was doing fairly well after 9 years. Hopefully, she will continue to work on her health and clear her remaining parasites. She might not be here today if she had gone the clinical route.

Half a year later

She had all metal removed from her mouth but got a severe infection afterward. She is still not completely healed. She neglected to take Vitamin D (50,000), 2 a week and has not drunk milk. She will get back to it.

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Haemophilus infl, Gardnerella vag, Eikenella, Lepto inter, Diplo pne, Klebsiella pn, Histomonas mel (Pathogens) YES**

She is obviously not well; has low immunity.

☒ **Pancreatic fluke stages (Parasite) YES**

☒ **PCB (Toxic Element) YES**

She will stay off detergents.

☒ **Benzene (Solvent) YES in thymus**

☒ **Isopropyl Alcohol (Solvent) YES**

These solvents would explain Martha's low immunity. Her cancer has not returned but it is only a hair's breadth away. She will avoid eating solvent-polluted food and products and using solvent-polluted products and go back on the parasite program.

22 Anna Stewart Colon Cancer

Anna Stewart is 83 years old, a charming intelligent person, interested in how everything worked and quite conversational. She is living alone in an apartment although her son brought her to see us. Her complaint is bloating and gas, loss of bowel control, and pain across the mid-abdomen. She had bone cancer 40 years ago and was treated at the Hoxsey Clinic for it. This clinic was shut down soon after her visit. It was considered quackery. She has stayed on their herb recommendations and been health conscious ever since.

☐ **Kidney Stones (ALL) NO**

Most unusual.

☒ **Eimeria (Parasite) YES**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis miracidia (Parasite) YES at liver and blood**

☒ **Orthophosphotyrosine (Cancer) YES at colon, NO at bone**

Has colon cancer. She will start parasite program.

One week later

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Eimeria (Parasite) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

Her pain is gone; her diarrhea is gone.

☒ **Radon (Toxic Element) YES**

She will continue the parasite program to completion. Her son will fix cracks aroundplumbing pipes. She asked about a safe deodorant! She asked

whether she should risk expanding her food list now that her pain and diarrhea are gone.

One week later

She can eat cheese and applesauce again, her favorite foods, without pain.

☒ **Radon (Toxic Element) YES**

☐ **Orthophosphotyrosine (Cancer) NO**

BLOOD TEST	Result	Comment
1. WBC	4.5 low	probably due to radon in bone marrow
2. RBC	Low	probably due to radon in bone marrow
3. Total protein	slightly low	liver problem
4. Potassium	very low	radon in adrenals

She will live with son for a while to clear radon from her body. She is interested in doing a liver cleanse to gain some energy. She will start on our readiness program for the cleanse.

Summary: This very pleasant woman apparently recovered from bone cancer decades ago! A case like this should have been followed by the National Cancer Institute to verify all the facts and not miss finding out what was responsible for her survival. She seemed at least 10 years younger than her real age - even needing deodorant! Could this be due to the herbs she was taking, too? She has no kidney stones and only one additional parasite: possibly the herbs, whose names she had forgotten after she threw them out recently, kept her free of parasites and also kept her youthful!

23 Debbie Lai Breast Cancer

This 56-year-old female reported that her main problems were: 1)Cancer of the breast (R. side). Diagnosed 4 weeks ago via mammogram. She will be scanned tomorrow. They called it an inflammatory “invasive” inoperable cancer. 2)Lower back. She has had chiropractic treatment for 25-30 years. 3)Sleep problems. 4)Headaches. 5)Weight problem - of recent origin.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver, side of breast**

☒ **Isopropyl Alcohol (Solvent) YES at liver, side of breast**

☒ **Fasciolopsis (Parasite) YES at liver, intestine**

☐ **Fasciolopsis other stages (Parasite) NO**

Start on parasite program. Go off caffeine and onto milk, 2 pints of

water/day, citrus juice, freshly squeezed or fresh squeezed frozen.

Five days later

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☐ **Isopropyl Alcohol (Solvent) NO**

  Has gone off cosmetics.

- ☒ **Beryllium (Toxic Element) YES**

  Bedroom is over their garage

- ☒ **Lanthanum (Toxic Element) YES**

  Has been doing computer work, keep printer covered, don't touch ink on pages.

- ☒ **Vanadium(Toxic Element) YES**

  Gas leak in home; had been staying with family in last few days - will test home air.

Twenty days later

She is feeling OK. There is still some pain on mid-sternum and under left breast but not at nipple.

- ☐ **Beryllium, Lanthanum, Vanadium (Toxic Element) NO**

  2 gas leaks were found. The breast biopsy done by regular doctor came back YES (*Positive*). She brought reports.

- ☒ **Loa Loa (Parasite) YES**

  Probable cause of sternal pain. She will go on 5-day high dose parasite program.

- ☐ **Dirofilaria (Parasite) NO**

Twelve days later

Still a small pain under R. breast.

☒ **Wood Alcohol (Solvent) YES**

She will go off commercial beverages. Her body current level seemed low, suggestive ofPCB's.

☒ **PCB (Toxic Element) YES**

She will switch to using borax for everything.

☒ **Loa Loa (Parasite) YES**

Repeat 5-day high dose parasite program.

Three weeks later

She is feeling much better. Pain over mid-chest is all gone. Still a little pain under R breast coming in from the side. The coloration of breast is back to normal. Some low back pain persists.

☒ **Dibasic Calcium Phosphate (Kidney Stone) YES**

Continue kidney herbs.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Loa Loa (Parasite) NO**

Stay on maintenance parasite program.

☐ **Solvents (ALL) NO**

☒ **PCB (Toxic Element) YES**

☐ **PCB (Toxic Element) NO in drinking water sample**

Source still not found - has switched off detergents.

☒ **Zirconium (Toxic Element) YES**

Probable cause of breast pain. She is using no body products that could have zirconium. She uses contact lens cleaner, however. Will make her own.

Summary: Debbie and her elderly mother who came with her were radiating joy at her last visit. She had cancer in the liver as well as breast, although her regular doctor's diagnosis was breast cancer. Five days after starting the Parasite-Killing Program all the malignancy was gone. She moved her bed to the other end of the house and the computer-room door was kept closed. Her

husband was supportive. She complied immediately with all the changes recommended. She is interested now in learning to make homemade cosmetics. She was so happy to have her life returned to her; she feels radiant and full of plans for the future.

One month later

She is free of cancer, headache, and low back pain.

24 Susana Clausson Skin Cancer

The main problems reported were: eyes - developing cataracts at the young age of 66; skin rash - for about 6 years, especially after showering. It does not itch. Respiratory problem comes and goes. She chokes and coughs, especially in damp weather, asthma-like; a lot of laryngitis. Lower back pain; knee pain. Sleep problems. Nervousness.

☒ **Orthophosphotyrosine (Cancer) YES found at skin only**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☐ **Fasciolopsis eggs (Parasite) NO**

☒ **Fasciolopsis redia (Parasite) YES in blood**

☒ **Ancylostoma, Dipylidium caninum (eggs and adult), Endolimax nana, Taenia pisiformis, Haemonchus contortus, Heterophyes, Macracanthorhynchus (Parasite) YES**

Has lived with dogs entire life. Start on the *Parasite-Killing Program*.

☐ **Kidney Stones (ALL) NO**

No kidney stones - has been using herbs of various kinds a long time; maybe this accounts for no kidney stones. Her dad died of prostate cancer. She said she had skin biopsies done by a dermatologist in Illinois about one year ago, taken from the red big blotches on her skin. They came back *Negative* for cancer.

Two weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

The pinching in the skin has stopped.

☒ **Lanthanum (Toxic Element) YES**

Will test her dentures.

☒ **Lanthanum (Toxic Element) YES, pink side of dentures; NO, white side of dentures.**

☒ **PVC (Toxic Element) YES**

We will test carpets, they have indoor/outdoor carpet.

☒ **Thulium (Toxic Element) YES**

She is using a brand of vitamin C which I always find polluted with thulium. She will go off it. She will take thioctic - 2 a day. She will arrange for new dentures.

Two weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at one side of liver only**

☒ **Fasciolopsis cercaria (Parasite) YES at one side of liver and blood**

Note: Cancer is already gone, although one part of liver still has the fluke parasite and stage. Continue parasite program.

☐ **Lanthanum (Toxic Element) NO**

☐ **PVC (Toxic Element) NO**

Was away from home most of the time.

☐ **Thulium (Toxic Element) NO**

Went off all supplements.

Summary: This is a happy story where Susana came in for a simple skin rash. Then she got terribly shocked and frightened to hear it was cancerous, in spite of her clinical doctor's negative results. She was rid of all of it in just over 2 weeks. We did not see her again but trust that she would hurry back if a new problem occurred.

25 Dale Austin Lung Cancer

Diagnosed lung cancer a few months ago. It started with bronchitis last fall. X-ray showed abnormality. Pleural biopsy showed adenocarcinoma (scattered malignant clear cell carcinoma). Right side was clear. Several CAT scans have been done. He had 36 radiation treatments. He is now having pleural fluid accumulation for the third time. The first 2 times he was drained. They do not want to drain again.

☒ **Titanium (Toxic Element) YES at lung and bronchioles**

Has a bridge.

☒ **Tantalum (Toxic Element) YES at lung and bronchioles**

Tooth metal.

☒ **Zirconium (Toxic Element) YES at lung and bronchioles**

He will go off deodorant and toothpaste (onto grain alcohol and baking soda).

☒ **Scandium, Hafnium, PVC (Toxic Elements) YES at lung and bronchioles**

☒ **Europium, Cerium, Iridium(Toxic Element) YES at lungs**

Dental alloy.

☒ **Gold (Toxic Element) YES at lungs**

Teeth.

☒ **Asbestos (Toxic Element) YES at lung**

Clothes dryer and hair dryer.

☒ **Oxalate (Kidney Stones) YES**

He is to take metal bridge out of mouth. Get all metal tooth fillings replaced with plastic immediately. They will take their laundry to a commercial laundry to dry and not use clothes dryer nor hair dryer. Start thioctic, 100 mg, 2 every waking hour the first day, then 10/day.

10 days later

A person called on the telephone saying they had decided “not to go this route.”

Summary: This man had 4 obvious problems: 1) his dental ware; 2) his deodorant; 3) asbestos source in his house; 4) PVC somewhere in his house. I made the mistake of thinking he would certainly return in a few days for his appointment and we would get him started on his parasite program then. It was not to be. I can't help wondering who made the choice: his wife, his children, or himself? I often do see a family member making the choice for the sick person. Often it's the sick person's fault for not stating his or her wishes; they are afraid of inconveniencing the family and being a burden and costing money. He was an alert, intelligent man at age 67; he still had a lot

to live for.

26 Joyce Stegeman Breast Cancer, Colon Cancer, HIV

Joyce has been going to a clinical doctor for 2 months, but no diagnosis has been reached. She reported the following problems: 1) fatigue; 2) hunger and nausea both; 3) warmth in head (mild fever?), occasional chills; 4) sounds like wind tunnel inside the head (roaring); 5) loose bowels, 3 to 4 times daily; 6) weight loss; 7) weakness; 8) tired and restless at same time; 9) some numbness. Slight inflammation of the liver was seen by one doctor.

☒ **Fasciolopsis (Parasite) YES at gallbladder, liver, thymus; NO at intestine**

☒ **Fasciolopsis redia (Parasite) YES**

☒ **Orthophosphotyrosine (Cancer) YES at colon and breast**

She had intense stinging in her colon and in both her breasts and under armpits 2 months ago, but it went away.

☒ **Protein 24 (HIV) YES**

This came as a surprise. She was tested clinically for HIV a few months ago; it was NO (*Negative*). She seemed relieved to hear these findings; that is, that she was HIV *Positive*; she thought she'd had it for some time.

☒ **Dipetalonema, Echinococcus granulosus, Fischoedrius, Haemoproteus, Toxoplasma (Parasite) YES**

Start on parasite program.

Four days later

☐ **Fasciolopsis (Parasite) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES at muscle, bone, thyroid, thymus**

She is using Tom's™ fennel toothpaste. Will go off.

☒ **Tin (Toxic Element) YES at muscle, bone, thyroid, thymus**

Toothpaste.

Three days later

☐ **Tin (Toxic Element) NO**

☒ **Benzene (Solvent) YES**

She has been off toothpaste. She will go off the whole benzene list. She is too fatigued to go to work.

Six days later

She is feeling more like herself. No hot spells, but she is not well.

☐ **Benzene (Solvent) NO**

☐ **Protein 24 (HIV) NO**

☒ **Dipetalonema, Pancreatic fluke (Parasite) YES; remainder of box 1 NO**

Summary: Joyce had both cancer and the HIV virus. Small wonder that her symptoms were too confusing for clinical doctors to reach a diagnosis. By the time I saw her I was routinely testing everybody for Protein 24 in their white blood cells (immune system); P24 is a small chip off the core of the virus. When the intestinal fluke was gone, both cancer and HIV were gone! She had the solvent benzene accumulated in her; propanol was not tested at the first visit so it can't be ruled out of the picture. Joyce got her health back. Her illness had made her financially broke, so she did not come back. She was only in her early 30's. We hope she is staying off benzene and propanol sources.

27 Edna Kennedy Breast Cancer, Lung Cancer

Edna Kennedy is a vivacious, middle-aged woman with a slightly stocky frame, age 59. She communicates readily about all the issues involved in her health problem. She came with her daughter who had her toddler with her. She is currently undergoing chemotherapy for recurrence of breast cancer. Her breast cancer started just 5 years ago. She had a mastectomy and chemo at that time.

Five months ago the cancer recurred in the lung. It was treated to completion, showing no presence of cancer. But now it has broken out again and is present in her lung, liver, and brain, as well as other sites. Her history of previous surgeries is: breast lump - benign, hysterectomy - parotid tumor, benign. She is currently on four drugs.

She has been on the Birth Control Pill in the past. She has a minor vision problem. She has overall weakness in her arms, elbows, shoulders, wrist and hands. Some backache, legs and knees are very weak. Energy is very low. She will go off caffeine. She does not smoke or use alcohol. She will also be off mustard, nitrites and artificial sweeteners in her food.

☒ **Nickel (Toxic Element) YES at lungs, liver, breast, brain**

This high level of nickel in her tissues, including brain locations, suggests tooth metal. She has a rather small amount of visible tooth metal. She says

she also has a crown. I recommended immediate removal with no replacement except Duralon sealer for 1 or more months until the cancer is gone. We discussed this at length, since she has a preference for her own dentist at home (several states away).

☒ **Beryllium (Toxic Element) YES at lungs, liver, breast, brain**

She has none of the usual sources of beryllium. She has no attached garage, no hurricane lamps or containers with fuel or solvent in the house. Nobody is a smoker in the house. (I believe she lives alone.)She works in a doctor's office. She has gas heat at home. We will test her home air by getting a dust sample sent to us by overnight mail taken from various rooms and her basement.

☒ **Scandium, Mercury (Toxic Elements) YES at lungs, liver, breast, brain; remainder NO**

The scandium, mercury, and nickel are quite probably all coming from tooth metal. I started her on a moderate amount of thioctic acid, 100 mg, 6/day. She had not been on vitamin C, so I started her on 3000 mg/day (with meals). Start on parasite program. She brought her blood test with her, done one month ago:

BLOOD TEST	Result	Comments
1. FBS	slightly high (117)	pancreas problem, needs to cleanse liver
2. BUN	high (23)	kidney disease
3. Creatinine	slightly high (1.1)	kidney
4. Triglycerides	very high (260)	kidney disease
5. Alk phos	very high (221)	cancer
6. GGT, SGPT (103), SGOT (69)	All very high	reflecting a liver problem
7. LDH	very high at 277	reflecting the cancerous cells product of lactic acid. Her CBC showed lymphs only 9.7% (toxin in lymphocytes).
8. RBC	3.78	anemic, parasites

Weight 150, temperature 97.9, blood pressure 120/80, pulse 80. We agreed to cleanse liver as soon as possible after parasite program.

Three weeks later

She is looking pale and fatigued. She will have dental work done this week. Her daughter found container of lamp oil and solvent, etc. in the basement, and she threw it out 1 week ago. She was in the hospital Monday through Saturday (5 days). She got platelets, potassium and nourishment through IV. They got her blood normal. She is resting her head on her right hand and breathing fast. *She did not get started on parasite program* (didn't find the time).

☐ **Beryllium (Toxic Element) NO**

☒ **Oxalate, Uric Acid (Kidney Stones) YES**

She will start on kidney herbs. She is scheduled for chemo for a week.

☒ **Fasciolopsis, Endolimax, Loa Loa, Naegleria (Parasites) YES at colon, lung, liver, breast (massive infestation)**

She agreed again to start on parasite program.

Summary: What a terrible way to die: being eaten alive by a horde of hungry mouths. Maybe she just didn't believe what I was telling her. So she gave the parasite program last priority. I will never know because her daughter called to say she died before her next appointment. She could have easily recovered. What a loss to society as well as her family.

28 Janice Crooks Liver Cancer

Janice Crooks is a middle-aged, slightly overweight woman with a pleasant disposition. She appears healthy. She is on Halcion™ for sleep and has been on it for three years. Her whole family has a lot of sleep problems. She has extreme sweats during the night; she gets wet all over with feeling hot. She agreed to shower off her sweat each time to get rid of the toxins in sweat. She is on morphine for pain. Her dosage is 30 mg taken at 9 am, 2 PM, and 9 PM daily. She has pain from her right upper abdomen across the front to the left side. It is more like soreness, when moving. She was on Percocet™ for pain before morphine until it failed. She is on Hytrin™ for high blood pressure and has been on it for eight years. It keeps her blood pressure at 140-150/70-80. She is on stool softener each night.

Many years ago she went to the doctorto say that she had pain to the right of her gallbladder. They never found anything. In the early 70's, she had malignant melanoma on her forehead. The doctor froze it and it has not returned.

In the 70's she had a bowel obstruction and needed surgery. About three years ago the bowels bled a little. Her doctor found a tumor. They proceeded with chemotherapy and radiation therapy. The tumor was biopsied and labeled “oat germ,” a very rare tumor. The surgeon said it was inoperable because it was on the spinal bone - too dangerous. It was sent to the Mayo Clinic. The oncologist said it was hopeless. The liver showed holes where the cancer had eaten it away.

Some months ago she took radiation for the tumor. They said it would only shrink it slightly, so her bowels would move better.

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Oxalate, Uric Acid (Kidney Stones) YES**

Start on kidney herbs.

☒ **Fasciolopsis (Parasite) YES at liver and adrenals**

☒ **Ascaris (Parasite) YES at liver and adrenals**

☒ **Cat Liver Fluke (Parasite) YES at liver**

Start on parasite program also.

Four days later

Yesterday morning her heart pounded for about an hour, then it cleared. She will reduce her blood pressure pill.

☒ **Asbestos (Toxic Element) YES at liver**

She does not use a hair dryer. They will sample their clothes dryer exhaust and bring it in to test for asbestos. They have city gas heat. Temporarily they will not use their electric heater which may have asbestos.

☒ **Mercury (Toxic Element) YES at liver**

Very high reading. She will get her fillings removed and not replaced except with Duralon™ sealer for onemonth or until cancer is gone.

☒ **Palladium, Thorium (Toxic Elements) YES**

They need to put plastic sheet under trailer to keep out thorium and radon.

☒ **Rhodium, Cadmium (Toxic Elements) YES**

Assume this is tooth metal. They have plastic water pipes so suspect old tooth fillings. They will save drillings to test for cadmium.

☒ **Tungsten (Toxic Element) YES**

She uses an electric percolator, but will stop. They have a gas stove and electric oven. We will test the oven for tungsten with a piece of toast done in the oven.

Three days later

She had a blood test done yesterday. She had metal teeth (3) removed this morning. Radon problem will be worked on Friday.

☐ **Oxalate, Uric Acid (Kidney Stones) NO**

Continue kidney program for several months. We will now speed up the parasite program.

☒ **Fasciolopsis (Parasite) YES at liver and gallbladder**

☒ **Tungsten (Toxic Element) YES; electric oven NO; toaster YES**

She never uses the toaster (has not used in a few months). We have not positively identified the source of her tungsten yet.

☒ **Asbestos (Toxic Element) YES at liver and lungs; clothes dryer NO; electric heater YES; hair dryer NO**

This is a 3-4 year old electric oil heater shaped like a radiator. It was washed first. Then they placed a damp paper towel on top and over the air vent to make the sample for testing. They are fond of it but will turn it off.

☒ **Cadmium (Toxic Element) YES**

She is off caffeine now. We tested hot water from Hardees™ where they often eat. It had tungsten in it. She will buy milk there instead. They have an electric water heater, which may be putting out tungsten. They will bring in a sample of the hot water to test for tungsten.

Six days later

They have had plastic sheet put under their trailer two days ago for radon protection. She is removing her earrings that have metal posts. She can get polyethylene posts.

☒ **Tungsten (Toxic Element) YES at liver and lungs**

Toast: YES (*Positive*), but she has not eaten toast for 2+ days.

☒ **Tungsten(Toxic Element) YES hot water from kitchen faucet**

It is an 8 year old electric water heater. They will drain it and replace heater element to see if this clears up the tungsten problem. If not, they will get a gas water heater. They will also bring in a cold water sample next time.

☒ **Fasciolopsis (Parasite) YES at colon, gallbladder and liver**

☒ **Onchocerca (Parasite) YES**

☐ **Parasites (remainder of box 2) NO**

Her cyst used to impede a bowel movement - had to have laxative each time. Now she does not need laxative, it seems easier to pass. She would like to be released from Hospice. Her regular doctor sent her home to die and gave her over to Hospice. “They only check my blood pressure and temperature and listen to my heart”, she said. She is completely released from her doctor. She will not use any hot water. She will shower at her sister's or heat her cold water to take a shower to get away from tungsten.

Five days later

The pain is beginning to subside. She is off all morphine.

☒ **Tungsten (Toxic Element) YES at liver, and hot water**

Putting in the new element didn't help.)Suggest switching to gas water heater.

☐ **Mercury, Radon, Cadmium, Palladium, Rhodium, Asbestos (Toxic Elements) NO**

☐ **Fasciolopsis (Parasite) NO everywhere**

☐ **Orthophosphotyrosine (Cancer) NO**

Her cancer is completely gone. She is very pleased. Only problem remaining is tungsten.

Five days later

She has laundered clothes in cold water and is in newly washed clothes. The hot water line has not been used. This was an effort to avoid the tungsten.

☐ **Tungsten (Toxic Element) NO**

Due to being off hot water - will put in a gas water heater. Pain is starting to go down all over. We will next clean the liver. She has been on 10 drops of 07 and peroxy 3 times a day. She will start on liver cleanse.

Summary: This was a very pleasant couple to work with. They always came together. She had more than her share of toxic elements in her liver. Flukes in her adrenals may have caused her high blood pressure for the last 8 years. She was obviously a terminal patient, put on morphine to ease dying. But she conquered every problem with her husband's help. All except one: tungsten in her water supply, from a faulty rod that is meant to prevent metal loading of water in the electric heater. Then, just as she was bounding with joy at her miraculous recovery, her husband was diagnosed with prostate cancer! (He was also cured.)

29 Jerry Crooks Prostate Cancer

He is having difficult urination. His regular doctor put him on a pill to ease urination, but he is worried about it. His gallbladder was taken out 10 years ago. He had a stroke one year after that. He used to smoke, but he quit two years after his stroke. He has paralysis since his stroke.

Prostate was trimmed when he had prostate cancer six years ago. Radiation treatments were given at that time. Since the stroke he developed seizures and has been on Tegretol™ for this from about four years ago.

☒ **Oxalate (Kidney Stones) YES; remainder NO**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Orthophosphotyrosine (Cancer) YES at prostate**

He will start on parasite program.

Two months later

He has skipped all earlier appointments. He has been on maintenance parasite program and done everything correctly. His urination improved right away so he didn't think it was important to come in so soon. (I had not told him he had cancer again, since a return to his clinical doctor would have had serious consequences for him. He was only recently remarried.)

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis all stages (Parasite) NO**

BLOOD TEST	Result	Comment
1. WBC	has been very low in the past few years	bone marrow
2. RBC	low and has been frequently low over the past few years	probably parasites
3. Platelet count	high (408)	search for cancer, parasites
4. Eos	very high (7%)	parasites
5.	very low (3.7) and has been low over the	

Potassium	years	adrenal problems
6. CO2	very high	He explains this as —heavy air.‖ I think toxin in lungs
7. Creatinine	high, and it has been moderately high over the years	Toxin in kidneys
8. BUN	high	toxin in kidneys
9. Urinalysis	shows chronic urinary tract infection	

Start on kidney herbs. He had a check-up recently. The prostate was checked. The doctors felt he was merely suffering from stroke effects. They found no cause for frequent urination problems and merely put him on a pill. His body current is very low. I have to raise the calibration setting. His current only goes to 40 micro-amps with 5 volts across his hands, instead of 60.

☒ **Tungsten (Toxic Element) YES**

He has an electric water heater. We will test water.

☒ **Asbestos (Toxic Element) YES at prostate**

☒ **Niobium (Toxic Element) YES throughout body**

Probably a pill - will go off.

☒ **Holmium (Toxic Element) YES throughout body**

Search for PCB.

☒ **PCB (Toxic Element) YES**

Wife also PCB *Positive* - have been using regular laundry detergent and hand soap. Switch to borax for laundry, dishes and shampoo. Start on thioctic 100 mg 6/day. He will be off caffeine.

Summary: Jerry had me quite concerned during his long absence. It was a great relief to see him walk in briskly 2 months later, stating he was fine. Hopefully he has also cleared up his asbestos and PCB problem. He was heard from a month ago and was doing fine. Holmium and PCB are often found together.

30 Phylis Petrie Lung Cancer

This is a pleasant woman, age 56, who was first seen by us two years ago. Her reasons for coming were: 1) Arthritis everywhere (arms, elbows, shoulders, wrist, hands, legs, knees, feet) even her ears

hurt; 2) gas in stomach; 3) high blood pressure for which she was on Tenormin™; 4) appetite down; she lost about 15 pounds in the last 6 months.

She was on Voltaren™, codeine, Tylenol™, Niferex™. She smokes, and her son had come to live with her. He is a builder. By early 1990, she had cleared a lot of her problems. She was gaining some weight. We encouraged her to get dental work done and stop smoking. (Needs metal out of mouth.)

She did not come back for six months and is still smoking. Toxic element test showed PVC and cesium in her immune system. They were doing some remodeling. We also found bismuth, antimony, and vanadium. She was using Vick's Vaporub™. They searched for a gas leak (vanadium source) and found it. She resented being told to stop smoking. She intimidated her son; he bought cigarettes for her since she wasn't strong enough to shop herself. We begged her to stop after our orthophosphotyrosine (cancer) test was YES (*Positive*).

We did not see her again until four months after that. She had seen a clinical doctor who "tested her for cancer and gave her a clean bill of health."Still smoking.

☒ Orthophosphotyrosine (Cancer) YES

☒ Radon, Asbestos (Toxic Element) YES

They will stop home remodeling and seal cracks but don't wish to do anything else since they feel I am wrong about the cancer.

Three months later

Doctor found mass in lung at a routine checkup and diagnosed it as Large Cell Carcinoma. She stopped smoking and wants to get well. They will use commercial clothes dryer and seal cracks to get rid of asbestos and radon. Down to 75 pounds. Her regular doctor gives no hope. Family is arriving. They will do the complete parasite program.

One month later

She has gained 6 pounds. Son is enthusiastic. She misses "her" cigarettes!

☐ Orthophosphotyrosine (Cancer) NO

Three months later

She has missed her earlier appointments, but she is doing OK. Her regular doctor is amazed at her survival. Toxic Element test showed cerium in her lungs. They refuse to do dental work. They are going on vacation. She will stay with other relatives.

Eleven months later

Telephone call from her son. Phylis Petrie died 2 weeks ago.

Summary: This was a particularly tragic case because the children all wanted their mother to stop smoking. But she was so strong a personality that she just "snapped their heads off if they even brought up the subject." Even when she was bedridden and coughing without stopping, the children still brought her cigarettes. The asbestos probably came from the clothes dryer. She rallied after she stopped using it. They had vented it <u>into</u> the house to save heat! We detected the cancer originally

with the hCG marker, not orthophosphotyrosine; at that time I was still searching for the best cancer marker, one that wouldn't miss a single case of early malignancy. I have no doubt that Phylis would have recovered if she had continued on the parasite program while she was away with relatives. Without a maintenance program it is too easy to become reinfected.

31 Norman Jones Prostate Cancer

Prostate cancer was diagnosed one month ago. He had surgery two weeks ago - reamed it out (TUR) and analyzed it. Eight days ago his other testicle was removed. The first testicle was removed 11 years ago for Lymphoma (non-Hodgkin's). They will follow-up clinically in three months. No chemo or radiation is scheduled at this time.

☒ **Orthophosphotyrosine (Cancer) YES at the prostate**

☒ **Nickel (Toxic Element) YES at prostate and throughout body**

Suspect tooth fillings.

☒ **Thorium (Toxic Element) YES at prostate**

They live in a condominium on a slab. Suspect uranium in construction fill underneath. Uranium decays into thorium, then into radon.

☒ **Radon (Toxic Element) YES at lungs**

They will repair cracks and test the air by dust collection.

☒ **Cadmium (Toxic Element) YES throughout body**

They will bring in water samples, hot and cold, from the kitchen, bathroom, and shower to test for cadmium. They will see dentist, seal basement and do air test for radon. He has a mouthful of tooth fillings. Will get all metal out.

☒ **Oxalate, Dibasic Calcium Phosphate (Kidney Stone) YES**

☐ **Kidney Stones (remainder) NO**

Start kidney herbs. They will bring in copies of recent blood test.

Three days later

He is enjoying kidney herbs. They have brought in water samples to test for cadmium.

☒ **Cadmium (Toxic Element) YES in shower hot and cold, kitchen hot and cold, NO in master bedroom hot and cold**

They will get new socks and underwear so that their clothing is free of cadmium until plumbing is changed to PVC. He feels the repairs needed may be under the slab they live on.

☒ **Fasciolopsis (Parasite) YES at colon and liver**

We have not tested other parasites. He will start on parasite program.

One week later

☐ **Oxalate, Dibasic Calcium Phosphate (Kidney Stones) NO**

Continue on ½ dose herbs for 2 to 3 months.

☐ **Fasciolopsis (Parasite) NO**

Continue parasite program.

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Cadmium (Toxic Element) YES at genital tract**

☒ **Thorium, Radon, Nickel (Toxic Element) YES**

They have not sealed cracks around plumbing pipes yet.

Summary: Norman still had the cancer after his surgeries but in 7 days it was all gone after killing the intestinal fluke. He did not return after hearing this happy news, hoping that the dental problem and plumbing and radon problems would go away by themselves. However, he continued to have pain which was interpreted by his clinical doctors as ongoing cancer and was given anti-male hormone. This made his wife angry; she insisted on the dental work and radon work. After this, the genital pain went away: we learned this from one of the children. Also, they stopped using water from the cadmium-polluted faucets. Norman had a jolly nature; hopefully he is doing fine.

32 Joan Matlock Lymphoma

Joan Matlock was diagnosed as having lymphoma several months ago. Her only symptom was swelling of lymph node in neck and arm. She has 6 children.

She went to the doctor when she noticed her spleen was enlarged and hard. She has had chelation since then but spleen is still swollen. She has been on Hoxsey herb concentrate from Mexico. She is using chaparral, sweet clover, white oak bark, Immunoplex, potassium iodide, goldenseal, and Echinacea. She is on parsley and mullein tea in the morning. Also, hawthorn at lunch, violet leaf tea at supper, milk and ½ cup coffee. Lymphoma is common around her home. She knows 3 others with it! She is from 2 states away

Her chelator doctor recommends that she drink two 10-12 ounce glasses of vegetable juice each day made from: carrots, apples, grapes, ¼ beet, 1 ounce raw liver, and alfalfa sprouts. (I suggested omitting the raw liver.)

☒ **Fasciolopsis and miracidia, cercaria (Parasite and stages) YES at gallbladder, liver**

☒ **Iodamoeba, Schistosoma, Pigeon tapeworm, Chilomastix, Sheep liver fluke, Pancreatic fluke, Dientameoba, Notocotylus (Parasites) YES, remainder of box 1 and 2 NO**

She is having 3 bowel movements a day. Start on parasite program.

☒ **Uric Acid (Kidney Stone) YES**

She will go on kidney herb recipe also.

Two weeks later

☒ **Fasciolopsis miracidia (Parasite) YES at colon**

☒ **Fasciolopsis eggs (Parasite) YES at colon, blood**

☒ **Fasciolopsis cercaria (Parasite) YES at colon**

Continue parasite program.

☒ **Orthophosphotyrosine (Cancer) YES at spleen**

☒ **Indium (Toxic Element) YES**

Metal tooth fillings.

☒ **Mercury (Toxic Element) YES**

Tooth fillings.

☒ **Titanium (Toxic Element) YES**

Tooth fillings? powder?

☒ **Thallium (Toxic Element) YES**

Pollutant in Mercury fillings?

☒ **Vanadium(Toxic Element) YES**

Check for gas leak in home.

☒ **Niobium (Toxic Element) YES**

Pill?

☒ **Ytterbium (Toxic Element) YES**

Pills she is taking.

☒ **Ytterbium (Toxic Element) YES in supplements Twin Lab™ Vitamin E, KAL™ Calcium Magnesium (fast acting), Mayumi Shark Oil™ caps (Japan Health Products), Kwai™**

She needs to get metal teeth replaced. Go off all supplements except from Bronson's Pharm.

One month later

All her tooth metal is out. Spleen is still enlarged and she is experiencing lower back pain. She has to take cortisone two times a week. The gas company found no gas leaks. She will put out jars for air samples. She has lost 5 more pounds.

☐ **Fasciolopsis all stages (Parasite) NO**

☒ **Bismuth (Toxic Element) YES**

Off fragrances.

☒ **Ytterbium (Toxic Element) YES**

Off all supplements.

☒ **Ytterbium (Toxic Element) YES in her digestive enzymes**

She will switch to Bronson's Digestive Enzymes.

Eleven days later

Spleen has not gone down. She has to take ACTH shots twice a week to keep it under control.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis all stages (Parasite) NO**

☒ **Schistosoma (Parasite) YES at spleen**

Continue parasite program. There are numerous pets. She is treating all

animals with Black Walnut Hull tincture. She will bring saliva sample from dog. It is possible she is picking it up from her pets.

☐ **Bismuth (Toxic Element) NO**

☐ **Ytterbium (Toxic Element) NO**

☒ **Haemophilus infl (Pathogen) YES at spleen and wisdom tooth**

In teeth - needs cavitations cleaned.

Two weeks later

She had a cavitation cleaned followed by penicillin.

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Salmonella, Strep pneum, Gardnerella, Campyl, Resp Syncytial virus (Pathogens) YES at spleen**

She is still drinking a juice of carrots, beets, apple, grape, plus raw beef liver non-medicated source. Stop beef liver.

Two weeks later

One front tooth (with a root canal) has been pulled about 2 hours ago.

☐ **Haemophilus infl (Pathogen) NO**

Four days later

Spleen not down. She has been on Amoxicillin™ from Thursday evening. It is a one-week prescription. Her pulse is down from 115 to 90 beats per minute (this is an improvement).

Summary: The cancer was stopped for Joan but her spleen has not returned to normal size. It looks like more dental work is needed but she did not return. She was strong enough to return to work again, so she did not come back.

33 Jane Elliot Lung Cancer

Chronic bronchitis. Smoker.

☒ **Orthophosphotyrosine (Cancer) YES at lungs**

☒ **Fasciolopsis (Parasite) YES at liver, lungs**

☒ **Fasciolopsis eggs (Parasite) YES at liver and blood**

☒ **Fasciolopsis cercaria (Parasite) YES at kidney, bladder, liver, lungs, and blood**

☒ **Mercury (Toxic Element) YES at brain and liver**

☒ **Mercury (Toxic Element) YES in cigarettes, Marlboro 100's™**

Switch cigarette brands.

☒ **Vanadium(Toxic Element) YES**

Search for gas leak.

☒ **Uric Acid (Kidney Stone) YES**

Start on the Parasite-Killing Program.

Eight days later

☒ **Fasciolopsis cercaria (Parasite) YES at lungs, skin, blood, cervix, intestine**

She has had skin cancers removed in the past.

☒ **Orthophosphotyrosine (Cancer) YES at lungs**

☐ **Mercury (Toxic Element) NO**

Switched cigarette brands. Continue parasite program.

Three weeks later

Bronchitis gone.

☒ **Histoplasma, Proteus (Pathogen) YES at lung**

☒ **Mercury (Toxic Element) YES**

Went back to her old cigarettes.

☐ **Fasciolopsis, Dog heartworm (Parasite) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

Summary: Although Jane had had several bouts of skin cancer, this was not enough to stop her

from smoking. Not even the news of lung cancer could stop her addiction. But she switched her cosmetics to propanol-free varieties and carefully stayed on a parasite maintenance program. This was enough to stop her cancer. Perhaps she will some day find the strength to stop smoking.

34 Jennifer Carver Ovarian Cancer

Jennifer Carver is a vivacious young person, a university student, and accustomed to high achievement. Her high-pitched voice suggested high estrogen levels. This would increase her risk of breast cancer. Indeed, it was 150 pg/ml. She stated her mother had breast cancer. But her reason for coming to the office was a digestive problem. Her other problems were: upper back pain, insomnia, and frequent yeast infections. She would like to lose weight.

Urinalysis showed trace of protein. She empties bladder only 2 or 3 times in 24 hours. She will drink a lot more water and stop eating salted popcorn. We will test for toxic elements next time. She did not keep her next appointment.

Two and one half years later

She has a sore throat. Feels tired and must take a midday nap even though she's only in her mid-20's.

- ☐ **Kidney Stones (ALL) NO**

  No evidence of crystal deposits (has been drinking a lot of water since her first visit).

- ☒ **Orthophosphotyrosine (Cancer) YES at ovary**

- ☒ **Fasciolopsis (Parasite) YES at liver and intestine**

- ☒ **Fasciolopsis redia (Parasite) YES at ovary, kidneys, bladder, and blood**

  Start on parasite program.

- ☒ **Benzalkonium, Hafnium, Zirconium (Toxic Elements) YES**

  Nail polish, hair spray, and most of her cosmetics tested YES (*Positive*). She will discontinue them.

Five weeks later

- ☐ **Orthophosphotyrosine (Cancer) NO**

- ☐ **Fasciolopsis (Parasite) NO**

- ☐ **Protein 24 (HIV) NO**

- ☒ **Isopropyl Alcohol, Mineral Oil (Solvents) YES**

She will remove all “prop” from her lifestyle. She will stop using “bag balm” and commercial cosmetics.

Five weeks later

(10 weeks after visit, which indicated cancer.) A minor complexion problem has returned. She has normal energy again.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☐ **Protein 24 (HIV) NO**
- ☐ **Sheep liver fluke and all stages (Parasite) NO**

She did a 5-day high dose parasite program, followed by maintenance. Boyfriend will get cleared of parasites also.

- ☐ **Solvents (ALL) NO**

She wants to do a liver cleanse next.

Summary: Cases like Jennifer's are inspirational. Two years earlier, in her early 20's, she sensed her cancer risk because of her mother's and aunts' cancer history. But she felt better as soon as she drank a lot more water and did not follow up. Notice how drinking more water washed away any beginning stone formation without having to take the kidney herb recipe! She might have had a small cancer started then already. How fortunate that she returned for a simple sore throat. Her cancer was already going strong and would have overwhelmed her soon. But she complied in every detail and got her radiant health back, although giving up her favorite cosmetics was hard.

35 David Whitman Acute Lymphocytic Leukemia

Dave is a 9-year-old boy, in good health, by appearance, with normal energy and good mood. Two months ago he was diagnosed with acute lymphocytic leukemia for which he has been treated continuously. He is on Methotrexate™ once a week, Mercaptopurine™ every day, Vincristine™ once in 3 weeks, Prednisone™ after the Vincristine.™ He gained 20 pounds.

- ☒ **Benzalkonium (Toxic Element) YES at lungs**
- ☒ **Asbestos (Toxic Element) YES at lungs**
- ☒ **Cobalt (Toxic Element) YES at skin**
- ☐ **Toxic Elements (Remainder) NO**

Testing the mother for asbestos: she is YES (*Positive*). It must be in their

home, which is new. Note: at this time I did not have a separate set of solvents for testing. I assume that he would have tested YES for isopropyl alcohol. As I came to realize the importance of solvents I expanded my test set and discovered the correlation.

☒ **Oxalate (Kidney Stones) YES**

Start on kidney herbs.

One day later

They have brought air samples with them to test for asbestos.

☒ **Asbestos (Toxic Element) YES in master bedroom, family room, laundry room, and dining room Asbestos (Toxic Element) NO in den, basement, sister's bedroom, mother's bedroom, brother's bedroom, upstairs bathroom, master bathroom, kitchen, and half bath**

Conclusion: The clothes dryer in the laundry room may be shedding asbestos and getting into a few rooms but Dave's bedroom is not contaminated; this does not seem sufficient to give Dave such high levels. We will check school air. His 2 classrooms will be dust checked for asbestos. They will send air samples since they live 2 states away. The school has been removing asbestos during summer vacation. They will check into asbestos tests done at school. They will switch off detergent to stop getting cobalt. They will stop using paper cups and napkins and plates to reduce getting benzalkonium; also switch to goat milk to reduce benzalkonium in udder wash used for cows, also switch off toothpaste to baking soda.

☒ **Fasciolopsis (Parasite) YES at WBCs, lungs and intestine**

☒ **Pneumocystis carnii (Parasite) YES**

☒ **Giardia (Parasite) YES at intestine**

Start on parasite program. Keep Dave out of school until air can be tested for asbestos. Do blood test every week to avoid over treatment with chemo as Dave's condition improves.

☒ **Orthophosphotyrosine (Cancer) YES**

Six days later

Testing air sample sent by mail.

☒ **Asbestos (Toxic Element) YES Church schoolrooms A and B, hair blower B (they have two)**

☐ **Asbestos (Toxic Element) NO Hair blower A, clothes dryer vent**

Conclusion: the source of asbestos in Dave's home is not the clothes dryer; it is a single hair blower. There is a limited amount of asbestos coming from Dave's home (all due to one hair dryer; she will stop using it). He is getting asbestos all day at school. He must stay out of school.

☐ **Oxalate (Kidney Stone) NO**

He can go off kidney herbs.

Seven days later

Clinical doctors have reduced his chemo.

☒ **Asbestos (Toxic Element) YES** THE

☐ **Benzalkonium (Toxic Element) NO**

☒ **Cobalt (Toxic Element) YES**

They switched off detergent. Cobalt must be coming from water softener. Bypass immediately. Testing mother for asbestos: NO. She stopped using hair blower so Dave must be getting all of it from school. She did not keep him out of school because she feels intimidated by school authorities. She will try again.

Two weeks later

☐ **Asbestos (Toxic Element) NO**

Moved to different classroom.

☐ **Benzalkonium (Toxic Element) NO**

☐ **Cobalt (Toxic Element) NO**

☒ **Fasciolopsis (Parasite) YES**

Continue parasite program.

☐ **Orthophosphotyrosine (Cancer) NO**

Note: the cancer is gone and *Fasciolopsis* is still present, but not in the liver.

Summary: This was a happy story. The parents openly stated that they did not believe my explanations or test results but would carry out my instructions anyway due to their simplicity. At the last visit, Dave's chemo had been reduced further, showing that his clinical doctors were watching him closely. I believe this all began with the school asbestos-removal program. Although a building is tested for asbestos at the end of a job, the test equipment isn't good enough to pick up the smallest fibers. One can't help wonder if other children in this school developed illness.

36 Cynthia Broadhurst Retinoblastoma

Cynthia is a beautiful 19-year-old girl, blind due to cancers dating back to infancy. They brought a description summary with them. A recent return of the cancer is threatening the loss of most of her face. Her parents are professional, highly trained people. They could discuss all the kinds of cancer Cynthia has had from retinoblastoma after birth to rhabdomyosarcoma at age 14 to fibrous histiocytoma earlier this year. They are using well water. They will get her latest blood test.

☒ **Toxoplasma (Parasite) YES at the eye**

Toxoplasma is a parasite that comes from a cat box, this is the reason pregnant women are told not to change their cat boxes. Cynthia is allergic to cats, and doesn't have one.

☒ **E. hist, Trichinella (Parasites) YES at the eye**

☒ **Ancylostoma, Human liver fluke (Parasite) YES at part of eye only**

The *human liver fluke* is not the same as *Fasciolopsis*, the human INTESTINAL fluke, which starts a cancer when it moves its —home‖ from the intestine to the liver.

☒ **Fasciolopsis (Parasite) YES at retina and same part of eye**

Very unusual.

☒ **Oxalate (Kidney Stones) YES**

She will stop drinking tea and start vitamin B6 and magnesium oxide 300 mg/day. They are suspicious of herbs, so won't start on kidney herb recipe.

☒ **Cadmium (Toxic Element) YES at kidneys**

Corroded water pipes.

Summary: The parents left abruptly at this point. I could not persuade them to start on anything. She was scheduled to have half her face, including part of the jaw, removed by surgery in a few weeks. Yet a harmless herbal treatment did not tempt them to try it. I'm sure they loved their daughter as much as life itself. Yet, my methods seemed to arouse anger instead of joy at finding a fresh approach to a hopeless situation. They took no supplies and did not return. I believe this must be a case where Fasciolopsis stages crossed the placenta into the unborn child. The mother may have had high levels of a solvent causing them to disperse from the mother's intestine. I must also wonder whether this solvent was fed to the baby through the mother's milk so that the fluke stages would quickly multiply in the baby. Wood alcohol is a solvent that might do this because it accumulates in the eye (as well as pancreas).

37 John Knowles Prostate Cancer

This 67-year-old man reported the following main problems: history of stomach problems, history of lower back pain, occasional numbness of feet; some sinus problems, history of prostate problems, hemorrhoids. Recently, he has been getting sleepy during the daytime, which was the reason for coming to our office.

☒ **Eimeria (Parasite) YES**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis eggs, cercaria (Parasite) YES at liver, colon, blood, and prostate**

☒ **Ascaris, Cat liver fluke, Diphyllobothrium, Plasmodium vivax (Parasites) YES**

Seeing the intestinal fluke in the liver, I suspect cancer.

☒ **Orthophosphotyrosine (Cancer) YES**

Start on parasite program.

Two weeks later

Not as sleepy as he used to be.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Cesium (Toxic Element) YES**

Drinks distilled water in plastic jug.

☒ **Vanadium(Toxic Element) YES**

Has a gas hot water heater, furnace, stove and clothes dryer but does not believe there is a leak anywhere. Continue parasite program.

Three weeks later

He still gets occasional sleepy attacks.

☐ **Cesium (Toxic Element) NO**

Stopped drinking distilled water.

☒ **Vanadium(Toxic Element) YES**

He did nothing about gas pipes. They will do an air test in their home and bring it next time to test for gas.

☒ **Human liver fluke, Cysticercus, Echinococcus granulosus cyst, Endolimax (Parasites) YES**

☐ **Parasites (Remainder) NO**

Continue parasite program.

Summary: This strong, tall man came in for a minor problem - just needing to nap in the middle of the day. But his intuition told him there was something wrong about that. The prostate cancer shocked him, but he attacked the problem immediately. In 2 weeks the cancer was gone, but his fatigue spells weren't. We have not seen him since his last visit; hopefully his wife will smell the gas in time to prevent a tragedy in their home.

38 Anne Brill Breast Cancer

Anne Brill is a physically active 61-year-old woman with few health complaints. She is a former home economics teacher who has traveled extensively and is now retired. She has pain in her lower back, knees, and feet; a rash on her face periodically; and considers herself to have a weight problem. She has a history of breast cancer, starting over twenty five years ago. She has had radical surgery. Now, for about two months, she has had pain in the left breast area under the left armpit, midline with the nipple.

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis redia (Parasite) YES at breast, liver, blood**

☒ **Fasciolopsis eggs (Parasite) YES at gallbladder, liver, blood**

☒ **Chilomastix (Parasite) YES**

☒ **Pancreatic fluke (Parasite) YES**

Gets waves of nausea - doctor gave medicine for it.

☒ **Echinococcus granulosus, Echinococcus granulosus eggs, Gyrodactylus, Human hookworm (Parasites) YES**

☒ **Oxalate, all types Calcium Phosphate (Kidney Stones) YES**

Start on parasite program and kidney herb recipe.

Three days later

She reported that she had followed the parasite and kidney programs as recommended. Her lower back, knee, and foot pain is gone, and she is back playing golf this morning. Left breast is no longer sore in old spot, but there is still a little soreness in another place on breast.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Echinococcus granulosus all stages (Parasite) NO**

☐ **Pancreatic fluke, Chilomastix, Gyrodactylus, Necator (Parasites) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

Continue parasite program and kidney herbs. The cause of remaining soreness is not determined yet.

Six days later

She reported no new symptoms. Feet and knees continue to be much better, and the breast pain is all gone.

BLOOD TEST	Result	Comment
1. FBS	slightly high	prediabetic, need to clean liver
2. Total Protein	slightly low	liver problem
3. Alk Phos	high	start on vitamin A&D, magnesium, milk
4. GGT, SGOT, SGPT	high	gallstones and liver problem
5. Iron	low	parasites

☒ **Asbestos (Toxic Element) YES**

We will test her hair blower.

☒ **PCB (Toxic Element) YES**

Probable cause of rash on face. She is to go off detergents and use borax only for all purposes.

One week later

Her feet are still painful sometimes, but better. Rash is still on her face. She has continued with parasite and kidney programs.

☐ **Asbestos (Toxic Element) NO**

Must have been coming from her hair blower - stopped using it but used clothes dryer yesterday.

☒ **PCB (Toxic Element) YES**

Is still using detergent for dishwasher, will stop.

☐ **Orthophosphotyrosine (Cancer) NO**

Summary: It only took Anna 3 days to rid herself of cancer and a little over a week to be rid of her pains. The pain under the armpit is typical of a cancer development in the breast. Since she was back to playing golf again and free of pain, she did not follow-up to be sure the PCBs were gone.

39 Claudia Stein Breast Cancer

Claudia Stein is a 27-year-old woman with exposure to contaminated well water. The whole family got sick. The baby does not nurse well. Claudia has pain at lower back, neck, and below both breasts.

☐ **Kidney Stones (ALL) NO**

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis miracidia (Parasite) YES at liver, breast, and blood**

☒ **Fasciolopsis redia (Parasite) YES at breast**

☒ **Fasciolopsis cercaria (Parasite) YES at breast and blood**

She and her husband will start on parasite program. She will start the children (but not the baby) on vermifuge syrup.

Two weeks later

All pain is gone. She has been on parasite program. There is some burning or ache in middle of right groin and both sides of upper chest.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **Fasciolopsis (Parasite) YES at colon only**
- ☒ **Fasciolopsis redia (Parasite) YES at colon and breast**

The baby is breast-feeding OK now.

- ☒ **Fluoride (Toxic Element) YES at breast**

Stop toothpaste.

- ☒ **Scandium (Toxic Element) YES**

Tooth metal.

- ☒ **PVC (Toxic Element) YES, high**

Husband is a painter - will test air at home and work. She will continue parasite program.

One week later

- ☐ **Fasciolopsis (Parasite) NO all stages, all locations**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fluoride (Toxic Element) NO**
- ☒ **Scandium (Toxic Element) YES**
- ☒ **PVC (Toxic Element) YES**
- ☒ **PVC (Toxic Element) YES in bedroom, TV room; NO in other rooms**

There is old carpet backing in the PVC YES rooms. They will remove it and do new air tests 3 days later.

Summary: This young mother of 4 was concerned when her baby did not nurse well, thinking that the contaminated well water experience might still be having bad effects. She was not very shocked, though, to hear she had cancer because her sisters had it. She was delighted that the baby was feeding well again after 2 weeks. Their limited finances prevented her from coming back to solve the PVC problem. I should have gotten a milk sample to see if Fasciolopsis stages are in her milk. This question has been on my mind for some time, since it is a body fluid where parasite stages could be

transmitted.

40 Marlene Broad Hodgkin's Disease

Marlene Broad, a 32-year-old woman, began having shoulder pain about 2 years ago. It was treated as bursitis, but the pain became worse. She lived with it. A few months ago, a varicose vein was noted on her right arm, as well as swelling on the right side of her neck. Her WBC (white blood cell count) had been rising. A venogram and CAT scan showed lymphoma. They also saw 2 tumors, 6-7 cm, believed to be behind the sternum. Numbness of arm has occurred in the past. She will have a biopsy at the hospital soon.

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

She will stop smoking today and get a patch of nicotine. She has only one kidney. The other one was removed due to congenital deformity.

☒ **Oxalate, Uric Acid, Tribasic Calcium Phosphate (Kidney Stones) YES**

☐ **Kidney Stones (remainder) NO**

Start on kidney herbs. Start on parasite program. Go off margarine onto real unsalted butter (and salt it herself with aluminum-free salt).

Six days later

She is on Darvocet Plus™ for pain. She is scheduled for a CAT scan on Monday and will be on Prednisone™. She is now smoking under 1 pack/day but got a Habitrol Patch™ and put it on today (23 mg). She is feeling fine and will stop smoking today. She slept all night for the first time in 6 months (no bathroom visits).

☒ **Fasciolopsis (Parasite) YES but not at liver or intestine**

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Palladium, Mercury (Toxic Element) YES**

☐ **Toxic Elements (remainder) NO**

See dentist immediately to remove metal tooth fillings.

Four days later

Pain is out of shoulder today. She received a diagnosis of Hodgkin's disease by her clinical doctor yesterday. Dentist took out a root canal from her upper left incisor and removed all metal fillings except lower left side.

☐ **Fasciolopsis (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES at liver**

☐ **Fasciolopsis (other stages) NO**

She is scheduled for a CAT scan of her abdomen.

☐ **Kidney Stones (ALL) NO**

Continue kidney herbs for 1 month.

☐ **Orthophosphotyrosine (Cancer) NO**

She is scheduled for chemo and x-ray in about 1 week - after seeing her oncologist. Of course, this is unnecessary now.

Three days later

☐ **Fasciolopsis (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES**

☐ **Fasciolopsis (other stages) NO**

She needs one more quadrant of dental work.

Summary: This young woman started out with a handicap at the location of the kidney that was inherited, plus surgery at the kidney. The remaining kidney was clogged with mercury and palladium from her tooth fillings; this gave her 3 kinds of kidney stones. In addition, she smoked. But 7 days later the cancer was gone. She had reduced smoking, removed the metal fillings and a root canal, removed the kidney stones with herbs, and killed the parasites in her liver. Parasite stages hung on, but she will have those eradicated soon. She seemed committed to improving her life style and beat-out the scheduled x-ray and chemo. We have not seen her since, but we have no reason to think she was unsuccessful. Notice that the pain and swelling in her shoulder and arm was gone the day after the dental work was done.

41 Lisa Lindley Colon Cancer

Lisa Lindley is an 82-year-old woman whose main problem is: she spends 20 hours a day in bed because she is so fatigued. Two years ago, she had colon cancer surgery (14 feet of her colon was removed). She had 17 radiation treatments. She also has high blood pressure.

☒ **Orthophosphotyrosine (Cancer) YES at colon**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis redia (Parasite) YES at colon and blood, other stages NO**

She was started on parasite program. However, we were out of Wormwood capsules, so we substituted Quassia herb. She was to drink 1/8 cup of a strong tea of quassia 4 times/day.

Seven days later

She had taken everything as directed.

- ☐ **Orthophosphotyrosine (Cancer) NO everywhere**
- ☐ **Fasciolopsis (Parasite) NO everywhere**
- ☒ **Fasciolopsis redia (Parasite) YES at blood, NO at colon**

She was to continue on *Parasite-Killing Program* and start on our kidney herb recipe for the high blood pressure (kidneys and adrenal glands are responsible for water and salt regulation, which in turn determines blood pressure). Note that cancer is gone but a stage of the fluke remains in the blood.

Three months later

She is still fatigued.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Protein 24 (HIV) NO**
- ☐ **Fasciolopsis (Parasite) NO**
- ☒ **Fasciolopsis redia (Parasite) YES at colon and blood**

She has extensive fluid around the eyes and is on B12 shots from her clinical doctor twice a week. Swollen eyelids are usually due to *Ascaris*, the common roundworm of cats and dogs.

- ☒ **Ascaris (Parasite) YES**

She has a cat and will treat it with our pet parasite program.

Three weeks later

- ☐ **Fasciolopsis (Parasite) NO**
- ☐ **Solvents (ALL) NO**

☒ **Antimony (Toxic Element) YES**

Will stop using Noxzema™.

☒ **Formaldehyde (Toxic Element) YES**

She will replace the foam mattress they got from the hospital (free of charge) for a common cloth one.

☒ **Mercury (Toxic Element) YES very high in tissues**

She will see dentist to remove metal tooth fillings. She is not fatigued and can work around the house.

Summary: This intelligent elderly woman got rid of her cancer in 7 days. Swelling of the eyelids always implicates common roundworm of cats and dogs, Ascaris. The eggs are always on their fur so petting them transfers it to human hands. I encouraged her to keep her pet in top health, as well as herself.

Four months later (eight months after the first visit)

She is still very tired, napping 2 hours a day.

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **Benzene (Solvent) YES in all her organs**

She is still using Noxzema™ daily, liberally on herself. She will stop.

☒ **Acetone, Methyl Butyl Ketone, Methylene Chloride (Solvents) YES**

She will go off commercial beverages. She has not done dental work yet.

☒ **Antimony (Toxic Element) YES**

Probably in Noxzema™.

☐ **Formaldehyde (Toxic Element) NO**

Threw out the foam furniture. She will get dental work done.

42 Josefine Flores Cancer Of Genital Tract

This 46-year-old woman reported her main problems as: hands and ankles swelling (probably a kidney condition); coughing (I suspect a respiratory toxin), fatigue, irregular periods, often lasting 3 to 4 weeks, migraine headaches, especially with period (most likely Strongyloides parasites), and a weight problem. Her clinical doctor did a bone density test and found osteoporosis.

We told her to take the following: 3 glasses of 2% milk/day; magnesium oxide tablets from Bronson's, 300 mg, 1/day; vitamin D 1/day any size.

☒ **Isopropyl Alcohol, Xylene (Solvents) YES, remainder NO**

She will go off shampoo and use borax for all purposes. She uses no cosmetics.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES throughout genital tract**

☒ **Fasciolopsis (Parasite) YES at colon only**

Note: Absent in liver!!

Fasciolopsis redia (Parasite) YES, other stages NO

Start parasite program. This is a strong, healthy-looking woman. She has a disseminated cancer of the genital area, including her vagina and uterus. This news was shocking to her. She will go off commercial beverages to get rid of solvents.

Six days later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis (Parasite) NO all stages**

Cancer is gone. Continue on parasite program at maintenance levels.

☒ **Hexane (Solvent) YES**

She is drinking Folger's™ decaffeinated instant coffee. She will go off it and drink water.

☒ **Cysteine, Phosphates (Kidney Stones) YES, high**

The numerous phosphate crystals are probably the result of drinking so much carbonated beverages. She will stop. Her diet will change as follows: Decrease animal food, grains, carbonated beverages (phosphates), increase milk, fruits and vegetables. Start kidney herbs.

One month later

Her period is normal. Her swelling is down, her headaches are better, she has more energy. She is still coughing. She is off caffeine.

☒ **Fluoride (Toxic Element) YES**

Uses no toothpaste.

☐ **Toxic Elements (remainder) NO**

She is preparing to do a liver cleanse.

One month later

She is still coughing. She has a slight swelling in her hands and ankles. She is feeling very well.

☒ **Cysteine (Kidney Stone) YES, remainder NO**

Continue kidney herbs.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒ **Sheep liver fluke (Parasite) YES**

Remainder of parasites not tested. Continue parasite program. Avoid undercooked meats. Eat no meat in restaurants.

One month later

She is no longer coughing, but her left hand is hot and swollen.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Xylene (Solvent) YES**

☒ **Uric Acid (Kidney Stone) YES**

Go back on kidney herbs. Drink milk instead of soda pop.

Summary: This was such a friendly, pleasant woman it would have been a tragedy to lose her to massive genital cancer. She saved herself from this dreadful fate in 6 days. She knew intuitively she was drinking too much pop and was rather glad to be told to be off pop and caffeine both. She may have had the liver fluke from the start since I had not done the complete parasite test. Her visits had

to be very brief since they were shared by other family members.

43 Peter Smith Cancer At Colon

This is a 41-year-old man with psoriasis for over 10 years. It began behind his calf. He has large patches about 4 inches in diameter on his elbow and right side and all over him, including his scalp. He is using a non-prescription drug. He has used cortisone. His scalp is also very bad, and it is getting worse. He has spent a lot of money on the problem over the years. He also has arthritis in his elbows, feet, wrist, shoulders, hands, and back. He developed a stomach ulcer about 1 year ago. He has a minor sleep problem as well as depression and a weight problem. He is a building contractor.

☒ **Oxalate, mono-Calcium Phosphate (Kidney Stones) YES**

Start on kidney herb recipe.

Four days later

He is feeling better and has lost about 6 pounds.

☒ **Dipylidium caninum (Parasite) YES at skin**

Dog tapeworm.

☒ **Echinococcus granulosus (Parasite) YES**

Has always had dogs.

☒ **Fasciolopsis (Parasite) YES at one side of liver**

Suspect cancer.

☒ **Fasciolopsis redia (Parasite) YES at skin, liver, blood, and colon, other locations NO**

☒ **Orthophosphotyrosine (Cancer) YES at colon**

Start on parasite program.

Nine days later

BLOOD TEST	Result	Comment
1. Cholesterol	is low (177)	liver problem
2. Phosphate	high very	He is dissolving bone and making calcium phosphate deposits. He will change his diet: less phosphate, more Calcium and Magnesium: 3 glasses of 2% milk/day. Vitamin D (50,000) 2/week, by prescription from dentist. Magnesium oxide, 300

Calcium	low	mg, one/day.]
3. Potassium	low	due to adrenal/kidney problem
4. SGPT	slightly high	needs to clean liver
5. Iron	very low	parasites
6. Platelet count	slightly high	parasites

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES in blood**

Continue parasite program. Skin is starting to improve.

Summary: Skin eruptions of all kinds are always due to parasites. But I gave his pain a higher priority than his skin, so I started him with the kidney treatment at his first visit. Consequently, I did not find the cancer until his second visit. Since his pains were lessening, he was not too angered by the bad news. His income did not allow him to return after his third visit.

44 Stella Rowley HIV and Cancer

This 23-year-old woman came in because of her chronic yeast infection, cramps she has suffered from —all her life,‖ migraines, bunions, and heart arrhythmia. She also noted that she has sinus problems during the fall and spring. Her right wrist is sore. She has occasional constipation and diarrhea; her right knee is sometimes sore. She is on several medications for her various ailments, way too many for her age.

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Protein 24 (HIV) YES**

She has both cancer and HIV illness unbeknownst to her, but she is not too surprised. I am surprised at her calmness.

☒ **Isopropyl Alcohol (Solvent) YES high**

Eliminate propanol polluted products like cold cereal and shampoo.

☒ **Benzene (Solvent) YES high**

Off benzene list.

☐ **PCB (Toxic Element) NO**

Summary: She arrived with HIV test results that were NEGATIVE. Apparently, however, she had the intuition that something was quite wrong with her but could not get it established clinically. We recommended a vegetarian diet for her, which appealed to her anyway. She has not returned, and three months have passed. Hopefully, she has followed some of the advice we gave her. Her finances may not have been adequate for her to return for follow-up.

45 Earl Grad Prostate Cancer

Earl Grad, age 72, came in for prostate cancer. His clinical doctor had found a high PSA (prostate cancer marker). He also found a small nodule on the left side of Earl's prostate. Earl has diabetes and high blood pressure. He is on Lopid™ to lower triglyceride; a diuretic, Hytrin™, to lower his blood pressure and Lanoxin™ to strengthen his heart.

He will start on parasite program. Since he could barely sit because of pain, I only took 5 minutes to get him started and let him leave the office. I had to assume the orthophosphotyrosine and Fasciolopsis tests would be YES.

Twenty days later

His blood test with his clinical doctor showed PSA is very high (45). He also has to get up every hour in the night to urinate.

☐ Orthophosphotyrosine (Cancer) NO

His cancer is now gone. He will continue with parasite program. He will start on kidney herbs to cleanse prostate.

☒ Niobium (Toxic Element) YES

Probably polluted pills.

☒ Platinum (Toxic Element) YES

He has full dentures so this is not coming from metal tooth fillings. He will change to wearing a plastic watch.

☒ Tin (Toxic Element) YES

He will switch to salt water to clean his dentures and stop commercial tooth cleaners that have stannous (tin) compounds.

☒ PCB (Toxic Element) YES, high

He will switch off detergent to borax.

BLOOD TEST	Result	Comment
1. FBS	very high (209)	needs to cleanse liver

2. Potassium	very low	take kidney herbs, drink vegetable juice
3. Triglycerides	very high	clean kidneys
4. LDH	very high	heart stress, recent cancer
5. PSA	very high	prostate cancer

Six weeks later

There is no pain in his prostate. He still has frequent urination (3 to 4 times/night, which is much better than before). He has dizziness. He stopped his parasite treatment.

☒ **Acanthocephala (Parasite) YES**

He will continue parasite treatment.

Nine days later

☒ **Heterakis (Parasite) YES**

Stay on parasite treatment.

☐ **Orthophosphotyrosine (Cancer) NO Tin, Platinum (Toxic Elements) YES Prescription drugs (in WBC) YES**

He will try ginseng and stop caffeine to keep down blood pressure.

Two weeks later

He is off all drugs. His blood pressure is 128/76 (normal). He is getting up less at night.

☐ **Toxic Elements (ALL) NO**

He will get ready to clean liver for his diabetes.

Four months later

He feels fine, has good elimination, still urinates 3 to 4 times at night, has sexual function back.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages, Sheep liver fluke and all stages, Pancreatic**

fluke (Parasites) NO

☒ **Ascaris (Parasite) YES**

Probable cause of remaining prostate problem. He has been on maintenance parasite program twice a week. He has a cat. This is probably a source of daily reinfection. He will give his cat the parasite program. He will give himself 5 days of the high dose parasite treatment. He would like an aphrodisiac.

Summary: Earl was at the turning point in his life, from general good health to invalidism. Fortunately, he chose to work on his health instead of settling for a handful of prescription drugs. I encouraged him to follow up his PSA test with his clinical doctor so his clinical doctor wouldn't worry about him. He should tell his clinical doctor what he is doing. He still needs to clear his diabetes. He is strong and healthy again, able to work.

46 Lynn Mercer Cancer Of The Uterus and Colon

Lynn came into the office for menstruation problems; she was experiencing excessive bleeding. Provera™ got it stopped once before but not now. Recently, she has been having severe diarrhea that she thinks is stress related. She will go off caffeine. She is very fatigued.

☒ **mono-Calcium Phosphate, Oxalate (Kidney Stones) YES**

She will start on kidney herbs.

☒ **Orthophosphotyrosine (Cancer) YES at colon, uterus**

She had a polyp removed from the outside of her uterus during her last pregnancy.

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis eggs (Parasite) YES at uterus and in blood**

Start parasite program and postpone kidney herb recipe until later. She has had a colonoscopy in the past, she was diagnosed with spastic colon. Her father had colon cancer. Her child has abdominal pain. **Five weeks later** She has had a normal period.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Echinoporypheum, Pancreatic fluke, Entamoeba histolytica (Parasites) YES**

Continue parasite program.

One month later

She is concerned mainly about her hip and knee pain.

☒ **B strep, Histoplasma, Adenovirus (Pathogens) YES**

☒ **A strep (Pathogen) YES at tooth #17**

Stay on maintenance parasite program. Start on kidney herb recipe. See dentist for cavitation at lower left wisdom tooth.

☒ **Isopropyl Alcohol (Solvent) YES**

Remove from home and everywhere.

☒ **Hexane (Solvent) YES**

Is drinking Folger's™ decaf - off commercial beverages.

Two months later

A cyst was seen on the top of her pelvis on an x-ray given by her clinical doctor.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at colon**

☐ **Fasciolopsis stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒ **Xylene (Solvent) YES**

Off commercial beverages.

Summary: Lynn's period problem of long standing cleared up after taking the kidney herbs and doing the parasite program. What was diagnosed as a spastic colon was actually the beginning of

cancer. Her hip and knee pain were eliminated by cleaning an old tooth cavity. But she allowed herself a cosmetic and got her parasite back. She caught it, though, before it established itself in the liver and avoided getting cancer again.

Six weeks later (5½ months after the first visit)

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES**

  Has cancer back, this time at uterus and not colon - has been eating home fried chicken, using regular shampoo and commercial hair spray.

- ☒ **hCG (Pre-Cancer) YES everywhere in her body**

  She will go on a 5 day high dose parasite program.

- ☒ **Isopropyl Alcohol (Solvent) YES**

  Will make her own hair spray.

- ☒ **Benzene (Solvent) YES**

  Has been using Vaseline products and hand creams.

- ☒ **Cobalt (Toxic Element) YES**

  Off detergent.

- ☒ **Silver, Mercury (Toxic Elements) YES**

  Tooth fillings. Lynn needs all the metal in her mouth replaced with metal-free plastics.

- ☒ **Antimony (Toxic Element) YES**

  She will stop using fragranced household products.

- ☒ **Formaldehyde (Toxic Element) YES**

  Has a new couch and chair - will move them into one room and lock it to see if this clears up the problem.

Second summary: Lynn's body is continuing to drain mercury and silver from her tooth fillings into the old cancer site, the uterus. Hopefully, she will get the dental work done soon.

47 Heidi Mertens Lung Cancer

At a routine x-ray and mammogram, the x-ray showed a —marble size‖ item on the left lung. The radiologist suspected a calcium deposit. The CAT scan showed the lesion was contained, not spreading. Bronchoscopy is scheduled. She is stopping smoking today. She also has a pain at the left lower abdomen.

☒ **Chromate (Toxic Element) YES at lungs and colon**

Off cosmetics.

☒ **Barium (Toxic Element) YES**

Off lipstick.

☒ **Titanium (Toxic Element) YES at colon**

Probably due to cosmetics.

☒ **Tin (Toxic Element) YES at colon**

She will go off toothpaste; start on 17½% food grade hydrogen peroxide to brush.

☒ **Tungsten (Toxic Element) YES**

She is using an electric coffee percolator. She will use nothing coming from electrically heated devices. She is in her friend's home temporarily where there is electrically heated hot water. She will move to another friend's home.

☒ **PVC (Toxic Element) YES at colon**

Her bedroom may have been painted in the last 3 weeks. Also, she used a lot of household cleaners 3 weeks ago. She is away from it now. We will see if PVC goes away.

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Orthophosphotyrosine (Cancer) YES in many organs, not only the lungs**

She will go off all cosmetics. Start parasite program.

Two days later

She jumped the parasite treatment to twice the doses to speed things up; she's feeling fine. She is not smoking. She is using no makeup. She has

moved to a friend's house where they have a heat pump.

☒ **Fasciolopsis (Parasite) YES at liver only**

☐ **PVC, Barium, Tin, Tungsten (Toxic Elements) NO**

☒ **Chromate (Toxic Element) YES at lungs**

She will stop wearing a metal watch and will get plastic glasses (hers were metal rimmed). There is no metal in her mouth. She does not wear a metal bra support.

☒ **Titanium (Toxic Element) YES at lungs and breast**

She is scheduled for a bronchoscopy later today and will take the parasite medicine if not too nauseated after she gets home.

Three days later

She had a bronchoscopy yesterday and will get the results tomorrow. She started thioctic acid (100 mg) this morning, taking 2 every 2 hours. Since her bronchoscopy showed bleeding in the lung, start Ginger capsules, 2 per day.

☒ **Fasciolopsis (Parasite) YES at unknown location, NO at liver**

☐ **Tungsten, PVC, Titanium, Samarium, Chromium (Toxic Elements) NO**

I presume the chromium, samarium, and titanium were in her glasses or cosmetics. She taped up her glasses.

☒ **Orthophosphotyrosine (Cancer) YES at lung only**

Apparently she has gotten rid of all the other cancerous areas. She has not had a cigarette in 75 hours.

Two days later

She has not smoked for 5 days (at 1 PM today). She has made a substitute cosmetic for herself.

☐ **Fasciolopsis (Parasite) NO**

Reduce ginger to 1/day with meal.

☐ **Orthophosphotyrosine (Cancer) NO**

The cancer is stopped. We can expect to see the tumor begin to shrink on the x-ray in three weeks.

Four days later

She has not smoked for 8 days now. She is trying to avoid having surgery. She will try to shrink the tumor.

☒ **Copper, Benzalkonium, Nicorette™ gum (Toxic Elements) YES**

She has picked up 2 new metals. She has started using decaf coffee packs; will go off. She is craving nicotine and needs the nicorette gum; I recommended a patch plus herbs.

☐ **Fasciolopsis (Parasite) NO**

We will increase thioctic to 10/day for 2 days to remove the copper and benzalkonium. Then she will go back to 4/day. Start on mullein and lung herbs (she is on comfrey already).

Three days later

She has not smoked for 12 days (as of 1 PM today).

☒ **Copper (Toxic Element) YES at lungs, kidney, colon**

☒ **Toxoplasma (Parasite) YES at lungs, kidney, and colon**

Copper and Toxoplasma in the lungs and colon will prevent tumors from shrinking.

Ten days later

☒ **PCB (Toxic Element) YES at lungs**

☐ **Copper (Toxic Element) NO**

Stopped coffee. She must stop PCB's immediately since this makes cysts in her body. Probably from detergent. Will switch to borax.

Eight days later

☐ **PCB (Toxic Element) NO**

She has had about 6 cigarettes in the last week. She will check into the nicotine patch.

Summary: Heidi made an excellent beginning but her craving for nicotine overwhelmed her. She took up smoking again and returned to the clinical methods for dealing with tumors; she is now unable to drive a car and is a permanent invalid.

48 Jane Stepenuck Lymphoma

Jane and her husband, Scott, are missionaries. They had to return from the Far East because of her cancer. She first got lymphoma two years ago, lumps were removed from her left shoulder and left cheek. She finished all her treatments a year later and returned to her missionary work. Half a year after that, a sudden severe pain in her lower back occurred in the night. The clinical doctor said it was a collapsed vertebra due to radiation or chemo. Pain continued. She came home to the USA since she couldn't work. A new lump is growing under the jaw. She decided to try some health routines, cutting out a lot of poor foods, starting on Echinacea, vitamin E, and various cleansing routines. She has not gone back to the clinical doctor.

☒ **Fasciolopsis, and eggs, miracidia, cercaria (Parasite) YES at liver**

☒ **Sheep liver fluke redia, miracidia (Parasite) YES at liver**

☒ **Echinococcus multilocularis, Strongyloides, Ancylostoma d., Trichinella, Ascaris, Dipylidium can, Taenia pis, Onchocerca, Dipetalonema, Endolimax, Fischoedrius (Parasites) YES**

Note large number of serious parasites. Start on parasite program.

☒ **Oxalate (Kidney Stones) YES**

Probable cause of lower back pain - start on kidney herbs.

Five days later

☐ **Oxalate (Kidney Stone) NO**

Lower back much better.

☒ **Chromate (Toxic Element) YES**

Hair spray?

☒ **Antimony (Toxic Element) YES**

Cosmetics.

☒ **Neodymium (Toxic Element) YES**

Probably a pill.

☒ **Germanium, Thallium (Toxic Elements) YES**

When germanium and thallium are seen together, it is coming from tooth fillings. Thallium, more toxic than arsenic or lead, is used as an alloy of mercury to make outdoor thermometers for use in the Arctic or Antarctica. Could the mercury being shipped to the dentist sometimes be contaminated with thallium? Is the same company that ships mercury to dentists also making the thallium/mercury alloy for thermometers? Thallium affects the legs first, climbing higher to reach the lower back and then makes it difficult to walk. 90% of the wheelchair cases seen in this office are actually full of thallium. Thallium was used as a rat poison until it was banned! It is simply too toxic to set out as poison! Yet it has found its way into some people's mouths! She will see a dentist to remove all mercury fillings and save the drillings for me to analyze for thallium.

☒ **PVC (Toxic Element) YES**

They had new carpeting installed plus linoleum in the kitchen (glued down). We will test the house air for PVC.

☒ **Cadmium (Toxic Element) YES, high**

Will test hot and cold water.

Eight days later

Slight nausea returned this morning but is now gone. She feels much better. Back pain OK.

☐ **Antimony (Toxic Element) NO**

☒ **Chromate, Neodymium, Cadmium (Toxic Elements) YES**

☒ **Cadmium (Toxic Element) YES in kitchen cold, kitchen hot, and distilled water**

They have their own distiller.

☒ **PVC (Toxic Element) YES, and in bedroom air, kitchen air**

☒ **Twin Labs Multi Mineral Caps™, Solgar™ Rose Hips Vitamin C (Undetermined Elements) YES**

There is something toxic in them. Go off.

☒ **Neodymium (Toxic Element) YES in Provera™**

She will go off all supplements and pills. She will switch to borax from detergents. She will drink store bought spring water and rotate brands even though they may be polluted too. They will change water pipes to plastic for kitchen and bathroom. It is a very old house and they are living in it cheaply. Their income is low. The kitchen and bedroom are the rooms where carpet and linoleum were installed. They will keep fan on and window open to blow out the PVC. She is breaking out in a rash on the thigh. They cannot afford to come back; we will do remainder gratis.

One week later

☐ **Fasciolopsis (Parasite) NO at liver**

☒ **Fasciolopsis eggs (Parasite) YES at blood only**

☒ **Fasciolopsis cercaria (Parasite) YES**

She is nearly rid of her parasites. I did not do cancer test so she will not stop coming. (If I found the cancer to be gone, she might stop coming.)

☒ **Chromate, Cadmium, PVC (Toxic Element) YES all very high**

☐ **Germanium, Thallium (Toxic Element) NO**

Her own dentist removed the mercury fillings; she brought me the drillings. Her thallium is gone. She appears healthier. Her leg rash is better.

One week later

Her leg rash is worse. Probably PCB. She will switch dish soap to borax, too. Her energy is good now.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Chromate (Toxic Element) YES**

She will go off hair spray.

☒ **PVC (Toxic Element) YES**

They are trying to get their carpets changed. She will stay on maintenance parasite program. She is to eat butter (3 pats a day), not margarine.

Summary: We saw no more of her after this last happy visit, when she heard the cancer was gone. I had tested her husband for intestinal fluke earlier, and he was rid of it, too, by the last visit. They are a happy couple. There were no lumps anywhere, she was free of pain, and she had enough energy to bring up the idea of going back to Taiwan. Her husband deserves a medal for all the work he did to get Jane well.

49 Charlene Neely Breast Cancer

This 50-year-old woman reported that her main problems are: fibrocystic breast disease; lower back pain; headaches; bloating (she's on Lasix™ for this); sinus problems (she's on Actifed™ for this); pain over liver at right side.

☒ **Orthophosphotyrosine (Cancer) YES at breast**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

Gets loose bowels after eating.

☒ **Fasciolopsis miracidia (Parasite) YES at liver, breast, cervix, blood, and colon**

☒ **Fasciolopsis cercaria (Parasite) YES**

Her mother died of liver cancer.

☒ **Isopropyl Alcohol (Solvent) YES at liver, breast, cervix, and colon; NO at blood**

She will go off cosmetics with —PROP‖ on the label. Start on parasite program.

One month later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at breast only**

☒ **Sheep liver fluke eggs (Parasite) YES**

She has been eating hamburger. She will eat only overcooked meat, done only at home. Start on 5-day high dose parasite program, then maintenance.

☒ **Isopropyl Alcohol (Solvent) YES**

She will go off commercial shampoo and hair spray.

☒ **Aluminum (Toxic Element) YES**

Off deodorant.

☒ **Copper (Toxic Element) YES**

Replace metal tooth fillings.

☒ **Formaldehyde (Toxic Element) YES**

Sleeps on foam pillow - will change to Dacron or cotton.

Three weeks later

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke redia, eggs (Parasite) YES**

☒ **Pancreatic fluke (Parasite) YES**

She is still eating hamburgers but will stop. Will order only fish and seafood in restaurants. She will start a 5-day high dose parasite program again.

☒ **Isopropyl Alcohol (Solvent) YES**

Will switch to homemade hair spray this time.

☒ **TCE, Benzene, Xylene, Hexane, TC-Ethylene, Methyl Ethyl Ketone (Solvents) YES**

She is eating ice cream and drinking carbonated beverages. She will make her own.

☐ **Formaldehyde (Toxic Element) NO**

Changed her pillow.

One month later

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☒ **Sheep liver fluke and miracidia (Parasite) YES**

  Probable cause of liver pain.

- ☐ **Pancreatic fluke and stages (Parasite) NO**
- ☒ **Acetone, TCE (Solvent) YES**

  Drinking tea - will stop commercial beverages.

- ☒ **Oxalate, Uric Acid, Cysteine, Phosphate (Kidney Stones) YES**

  Start on kidney herbs.

Summary: The cancer news must have surprised her since she came in only for fibrocystic disease. But she started her program eagerly. The hardest change for her was changing her hamburger and pop habit. She had 4 kinds of kidney stones causing her low back pain. But she wants to improve and is making progress.

One month later (4 months after the first visit)

She still has pain over the gallbladder region. She still has soreness in her breasts. Her lower back pain is gone, but she will continue on kidney herbs.

- ☐ **Protein 24 (HIV) NO**
- ☐ **hCG, Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☐ **Sheep liver fluke and all stages (Parasite) NO**
- ☐ **Pancreatic fluke and stages (Parasite) NO**
- ☐ **Human liver fluke and stages (Parasite) NO**

  She is staying on parasite maintenance program.

- ☒ **Methylene, Carbon Tetrachloride (Solvents) YES**

She is drinking Nestea™ and using Sweet N' Lo™; she will stop. Our next goal is to cleanse the liver to clear the gallstones.

50 Andrew Elmer Lung Cancer

Andrew Elmer is a 58 year old man who, just this week, finished lung cancer therapy - both chemotherapy and radiation. Lung cancer was diagnosed several months ago, and they first operated on the right lung, removing the top lobe. Then he noticed he was spitting up blood. They went down and found cancer in the bottom of the left lung. But his lump was inoperable. So therapy was started. He had 34 radiation treatments and 5 chemotherapy treatments (originally scheduled to have 6). He is experiencing fatigue with exertion, and his energy has not returned yet from the last —blast.‖ He was on Cisplaten™ and VP (Carboplatin™) also. He is a recovering alcoholic of 20 years. He quit smoking about 4 years ago when he had two angioplasties. He is presently on drugs for his heart: Cardizem™, Delatrate™, Coumadin™ and Mevacor™ for blockage. He has no appetite and needs to gain weight.

☒ **Fischoedrius, Dientameoba (Parasites) YES**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis eggs (Parasite) YES at blood and lungs**

☒ **Prosthogonimus eggs, Hypodereum, Paragonimus, Plasmodium vivax (Parasites) YES at lungs**

☒ **Sarcocystis (Parasite) YES at muscle**

Remaining 70 parasites were *Negative*

☒ **Orthophosphotyrosine (Cancer) YES**

He will start on a *Parasite-Killing Program*, using an aqueous Black Walnut Hull tincture to avoid the alcohol. We are out of Wormwood presently, so he will do without.

He is getting freshly made carrot juice with celery, ginger root and other vegetables, and 1 apple and sometimes beet or cabbage. He is also eating Meritene™ and Carnation Instant Breakfast™ and papaya. He got some blood tests done yesterday. He did not seem enthusiastic and asked how many times he would have to come back. I said —six,‖ and he looked dismayed. I tried to encourage him. His wife seemed more receptive, and she took all the notes during the visit.

Six days later

He has followed the parasite program.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis adults, miracidia, redia, eggs, cercaria, Fischeodrius, Dientameoba, Prosthogonimus, Hypodereum (Parasites) NO**

☒ **Sarcocystis (Parasite) YES**

All parasites were NO except Sarcocystis. We will add Quassia to the program since our Wormwood is not in yet.

☒ **Calcium Phosphate, all types (Kidney Stones) YES**

This is the probable cause of deposits in heart blood vessels for which he needed angioplasties. He needs to decrease phosphate (reduce meats, grains, eggs, and cheese). He needs to increase his mineral consumption by consuming the following: whole milk to 3+ glasses a day; magnesium (300 mg) 2/day; zinc (50 mg Bronson's) 1/day; manganese (50 mg) 1/day for one bottle only; increase fruits and vegetables.

Start on kidney herb recipe. Stop using aluminum pots and use of aluminum.

For sweetening use: glycerin (pure vegetable); Stevia powder; honey (3 kinds), pure maple syrup, molasses, sorghum. He has been using Sweet-n-Low™ and other chemical sugars. He is to throw it all out. He is a big meat-eater. He will have 4 cans of sardines per week, seafood and salmon for two days, and one vegetarian day per week. He brought two recent blood tests with him:

BLOOD TEST	Result	Comment
1. Chloride	slightly high (107)	adrenal
2. Platelet count	very high (402, 417)	parasites
3. RBC	very low (3.4, 3.5)	parasites
4. WBC	low (4.6, 4.7)	toxin in bone marrow
5. Lymphs	low (12, 14%)	toxin in bone marrow
6. Monocytes	high	due to illness
7. Calcium	very low	needs more milk, fruit, vegetables to offset phosphate
8. FBS	slightly high	probably due to a non fasting state at test time
9. BUN and Creatinine	slightly high	kidney
10. Total protein	very low	liver problem
11. LDH	slightly low	muscle fatigue

12. SGOT low needs 1/day Vit. B6 [500 mg] from Bronson

Also needs B-50 complex, 2/day; vitamin C (1000-3000 mg/day); vitamin E (100 mg/day, all before meals); beta carotene (25,000 mg, 2/day).

Seven days later

Energy is better. Appetite still poor. No weight gain yet. For breakfast he should eat cooked cereal (buy salt-free variety and add own salt - aluminum-free salt) with cream and sweeteners. Add Vitamin. D (50,000 - 1/day) for three weeks, then move to 2/week; get Rx from dentist. Still has shortness of breath but is playing golf now.

☐ **Sarcocystis (Parasite) NO One month later**

We have received his hospital records but not x-rays yet. Appetite better. Energy better. Low back pain gone. Breathing unchanged. Add comfrey to kidney herb recipe. Add fresh garlic to diet (1 clove/day), both are for lungs.

☐ **Kidney Stones (ALL) NO**

☒ **Neodymium (Toxic Element) YES**

Possibly a pill.

☒ **Radon (Toxic Element) YES**

Will test air at home and at office.

Two weeks later

He has gone back to work at his office.

☐ **Neodymium (Toxic Element) NO**

Changed brands of medicine.

☒ **Radon (Toxic Element) YES, high**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

His voice is very weak. This problem is probably due to radon. Home air

sample shows it is NO (*Negative*). Office air is YES (*Positive*). He will move his office to other end of hall.

One month later

No improvement in breathing capacity. He has gained 2 lbs. He wants to go off garlic and comfrey. Pathogen test showed *Clostridium* botulinum in lungs and in 2 teeth (teeth #10 and #28). He needs to see the dentist.

One month later (3 months and 2 weeks since first visit)

Teeth numbers 10 and 28 were extracted. His breathing is better, and his voice is stronger. No weight gain. He is on penicillin from his dental work. He is on parasite maintenance program. He feels fine and is back to work. His appetite is better. He is very happy to be off garlic and comfrey. He needs to start on 07 and peroxy to prepare for liver cleanse.

Summary: This was an exemplary couple; they wasted no time in carrying out every instruction. We heard from them recently; they wanted to tell all their friends and especially their clinical doctor about this treatment program. My attorney advised against this, so we asked them not to. Note that Quassia is a rather good parasiticide. At the end he began to prepare for a liver cleanse.

During the following year

He looks rather well; has gained weight. He has not yet done a liver cleanse. He has had all the metal removed from his mouth. Andrew went to the hospital for clogged arteries. X-ray and CT scan showed no trace of cancer in lungs or anywhere, according to his wife. Doctors are surprised.

51 Edward Steinman Prostate Cancer

Edward Steinman is a 64-year-old man who has beginning diabetes. He is not on medication for it. He states his main problem is his eyes. He also has a respiratory problem, pain in the upper arm, aching hands, and lower back pain. Possible neuropathy in left leg. Numbness of 2 middle toes. History of scrotal problem and skin cancer (a new spot is forming). History of prostate problem. Frequent urination. Family members died of diabetes and cancer. His aunt died of cancer. His father had colon cancer and Parkinson's disease. He has osteoarthritis in his neck.

☒ **Oxalate and others (Kidney Stones) YES very high**

Start on kidney stone removal with herb recipe.

One week later

He has not started on kidney herbs yet.

BLOOD TEST	Result	Comment
1. Urinalysis	very good	probably due to recent antibiotics
2. WBC	very low	bone marrow toxin
3. RBC	slightly low	minor bleeding, needs to follow up with CBC in March/April 1992. He has had polyps removed in the past.
4. Platelet count	low	possibly due to bone marrow problem
5. CO2	slightly high	toxin in air
6. BUN	slightly elevated and Creatinine is high	kidney
7. Total protein	slightly low	liver problem
8. LDH	slightly high	liver or heart, possibly due to pain syndrome, muscle cramps at night, or cancer
9. Iron	high	

Three week later

☒ **Uric Acid (Kidney Stone) YES**

Had not obtained black cherry concentrate for kidney herb recipe.

☒ **Antimony, Palladium, Rhenium (Toxic Elements) YES at bone marrow, lung, prostate**

☐ **Toxic Elements (Remainder) NO**

He will stop using Vaseline products and Vicks™. He needs metal tooth fillings out.

Two week later

- ☐ **Kidney Stones (ALL) NO**
- ☒ **Antimony (Toxic Element) YES**

  Stop after-shave

- ☒ **Thulium (Toxic Element) YES at prostate and stomach**

  Go off her brand of vitamin C.

- ☒ **Cat liver fluke, Ascaris (Parasites) YES**
- ☒ **Fasciolopsis (Parasite) YES at liver and colon**

  Must check for cancer. Start parasite program. He will stop hand lotion (has antimony) and use ours.

- ☒ **Orthophosphotyrosine (Cancer) YES at prostate**

Two months later

- ☐ **Fasciolopsis (Parasite) NO**

  Onto maintenance parasite program, 2 times/week.

- ☐ **Thulium, Palladium, Rhenium (Toxic Elements) YES at bone marrow and prostate**

  Palladium and rhenium possibly in gold crowns. He did not get crowns replaced. He will go off his vitamin C and switch to Bronson's brand.

Five weeks later

- ☒ **Loa Loa, Strongyloides, Chilomastix, Trichinella (Parasites) YES**
- ☒ **Fasciolopsis cercaria (Parasite) YES**
- ☐ **Antimony, Thulium (Toxic Elements) NO**

  Will stay on parasite maintenance program.

One weeks later

He had a medical check-up 2 weeks ago. Dermatologist says he is OK, doesn't have skin cancer.

☒ **Calcium Phosphate (Kidney Stone) YES**

Increase milk consumption. Take vitamin. D (1000 u, 3/day). Decrease phosphate (breads, meat).

☒ **Asbestos (Toxic Element) YES, high**

Will test house air and water.

☒ **Sheep liver fluke, Pancreatic fluke (Parasites) YES**

He is eating rare-cooked beef, but will stop. He will eat only fish and seafood in restaurants. He is still using commercial shaving products with propanol. He will switch to an electric shaver.

One month later

☒ **Fasciolopsis (Parasite) YES at one side of liver**

☒ **Fasciolopsis eggs (Parasite) YES at blood and prostate**

☐ **Orthophosphotyrosine (Cancer) NO**

Note: He is just beginning to develop adult flukes in the liver but O.P.T. (cancer test) is not yet Positive. He will stay on parasite program and not eat beef.

☒ **Silver, Uranium, Palladium, Platinum (Toxic Elements) YES**

Needs crowns out.

Five weeks later (six months one week after first visit)

☐ **Fasciolopsis and all stages (Parasite) NO**

He is strictly on maintenance parasite program.

Summary: Edward took many risks and one could say that he had poor compliance, but due to his wife's persistence, he returned many times, making a little progress each time. After his pains were gone and his clinical doctor said he was free of skin cancer, he lost interest in improving his health. Hopefully, his wife is keeping a watch over his shampoo and shaving products to avoid propanol.

She can do nothing about his eating habits in restaurants. Edward is one of the rare cases where the fluke adult is already present in the liver, and yet there is no cancer marker, orthophosphotyrosine, being produced. Perhaps an additional stage, besides eggs, is necessary, since reproduction is the parasites' objective.

52 Loreen Pennell Lymphoma

This 60-year-old woman reported 3 main problems: 1) She had cancer (lymphoma) 3½ years ago. Recently, she developed a lump in the neck at her left lymph node. She had 12 chemotherapies. The lump was removed and tested *POSITIVE* to lymphoma. Her last test three months ago appeared normal. She had a CAT scan yesterday. 2) She has a sleep problem. 3) She has had arthritis in her right hip for 1 to 2 years.

☒ **Orthophosphotyrosine (Cancer) YES**

☐ **Protein 24 (HIV) NO**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis miracidia (Parasite) YES at liver and colon**

Start on parasite program.

BLOOD TEST recent one she brought with her	**Result**	**Comment**
1. RBC	very low (3.95)	parasites
2. Platelet count	very low (109)	bone marrow
3. WBC	low (4.4)	bone marrow
4. Urinalysis	shows urobilinogen	liver
5. FBS	slightly high (107)	needs to clean liver
6. Iron	very low	parasites
7. Cholesterol	very low	cancer risk, clean liver

Summary: Loreen has not returned. We can see that the cancer was not gone as she had hoped after her clinical therapy. The adult fluke was alive in her liver. The solvent test was not recorded, but I generally discuss propanol at the first visit. Hopefully, she has removed all propanol-containing body products from her life-style and has taken the parasite program.

53 Kirk Gunderson Colon Cancer

He reported that his main problems were: 1) Colostomy for colon cancer in mid-70s. 2) Two years later he went to Tijuana, Mexico for bladder cancer. They took the cancer off the bladder wall with a laser. He then had laetrile treatment. Since then several more have been removed at local hospital. 3) Minor sleep problem due to getting up 5 to 6 times a night. His clinical doctor said that within 3 months they would need to remove a testicle. Prostate test showed bad pathology. He has lost about 10 lbs in 3 months, and now weights 140.

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES**

Note: No fluke stages anywhere; only adults. Start parasite program.

☐ **Kidney Stones (ALL) NO**

Note: He has no kidney crystals! He says he has always drunk 2 quarts water/day! I cut short his testing since he was in the office under pressure of his family, not willingly.

Four days later

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Mercury (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

Continue parasite program. Get all metal fillings replaced with plastic. Start on thioctic, 4/day.

One week later

He has a very sore seat, he can hardly sit. He seems very sick.

☐ **Mercury (Toxic Element) NO**

He has not done any dental work! He said he went to a kinesiologist who did a special routine and said it would get rid of his mercury without dental work.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Borellia (Pathogen) YES at prostate, lungs, penis and teeth**

☒ **Clostridium (Pathogen) YES at lungs and teeth**

Recommend cavitation cleaning by dentist.

☒ **Diplococcus (Pathogen) YES high at teeth**

☒ **Histomonas, Mycobacterium (Pathogens) YES**

☒ **Salmonella (Pathogen) YES at penis**

Needs dental work.

☐ **Pathogens (Remainder) NOs**

Six weeks later

He has had both testicles removed by surgery. He looks terminally ill. His family has arrived. Family members are pushing him in different directions.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Strep pneumonia (Pathogen) YES and very high throughout his body**

He was in the hospital for dehydration. He did not get his mercury-filled teeth out. He now is septic with bacteria throughout his body. He still resists getting his teeth pulled in spite of his terminal condition. He raised the issue of cost. Due to the systemic infection, the remaining bacteria and virus were not tested. Possibly no dentist would take him in this condition. Note: he will die of sepsis, not cancer.

Another 4½ months later (6½ months after first visit)

His family reported that he is well and active, doing the farm work with horses, as before his illness.

Summary: Mr. Gunderson has surprised me with his survival. I had given up hope. If the family found a health practitioner using a special method, I will try to find out. He is staying on a maintenance parasite program, according to his family.

54 Dan Johnson Leukemia (AML)

Dan Johnson is a thin young man, age 37, with a sallow complexion and hair loss from chemotherapy. He has had leukemia for 8 years. His clinical doctors told him this would be his last remission, and it would only last 4 months. His first remission lasted 4 years and 2 months. Last year he got a hard dose of chemo; they also took out his gallbladder. He got candidacies in the liver, spleen, and kidneys. He has been on Diflucain™ (400 mg/day) since then. He still has a temperature of 101-102 nightly. In the hospital it was called "fever of unknown origin." The present remission began two months ago.

☒ **Fasciolopsis (Parasite) YES at liver, intestine**

☒ **Fasciolopsis redia (Parasite) YES at intestine, testicles**

☒ Orthophosphotyrosine (Cancer) YES at testicles and bone marrow

He was started on the Parasite-Killing Program.

BLOOD TEST	Result	Comment
1. FBS	very high	due to chemotherapy
2. Phosphates	high	dissolving bone. Change diet: reduce phosphate (grains, animal food, carbonated beverages - increase milk (2%) and fruits and vegetables)
3. Uric acid	very high (8.1 mg/dl)	kidney problem
4. Alk. phos	very high (368)	bone disease and cancer
5. WBC	low	bone marrow toxin
6. Lymphs	very low (15%)	toxin in bone marrow
7. Blasts	high (4%)	typical of leukemia

Summary: Dan seemed quite enthusiastic but never returned. We have not heard about him since this first visit. He could have corrected his problems by changing the products he used in daily life. I hope we will hear from him eventually.

55 Joel Neal Prostate Cancer

This 71 year old man reported that his main problems were: cataract developing in the right eye (he already has a lens replacement in his left eye); ear pain close in behind his right ear; shoulder pain and bursitis in shoulder; minor pain under rib cage on both sides; gastritis (he is on medication for it); spastic colon; lower back pain; migraines; recent UTI; prostate enlarged. He is on numerous medications. He will start on digestive enzymes from Bronson's Pharm. and charcoal capsules.

☒ Uric Acid (Kidney Stone) YES

Start on kidney herb recipe.

☒ Orthophosphotyrosine (Cancer) YES at prostate

☒ Fasciolopsis (Parasite) YES at liver and colon

☒Fasciolopsis miracidia (Parasite) YES at prostate, colon, blood. Other stages NO

Due to presence of cancer, he was started on parasite program instead of kidney herbs.

Seven days later

He has had some spells of dizziness.

- ☐ **Orthophosphotyrosine (Cancer) NO**

  Cancer is gone.

- ☐ **Fasciolopsis and all stages (Parasite) NO**

  Continue parasite program.

- ☒ **Cobalt, Zirconium (Toxic Elements) YES at prostate**

  He will go off denture cleaner (Efferdent™) and use grain alcohol (50%).

- ☒ **Strontium (Toxic Element) YES at prostate**

  Efferdent™? water softener? doesn't use toothpaste. Start kidney herbs.

Eight days later

- ☐ **Cobalt, Zirconium, Strontium (Toxic Elements) NO**
- ☒ **Calcium Phosphate (Kidney Stone) YES**

  Continue kidney herbs, correct diet.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **Chilomastix, Taenia pisiformis (Parasites) YES**

  Daughter also has Taenia pisiformis.

- ☒ **Dog heartworm (Parasite) YES at heart**

  Pain over top of heart occasionally.

- ☒ **Strongyloides (Parasite) YES**

  Cause of migraines.

- ☒**Schistosoma mansoni (Parasite) YES**

  Continue on parasite program. (had gone off for a while).

One week later

He shows a drop in body current, hard to get my measurements. PCB?

☐ **Zirconium, Strontium (Toxic Elements) NO**

☒ **Cobalt, PCB (Toxic Elements) YES**

Off detergent.

☒ **Coxsackie B #4, Haemophilus inf (Pathogens) YES at 2 teeth, remainder were NO**

Needs cavitations cleaned, see dentist.

BLOOD TEST done 2 months previously	**Result**	**Comment**
1. PSA	high (16)	cancer marker for prostate
2. Creatinine	slightly high	kidney
3. Calcium	low (9.0)	Drink 2% milk - 3 glasses/day; take Magnesium 300 mg 1/day.
4. Triglycerides	high (198)	kidney. Take Vit. D (50,000 2 times per week.
5. SGPT	slightly high	needs liver cleanse
6. FBS	slightly high (116)	prediabetic - clean liver
7. Potassium	very low (3.6)	adrenal problem, clean kidney
8. WBC	high (9.3)	infection somewhere
9. Platelet count	very high (513)	had cancer at the time
10. Lymphs	very low (17.6)	toxin in bone marrow

Take vitamin C - 1000 mg each meal, from Bronson's Pharm only. Try going off Bentyl™ and muscle relaxant. Still having dizziness and mid-abdomen pain.

Three weeks later

He is working at the office again and around the house. Energy is up, big improvement. Disposition is better according to his wife.

Eight weeks later

He is feeling quite well. He had cavitations cleaned on left side (7 or 8 teeth). He will get Vitamin D from dentist (50,000 units 2/week).

Bone healing program:

1. Milk - 3 glasses/day, 2%

2. Magnesium oxide - 300 mg 2/day

3. Zinc - 60 mg once a day for 100 days from Bronson's Pharm.

4. Vitamin D - 50,000 2/week

Three months later

Prostate is fine, urination is fine. Still has occasional pain across chest (needs to clean liver). He still has daily headache (uses pain killer).

☒ **Dog heartworm (Parasite) YES**

Go back on high dose parasite program followed by maintenance.

Summary: Joel became a well, productive person in the course of a few months by working at cleaning his kidneys, killing parasites and changing his daily habits. Notice how dog heartworm easily comes back; it takes about ½ year on maintenance program to completely kill it. He was a very happy man at his last visit and was preparing for a liver cleanse.

56 Deanna Kaiser Colon Cancer

Deanna, age 40, came in for pain in her right leg, thigh, and foot. Hot flushes disturb her sleep. She has very low energy in the afternoon. Two years ago she had a lump removed from her left breast; she found it herself; it was cancerous. Her menstrual periods stopped after chemotherapy for this cancer.

BLOOD TEST	Result	Comment
1. Uric acid	high (6.7)	clean kidneys
2. Phosphates	high (4.4)	dissolving bone. Change diet: decrease phosphates in diet (decrease meats, grains, carbonated drinks). Increase calcium, magnesium, potassium (increase milk, fruits and vegetables). She is intolerant of milk. Will use a tablet until she is tolerant. Oyster shell calcium 2/day. Magnesium oxide 300 mg, 1/day.
3. LDH	slightly high	check for cancer
4. Iron	low	parasites
5. Triglycerides	high (151)	clean kidneys
6. Urinalysis	shows low level infection	clean kidneys

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis redia (Parasite) YES at blood**

☒ **all phosphates, Cystine (Kidney Stones) YES**

Start on kidney herbs and start parasite program.

One month later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at blood and colon**

☒ **Fasciolopsis miracidia (Parasite) YES at breast and blood**

Notice that she still has some fluke stages, although no adults remain. She used grocery store ground Cloves instead of ours to save money, but they were not as effective. She will switch to fresh ground Cloves and add quassia *(see Recipes)*.

☒ **Arsenic (Toxic Element) YES at breast**

Will test home air.

Three weeks later

☐ **Kidney Stones (ALL) NO**

Do kidney cleanse twice a year.

☐ **Orthophosphotyrosine (Cancer) NO**

She is concerned about pains persisting.

☒ **Nickel (Toxic Element) YES at breast**

She has had tooth problems recently. This is probable cause of pains at hip, leg, and foot. She needs to replace all metals in her mouth.

☒ **Thulium (Toxic Element) YES**

Will not use vitamin C except from Bronson's.

☒ **Campylobacter, Salmonella (Pathogens) YES**

☒ **Besnoitia at tooth #12, Anaplasma at tooth #31, Diplococcus diph. at tooth #12 (Pathogens) YES**

She will reduce Nickel intake, cook and eat with non-metal ware. Mouth program:

1. Baking soda from box (dissolve in water) to brush teeth.

2. Potassium iodide (white iodine) drops on toothbrush from dentist. Brush at bedtime. Use no toothpaste, nor peroxide (it reacts with metal).

Mouthwash: flush mouth with water at the faucet after each meal. Floss once a day, before brushing, with Osco Unwaxed Floss™.

Two months later

☐ **Fasciolopsis and all stages (Parasite) NO**

Parasite maintenance twice a week.

☐ **Arsenic (Toxic Element) NO**

Removed pesticide from house.

☒ **Nickel (Toxic Element) YES**

Has not done dental work.

☒ **Thulium (Toxic Element) YES**

Stopped vitamin C so source is probably a different supplement.

☒ **Wood Alcohol (Solvent) YES**

Off commercial beverages.

☒ **Isopropyl Alcohol (Solvent) YES**

Will eliminate it.

☒ **Influenza (Pathogen) YES**

Use homeopathic Oscillococcinum.

☒ **Borellia, Strep pneu, Coryne dip, Clostridium tet, Bacill anth, Clost sept, Clost bot (Pathogens) YES at teeth**

Needs to do dental work.

Summary: Deanna got rid of the problems she came in for and her cancer, too, in 3 visits, but she is choosing the unwise path. The bacteria under her metal teeth will continue to infect her body and let others grow as well. Hopefully, she will get the metal out soon. Notice how the breast was next in line for the cancer and how the breast had been accumulating arsenic and nickel. Toxic substances from the top of the body are collected by lymph nodes and passed into the breast for storage when there is too much for the kidneys to eliminate.

57 Sherry Wu Cervical Cancer

Sherry had a hysterectomy for endometrial cancer in 1965. A year ago her PAP test came back with suspicious results. She had pain from her left hip down her left leg. She had a hip replacement a few years ago, but her clinical doctor said this was not the cause of her pain. She also saw the dentist, Dr. J., who found no problem with her dentures.

BLOOD TEST	Result	Comment
1. WBC	low (4.9)	bone marrow toxin
2. Seg/lymph	low	chronic virus
3. Eos	high (5%)	parasites
4. Phosphates	high	dissolving bones She will drink 3 glasses of 2% milk and take Magnesium oxide (300 mg) one a day. She will reduce phosphate foods and increase fruit and vegetables. She will get Vitamin D, (50,000 u) from Dr. J. and take 3/week.
5. LDH	slightly high	cancer
6. Cholesterol	low	cancer risk. She will use butter, not margarine, and olive oil for cooking.

- ☒ **Orthophosphotyrosine (Cancer) YES at cervix**
- ☒ **Fasciolopsis (Parasite) YES at liver**
- ☒ **Fasciolopsis redia (Parasite) YES at liver**
- ☒ **Acetone (Solvent) YES**
- ☒ **Isopropyl Alcohol (Solvent) YES**
- ☐ **Protein 24 (HIV) NO**

Start on parasite program. She will search for "PROP" on labels and eliminate these items. She does not use carbonated beverages. She will have a follow-up PAP by her clinical doctor next week.

Summary: Sherry is a very active person; it would break her heart to be forced to stop her gymnastics class. This is what drove her 2000 miles to see us for a mere pain in the leg. But it turned out to be cancer. Since she is an old client who had seen us over the years for any major problem, I do not doubt she carried out our instructions precisely. She has probably saved herself surgery, and without any interruption of her gymnastics class.

58 Maria Perez Skin Cancer

This 44-year-old woman reported that her main problems are: 1) A lesion on her right lower leg which appeared about a year ago. It has been surgically removed but has returned. It tested *Negative* to cancer, but it isn't healing. It heals temporarily if cortisones are used on it. 2) Six months ago a small "cyst" was removed from her lip, diagnosed cancerous. (At the time, she had recently switched to a new lipstick.)

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at skin and colon**
- ☒ **Fasciolopsis (Parasite) YES at colon and liver**
- ☒ **Fasciolopsis miracidia (Parasite) YES at blood, liver, skin**
- ☐ **Sheep liver fluke (Parasite) NO**
- ☒ **Isopropyl Alcohol (Solvent) YES at liver and skin**

Start on parasite program.

Sixteen days later

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☒ **Sheep liver fluke cercaria (Parasite) YES**

Ate filet mignon yesterday.

- ☒ **Pancreatic fluke (Parasite) YES**
- ☒ **Isopropyl Alcohol (Solvent) YES**

Will stop using her regular cosmetics.

- ☒ **Wood Alcohol, Hexanedione, TCEthylene, Toluene (Solvents) YES**

She was told to go off all commercial beverages except fresh orange juice made in the store. She is to drink milk (2%), water, herb tea (not Celestial

Seasoning™), homemade vegetable juice, and fruit juice only. Start on kidney herb recipe.

Summary: Maria got rid of her cancer in 16 days when the intestinal fluke was gone. But she still had other flukes that were multiplying in her, due to a variety of solvents accumulated in her body. Hopefully she will try to eliminate them.

59 Gladys Jackson Cervical and Breast Cancer

Gladys is a young, vivacious person, only 39, complaining of chronic fatigue. Her arms and legs are especially weak. She was diagnosed with tendonitis and CMV virus a year ago. She also has a complexion problem (not significant to my mind), breathing problem, and insomnia. She has thumb pain and frequent urination.

BLOOD TEST	Result	Comment
1. Calcium	very low (8.7)	She will drink 2% milk, 3 glasses/day and take Magnesium oxide from Bronson Pharm. (300 mg), 1/day and a Vitamin A and D perle, any size, one/day.
2. SGOT, SGPT	very low (14, 11) showing low serum B6 levels	She will take B6 (250 mg) from Bronson's, two/day.
3. LDH	high (182)	We will test for cancer.

☒ **Orthophosphotyrosine (Cancer) YES at breast, genital tract**

This came as a bad surprise. She had just had a mammogram and it was *NEGATIVE*. We explained that it was probably very early, too small for the mammogram to detect.

☒**Fasciolopsis (Parasite) YES at liver, NO at colon**

☒**Fasciolopsis redia (Parasite) YES at genital tract and breast**

Start on parasite program.

Nine days later

☐**Orthophosphotyrosine (Cancer) NO**

☐**Fasciolopsis and all stages (Parasite) NO**

With the cancer out of the way we can pursue the problems she came in for but with priority given to toxic elements due to their cancer connection.

☒**Cadmium (Toxic Element) YES**

Probably her plumbing, we will check water.

☒Gallium, Nickel (Toxic Elements) YES

Tooth fillings.

☒Thorium (Toxic Element) YES

Reduce dust in the house, repair cracks, open crawl space vents regardless of fuel cost.

☒Silver (Toxic Element) YES

Metal teeth. She needs to replace all metal in her mouth.

☒Oxalate (Kidney Stones) YES, remainder NO

Since oxalate is the main pain-causing kidney stone, Gladys should get considerable improvement from taking our kidney herb recipe. Continue parasite program. She should make an appointment with us after she gets her dental work done.

Summary: Gladys did not come back after her second visit. She did well, considering that she was barely able to believe she had cancer after her Negative mammogram. Perhaps the diet improvement made her feel so much better that she didn't think the dental work was needed at this time. Perhaps her husband could not accept the need for plumbing improvement. But I hope she stayed with the parasite program to protect herself from cancer, at least.

60 Debra Ells Colon, Stomach, Liver Cancer and HIV

This is a 41-year-old woman who came in for a long list of problems: 1) Cysts and rashes on skin. She has had them removed from back of neck, ears, chin, breast and even fingers. (My guess is these are PCB caused.) 2) Swelling at joints all over body. 3) Pain everywhere: elbows, shoulders, wrists, hands, chest, lower back, legs, knees, feet, and headaches. This suggests gallstones and rheumatoid arthritis but the chest pain doesn't fit into this picture. I will test for HIV (She is using Advil™ as a pain killer. It doesn't help much.) 4) Stomach problem.

She had a hysterectomy for excessive bleeding in her early 20's and her ovaries were removed 5 years ago. A total mastectomy was done 8 years ago for multiple cysts and she got breast implants but had to have them removed for leakage later.

I discussed with her the need to do all 5 of our routines and that she would probably be much better in 3 months. These would be: 1) Kidney cleanse; 2) Parasite-killing; 3) Toxic element removal; 4) Bacteria and virus elimination; and 5) Liver cleanse.

Since her urinalysis showed crystals in the urine, we would start with a kidney cleanse.

☒Orthophosphotyrosine (Cancer) YES at colon, liver, and stomach

I explained to Debra that this unexpected result would change the order of our program; we would kill parasites first. She said her brother had died of cirrhosis of the liver; she was not too surprised she had liver cancer!

☒**Fasciolopsis (Parasite) YES at thymus, blood, colon, stomach; NOT IN LIVER!**

☒**Fasciolopsis cercaria (Parasite) YES at thymus and stomach only**

☐**Fasciolopsis remaining stages (Parasite) NO**

This picture suggests HIV/AIDS illness together with cancer. There are probably other flukes, like the liver fluke and pancreatic fluke at the extra locations. But I did not test since she had enough shock from hearing about the cancer. I postponed the tests for 2 days. She will start on the *Parasite-Killing Program*.

Two days later

☐**Orthophosphotyrosine (Cancer) NO**

☐**Fasciolopsis and all stages (Parasite) NO**

When I gave her this exceptionally good news, she was not happy since she did not feel any differently; she had no pain relief and she expressed her disappointment.

☒**Arsenic (Toxic Element) YES**

☒**Europium, Lutetium, Yttrium, Ytterbium (Toxic Elements) YES**

☐**Toxic Elements (Remainder) NO**

Since health supplements and drug tablets were implicated, plus her carpets, she could not believe my explanations. I decided to postpone this part of her corrective programs and go directly to HIV testing.

☒**Protein 24 (HIV) YES at genital tract and thymus**

She did not believe this result, nor was she willing to go for a conventional HIV test at the Health Department. I could see she was very angry and would not come back to see me. I emphasized the primary importance of staying on a parasite-killing maintenance program. I did not manage to warn her of the solvents benzene and isopropyl alcohol, or of the danger of

eating undercooked beef, chicken and turkey.

Summary: It is understandable when a sick person finds our methods and results too strange to believe. Hopefully, as illness worsens, she will get tested and find her way back here. Note: In HIV cases, the adult fluke has developed from a cercaria in the THYMUS, not in the LIVER.

61 Leona Taylor Cancer Of Cervix

Leona was referred to us by a recovered cancer client. Her clinical doctor has been following the cysts in her breast for 7 years. One got to be the size of an egg; it was drained. Two years ago she had a bad PAP. 1½ years ago a lesion was found in the breast. She has done nothing. She now aches over the ovary regions. She has lower back pain. She has had double periods all this year. She is so fatigued that she has to lie down after 3 hours of work. She aches all over the chest area. Her neck aches and the back of her head feels very strange. The back of her head is numb. The soles of her feet hurt. Her clinical doctor removed certain "spots" recently from her cervix.

☒ **Orthophosphotyrosine (Cancer) YES at cervix and breast**

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis eggs (Parasite) YES at cervix, blood, breast, bladder, liver, colon**

With such a wide distribution of fluke eggs, she must be full of solvent. She will go off her favorite beverages (colas). She had noticed that drinking NutraSweet™ caused her cysts to enlarge immediately. She will make her own vegetable juice out of 50% carrots, 50% greens. She has not been eating red meat. Start on parasite program.

One week later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Mercury (Toxic Element) YES high**

Has numerous tooth fillings.

☒ **Zirconium (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

She will go off toothpaste, deodorant, shampoo, salves and lotions and substitute homemade varieties to get rid of zirconium. She is to see dentist immediately to have metal tooth fillings replaced. She had a urinalysis test

with her. It showed crystals of various kinds in the urine. She is to start on kidney herb recipe. Continue parasite program.

Summary: I wonder if I did the right thing in telling her the cancer was already gone at her second visit. She did not return and possibly has done nothing about her mercury problem. Mercury may be the cause of the strange symptoms. At age 47, she should be trying to undo the bad health practices of her youth, not sweeping them aside. Perhaps she will surprise us and one day walk back in, in radiant health.

62 Robert Ohr Prostate Cancer

This is a sturdy, confident looking man, age 55. He is here for prostate problems. It began 3 decades ago with blockage and acute prostatitis. Two years ago it was blocked again. The clinical doctors tried an experimental drug on him. It didn't work. He has cramping in the lower abdomen. A year ago he had prostatectomy and a cyst removed. A few months ago another cyst was removed from the right testicle. Nothing has helped the pain. At surgery, the doctor told him he had early cancer. But PSA was not high (1.1), as expected for prostate cancer. He picked up Candida after the surgery. He also has pain over the rib cage, in both elbows, and at his right knee. He is fatigued but forces himself to exercise. His urination is with extreme urgency, causing him to panic if not near a toilet.

☒Orthophosphotyrosine (Cancer) YES at prostate

☒Fasciolopsis (Parasite) YES at colon and liver

☒Fasciolopsis cercaria (Parasite) YES at prostate and liver

☐Fasciolopsis remaining stages (Parasite) NO

Start parasite program.

BLOOD TEST	Result	Comment
1. RBC	low (4.72)	parasites
2. Creatinine	high (1.2)	kidney problem
3. FBS	low (79)	unusually low - will check for pancreatic fluke
4. Potassium	very low (3.7)	adrenals
5. Chloride	very low	adrenals
6. CO2	very high	lung problem, probable cause of panic attacks, look for air pollutant

☒Pancreatic fluke (Parasite) YES at pancreas

Probable cause of low blood sugar.

Ten days later

☐Orthophosphotyrosine (Cancer) NO

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis redia (Parasite) YES at prostate**

☐ **Fasciolopsis remaining stages (Parasite) NO**

☒ **Pancreatic fluke (Parasite) YES**

☒ **Wood Alcohol (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

Stop shampoo, shaving chemicals, mouthwash, cold cereal.

☒ **Mineral oil (Toxic Element) YES**

Stop using lotions. Continue parasite program. Note: He is full of wood alcohol, which has a tendency to accumulate in the pancreas. This allows the fluke family to develop and multiply in the pancreas. He is to stop eating undercooked chicken, turkey, beef. He will stop drinking commercial beverages.

☒ **Cadmium (Toxic Element) YES**

Plumbing or old tooth fillings.

☒ **Copper (Toxic Element) YES**

Has copper water pipes.

☒ **Iridium (Toxic Element) YES**

Needs to change metal frame glasses to plastic.

☒ **Hafnium (Toxic Element) YES**

Stop hair spray or see *Recipes*.

☒ **Thallium, Germanium (Toxic Element) YES**

Thallium and germanium together point at metal tooth fillings. Thallium is a deadly toxin, polluting the mercury alloy. He is to see dentist immediately to remove all metal. Toxic element test is not yet completed. Note: cancer is gone but Robert is still at high risk for it.

Eight weeks later

All dental work is complete. He still has abdominal cramping.

☒**Beryllium (Toxic Element) YES**

There is a door between garage and kitchen - will cover with plastic or park vehicles outside.

☒**Cobalt (Toxic Element) YES**

Off detergent.

☒**Asbestos (Toxic Element) YES**

Needs to change clothes dryer belt.

☒**Copper (Toxic Element) YES**

☒**Chromate (Toxic Element) YES**

Needs to change metal glasses to plastic.

☒**Cesium (Toxic Element) YES**

No source found.

☒**PCB (Toxic Element) YES**

Off detergents, use borax.

☒**Scandium, Tantalum, Rhodium, Nickel (Toxic Element) YES**

The metals are coming out of him rather slowly considering all his metal tooth fillings are gone. Start thioctic acid, 100 mg, 2/day. Note: His cadmium is gone - it must have been in his tooth fillings.

☒**Hexane (Solvent) YES**

Off commercial beverages.

☒**Petroleum ether (Solvent) YES**

Will be more careful with gasoline.

One month later

He still has a lot of pain with sitting. Still some lower abdominal pain.

☐ **Beryllium (Toxic Element) NO**

Is parking vehicles outside.

☐ **Cobalt (Toxic Element) NO**

Switched to borax.

☒ **Asbestos (Toxic Element) YES**

Hasn't changed the dryer belt yet.

☐ **Copper, Chromate, Cesium (Toxic Elements) NO**

☐ **PCB (Toxic Element) NO**

Is off detergent.

☐ **Scandium, Tantalum, Rhodium (Toxic Elements) NO**

☒ **Nickel (Toxic Element) YES**

Glasses frames not yet changed.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Methylene chloride (Solvent) YES**

Go off commercial beverages. The kidney tests were not done, but he will start on kidney herbs anyway.

Summary: The metal from glasses frames is usually the second highest source of body metal, coming right after metal tooth fillings, from my observation. Nickel is quite soluble in fat, so skin oils could dissolve a lot of it out of the glasses frames and absorb it. Notice that Robert has made a lot of changes already in his lifestyle and yet his pains remain. But he has two potent causes of prostate trouble still left to conquer: asbestos and nickel. The list of metals absorbed into his body was exceptionally long - probably due to many kidney stones blocking their excretion. Although the kidney stone test was not done, I am curious to see how his pains are after several weeks of stone removal. Usually we cleanse kidneys early on to give clients pain relief. Our preoccupation with toxic elements slowed down the whole program. But he is free of cancer and soon will be free of pain.

One month later (4 months and 2 weeks after the first visit)

He has no pain with sitting but pain in front lower abdomen persists as well as in testicles. (This is probably the bladder.) I suspect a missed parasite, even though he has been on maintenance parasite program.

☒**Hymenolepis dim (Parasite) YES**

A small tapeworm!

☒**Schistosoma haem (Parasite) YES at bladder**

Could this be causing his abdominal pain? He will take 20 Wormwood for a few days in a row and note if pain stops. This is in addition to high dose Black Walnut Hull tincture and Cloves. This often comes from a pet. Must ask if he owns one.

63 Erik Gerger Cancer and HIV

Erik is 26 years old and has only minor problems. He is here for his underweight condition; he is 25 lbs. underweight. There is a cat in his house.He needs ten hours of sleep at night but still has low energy.

☒**Orthophosphotyrosine (Cancer) YES**

He has cancer, but he is incredulous and anxious to leave. There isn't time to search for its location.

☒**Protein 24 (HIV) YES high**

He has a very high level of HIV virus. This seems even less likely to him. But I prevailed upon him to stay long enough to get his instructions.

☒**Fasciolopsis adults and redia (Parasite) YES at thymus**

☐**Sheep liver fluke (Parasite) NO**

☐**Pancreatic fluke (Parasite) NO**

Others not tested. He will start on the *Parasite-Killing Program*.

☒**Benzene (Solvent) YES at thymus**

Uses Tom's™ toothpaste.

☒**Hexane (Solvent) YES**

☐ **Solvents (Remainder) NO**

He is instructed to go off commercial beverages and avoid the benzene list.

Summary: Erik has not returned. I hope he at least stopped using benzene-polluted products, and is staying on a parasite maintenance program. But it's too much to hope for. Note that propanol was not listed as YES and yet orthophosphotyrosine is present. Nor is Fasciolopsis listed as present in the liver. Were these tests missed? If not, this would be a unique case of cancer without both of its two chief causes. I will search for more such exceptions.

64 Rojer Costa Brain Cancer

This is a young (age 29), sturdy man with one leg amputated, sitting in a wheel chair. He has had several operations for cancer, it runs in his family. His brother has brought him from his home in the northwest.

His leg was amputated for osteogenicsarcoma two decades ago. He received 19 months of chemo. Earlier, he had a brain tumor, astrocytoma. It was removed by surgery. Three years ago, he got radiation for a subsequent brain tumor. He also had surgery and chemotherapy at the time. As a result of his last surgery, he has mild seizures in his left hand and left arm.

He is on Dilantin 400™ in 2 doses plus Valium™ for muscle relaxant as necessary. He also has left side weakness in his hand, arm, and leg. He has been in a wheelchair for 2 years, since his brain surgery, due to residual weakness from surgery.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at bone, brain, cerebellum**

☒ **Fasciolopsis (Parasite) YES at liver only**

☒ **Fasciolopsis miracidia (Parasite) YES at brain and blood**

☒ **Sheep liver fluke (Parasite) YES at liver**

☒ **Sheep liver fluke cercaria (Parasite) YES at brain and blood**

Note: We have not accounted for cancer at bone and cerebellum since the above fluke stages were not present there. Is there another fluke involved?

☐ **Pancreatic fluke (Parasite) NO**

☒ **Human liver fluke (Parasite) YES at liver, brain, bone and cerebellum**

☒ **Human liver fluke metacercaria (Parasite) YES at brain, bone, and cerebellum**

☐ **Human liver fluke eggs (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES at liver, brain, bone and cerebellum**

Start on parasite program. Go off all propanol-containing products.

One week later

BLOOD TEST	Result	Comment
1. Seg/Lymph	low	chronic virus
2. Eos	slightly high (3%)	parasites
3. Platelet count	slightly low (170)	bone marrow toxin
4. Total protein and albumin	low	liver problem
5. SGPT, SGOT	high	liver problem

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Human liver fluke and all stages (Parasite) NO**

Continue parasite program.

☐ **Isopropyl Alcohol (Solvent) NO**

He could not find "prop" on any of his body products so he did not change anything. But he has not shampooed or shaved since last visit, and he has stopped using rubbing alcohol.

☒ **Antimony (Toxic Element) YES at brain**

Go off colognes.

☒ **Cadmium (Toxic Element) YES high at brain**

Will test water sources, then dental sources.

☒ **Thallium, Germanium (Toxic Element) YES at prostate and lung**

☐ **Toxic Elements (Remainder) NO**

Thallium/germanium in his dental materials is the probable cause of his weakness, not the after-effects of surgery. He must immediately have this

removed. He stands a good chance of getting out of his wheelchair again. His cancer is gone and tumors can be shrunk.

Summary: Rojer was from 2000 miles away and had only one week to spend with us, yet he accomplished his purpose. This was a most fascinating case: another parasite of the fluke family, the Human liver fluke, has joined the intestinal and other liver flukes to invade tissues like bone and brain. This is no doubt due to the presence of solvent in these tissues. Perhaps his whole family was in the habit of using a lot of rubbing alcohol. Both the cancer and the propanol were eliminated in a week's time. But will he pursue the dental problem?

65 Jan Whitacker Cervical and Uterine Cancer

Jan, age 41, came with friends who had an appointment in the hope that I could work her into the schedule for a very short visit. She had cancer of the cervix and uterus twelve years ago. They both were removed by a complete hysterectomy. She got no radiation or chemo. She was told by her clinical doctors that they "got it all." But she is not in good health. She has a stomach problem, insomnia, weakness in her arms, pain in her lower back, and other problems, including mood.

☒ **Orthophosphotyrosine (Cancer) YES at cervix and uterus**

This surprised and disappointed her.

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at liver, cervix, uterus, and colon**

☐ **Fasciolopsis remaining stages (Parasite) NO**

She is to avoid undercooked meats and avoid propanol in her body products.Start on parasite program.

Summary: Jan did not come back. She is dependent on friends for transportation. Notice that there are fluke miracidia present without any adults! Sexual transmission seems likely. She was to bring her husband along at her next visit. There are other explanations but not enough evidence. Note that the test showed fluke stages at the cervix and uterus when these had been removed! I suppose this means there is a remnant of such tissue still present.

66 Kathryn Poore Breast Cancer

Kathryn Poore (age 56) came to the office because of long-standing problems with shingles that were spreading into the right eye. She had a mastectomy 11 years ago but now the cancer is back, under the same breast and armpit. Her clinical doctor wants to start her on chemotherapy. She started herself on a new essential oil product as well as some other herbs. She has both upper back and lower back pain. She had a hysterectomy in the past for growths on one ovary and the uterus.

☒ **Orthophosphotyrosine (Cancer) YES at breast**

☒ **Fasciolopsis (Parasite) YES at colon, liver and blood**

This is very unusual. The parasite is large. How could it be in blood vessels? Does this represent a hemorrhage?

☒ **Fasciolopsis redia (Parasite) YES at breast, pancreas and blood**

☒ **Fasciolopsis cercaria (Parasite) YES at breast and blood**

She has been running a fever and has lost weight. Start on parasite program.

Note: cancer is trying to spread to pancreas. She will stop essential oilproducts immediately since I know they have benzene pollution in them.

☒ **Five days later**

She is feeling better. The shingles in her eye seem to be gone for now. She put herself on 3 goldenseal a day.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES at colon, breast, liver, blood**

Continue parasite program. Note that the malignancy is gone.

☒ **One month later**

She complains about dizziness. Shingles in eye still noticeable.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Wood Alcohol (Solvent) YES**

☐ **Solvents (Remainder) NO**

She will stop drinking carbonated beverages and drink milk and water instead.

☒ **Herpes zoster (Pathogen) YES**

(Shingles virus.)

☒ **One month later**

☒ **Wood Alcohol (Solvent) YES**

Off beverages and cold cereals.

☒ **Herpes zoster (Pathogen) YES**

☒ **PCB (Toxic Element) YES**

Off detergent.

☒ **One month later**

She is feeling better.

☐ **Wood alcohol (Toxic Element) NO**

☐ **PCB (Toxic Element) NO**

Switched off detergents.

☐ **Herpes zoster (Pathogen) NO**

BLOOD TEST	Result	Comment
1. RBC	low	anemic, probably parasites
2. MCV	high	In need of B12. This always implicates common roundworm *Ascaris* . These worms are often pink from absorbing our B12!
3. Phosphates	high (over 4)	dissolving bones - reduce phosphate in diet, increase milk, fruit, and vegetables)
4. Cholesterol	low (123)	liver problem - use butter, not margarine; low cholesterol is also a cancer risk factor

☒ **Ascaris (Parasite) YES**

It is easy to pick this up from somebody else's dog or cat. She will start on a 5-day high dose parasite program and then continue on maintenance as before.

☒ **Barium (Toxic Element) YES at thyroid**

The usual sources are lipstick and bus exhaust, and she does not use lipstick. Also, her recent plastic fillings can not be ruled out (remember all dental composites contain barium to enable them to show up on x-ray).

☒ **Fluoride (Toxic Element) YES**

Will stop using toothpaste.

☒ **Vanadium(Toxic Element) YES very high**

Will check for a gas leak - says can smell stove.

Summary: Kathryn is happy to have the shingles under control at last. I believe they were started when she began to get benzene in the new essential oil product. The cancer was cured in 5 days but the shingles were more of a challenge. They will probably recur each time she is indiscreet and allows herself commercial beverages or goes off the parasite maintenance program. In this way, the shingles will serve as a watch dog for her and remind her to clean-up before a cancer would return.

☒ **Seven weeks later**

She feels quite a bit better, more like her former self. She has brought air samples for testing.

☐ **Barium, Fluoride (Toxic Element) NO**

Evidently the barium was not from her plastic fillings.

☒ **Vanadium(Toxic Element) YES**

Have not found their gas leak and are still suffering.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Herpes zoster (Pathogen) NO**

☐ **Ascaris (Parasite) NO**

5-day high dose parasite program got rid of roundworms.

☒ **Ascaris eggs, Schistosoma jap eggs, Hymenolepis dim eggs, Schistosoma haem eggs (Parasite) YES**

Notice: These eggs have survived the 5 day high dose program. She will take 1 tsp. Cloves twice a day for several days.

☒ **Six weeks later**

Kathryn had another dizzy spell since last seen.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **Fasciolopsis eggs (Parasite) YES at kidneys only**

She has eaten no meat or any dairy products. (Possibly from her husband; he will do a 3 day high-dose parasite program.)

☒ **Vanadium(Toxic Element) YES**

Six out of eight rooms tested had vanadium in the air; they were advised to hurriedly call the Health Department or Gas Company to fix the gas leaks. This could be the cause of her dizzy spells.

67 Beth Morato Breast and Lung Cancer

Beth is a middle aged, pleasant woman, who had severe lower back pain before her clinical doctor found she had cancer of the lower spine. Since bone cancer is seldom the primary cancer, they searched for the primary source and found it in the lung. She was treated with chemotherapy and radiation to her lung and back. The spot on her lung has only shrunk 30%. She had to quit her job at that time, over a year ago.

☒ **Orthophosphotyrosine (Cancer) YES at liver and pancreas (not lung!)**

☒**Fasciolopsis (Parasite) YES at liver and pancreas**

☒**Fasciolopsis eggs (Parasite) YES at breast, pancreas, intestine, lungs and bone**

☐**Fasciolopsis remaining stages (Parasite) NO**

Other parasites not tested. Start on parasite program. Go off all commercial cosmetics and shampoo and the whole isopropyl alcohol pollution list.

Seven days later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

Had forgotten to pick up Cloves from us so she used grocery store WHOLE Cloves, and they worked.

☒ **Radon (Toxic Element) YES at kidney, breast, bone (other organs not tested)**

☐ **Toxic Elements (Remainder) NO**

Note: cancer is already gone. Only one toxic element was present: radon. There is a crawl space under their house. They will open vents and then bring in air sample to test.

Nine days later

Her fatigue is worsening. But her low back pain is gone.

☐ **Radon (Toxic Element) NO**

Opened vents.

☐ **Kidney Stones (ALL) NO**

Drinks a lot of water, eats a lot of vegetables and fruit, empties her bladder about 10 times in 24 hours. Continue parasite program.

☒ **Benzene (Solvent) YES**

☐ **Solvents (Remainder) NO**

She will go off toothpaste, chapstick, ice cream, and frozen yogurt.

BLOOD TEST	Result	Comment
1. WBC	very low (3.2)	bone marrow toxin
2. RBC	very low (3.48)	bone marrow, parasites
3. Platelet count	slightly low	bone marrow probably has benzene
4. Eos	slightly high (3%)	parasites
5. BUN	slightly high	kidney
6. Phosphate	high	dissolving bone. She will drink 2% milk, 3 glasses/day and reduce phosphate sources. She will start to make vegetable juice.
7. Cholesterol	low (169)	cancer risk

She will start on supplements, from Bronson's only, B6 (250) 1/day, magnesium oxide (300) 1/day, vitamin C (500) 1 to 6/day, vitamin E (400), 1/day, beta carotene (25,000) 1/day.

Summary: Beth planned to do everything perfectly; her lower back pain was gone, and she did not need to return. Her cancer was ready to burst out at her breast and pancreas, but she got it all

stopped and was enjoying planning her future again. She appreciated all the helpful advice and her husband was supportive. She should follow up in 3 months.

68 Loreen Pennell Lymphoma

This is a young 41-year-old woman who is a cat lover. She has had as many as 40 cats at one time, all of them house cats. She only has 10 now. She has a constant migraine for which she is on 3 medications, including codeine. Nothing else helps. She also has total insomnia without her medications. Her entire colon has been removed surgically for colitis; there is no rectum or anus. Her clinical doctor said it was all-precancerous. She also has a history of stomach ulcers and numerous smaller health problems. But her eyes light up at the mention of cats, as if they had nothing to do with her condition. She has extreme allergies - to almost everything; I would suspect Sheep liver flukes as well as Strongyloides.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

This comes as a surprise to her. She felt that all that surgery was protecting her.

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis cercaria (Parasite) YES at kidney, bladder and intestine**

☒**Sheep liver fluke (Parasite) YES at liver and intestine**

☒ **Sheep liver fluke miracidia and redia (Parasite) YES at kidney, bladder**

☒ **Pancreatic fluke (Parasite) YES at kidney, bladder and pancreas**

We will search urine for these stages since they are present in the bladder.

☒ **Isopropyl Alcohol (Solvent) YES at liver, kidney, intestine and bladder**

☒ **Toluene, Xylene Hexane, methyl ethyl ketone, methylene chloride (Solvents) YES**

☒ **Wood Alcohol (Solvent) YES at uterus, stomach, pancreas** S

She is to go off all commercial beverages, except fresh squeezed (in her grocery store) orange juice if she can find it. If not, she is to make all her own beverages from fruits and vegetables. She can drink 2% or more milk, if tolerated, and single-herb teas. She will be off cold cereals. She will start on parasite program for herself and cats.

Summary: Susan came to the office for migraines, never suspecting that this could be due to a tiny parasite, threadworm, that cats could bring her. Her chances of recovering from migraines are zero, but maybe she can reduce them a lot by treating her pets daily with a parasite program designed for them. Indeed, she did have the Sheep liver fluke; this causes terrible obstruction in the liver bile ducts; how can the liver detoxify food chemicals with such a severe handicap? Besides this, some intestinal flukes are nesting there. We don't often see them together in the liver. Together, these two flukes are probably keeping the pancreatic fluke out of the liver, relegating it to bladder and kidney, besides pancreas. These were the only parasites tested; she scored three out of three, and in quite untraditional organs for these parasites. One look at the solvent test gives the clue. Wood alcohol accumulates in the pancreas and induces hatching of flukes there. Propanol induces hatching in the liver. The other solvents may have their favorite target organs, too, causing parasitism there. This has not been studied yet. Happily, she was eager to correct her problems.

Eight days later

Susan came back for a follow-up.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Solvents (ALL) NO**

She feels quite different (better). The Toxic Element tests showed asbestos very high, antimony YES, arsenic very high, and PCB YES. Others were not tested since this is enough for her to cope with. She doesn't use a hair blower so the asbestos must be coming from the clothes dryer. She will persuade her husband to change the belt to a USA made belt. The antimony may be in her hand cream, she will switch to our skin softener and apricot kernel oil. She will go off detergents to get rid of PCB. But the arsenic is a real problem because she needs to treat the house and cats with pesticide frequently. I could not give her a good solution, but she will start by putting a lot of boric acid behind the stove, refrigerator and in the carpet. She is enjoying her new lifestyle and wants to make changes.

Four weeks later (5 weeks after first visit)

She is still complaining about memory lapses. Her husband insisted on a CAT scan and other clinical tests which she has done; nothing showed up. She has periods of completely irrational behavior. This suggests intermittent interference with brain function. I will search for tapeworm heads (scolices).

- ☒ **Moniezia (Parasite) YES**

She will kill this extremely harmful tapeworm stage with an herbal product called Rascal (which we used before we developed the Mop Up program).

After 3 weeks she will be on the usual maintenance program of twice a week treatment, including Rascal. This tapeworm head may be emerging due to solvent exposure in the past.

☒ **Hexane, Methyl Butyl Ketone, Styrene (Solvents) YES**

She will stay off processed food.

69 Carol Masters Intestinal Cancer

Carol was accompanying another client of ours and after seeing what our diagnostic system could do, she wanted to be tested for cancer before leaving. We did not get her history or list of symptoms. Her mother had died of breastbone and pancreatic cancer. We gave her 15 minutes of office time.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

☒ **Fasciolopsis (Parasite) YES at intestine and liver**

☒ **Fasciolopsis miracidia (Parasite) YES at liver, thymus, intestine**

☒ **Sheep liver fluke and stages (Parasite) NO**

☐ **Isopropyl Alcohol (Solvent) YES at liver, thymus, pancreas**

☒ **TCE (Solvent) YES**

She will remove all propanol-containing products. She will go off cold cereals and commercial beverages and drink milk, water and home made juices or simple herb tea. She will not eat beef, turkey, or chicken in restaurants, and will cook them as if they were pork at home. Start on parasite program.

70 Dan Hudgins Prostate Cancer

Dan is a youngish man brought in by his sister in great secrecy. He did not wish to give his address, age, or fill out any paper work. His sister said he was diagnosed with prostate cancer a few weeks ago, although he was given a clean bill of health at a different clinic. His clinical doctor put him on antibiotics. His PSA is 12 (too high, indicative of prostate cancer).

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at prostate**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis eggs (Parasite) YES at liver and prostate**

☒ **Sheep liver fluke (Parasite) YES at prostate**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES at liver and prostate**

☐ **Solvents (Remainder) NO**

He will remove all products with "PROP" on the label from his house. He will start on parasite program. His sister discreetly pointed out, here, that Dan is not likely to come in for a follow up; the implication was that we must do all we can in one visit.

☒ **Oxalate (Kidney Stones) YES**

☒ **di Calcium Phosphate (Kidney Stones) YES**

Start on kidney herbs after 3 weeks. He will avoid rare meat.

Summary: What a blessing it is for some of us to have a sister or brother, so truly interested in our welfare that idiosyncrasies are overlooked. Perhaps she will help him recover if she can't persuade him to come back. Notice that the two big flukes were thriving in his body, but the pancreatic fluke, which he must be picking up frequently, too, had not gotten established. This is probably due to the absence of wood alcohol in his body. Wood alcohol accumulates in the pancreas allowing the pancreatic fluke to multiply there.

71 Greg Byrem Colon Cancer

Greg Byrem was seen by us 1½ years ago for gout. At that time he could barely hobble about in spite of being on two medicines for it. He said that 3 days after beginning our kidney herb recipe, he was able to walk again. He got well enough to resume his job as a traveling salesperson. He is in this area now and wants to be given the same kidney program as before in order to gain energy and lose weight. He has put himself on a high protein diet and is eating a lot of rare meat. He brought a blood test with him.

BLOOD TEST	Result	Comment
1. Phosphates	very low (2.8)	He will go on Vitamin D, Rx from the dentist, 2/week.
2. Uric acid	high (7.6)	kidney problem
3. SGOT, SGPT	high (32, 42)	needs to cleanse liver
4. LDH	high (210)	cancer, heart disease, recent exercise?
5. Ferritin	high (260)	cancer?

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis eggs (Parasite) YES at liver, intestine, bladder, and semen**

☐ **Sheep liver fluke (Parasite) NO**

☒ **Pancreatic fluke and all stages (Parasite) YES at pancreas**

☒ **Isopropyl Alcohol (Solvent) YES at liver and intestine**

☒ **Wood Alcohol (Solvent) YES at pancreas**

He is using a lot of EQUAL™ artificial sweetener; he will switch to honey. Start on parasite program. Get off all propanol products. Go off cold cereals and commercial beverages and switch to milk, freshly made fruit and vegetable juice and simple herb teas (not blends).

Summary: This was certainly not what Mr. Byrem had expected. He felt healthy and simply wanted a weight loss diet. Fortunately, we discovered this early cancer. He is eager to eliminate it. Notice that there were fluke eggs in his bladder (urine) and semen; meaning he could sexually transmit it. Notice also that wood alcohol accumulates in the pancreas causing the pancreatic fluke, which is also abundant in our meat supply, to increase its population in the pancreas. This would soon give him diabetes. What an irony that diabetics use artificial sweeteners (which contain wood alcohol) to HELP their diabetes, thereby putting wood alcohol into the pancreas to make the diabetes WORSE.

Twelve days later

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☒ **Pancreatic fluke (Parasite) YES at pancreas**

☐ **Human liver fluke (Parasite) NO**

He will not eat undercooked meats and only eat fish in restaurants.

☒ **Styrene (Solvent) YES at prostate, intestine, pancreas**

He will stop using styrofoam.

☒ **Hexane, Kerosene (Solvent) YES**

He will be more careful at gas stations and not get any drops of gasoline on himself.

☒ **Mineral oil (Toxic Element) YES**

Stop hand lotions, use ours.

☒ **Isophorone (Solvent) YES**

He will definitely go off commercial beverages. With the cancer gone, Greg can follow his original plan, which was to go on a weight loss program. To begin this, he will go on the kidney herb recipe. He will continue the parasite program. He is anxious to clean the liver to realize his weight loss. THE CURE FOR ALL CANCERS 314

☒ **Mercury (Toxic Element) YES**

He has a root canal, also. He is advised to remove all metal from his mouth.

Two months later

He has done 2 liver cleanses and got out about 2000 countable stones. He also lost 10 pounds at that time.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

Has not gotten cancer back. He still needs to do dental work.

72 Pete Mathes Intestinal Cancer

Pete Mathes, age 71, has had heart bypasses and several small strokes for which he is on medication. He feels fine but would like to improve his failing memory. He lives in a large city.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

His bowel habits have changed recently.

☒ **Fasciolopsis eggs (Parasite) YES at intestine**

Note: No adults in the liver!

☒ **Fasciolopsis miracidia (Parasite) YES at intestine**

☒ **Sheep liver fluke adults, redia, cercaria, miracidia (Parasite) YES**

He is heavily parasitized with Sheep liver fluke, which is a probable explanation for his severe allergies in the past.

☐ **Pancreatic fluke and stages (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

He uses no body products except Dr. Bronner's baby soap, which he has used for years. He also uses shaving cream. He will go off these and other propanol polluted products.

☒ **Acetone, Methyl butyl ketone (Solvents) YES**

He will go off all commercial beverages. He will start parasite program. After this he will start on half a dose of kidney herb recipe. He agrees to come back in a month.

One month later

☐ **Orthophosphotyrosine (Cancer) NO**

Bowel is normal again.

☐ **Isopropyl Alcohol (Solvent) NO**

Stopped using shaving cream and uses an electric razor.

☒ **Wood Alcohol (Solvent) YES**

Artificial sweetener.

☒ **Styrene (Solvent) YES**

Drank from a styrofoam cup yesterday - will stop.

☒ **Europium and europium oxide (Toxic Elements) YES**

Dentures.

☒ **Aluminum Silicate (Toxic Element) YES**

Salt. Switch to Hain's Sea Salt.™

☒ **Scandium, Silver (Toxic Element) YES**

Teeth? He has complete dentures; yet these are metals used in tooth fillings. He will ask dentist to do a whole mouth x-ray to search for bits of left over amalgam in his jaw bone.

☒ **PVC (Toxic Element) YES**

Hobby supplies?

☒ **Tungsten (Toxic Element) YES**

Will test toaster and hot water system.

Summary: Pete eliminated his intestinal cancer and propanol by his second visit. His heavy burden of Sheep liver flukes may have been with him for many decades since he has been extremely allergic most of his life. They came a very long distance and would like very much to have a healthy old age. Notice that there were no adult intestinal flukes in his liver. Did the Sheep liver flukes keep them out? He, nevertheless, developed cancer!

73 Rosie Veach Bladder and Colon Cancer

Rosie Veach is 86 years old and still sturdy looking. She had some surgery 5 years ago and ever since then she doesn't feel right. She is sore over the lower abdomen. The surgery was for cancer of the colon; a piece of the colon was removed along with the uterus (her daughter-in-law related this). She thinks her problem is the bladder.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at bladder; NO elsewhere**

☒ **Fasciolopsis (Parasite) YES at liver and bladder**

☐ **Fasciolopsis other stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

Start on the *Parasite-Killing Program*. She is concerned that the herbs will bother her super-sensitive stomach. She probably has *Ascaris* (roundworm of cats and dogs) in her stomach.

☒ **Ascaris, Ascaris megalo. (Parasites) YES**

(*Ascaris* megalo is roundworm of horses.) These will certainly give her a sensitive stomach. She is to go slowly with the parasite program after day 5, increasing the dose only when she feels ready. She is to cook all meat as if it were pork.

☒ **Isopropyl Alcohol (Solvent) YES**

Probably in shampoo - will switch to borax.

☒ **Toluene (Solvent) YES**

She has been drinking 7Up™ to settle her stomach. She will switch to

☒ **Bronson's digestive enzymes: 2 for breakfast, 4 for supper.**

☒ **Pentane (Solvent) YES**

Will switch from Sanka™ to hot water with cream and honey.

☒ **Carbon Tetrachloride (Solvent) YES**

Will go off cold cereal.

Two weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

Cancer is gone. She said she had quite a difficult time with her stomach but is very pleased. Her front lower abdomen is still painful. She has to get up six times in the night to empty her bladder. This leaves her exhausted the next day. But she is afraid of taking any more herbs on account of her stomach.

☐ **Solvents (ALL) NO**

☒ **Oxalate, Cysteine, Cystine (Kidney Stones) YES**

Start on kidney herbs: only a half dose for first five days; then full dose for 2 weeks; then half a dose for 3 months.

Summary: Very elderly clients immediately strike a chord in me. Do they try harder? Do they complain less? Are they more successful, giving me pride? Is their personality sweeter? Rosie is a perfect example of all these virtues. I believe she will do everything right and earn a pain-free, pill-free old age.

74 Nancy Hamper Intestinal Cancer

Nancy's main problem was Crohn's disease, diagnosed in 1973. The colon became cancerous in 1974 and a portion was removed that year. Additional surgery was done the next year for adhesions. She has a list of impressive illnesses: 1) Sores on her face that won't heal. 2) Fibrositis/fibromyalgia all over her body at times (probably due to Trichinella). 3) Mitral valve prolapse (probably due to tooth bacteria). 4) Stomach ulcers. 5) Low back pain.

She has dentures. She is 49.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

☐ **Fasciolopsis adults (Parasite) NO**

Very unusual!

☒ **Fasciolopsis miracidia (Parasite) YES**

☒ **Sheep liver fluke adult and its stages (Parasite) YES at liver**

Note: There is no intestinal fluke adult in the liver! Yet she is forming orthophosphotyrosine.

☒ **Isopropyl Alcohol (Solvent) YES**

Will remove it from her dwelling and products.

☒ **Benzene (Solvent) YES at liver, thymus and intestine**

She will go off everything on the benzene list I gave her.

☒ **Toluene, Hexane (Solvents) YES at intestine**

She will go off commercial beverages and cold cereal and make her own juices and drinks and cereal. She doesn't tolerate milk, so she will make vegetable juice: 50% carrot, 50% remaining vegetables until she is well enough to try milk. She will start parasite program.

Summary: A month has passed and Nancy has not returned. Notice how the Sheep liver fluke is in the liver instead of the intestinal fluke adults. The cancer is present. Does this mean that the Sheep liver fluke can initiate a cancer as well as the intestinal fluke? Or did Nancy actually have intestinal flukes in the liver until very recently? What killed them? Nancy has both propanol and benzene accumulated in her body. Very soon some flukes would mature in the thymus, and she would get the HIV virus. Hopefully, she will prevent all this.

75 Lois Browne Liver Cancer

Lois is 72, and looks sturdy and healthy. She embroiders for extra income; she wishes to pay us in embroidery! We agreed. She had colon cancer four years ago and part of the colon was removed. Her clinical doctor has been keeping track of the cancer marker CEA since then. This spring the cancer returned.There are 3 lesions in the liver. She had chemotherapy last month. There is also a tumor on the wall of her uterus. It is inoperable.

☐ **Fasciolopsis adults (Parasite) NO**

Very unusual.

☒ **Fasciolopsis redia (Parasite) YES at liver and colon**

☒ **Sheep liver fluke adults and eggs (Parasite) YES at liver and colon**

☒ **Sheep liver fluke (Parasite) YES**

☒ **Pancreatic fluke and stages (Parasite) YES**

☒ **Dog heartworm (Parasite) YES**

Used to have a dog.

☒ **Echinococcus granulosus cysts (Parasite) YES**

☒ **Eimeria (Parasite) YES at liver**

End Box 1.

☒ **Toluene (Solvent) YES**

☒ **Xylene (Solvent) YES**

Drinks one glass of 7Up™ a day- will stop.

☒ **Methyl ethyl ketone (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

Uses hair spray and a salve -will go off.

☒ **Mineral oil (Toxic Element) YES**

☒ **Probably in salve.**

☒ **TCE, Hexane (Solvents) YES**

Note: She is very full of solvents. She will go off all commercial beverages, cold cereals and body products. She will start the *Parasite-Killing Program*.

☒ **Orthophosphotyrosine (Cancer) YES at liver and uterus**

One week later

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Eliminated cancer.**

☒ **Styrene (Solvent) YES**

She ate fast food from a styrofoam plate earlier today. She will stop using it.

☒ **Hexane, Benzene (Solvents) YES**

She ate ice cream yesterday. She will avoid everything on the benzene list.

☒ **Barium (Toxic Element) YES**

☒ **Copper (Toxic Element) YES**

Has metal tooth fillings.

☒ **Fiberglass (Toxic Element) YES**

Source unknown.

☒ **Mercury (Toxic Element) YES**

Tooth metal.

☒ **Yttrium (Toxic Element) YES**

☒ **Probably a pill; will not use any.**

☒ **Radon (Toxic Element) YES**

Will get her son to seal cracks for her.

☒ **Tantalum, Tellurium, Rhodium (Toxic Element) YES**

Tooth metals. She is to see dentist to remove all metal from her mouth.

Until then, she should get a new soft toothbrush, and use only water, no toothpaste nor soda nor salt since the metal would corrode faster.

Ten days later

A telephone call from her family canceled the next appointment and reported that Lois is in the hospital for bleeding.

Summary: Lois was heavily parasitized, no doubt due to the accumulation of solvent in her tissues. Her body could no longer detoxify solvents. But by getting rid of propanol and killing the intestinal fluke, she got rid of her cancer in a week, even though it was in her liver. Notice that there were no adults of the intestinal fluke in her liver! But there were redia. Can redia by themselves make orthophosphotyrosine? Or had there been an adult lately, which had gotten killed by her chemo treatments? Obviously, she has a terrible mouth, maybe it is all the mercury and other metals finding their way to the liver that lets it become cancerous. I do hope she makes the dental work her top priority. While we wait for her, there is some lovely embroidery here for sale!

76 Irene Williams Cancer

Irene is a youngish woman, age 53, brought in by her brother, for a diagnosis of non-Hodgkin's Lymphoma given to her five years ago. It is not operable, but she has been on every kind of chemo. She has had extensive radiation, too. Her entire body is involved in the cancer. Her body is not making any antibodies, according to her clinical doctor, so she is getting shots of Gammamune™ monthly. She is not able to work and does appear very ill. She smokes. She has been drinking bottled water. I started with a discussion of smoking, she needs to stop. She will check into a nicotine patch. She will use ginseng - 2, three times a day - to give her some relaxation.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES**

Did not search for the location.

☒ **Fasciolopsis (Parasite) YES at liver, NO at colon**

☐ **Fasciolopsis other stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

She said her WBC was very, very low (about 900). She probably has the parasite in her thymus or bone marrow, but I didn't check.

☒ **Benzene, Isopropyl Alcohol, Methyl butyl ketone (Solvents) YES all very high**

☒ **Methyl ethyl ketone (Solvent) YES**

☐ **Solvents (Remainder) NO**

She was instructed to make all her own beverages, cereal, ice cream and frozen yogurt, to purchase only fresh squeezed orange juice made in her grocery store. She will go off Chapstick™ and all Vaseline™ products and toothpaste. (We gave her the benzene list.)She must not use Celestial Seasonings™ teas or other mixed-herb teas. She will remove all propanol-containing items from her bathroom and kitchen. She will start on parasiteprogram.

Two weeks later

A telephone call from her was received telling us she couldn't stop smoking and wanted to cancel her appointment.

Summary: I believe Irene was overburdened. If I had postponed the subject of smoking I probably would have kept this client and prolonged her life.

77 Barbara Kiley Colon Cancer

Barbara came in to the office for what she believed was arthritis: she had pain in her shoulder and upper arm and upper back, which is actually due to clogging of the biliary tubing. She needs to clean this tubing with our liver cleanse, which gives immediate pain relief the next day. She also had lower back pain for which cleaning the kidney tubules of sediment is the answer. She is on painkiller each day.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine only**

Our routine start up tests showed she had a cancer growing in her intestine somewhere. She had a hysterectomy 10 years ago and a benign lump was also removed from her left breast. But she was quite shocked at the news. She is 55 years old.

☒ **Fasciolopsis (Parasite) YES at liver**

☐ **Sheep liver fluke (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

She will remove all propanol from her dwelling so nobody could ever accidentally use it again. She will start on a *Parasite-Killing Program*.

☐ **Oxalate (Kidney Stones) YES**

☒ **Kidney Stones (Remainder) NO**

She also had gallstones. She will start on parasite program, followed by kidney herbs in about 3 weeks. Then she may clean the liver.

Summary: colon or intestinal cancer came as a surprise to Barbara as it did to me. She had no bowel problems.

Seven weeks later

She has not yet followed-up, but if she complies with all my instructions she will never get cancer again. She took the kidney herb pack with her, so she may be in the process of taking that; this should bring her relief from lower back pain. The gallstone test is for cholesterol crystals. Since we nearly all have them in our bile ducts, I seldom test for them. I tested her for gallstones for the persuasion value and motivation to clean her liver. Barbara had a shortened appointment to spare her financially, since she did not expect to have to purchase something like the parasite-killing ingredients.

Two weeks later

We are happy to see Barbara. She has been traveling a lot, explaining her long lapse. She has had an x-ray of her shoulder but can't take the painkillers, which were prescribed because they bother her a lot.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **Acetone, Wood alcohol (Solvent) YES**

☐ **Solvents (Remainder) NO**

Off commercial beverages. Start on kidney program.

78 Judy Olesen Cancer, Unknown Location

Judy, age 31, from a neighboring state, brought in a long list of symptoms. The most serious were: psoriasis in 4 locations, thyroid disease, migraine headaches, irritable bowel syndrome, stomach trouble with lactose intolerance, and a severe upper and lower back pain which keeps her from sleeping at night. She had a long list of medicines to take. She is drinking water that has come from the refrigerator. Because of severe allergies she eats a lot of tofu cheese. I explained to her that

in order to get well, she would need to : 1) Cleanse her kidneys for 3 weeks; 2) Kill all her parasites; 3) Eliminate toxic elements from her body; and 4) Cleanse her liver. All this could take several months so she should be patient. At least it wouldn't be expensive.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES**

This *Positive* cancer result was so shocking to her that I did not search for a location, but simply reassured her that she could completely cure it quite quickly.

☒ **Fasciolopsis miracidia (Parasite) YES**

There were no adults in the liver! Does it mean that the miracidia by themselves can start orthophosphotyrosine forming? Or had there been an adult in the liver recently to start it all, but then got killed somehow?

☒ **Sheep liver fluke adult (Parasite) YES at liver**

☒ **Sheep liver fluke cercaria, redia, eggs, and miracidia (Parasite) YES**

☒ **Pancreatic fluke and stages (Parasite) YES**

☒ **Isopropyl Alcohol (Solvent) YES very high everywhere**

She will go off commercial body products and use our replacements.

☒ **Methylene chloride, methyl ethyl ketone (Solvents) YES**

She will go off commercial beverages and cold cereals. Start the *Parasite-Killing Program*.

Summary: What an unusual case. Judy was smothered in Sheep liver flukes and all their stages. Could the Sheep liver fluke also induce a cancer by starting orthophosphotyrosine formation? It is an intriguing question. It is 6 weeks already, and she has not returned. We wonder what happened.

Three months later

Judy has appeared. We are happy to see her. She stated she did not believe a thing we told her at her earlier visit. But she was too afraid not to take our herbs and follow the rules about products. Suddenly she began to feel amazingly well and wondered if it was all in her head. Although she was done with the recipe she was too afraid to stop. She was also afraid to continue and this indecision brought her back.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **TCEthylene (Solvent) YES**

☒ **Mercury, Silver (Toxic Elements) YES**

Others not tested. She is advised to replace all tooth metal with metal-free plastic.

Summary: This was certainly a happy ending for us since we had waited anxiously to hear what might have happened to her. We were not at all sure she was complying with instructions after the first visit. But her intelligence (and perhaps a little fear) saw her safely through this ordeal.

79 Juanita Holden Colon Cancer, Metastasized

Ms. Holden is only 57 but her clinical doctor has given her 2 months to live and doesn't mind if she goes to see alternative therapists. She had surgery for colon cancer five years ago, and now it is in her liver. She has been getting chemo once a month, but it is getting worse. Her doctor is using the CEA test as a cancer marker. She will bring in future results of CEA tests, although she hadn't expected to do any more since she was so terminal.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver, brain, pancreas and vagina**

☒ **Fasciolopsis (Parasite) YES at liver, thymus, brain and colon**

☐ **Fasciolopsis other stages (Parasite) NO**

☒ **Sheep liver fluke (Parasite) YES at thymus and colon, NO at liver**

☒ **Pancreatic fluke (Parasite) YES**

Note: All three large flukes are present. The sheep liver fluke is not in the liver, but in the thymus! She probably has benzene in her body.

☒ **Isopropyl Alcohol (Solvent) YES**

☒ **Hexanedione (Solvent) YES**

Drinks a variety of teas.

☒ **Benzene (Solvent) YES**

Uses toothpaste - will go off.

☒ **Methyl ethyl ketone (Solvent) YES**

Start on parasite program. Off all commercial beverages except herb teas (not Celestial Seasonings™, not mixtures) and off cold cereals. She will avoid Vaseline™ products like Chapstick™ and ice cream and frozen yogurt as well as all toothpastes. She will remove all body products that say "PROP" on the label. She will eat no meat that isn't cooked in the oven until the meat falls off the bone. And order only fish and seafood in restaurants.

Summary: Six weeks have passed, and we haven't seen Ms. Holden for follow-up. She had the deadly benzene solvent in her, and it was difficult for her to believe it was in her toothpaste. But she had a chance to save herself and recover. Did she take it?

80 Alan Anderson Multiple Cancer Sites

Alan has a son who is an oncologist and recommended a PSA test for him a few years ago. This is a marker for prostate cancer. It was over 100! It should be less than 4. Doctors found cancer metastases into lymph nodes and bone. Chemo brought his PSA down to one. Recently it began to rise again. He was switched from Lupron™ (antitestosterone drug) to Cytradin™ plus cortisone to replace his own. He had a hip replacement several years before the prostate problem. He also now has arthritis in his knees. They have a water softener.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at adrenals, kidneys, bone, testicles and intestine**

Beginning a massive invasion of cancer.

☒ **Fasciolopsis (Parasite) YES at liver, intestine**

☒ **Fasciolopsis eggs (Parasite) YES at adrenals, kidneys, bone, testicles, blood**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES at liver, adrenals, kidneys**

Off propanol sources.

☒ **Methyl ethyl ketone (Solvent) YES**

☒ **TCEthylene (Solvent) YES**

Make own fruit and vegetable juices.

☒ **Uric Acid (Kidney Stone) YES**

☒ **di Calcium Phosphate (Kidney Stones) YES**

Start on kidney herb recipe 2 weeks after starting parasite-killing recipe. We will follow upin a month.

Summary: We will also use the PSA test to follow up on his prostate cancer. He was very eager to solve his prostate problem. He seemed to have enough determination for us to let him start his second program, the kidney herbs, on his own without visiting the office in between. This is not generally good policy since it tends to become overwhelming. But he begged for progress with his pain when sitting and lives two states away, too far away for frequent visits.

Two months and two weeks after the first visit

His PSA has gone up. He will need urethral cleaning.

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Orthophosphotyrosine (Cancer) YES very high**

Worse than before; still using hair spray and has not searched for propanol.

☒ **Nickel, Chromium, Gadolinium, Rubidium (Toxic Elements) YES**

Tooth fillings.

☒ **Molybdenum (Toxic Element) YES**

Automotive?

☒ **Lead (Toxic Element) YES**

Root canal, water?

☒ **PVC (Toxic Element) YES**

Source unknown.

☒ **Tungsten (Toxic Element) YES**

Comes from an electrical heating element. There is no electric water heater.

He does not use a wok or electric frying pan. We will test his toasters. He will not eat toast till then.

☒ **Radon, Uranium (Toxic Elements) YES**

They are living on the 2nd floor. He will read a pamphlet on clearing up radon.

Summary: We are anxiously waiting to hear about him. Hopefully he carried out our instructions and got himself well this time. It was a mistake to let him start out with more than one program in spite of his eagerness.

81 Lynette Sarda Breast and Liver Cancer

Lynette is a 51 year old woman from three states away who came for a number of problems she thought were stemming from her taking Tamoxifen™ for several years. So she took herself off recently but the problems are getting worse. The Tamoxifen™ was given to her to block estrogen uptake after she had a mastectomy on the right side. She had breast cancer in 1986. She now has severe migraines, insomnia and sees her moles are growing. She has had a hysterectomy. They have a water softener.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver and breast**

Cancer spread to the liver.

☒ **Fasciolopsis (Parasite) YES at liver and colon**

☒ **Fasciolopsis eggs (Parasite) YES at liver, colon and blood**

☒ **Isopropyl Alcohol (Solvent) YES at liver and breast**

She has a pet (no doubt the source of Strongyloides, causing her migraines). She will start her pet on pet parasite program and herself on the human parasite program. She will remove all propanol from use *without using up any first*.

Two weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis miracidia (Parasite) YES**

Note: She took the parasite treatment carefully, she got to 12 Wormwood capsules, but one stage is still present. She has had a frozen turkey breast to

eat recently. She will give herself a 3 day high dose program and then maintenance parasite treatment. She will stop eating meats. We have recent blood test results:

BLOOD TEST	Result	Comment
1. Calcium	very low (8.7)	She has been drinking lots of milk, but always skim. She will switch to 2%. Also take magnesium oxide (300mg), one/day.
2. LDH	slightly high (175)	recent cancer
3. SGOT, SGPT	low	Take B6 (250 mg) one/day, forever.
4. Cholesterol	low (172)	cancer risk. Eat butter and olive oil, not margarine.
5. Estrogen	very low	clean adrenals with kidney herb recipe
6. WBC	very low (3.65)	toxin in bone marrow
7. Eos	high (4%)	parasites
8. Atyp lymphs	high (4.7%)	cancer risk

☒ **Aluminum Silicate (Toxic Element) YES at breast**

Change salt to Hain, bypass water softener.

☒ **Aluminum (Toxic Element) YES high at breast**

Deodorant, cookware.

☒ **Iridium, Mercury (Toxic Elements) YES at breast**

Tooth fillings. Obviously, this is quite a burden to her breasts. She needs all amalgam fillings out of her mouth, all aluminum out of her kitchen, and the water softener taken out.

☒ **Platinum, Gallium (Toxic Elements) YES**

Tooth fillings

☒ **Gold (Toxic Element) YES at breast and ovaries**

☒ **Tellurium (Toxic Element) YES at breast**

☒ **Zirconium (Toxic Element) YES**

Off deodorant and toothpaste.

☒ **Terbium (Toxic Element) YES**

Off foil packed foods, off all lozenges and pills except from Bronson's Pharm.

☒ **Wood Alcohol (Solvent) YES**

Drinks Coke™ products.

☒ **Ethyl denatured alcohol (Solvent) YES**

Uses this to clean bathroom. She will go back to simple chlorine bleach for cleaning the bathroom.

☒ **TCEthylene, Methylene chloride (Solvents) YES**

She will stop drinking commercial beverages and eating cold cereals.

Summary: What a toxic build-up there is in Lynette's body! She is dissolving her tooth fillings but instead of passing the metals through the kidney and bowel they are staying stuck in her breast. She probably has numerous kidney stones from all this which, in turn, then slow down excretion. She is full of solvents; no doubt her detoxifying mechanisms are so overtaxed that no solvent can be oxidized any more. The aluminum silicate is probably coming from the water softener. She has not returned. Perhaps her husband did not like to hear all this. We hope he will come along if she comes back.

82 Sarah Hor Kidney and Colon Cancer

Sarah is 47 years old, and came for her kidney disease. She was given interleukin 1 and interleukin 2 plus Interferon shots for her multiple kidney tumors. That was 9 months ago. She was scanned recently, and the tumors are growing again. She has only one kidney left. The other kidney was removed, full of tumors, 2 years ago, and at the same time half of her thyroid was removed for renal cell carcinoma. She listed ringing in her ears and stomach problems as her other problems. She has had a complete hysterectomy and wears an estrogen patch. She is presently on chemo-drip (a catheter implanted in her chest).

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at kidney (very high) and colon only**

☒ **Fasciolopsis (Parasite) YES at liver, kidney and colon**

☒ **Fasciolopsis cercaria (Parasite) YES at kidney and in blood**

☒ **Sheep liver fluke (Parasite) YES at liver, kidney and colon**

☒ **Sheep liver fluke cercaria Parasite) YES at kidney, liver, colon, and in blood**

Start on parasite program.

☒ **Isopropyl Alcohol (Solvent) YES high**

Other solvents not tested. She cleanses her catheter with rubbing alcohol. She will switch to grain alcohol or food grade hydrogen peroxide. We will give her some 17½% "peroxy" to get started. She usually orders medium-cooked beef in restaurants, will stop.

Nine days later

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at kidney, blood only**

☒ **Sheep liver fluke redia (Parasite) YES at kidney, blood only**

Other stages and adults are gone.

☒ **Pentane (Solvent) YES**

☐ **Solvents (Remainder) NO**

The propanol is gone. She drinks coffee and Pepsi™. She will switch to home made beverages.

☒ **Gallium (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

She wears rings. They were YES (*Positive*) for gallium. She will stop wearing them. She will start on thioctic acid (100 mg), 4 per day. She has dentures. We hope they do not contain gallium. Continue parasite program.

Summary: Sarah did not return after hearing her cancer was gone. This is probably for financial reasons. She was very pleased with how she felt and could not believe these simple herbs succeeded where interleukin and interferon had failed. Hopefully, she is staying on our meat rule (beef, turkey, and chicken must be cooked at home, as well done as if it were pork, never grilled. And only fish or seafood in restaurants). The thioctic acid will speed up removal of gallium from her body.

83 Bryan Myers Colon Cancer

Bryan, age 57, came for his painful feet, which began after an aortic bypass was done in 1990. At

first the leg from which the blood vessel was taken was painful, too. His clinical doctor told him there was no connection. He smokes. My first thoughts were thallium or cadmium toxicity.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

This was a surprise. His wife had had cancer and had a breast removed. She also smokes. They have a water softener.

☒ **Fasciolopsis (Parasite) YES at liver only; NO at intestine**

☒ **Fasciolopsis eggs (Parasite) YES at lung and blood only; NO at intestine**

Obviously, he picked up the infective stages from somewhere other than if he had adults in his own intestine. This could be from eating raw meat or by sex or kissing. Smoking probably drew it to his lung. Another possibility is that his intestinal flukes were somehow killed while the stages survived in the blood. He will start on parasite program. He will use ginseng capsules and Chinese herbs to help him stop smoking. His wife will smoke outdoors only. He will switch his shampoo and shaving supplies to our varieties.

☒ **Oxalate, Phosphates (Kidney Stones) YES**

Sixteen days later

He has done parasite program. He will start kidney program.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

His cancer is gone. He says his bowel movement is normal again. He has notstopped smoking but likes the ginseng. His wife stopped smoking for his sake. He would like to do his share.

☒ **Cadmium, Europium oxide (Toxic Element) YES**

He has dentures. He will stop abrasive brushing and will use strong salt water and food grade hydrogen peroxide for brushing instead. We will see if this clears it up.

☒ **Ruthenium (Toxic Element) YES**

Dentures?

☐ **Toxic Elements (Remainder) NO**

His glasses frames are YES (*Positive*). They may contain cadmium, adding to cadmium from cigarettes. Cadmium is the usual cause of leg pain (smoker's leg). It could, of course, be in his water supply if there is galvanized piping, but we will try to emphasize the smoking first, for his sake. He will get plastic framed glasses. He had a blood test done and will bring a copy next time.

Summary: Although Bryan's cancer cleared up within 16 days without stopping smoking, we emphasize stopping a lot. His lung lesions will probably continue to enlarge, and he may not get his foot pain relieved without stopping. We may not see him again, though, since heavy emphasis on stopping addictions loses us nearly every client.

84 Leo Stafford Liver and Intestinal Cancer

This young man in his early thirties came to the office for a skin rash in the groin area. Although it is no doubt Candida, I suspect PCBs are weakening his immunity. He has tried every medication given by clinical doctors, as well as over-the-counter products. Nothing works. Also, any little sore he gets from his work (he works with lumber) does not heal for a long time. I suggested stopping using detergents, where PCBs are found, and using simple borax for all purposes: dish washing, laundry, shampoo, bathing, and citric acid to rinse his hair and body (¼ tsp. to a pint of water).

☒ **Aluminum Silicate (Toxic Element) YES**

In salt, switch to Hain's

☒ **Bromine (Toxic Element) YES**

Rare, could it be in lumber treatment? Stop eating bread made with brominated (bleached) flour.

☒ **Europium (Toxic Element) YES** Tooth metal?

☒ **Platinum (Toxic Element) YES** Tooth filling or metal watch or glasses rims.

☐ **Solvents (ALL) NO**

☒ **Candida (Pathogen) YES**

He will use only our homemade skin lotions or apricot kernel oil, or 50% glycerin.

☒ **Cholesterol crystals (Gallstones in liver) YES**

Crystals deposited somewhere. Clean liver.

One month later

He says there is some improvement but some lesions, especially on legs, are two years old!

BLOOD TEST	Result	Comment
1. WBC	high (8.2)	infection somewhere
2. RBC	low (4.7)	there is a blood loss somewhere. Parasites?
3. Eos	very high (12%)	parasites at high level
4. Urinalysis	shows urinary tract infection	
5. Cholesterol	very low	cancer risk - will test; eat butter and olive oil)
6. Ferritin	high (137)	cancer risk

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver and intestine**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis miracidia (Parasite) YES at blood only**

☒ **Sheep liver fluke redia, miracidia, and eggs (Parasite) YES at intestine**

☒ **Ancylostoma (hookworm) duod. (Parasite) YES at skin**

☐ **Pancreatic fluke, Ascaris, Trichinella, Strongyloides, Necator (Parasites) NO**

He will start on the Parasite-Killing Program.

☒ **PCB (Toxic Element) YES**

Off detergent.

One month later

He is healing better. Leg lesions are better. Scrotum is still raw and flaking. He has chest pain today, over breast bone.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at thymus; NO at liver**

Suspect benzene.

☒ **Sheep liver fluke (Parasite) YES at thymus; NO at liver**

No stages found for either fluke. Repeat 5-day high dose parasite program, then maintenance.

☒ **Benzene (Solvent) YES at thymus; NO at liver**

He will go off all toothpaste and Vaseline products, ice cream, and frozen yogurt.

☐ **Aluminum Silicate, Europium. Bromine (Toxic Elements) NO**

Now wears gloves to handle lumber.

☒ **Platinum (Toxic Element) YES**

Must be tooth fillings since he has changed glasses and wrist watch to plastic - replace tooth fillings with composite.

☒ **Candida (Pathogen) YES**

PCBs probably still in clothing.

☒ **tri Calcium Phosphate, Oxalate, Uric Acid (Kidney Stones) YES**

Summary: What a tragedy it is to fill up a young person, the same age as my children, with PCBs. My generation did not have this handicap. Body yeast in the genital area must be a difficult problem. If all the people with this problem were to join hands, could they persuade authorities to protect them? Could the responsibility be placed on the suppliers to analyze their products for a list of harmful substances (like PCBs or solvents) rather than having the responsibility be with the individual person to prove that the ailment was caused by a particular product? We shall soon all be in this young man's situation! Notice that in the first solvent test there was no benzene, and in the second test it was YES. He had picked it up between tests. He was still healthy enough to detoxify and clear it from his body. But he is very near to getting the HIV virus from the fluke in his thymus.

Five weeks later

He feels better and has more energy. Skin purple spots (reddish, but not open lesions) are still on both legs. He has had 2 bouts of the flu. Groin itch is better. He has not yet done dental work.

85 Sue Weeks Cancer at Multiple Sites

This 52-year-old woman gave a hair-raising account of brushes with death. In the early 80s, she was diagnosed as having Chronic Fatigue Syndrome. Her clinical doctors found she had 80% blockage of carotid arteries and leg arteries. She chose chelation instead of standard clinical treatment but stopped after 60 treatments without responding. She was on 90 supplements a day but was still bedridden. She picked up active mononucleosis and went down to 84 pounds in weight. She got all amalgams out but it made no difference. She tried acupuncture for pain. She was in pain all over and had terrible fatigue. She tried the macrobiotic diet for 2 years; this made her feel better, but she didn't gain weight or energy. She went to an Oklahoma clinic and a Reno clinic for homeopathy. No improvement. Near death, she went to an alternative hospital in Mexico. She was on Gerson therapy for 2 years but couldn't get well. Suddenly she improved without explanation for 3 months. Then she worsened and was hospitalized. Her relationship broke, and she had to return to her mother's home. At the same time she was pursuing clinical routes with CAT scans, hematologists, neurologists, and other specialists too numerous to mention. Her mother died of cancer.

☒ **Orthophosphotyrosine (Cancer) YES at liver, kidney, bladder, intestine, stomach**

Cancer everywhere! How has she survived?

☐ **Protein 24 (HIV) NO**

☒ **Fasciolopsis (Parasite) YES at liver, kidney, bladder, intestine, stomach**

☒ **Fasciolopsis miracidia (Parasite) YES at liver, kidney, bladder, stomach**

She used to eat rare meat. She craved meat. Start on parasite program.

Two weeks later

☐ **Orthophosphotyrosine (Cancer) NO**

Client says she is cured, she feels fine. She can't believe it was simply a parasite and that she probably ate it many times. She wonders why nobody is looking for such things.

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Ancylostoma can. (Parasite) YES**

Has a dog and will treat it

☒ **Human liver fluke (Parasite) YES**

☒ **Ancylostoma br. (Parasite) YES**

☒ **Dog heartworm (Parasite) YES**

Raised horses, had dogs, was a nail biter.

☒ **Eimeria (Parasite) YES**

Used to have ducks.

☐ **Parasites (Remainder) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

☒ **Benzene (Solvent) YES**

Uses Tom's Toothpaste™, will stop. She will use Milk Thistle, 2 a day. She will get all solvents out of her house, except grain alcohol. She will avoid the benzene list I gave her and the propanol list.

Summary: A ten year torment was ended in 2 weeks by killing this large parasite that had invaded so much of her body; it is a wonder she was alive to tell the story. Possibly all her alternative therapies helped her to survive, each in its own way. She was undoubtedly reinfecting herself many times and letting parasites proliferate due to having the two worst solvents accumulated in her. Her intelligence and courage saw her through. Hopefully she will follow-up in the near future.

86 Esther Santos Breast Cancer

This 49-year-old woman came to the office for a list of peculiar symptoms: numbness of lips, arms and tip of tongue occasionally. Tingling sensation in her back. Leg veins turn blue and painful, also the wrist veins. Her clinical doctor diagnosed pulmonary angina and put her on 2 aspirins a day for the last 4 months. The symptoms haven't changed. She had a polyp in a milk duct in her right breast removed a year ago and another one in the left cheek sinus, not removed. She recently discovered a lump in her breast and is scheduled for a biopsy in 10 days. They have a water softener. There is pain in her left collar bone.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES at liver, side of breast and intestine**

☒ **Fasciolopsis redia (Parasite) YES at liver, side of breast, blood**

☐ **Fasciolopsis other stages (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

☐ **Solvents (Remainder) NO**

Start on parasite program.

Summary: Esther only made this one visit to our office. She feared her insurance company would not pay for anything. Perhaps the breast lump biopsy showed a malignancy, and she pursued the clinical route of removing the breast. Perhaps it did not show a malignancy (the parasite program could have turned it around in 5 days), and she lost confidence in our testing. Whatever happened, we will never know. Hopefully she began to avoid propanol-containing cosmetics as we suggested.

87 Rosa Lee Kestler Pancreatic Cancer

Rosa Lee, age 63, came in because her clinical doctor found gallstones in her gallbladder. She had a serious attack where she passed out and was hospitalized. They did a blood test then, which showed that the pancreas had some blockage, too, because the pancreatic enzyme, lipase, was very high in the blood. The doctor wanted to do surgery to investigate the problem and possibly remove stones from the pancreas, too. But she declined the offer and doesn't know what to do next. She brought in a recent blood test when all this happened.

BLOOD TEST	Result	Comment
1. FBS	slightly high (135)	clean the liver
2. BUN and Creatinine	slightly high	clean the kidneys
3. Calcium	very low (8.7)	Drink 2% milk, 3 glasses a day (cow or goat); take Vitamin D (50,000 iu, from doctor or dentist), 3 a week; take magnesium oxide (300 mg), one a day.
4. Chloride and potassium	very low (95, 3.8)	adrenal problem; clean kidneys
5. Albumin and Total protein	slightly low	clean liver
6. GGT, SGOT, SGPT	all very high (74, 130, 140)	liver disease
7. LDH	very high (359)	heart stress or cancer
8. WBC	very high (20.8)	gallbladder disease
9. RBC	high (5.25)	check for cobalt toxicity
10. Lymphs	very low (5%)	toxin in bone marrow
11. Platelet count	very high (383)	parasites
12. Amylase	very high (548)	pancreas problem

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver, pancreas**

Her doctor may have suspected cancer when he wanted to look inside her body.

☒ **Fasciolopsis (Parasite) YES at liver, intestine, pancreas**

☐ **Sheep liver fluke and its stages (Parasite) NO**

☒ **Pancreatic fluke and stages (Parasite) YES**

Start on parasite program. Remove all propanol from her house.

Eight days later

She has a lot more energy. In fact she looks happy.

☐ **Orthophosphotyrosine (Cancer) NO**

She got up and hugged me. She brought in a jar with dead flukes in it. She passed them in her stool, they came to the top. They appeared to have black hairy legs. I recognized them as either intestinal or Sheep liver flukes; the "black hairy legs" are strings of eggs.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and stages (Parasite) NO**

☐ **Human liver fluke and stages (Parasite) NO**

She'll continue parasite program and go off all commercial beverages and cold cereals.

Summary: Rosa Lee was a model client, a joy to work with. In eight days she had eliminated cancer and begun to regain her health. I hope she carries out her whole program and learns to live into her 90's in a healthy state.

88 Kathy Doyle Breast Cancer

Kathy is 29 years old and has been watching a breast lump for 3 years. Mammograms were "sometimes *Positive*, sometimes *Negative*."She also has low back pain and very crampy menstrual periods. She drinks coffee, tea and cola to control her weight but feels she is still overweight. She

seems of normal weight to me.

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at breast**
- ☒ **Fasciolopsis (Parasite) YES at liver, uterus, intestine, breast**
- ☒ **Fasciolopsis cercaria (Parasite) YES at breast, blood, uterus**
- ☐ **Sheep liver fluke (Parasite) NO**
- ☒ **Isopropyl Alcohol (Solvent) YES at liver**

Since she came late to her appointment, it had to be cut short. Only these essentials were tested. She will start a *Parasite-Killing Program* and go off all propanol-containing products.

One month later

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**

She was late for her appointment, and I will need to cut her time short again.

- ☒ **Chromium (Toxic Element) YES**

The source of chromium is not clear since she does not use eye make-up, and they do not have a water softener. She'll go off her supplements and use only Bronson's Pharm brand.

- ☒ **Gallium, Gadolinium (high), Platinum, Silver (Toxic Elements) YES**

Tooth metal.

- ☒ **Strontium (Toxic Element) YES**

Off toothpaste.

- ☒ **Zirconium (Toxic Element) YES**

Go off deodorant.

☒ **Benzene (Solvent) YES**

Was just one step away from getting the HIV virus.

☒ **Pentane, Methyl ethyl ketone, Toluene, Methyl butyl ketone (Solvents) YES**

She will remove all solvent type cleaners from the house and stop drinking pop. She will go off toothpaste, chapstick, ice cream, and frozen yogurt to get rid of benzene.

Summary: Kathy was very lucky to be told about her benzene problem and how to stop getting it into herself; otherwise she would have soon had the HIV virus. Notice how her metal tooth fillings are dissolving. The toxic metals are probably attaching themselves to her breast tissue; there wasn't time to check this. She is to get dental work done before returning.

Three months after first visit

She is on the birth control pill for excessive bleeding. She has not done dental work yet.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

Her breast lump is still there.

☒ **Wood Alcohol, TCE (Solvents) YES**

She will go off commercial beverages, definitely, this time. She will start drinking 2% milk, 3 glasses a day and take magnesium, 300 mg, one a day. She had a blood test done.

BLOOD TEST	Result	Comment
1. SGOT, SGPT	slightly low (16, 18)	take B6 500 mg/day
2. Triglycerides	slightly high (157)	kidney problems
3. Iron	low	parasites and excessive bleeding
4. Urinalysis	shows urinary tract infection	kidney

She will go back on the kidney herbs for 2 weeks. She will also repeat a 3 day high dose parasite program.

89 Elizabeth Iler Cancer Of Pancreas

This 54-year-old woman looks like 74. Her sister-in-law and daughter-in-law brought her from

the West for treatment of cancer of the pancreas. It is inoperable, and she is losing weight fast. She has a tube implanted in her stomach to give herself extra feedings. She is on Percocet™ and morphine for pain. Her complexion is yellow, and she knows she is being treated like a terminal patient. She smokes. She does not want to stop.

☒ **Orthophosphotyrosine (Cancer) YES at liver, pancreas**

☒ **Fasciolopsis (Parasite) YES at liver and intestine, NO at pancreas**

☒ **Fasciolopsis eggs (Parasite) YES at pancreas**

☒ **Fasciolopsis cercaria (Parasite) YES at pancreas**

☒ **Sheep liver fluke redia (Parasite) YES at pancreas**

☐ **Pancreatic fluke and stages (Parasite) NO**

☒ **Human liver fluke metacercaria (Parasite) YES at pancreas, NO at liver**

☒ **Isopropyl Alcohol (Solvent) YES at liver and pancreas**

☒ **Wood Alcohol, Methyl butyl ketone (Solvent) YES**

She will start parasite program. She will go off all "prop"-containing products, meaning isopropanol. She will go off commercial beverages and make herself fruit and vegetable juices and cereals. She will be totally vegetarian for 3 months. She will use Bronson's Digestive Enzymes to assist the pancreas temporarily; 6 with larger meals, 4 with breakfast.

Two days later

☐ **Orthophosphotyrosine (Cancer) NO**

She was incredulous that her cancer could be gone in 2 days. She is off propanol (it was in her face cream and hair spray). She is off meat. She is off commercial beverages; she has found fresh squeezed juice in the grocery store. She is using Bronson's Digestive Enzymes and is feeling better.

☒ **Barium (Toxic Element) YES at pancreas**

Check lipstick.

☒ **Cesium (Toxic Element) YES**

She has been drinking distilled water from plastic bottles; will switch to cold faucet water.

☒ **Palladium, Mercury (high), Gold (high), Samarium (Toxic Elements) YES at pancreas**

Tooth fillings.

☒ **Tin (Toxic Element) YES high at pancreas**

Will go off toothpaste.

☒ **Uranium (Toxic Element) YES at pancreas**

Seal cracks.

☒ **Radon (Toxic Element) YES**

Summary: Elizabeth had perked up at her second visit when I told her that her cancer was already gone. She reeked strongly of tobacco smoke. When I brought this up to her, she replied that since she was dying there was no need to quit. The women with her disagreed and tried to support my view. Then I pointed out to her that she was one of the fortunate ones who have only 2 problems of any difficulty: She merely needed her teeth replaced by plastic and to seal cracks in her basement. Checking in her mouth, there were only 4 on each side that needed replacement, but she began to sob about the cost. She whined and groaned about having to borrow money from her family, and said she couldn't do it. I personally believe she was looking for any excuse to die rather than survive, so that she would not have to quit smoking. What devilish games our addictions play with us. And to think that wonderful, moral-minded people allow themselves to grow tobacco for money, knowing that the addiction spells death for other humans, perhaps their own grandchildren! I hope her wonderful family will persuade her to choose life for herself and transport her to the dentist.

90 Betty Naylor Cervical Cancer and HIV

Betty is 24 years old, arriving from a neighboring state for Chronic Fatigue Syndrome. However, she had an impressive list of additional symptoms involving her lower back, stomach, chest (tightness and the need for long breaths of air), throat, skin, ears, neck, and PMS. They have a water softener. The chest problem suggested the possibility of HIV-illness. She sleeps all day and has burning over the chest. She has been sick all winter.

☒ **Protein 24 (HIV) YES at thymus, vagina**

There are no known risk factors.

☒ **Orthophosphotyrosine (Cancer) YES at cervix only**

☒ **hCG (Pre-Cancer) YES at thymus, cervix, NO at vagina**

This was quite a surprise. Betty volunteered that she had never had sex in

her life and had never been in a hospital except at birth. I assured her that this virus, HIV, did not originate with sex and blood and could be quickly cleared up, provided she followed instructions meticulously. She was very eager to do so.

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at cervix and vagina**

☒ **Fasciolopsis cercaria (Parasite) YES at cervix**

☒ **Fasciolopsis eggs (Parasite) YES at vagina**

☒ **Sheep liver fluke adults (Parasite) YES high at liver (one side) and intestine**

☒ **Sheep liver fluke eggs (Parasite) YES at liver (one side) and cervix and vagina**

☒ **Human liver fluke adults and eggs (Parasite) YES at liver (same side as above)**

These findings suggest both benzene and isopropanol have accumulated in Betty's body. There isn't enough time to test for all solvents.

☒ **Benzene (Solvent) YES at thymus and vagina**

☒ **Isopropyl Alcohol (Solvent) YES at liver (same side as above) and thymus, NO at vagina**

Remainder of solvents not tested. She is to go off all toothpaste, Vaseline™ products, ice cream and frozen yogurt, cold cereals and cooking oils, except olive oil. This is to avoid benzene. She is to go off all body products that have "PROP" on the label to avoid propanol. She will go off her shampoo, mouthwash, hair mousse and hair spray because they contain it without labeling. She is to go off all commercial beverages to avoid other solvents, not yet tested. We will follow-up very soon. She is very anxious. She will start on the *Parasite-Killing Program*. She will be strictly vegetarian for 3 months. She will use our replacement shampoo, etc.

Five days later

She has a lot more energy and went off her antibiotics. She is very

apprehensive, though.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Solvents (ALL) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Human liver fluke and all stages (Parasite) NO**

She is elated. She will continue the *Parasite-Killing Program* and other lifestyle changes.

☒ **PCB (Toxic Element) YES**

Go off detergent; use borax, washing soda and homemade or Amish soap.

☒ **Gadolinium, Tantalum (Toxic Elements) YES**

Tooth fillings.

☒ **Holmium (Toxic Element) YES**

Probably with the PCBs.

☐ **Toxic Elements (Remainder) NO**

She needs metal tooth fillings replaced. After 3 months of vegetarian diet she will eat only fish and seafood in restaurants and super-well done meats at home.

Summary: This young woman fairly bounced out of the office at the good news of her second visit. The entire story of how she could have gotten the HIV virus and developed cancer of the cervix was like a revelation to her - almost unbelievable. Yet her mother, she said, was witness to her health improvement in just 5 days, and so she is forced to believe it. At any rate, she is much too scared not to believe that she had HIV virus. Notice a peculiarity: There is no adult intestinal fluke in the liver. Not even a stage of it is in the liver! Yet there is orthophosphotyrosine being produced. It is being produced at the cervix where the miracidia and cercaria are and where the Sheep liver fluke eggs are.

Now, the Sheep liver fluke adults are found in the liver. Could they orchestrate the production of orthophosphotyrosine for the intestinal fluke?

Or was there an adult intestinal fluke at some earlier time which died? One very seldom sees both adult flukes together. Do they kill each other somehow? Notice, too, that the cancer marker, hCG, was present along with the cancer marker, orthophosphotyrosine, at the cervix. But only hCG was being produced at the thymus. Is a particular parasite stage responsible for producing hCG? I explained to Betty that she must take great care to protect her thymus for two years so that it will completely regain its health. It would be tempting to neglect the dental work but this would be a tragic mistake. Benzene leaves the thymus in a weakened condition so that other solvents and toxic substances continue to get accumulate there. This would, surely, give her lowered immunity, perhaps even AIDS.

91 Ken Kitsinger Brain Cancer

Ken is a quiet but highly attentive young man of 19. He said his parents had brought him to our office for depression but he disagreed with this opinion. Both parents were respectfully quiet while he spoke. He is currently getting psychiatric counseling. I explained the cause of serious depression to be brain parasites and toxic elements accumulated in the brain. It was therefore quite shocking to see the initial test results.

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at brain**

He has brain cancer!

- ☒ **hCG (Pre-Cancer) YES at brain, blood**
- ☒ **Fasciolopsis (Parasite) YES at liver, intestine; NO at brain**
- ☒ **Fasciolopsis redia, cercaria, eggs, miracidia (Parasites) YES at brain**

Note: Every stage of the fluke is present, suggesting a high level of solvents. Note that the cancer marker hCG is present in the blood; it could have been found clinically by a blood test. Finding this brain cancer was rather shocking. But his mother stated that Ken's first cousin, a boy, had died of brain cancer at the age of 18. So the news of Ken's brain cancer was not totally unbelievable. I could assure them of a complete recovery.

- ☒ **Sheep liver fluke redia (Parasite) YES at brain**

Here the presence of a developmental stage of Sheep liver fluke without an adult present to produce it, suggests another source, most likely raw meats.

They will stop eating rarely cooked meats (they do a lot of grilling).

☒ **Pancreatic fluke stages (Parasite) YES at brain**

Again no adults.

☒ **Human liver fluke (Parasite) YES at brain and thymus**

Apparently the thymus is involved, too, suggesting benzene accumulation there. He will start on the *Parasite-Killing Program*.

☒ **Benzalkonium (Solvent) YES at brain**

Go off toothpaste.

☒ **Asbestos (Toxic Element) YES high at brain**

Change dryer belt to USA made; bring in old belt for testing; test hair blower. He will make his own hair spray, switch shampoos and go off the benzene-containing items on the benzene list. He will stop eating out of styrofoam.

☒ **Mercury (Toxic Element) YES at brain**

Remove amalgam tooth fillings.

Summary: brain cancer is fairly rare; yet two persons, both very young, had this disease in his family. Could it all be inherited through the placenta from the mother or through sex during pregnancy? Had his body defended him all these 19 years, only now to be losing the battle? Surely, he had not been using propanol all this time, nor benzene. My guess is that the fluke resided quietly in the intestine for all family members. Then, as usage of propanol and benzene began in early adulthood, they colonized the brain and thymus. This still does not answer why the brain was selected by the parasite stages, rather than another tissue. Possibly, the brain-seeking solvents, xylene and toluene, were present, the cousins choosing the same brands of beverages.

Seventeen days after first visit

The dentist took panoramic x-rays and found no mercury fillings. He will get a tooth extracted, though. He will take vitamin D (50,000 u) 2/week to help heal the bone cavity when the tooth is extracted. He is not drinking milk but will start with 3 glasses of 2% a day. He will also take magnesium oxide, (300 mg), 1 per day.

☒ **Asbestos, Mercury, Gadolinium, Indium, Fiberglass (Toxic Elements) YES**

They have brought air samples, but there is no time to test for them - he has just taken a job and must be on time for it!

☐ **Solvents (ALL) NO**

☒ **Mycoplasma (Pathogen) YES at brain (cerebrum)**

☒ **A strep, Measles (Pathogens) YES at brain**

☒ **Shigella flex (Pathogen) YES high at brain**

Shigella produces a toxin that causes intense irritability, even anger. Could this be the major cause of his depression? We will see him after the dental work. These are very rare pathogens to be seen in the brain!

☒ **Seven weeks later**

There are no changes in his condition. He has had one tooth extracted by a non-Huggins trained dentist, so the socket wasn't cleaned.

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **Benzene, Isopropyl alcohol (Solvents) YES**

☐ **PCB (Toxic Element) NO**

☒ **Mercury (Toxic Element) YES at teeth 10, 18, 22, and 29**

☒ **Fiberglass (Toxic Element) YES**

☒ **EBV, Bacteroides fragilis, Streptococcus pneumoniae, L strep, Haemophilus influenzae, Herpes zoster, Herpes simplex, FLU (Pathogens) YES in brain**

He will try harder to exclude benzene and propanol and other solvents from food and body products. He is showing an AIDS-like syndrome in the brain.

92 Alyce Dean Lung Cancer and HIV

Alyce is a low key, sweet tempered person, age 48, brought in by her brother for a spreading numbness in her body. She has pain and numbness at the same time in her arms, legs and hands. Three years ago Alyce had a mastectomy on the right side for cancer. Now a lump is developing on the back of her neck. (I suspect this is a PCB cyst.)Her father died of liver cancer a few years ago.

☒ **Orthophosphotyrosine (Cancer) YES at lungs only**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis redia (Parasite) YES in blood**

She will start on the Parasite-Killing Program.

Four days later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

Her cancer is gone, but her symptoms have not improved; in fact, she is worse, and walks slowly.

☒ **Terbium (Toxic Element) YES**

Probably in a pill.

☒ **Zirconium (Toxic Element) YES**

Off deodorant. These are not enough to explain her nerve-muscle deterioration.

☒ **Benzene (Solvent) YES**

There are building supplies (paint thinner) on the back porch. Also insect spray and chemicals for dairy animals. She lives alone but will have one of her children remove it all and make an air sample in her home for us to test. She is to return within the week, this is urgent.

Fifteen days later

She is much worse. It is tragic to see this young woman losing ground. If she can't find the benzene source, she may not survive. She missed 2 earlier appointments due to transportation problems.

☐ **Orthophosphotyrosine (Cancer) NO**

Cancer has not returned.

☒ **Protein 24 (HIV) YES**

Now has HIV illness.

☒ **Benzene (Solvent) YES, and in bedroom air sample, bathroom air, kitchen air, porch air**

Cattle spray supplies have not yet been removed.

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus, bone marrow, and blood**

This is evidently from eating undercooked meat since they were all absent last week. Herchildren are cooking for her. It is impossible to say no to their cooking,Some of the chemicals have been removed from the porch. She has seen her clinical doctor who has scheduled radiation for her.

☒ **Salmonella (Pathogen) YES throughout body (is septic)**

☒ **EBV, Coxsackie B #4 (Pathogens) YES**

Others not tested. She is to clear the whole house of chemicals; her highest priority is to get the benzene out of her body. Her family is sympathetic but isn't taking seriously the need to clear the house of chemicals. Alyce does not have enough immune power to combat the simplest infections anymore.

Summary: This is the last time we saw Alyce. She cleared her cancer in the first four days and the future looked bright. But she was not strong enough to clean up the solvent benzene, which was polluting the air in her house and let 2 weeks slip by. Her family did not come with her to learn the details of cleaning up and so the job was left undone. Without immunity, she was helpless against the most common bacteria and viruses.

93 Stan Spillman Prostate Cancer

Stan is 76 and was brought in by his sister because he has refused to go to a clinical doctor for almost 20 years. He has difficulty urinating and is up 4-5 times a night to try to empty his bladder.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at prostate**

☒ **hCG (Pre-Cancer) YES at prostate**

☒ **Isopropyl Alcohol (Solvent) YES at prostate, liver**

He uses a hair thickener, not a hair spray. He will go off, also off shampoo and after-shavelotion. He will use our products.

☒ **Isophorone, Pentane, Styrene, Methyl Ethyl Ketone (Solvents) YES**

Will be careful not to use styrofoam dishes. He drinks mostly root beer, thinking it is good for him to drink so much water to help his urination. He will go off all commercial beverages and stick to our list of six.

☒ **Fasciolopsis (Parasite) YES at prostate and liver**

Note: We seldom see an adult fluke in the prostate, but here is a case of it.

☒ **Fasciolopsis redia (Parasite) YES at bladder and semen**

Note: If he were sexually active, he would transmit redia to his spouse. We will search for them in his urine specimen.

☒ **Sheep liver fluke (Parasite) YES at prostate, NO at liver**

Note: quite unusual for a liver fluke that ought to be in the liver to be in the prostate. It often seems as though *Fasciolopsis* keeps the Sheep liver fluke out of the liver and vice versa.

☒ **Sheep liver fluke cercaria and metacercaria (Parasite) YES at prostate, bladder and semen**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☐ **Human liver fluke and all stages (Parasite) NO**

He will start on parasite program.

Summary: Both cancer markers orthophosphotyrosine and hCG were present in the white blood cells and prostate. It is tempting to speculate that propanol can cause the Sheep liver fluke, as well as the intestinal fluke, to produce orthophosphotyrosine. This would mean the Sheep liver fluke could give us cancer, too. But if they don't let each other into the liver, whoever gets there first may stay there. Or perhaps the intestinal fluke can chase the Sheep liver fluke out of the liver. Could it be that sheep flukes can defend against invasion by intestinal fluke? The relationship between them should be a fascinating study.

Five weeks later

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

He is rid of his cancer. We will now search for the heavy metals and other toxic accumulations in the prostate that enabled the cancer to develop there.

☒ **Mercury (Toxic Element) YES at prostate**

☒ **Tooth fillings.**

☒ **Nickel (Toxic Element) YES at prostate**

Tooth fillings. Remainder not tested. He is advised to have all metal removed from his mouth and replaced with metal-free plastic. Note: nickel is almost always seen accumulated in the prostate.

94 Sharon Brownie Liver and Lung Cancer and HIV

Sharon Brownie came to the office for pain behind her shoulder blades, behind her ears, in both legs, and on top of her head at the scalp. These are unusual symptoms to occur together.

☒ **Protein 24 (HIV) YES at thymus**

Quite a surprise.

☒ **Orthophosphotyrosine (Cancer) YES at liver and lungs**

She also has liver and lung cancer, another surprise, since there is no smoker in the house.

☒ **Fasciolopsis (Parasite) YES at thymus and blood**

The meaning of this result is not clear. How could an adult fluke fit into a blood vessel? She has both cancer and HIV. Yet, the adult intestinal fluke is not in the liver, only in the thymus and, apparently, blood.

☒ **Fasciolopsis redia (Parasite) YES at blood, thymus, liver and lung**

She will start on parasite program. She will go off items on the benzene and propanol lists.

Four days later

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Protein 24 (HIV) NO**

Fifteen days later

She feels considerably better. She still gets weak spells in her arms and legs (but not pain, now).

- ☐ **Protein 24 (HIV) NO**
- ☒ **Gallium, Gold, Ruthenium (Toxic Elements) YES**

  Tooth fillings. She has no tooth fillings but wears a metal partial denture. She will get a new metal-free plastic one.

Thirteen days later

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **Oxalate (Kidney Stones) YES**

  Start on kidney herb recipe.

- ☒ **Isopropyl Alcohol (Solvent) YES**
- ☒ **Pentane (Solvent) YES**
- ☒ **Kerosene (Solvent) YES**

  Used in cook stove.

- ☒ **Denatured alcohol (Solvent) YES**

  Used in lamps. She will be much more careful when pouring these fuels and will stop drinking soda pop.

- ☒ **Diphyllobothrium (Parasite) YES**

  Dog/fish tapeworm. She will increase parasite dosage.

Eleven days later

She still has pain at left lower abdomen, upper back and lower back. This is probably still due to parasites, plus liver gallstones.

- ☐ **Kidney Stones (ALL) NO**

  Continue kidney herbs at half dose.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Denatured alcohol (Solvent) NO**

☒ **Pentane (Solvent) YES**

Can't give up soda pop.

☒ **Isopropyl Alcohol (Solvent) YES**

Source unknown, since she uses no commercial body products.

☒ **Gastrothylax, Trichomonas (Parasites) YES**

☒ **Continue parasite program.**

☐ **Parasites (Remainder) NO**

She will start taking peroxy and 07 in preparation for a liver gallstone cleanse. She will do a 5 day high dose parasite treatment.

Another month later

Her left arm is numb, both feet are numb. There is shoulder and shoulder blade pain. She is still putting off the dental work.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **Diphyllobothrium Gastrothylax, Trichomonas (Parasites) NO**

☐ **Solvents (ALL) NO**

☒ **Diplococcus pneu, Histomonas, Salmonella typh, Haemoph inf (Pathogens) YES**

Two of these are teeth bacteria. She is getting a lot of headaches. Remainder of box 1 and 2: NO.

Five weeks later

She is still getting a lot of headaches, probably from tooth bacteria. She did a liver cleanse and got numerous tan-colored stones.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Clostridium sept. (Pathogen) YES**

Probable cause of pain behind both ears. Needs to do dental work.

☒ **Wood Alcohol (Solvent) YES**

Is drinking Pepsi™ again.

☒ **Kerosene (Solvent) YES**

They are using it again; must change.

Summary: Sharon eliminated the HIV virus and her liver cancer in record time: 4 days. What was more difficult was eliminating headaches; in fact, it was not accomplished. Her isopropanol disappeared after she switched off commercial shampoo. It remains to be seen whether her arms and feet will recover. She does plan to get the dental work done.

95 Kimberly Maston Brain Cancer

Kimberly is a middle-aged person from a Midwest state, seemingly quite anxious about her condition. Her whole left side feels as though electric shocks were traveling up and down it. It seems paralyzed, too. But she walks normally and can use her arm. This began after surgery 2 years ago at the base of her brain for cancer. She went through physical therapy after that and is exercising, but this new kind of paralysis set in just as she was discharged from the physical therapy program.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at cerebellum**

☒ **hCG (Pre-Cancer) YES at cerebellum**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis miracidia (Parasite) YES at intestine, spleen, kidney, bladder and cerebellum**

The remaining large fluke parasites were not tested because I felt she had too much anxiety already to cope with more information. I discussed avoiding rare meats with her; she is a lover of rare beef, but she agreed. I discussed avoiding propanol in her shampoo, hair spray and other products. She will switch to borax for shampoo. She will start on the *Parasite-Killing Program*.

Summary: Kimberly is having a recurrence or continuation of her brain cancer. Possibly this is the cause of her left side strange paralysis. However, it could also be bacterial in origin; the bacteria having gotten entrenched in the cerebellum during surgery, or simply coming along with the parasite stages. Bacteria such as Shigella produce powerful nerve toxins.

☒ **There could be a metal involvement, too, but all this must wait till she returns.**

Four weeks later

Kimberly has had a fall, due to the weak knee, she believes. She is in a wheel chair but very sprightly.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **Isopropyl Alcohol (Solvent) YES throughout her body**

Didn't switch body products.

☒ **Benzene, mothballs, kerosene, MBKetone, methyl propanol, butyl nitrite (Solvents) YES**

She was so engrossed in her fall and wheelchair adventure that she neglected the restrictions I gave her. But she took the parasite program carefully and got rid of her cancer. She will be careful about restrictions now, so she can recover.

☒ **Arsenic (Toxic Element) YES**

There is no pesticide in her home; she will steam clean her carpets.

☒ **Europium, Silver, Copper, Mercury (Toxic Elements) YES**

Tooth fillings. Others not tested. She is advised to replace all tooth metal with metal-free plastic.

96 Kitty Klipper Intestinal Cancer

Kitty is 46 years old and has written down a long list of symptoms. One would be tempted to think of hypochondria since she looks well. Her symptoms seem minor, such as weak hands, bad digestion, weak knees, tight throat, stiff neck. But 2 dozen of these is surely not hypochondria! She stated her anxiety about cancer. Her mother, aunt and sister had breast cancer. (This could unnerve anybody.)

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

☒ **hCG (Pre-Cancer) YES at intestine and breast**

Kitty's suspicion and anxiety proved correct; she had cancer, and it was beginning to move toward the breast in the family tradition. Note the cancer marker, hCG, was not in the blood yet, so it could not be detected this way, although it was present in the breast.

☒ **Fasciolopsis (Parasite) YES at intestine and liver**

☒ **Fasciolopsis eggs, cercaria (Parasite stages) YES at intestine, side of breast and center of breast**

She had, indeed, felt a sharp twang from under the arm into the breast occasionally for the past 2 years, but it would always go away. Due to shortness of time, we could not finish testing for the remaining flukes. She will start on parasite program.

☒ **Isopropyl Alcohol (Solvent) YES at liver, NO at breast**

She will remove all propanol containing body products from her house and use our substitutes for shampoo, soap, etc. She might try making her own hair spray.

Summary: Kitty's first visit came shortly before this book was begun so that her next visit could not be included.

97 Frances Ibsen Cervical Cancer

We have seen Frances several times over the past 6 years for chemical sensitivities, depression and fatigue syndrome. She has been exceptionally well this past year, until now. Her last PAP smear showed abnormal cells on the cervix. She also has intense burning in the vagina, but her clinical doctor says it is not yeast nor a urinary tract infection. Her husband also complains of burning. She had a Papilloma wart removed from the cervix 2 years ago.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at cervix**

☒ **hCG (Pre-Cancer) YES at cervix**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis eggs (Parasite) YES at intestine, bladder, kidney, and cervix**

☒ **Sheep liver fluke miracidia and redia (Parasite) YES at kidney and bladder**

She will start parasite program.

☒ **Kerosene (Solvent) YES high**

Source unknown, probably in gasoline.

☒ **Regular leaded gas (Solvent) YES**

☒ **Stopped for gas this morning.**

☒ **Wood Alcohol (Solvent) YES high**

☒ **Acetone (Solvent) YES**

☐ **Solvents (Remainder) NO**

She eats a lot of cold cereal. She will stop and also go off commercial beverages.

☒ **Isopropyl Alcohol (Solvent) YES**

She will switch off hair spray, shampoo and cosmetics.

Jerry, her husband

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Kerosene (Solvent) YES**

Will be more careful with gasoline.

☒ **TCE (Solvent) YES**

☒ **Styrene (Solvent) YES**

Will stop using styrofoam cups. Note: he has much less solvent in his body than Frances. He does not eat cold cereal or use a lot of body products.

☒ **Fasciolopsis redia (Parasite) YES at kidney, bladder, semen, penis, saliva**

☒ **Fasciolopsis miracidia (Parasite) YES**

☒ **Sheep liver fluke (Parasite) YES at liver**

☒ **Sheep liver fluke eggs (Parasite) YES at kidney, bladder, semen, penis, saliva**

Summary: Their appointment came just before the cut-off point for this book was reached so a follow-up was not included.

98 Lori Ellis Skin Cancer

Lori is 62, about the same age as myself. She came from a city a day's drive away for 2 purposes: to talk about her son's leukemia (he is presently on interferon) and to talk about her chronic yeast infection. It began 5 years ago, making blotches on her neck and face. She was advised to get the mercury fillings removed which she did, but it didn't help. She has tried other alternative therapies like a strict yeast-free diet. It helps somewhat. I suspect PCB accumulation in her skin and will test later. First, I assured her that if her son should worsen, she could bring him here and help him get cured.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at skin**

This is a surprise to me. However, she said she has had basal cell cancers removed before. She had just been carefully checked 1 month ago (some moles were removed and biopsied) and was pronounced clear of it, so this was a disappointment.

☒ **Fasciolopsis (Parasite) YES at liver and skin**

Says she gets dark spots under skin.

☒ **Fasciolopsis eggs, cercaria (Parasite) YES at saliva and skin**

☒ **Sheep liver fluke miracidia, eggs (Parasite) YES at saliva and skin**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Human liver fluke (Parasite) YES at saliva and skin**

We searched saliva for the stages under the microscope. Miracidia and eggs were immediately found. She will start on parasite program and avoid beef,

chicken and turkey in restaurants.

☒ **MEKetone (Solvent) YES high in all her organs**

☒ **Xylene, Toluene, MBKetone, TCE, Pentane, Hexanedione (Solvents) YES**

☒ **Isopropyl Alcohol (Solvent) YES at liver and skin**

She will go off commercial beverages and cold cereal, hair spray and shampoo.

Sixteen days later

Lori's itchy eyes and other yeast-like symptoms are gone.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

Her blood test results have arrived (it is dated one month ago, before we first saw her).

BLOOD TEST	Result	Comment
1. Cholesterol	very low (157)	cancer risk
2. Ferritin	very high (593)	cancer suspect
3. SGOT, SGPT	slightly low	take 1 B6, 250 mg, daily
4. WBC	very high (12.9)	infection?
5. Lymphs	low (18.5 %)	bone marrow toxin

☒ **Hafnium (Toxic Element) YES**

Off hair spray.

☒ **Mercury (Toxic Element) YES**

Still has a root canal.

☒ **Lead (Toxic Element) YES**

Root canal? Will test her water.

☒ **Platinum, Tellurium (Toxic Elements) YES**

Tooth fillings. Remainder not tested. She is instructed to have all metal removed from her mouth, including root canal. She feels ready to go on vacation. I have added PABA to our skin softener to give her some sun screening. She is also advised to wear a hat and not use sunscreen lotion.

Summary: Lori is free of her cancer and ready to enjoy life again.

99 Fred Ross Intestinal and Prostate Cancer

Fred is 66 and has been getting his prostate checked regularly because of inflammation and swelling and infection. He must get up 6 times in the night to empty his bladder. During the day he panics when not near a toilet. He is not on any medication. His eyes itch a lot and are blurry. He has a hiatal hernia. He will start on Bronson's digestive enzymes for this (6 for dinner, 4 for lunch, 2 for breakfast). Our kidney herb recipe should be able to clear up his prostate problem, I assured him. He uses a water softener.

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine and prostate**

This news dismayed him, wondering why his clinical doctor had not caught it when he was so frequently checked. I assured him he would quickly correct this by himself.

- ☒ **Fasciolopsis (Parasite) YES at liver and intestine**
- ☒ **Fasciolopsis cercaria, redia (Parasite) YES at prostate**
- ☒ **Sheep liver fluke redia (Parasite) YES at prostate; NO at liver**
- ☐ **Pancreatic fluke and stages (Parasite) NO**
- ☐ **Human liver fluke and stages (Parasite) NO**
- ☒ **Isopropyl Alcohol (Solvent) YES at liver and prostate**

Remaining solvents not tested. He will start on the *Parasite-Killing Program* and postpone the kidney program. He will avoid all propanol products: it has been used on his skin for hisB12 shots. He will bring his own grain alcohol or vodka for this purpose.

Seven weeks later

Fred has not started kidney program yet. He is still as troubled with night urination.

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **Cesium (Toxic Element) YES, high**

Does not drink anything out of clear plastic bottles.

☒ **Cadmium (Toxic Element) YES, high**

Not certain what kind of plumbing is at home.

☒ **Chromium (Toxic Element) YES, high**

Needs to take out water softener.

☒ **Scandium (Toxic Element) YES, high**

Tooth metal is dissolving.

☒ **Lead (Toxic Element) YES, high**

No obvious source; will check water supply.

☒ **Vanadium(Toxic Element) YES, high**

Gas leak - check gas lines.

☒ **Yttrium (Toxic Element) YES**

Will take vitamins from Bronson's only. He is to see dentist to get metal replaced by plastic. Continue parasite program.

Summary: Fred cured his cancer but not his prostate disease as yet. I suspect these metals are nearly all coming from his tooth fillings, including the lead. We will see if it is gone after doing dental work. Notice he had very high levels of metals in his white cells. He has not begun washing out his prostate with the kidney herbs yet. We are waiting for dental work to be done since these toxic metals are the highest priority.

100 Joyce Chambers Breast Cancer

At age 49, Joyce came specifically for her extreme hot flushes.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine, hCG (Pre-Cancer) YES at breast and under breast**

She is quite shocked and disappointed although she had been experiencing twinges at the side of her breast under the arm.

☒ **Fasciolopsis (Parasite) YES high at liver and intestine**

☒ **Fasciolopsis miracidia (Parasite) YES high at blood, kidney, bladder only**

☒ **Sheep liver fluke (Parasite) YES at pancreas**

Note: are the intestinal flukes in the liver keeping the liver flukes out?

☒ **Sheep liver fluke redia (Parasite) YES at blood only**

☒ **Sheep liver fluke miracidia (Parasite) YES at kidney and bladder**

☒ **Pancreatic fluke (Parasite) YES high at pancreas, breast, sides of breast**

☐ **Human liver fluke (Parasite) NO**

She will start on the *Parasite-Killing Program*, stay off rare meats and eliminate propanol from use.

Two weeks later

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

While she was using the herbs at first, the twinges under the breast were strong. Now they are gone. She has only eaten very well cooked meat.

Fasciolopsis and all stages (Parasite) NO

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

She stopped using propanol, has been off commercial beverages and cold cereal.

☒ **Asbestos (Toxic Element) YES, high**

Uses no clothes dryer—test hair blower, radiator paint.

☒ **Lanthanum (Toxic Element) YES**

Has a typewriter at home - will keep it covered.

BLOOD TEST	**Result**	**Comment**
1. WBC	low	bone marrow toxin
2. RBC	very low	anemic; bone marrow toxin and parasites
3. MCV	very high (110)	B12 deficiency - will test for *Ascaris*
4. Eos	very high (6%)	parasites
5. CO2	slightly high (27)	due to B12 deficiency?
6. Creatinine	high (1.2)	kidney problem
7. Calcium	very high (10.00)	.
8. Phosphates	very high	is dissolving bones. She will begin to drink milk. Will also take magnesium oxide (300 mg), 1/day.
9. LDH	low (134)	muscle fatigue

She will add Vitamin C, at least 1 gm/day, from Bronson's Pharm.

☒**Ascaris (Parasite) YES**

Go on 3- day parasite program. She will start on kidney herb recipe as well as continue the parasite program.

Summary: Joyce was very happy to learn what those twinges under her arm and toward the breast meant. She cured her cancer quickly. Hopefully, she will return to follow up on her asbestos problem.

101 Lucy Lindbeck Intestinal Cancer

Lucy is 42 and is concerned about her weight loss without a reason - she eats as much as ever. She has a few other minor complaints. She works for a doctor.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine**

☒ **hCG (Pre-Cancer) YES at intestine, NO in blood**

Note: A clinical cancer test for serum hCG would not have found this early cancer.

☒ **Fasciolopsis adults and cercaria (Parasite) YES at liver and intestine**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES at liver, thymus and throughout her body**

☒ **TCE (Solvent) YES high**

☐ **Solvents (Remainder) NO**

She will stop eating health food brand cold cereal. She was very disappointed that health food brands are not pollution-free. She will switch off her body

products to propanol-free kinds. She will start the *Parasite-Killing Program*.

Summary: Lucy's case came up near the end of this series so her follow-up is not available to us.

102 Wes Yerkley Breast Cancer

This is a 52-year-old man from Michigan who came with his wife and parents. He was very anxious about his condition. He had a large mass the size of my hand under his right chest wall. He was diagnosed with cancer 1 year ago in his right arm pit. Since this was not the primary location they searched very hard for it, but could not find it. So he was given extra heavy doses of chemotherapy and radiation. However, 5 weeks after ending the treatments, this very large lump appeared on his chest. He has a lot of pain on the right side and is on painkillers continually. His fingers and elbow on his right side are numb. He has no other problems. He appears well, except for cringing with pain throughout the appointment (despite the pain killers).

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine, side of breast and breast**

Note: I believe this is the only breast cancer in a man that I have seen.

☒ **hCG (Pre-Cancer) YES high at all organs!**

His body electrical resistance is exceptionally high, possibly due to PCBs. Will test later.

☐ **Fasciolopsis and all stages (Parasite) NO**

Most unusual.

☒ **Pancreatic fluke (Parasite) YES**

☒ **Pancreatic fluke stages (Parasite) YES in saliva**

☐ **Human liver fluke (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

Other solvents not tested. He will go off cold cereals and body products with propanol in them. He will switch to our shampoo and shaving products.

☒ **PCB (Toxic Element) YES high**

He will go off detergents and use borax for all purposes. He will start the *Parasite-Killing Program.*

Summary: Wes did not return, for reasons unknown. Hopefully, he carried out our instructions. Note his high level of PCBs. They reduced the body current from 55 micro-amps to about 40 micro-amps when 5 volts is applied across the hands. Perhaps they block or obliterate the conductance channels in our cells. Perhaps they raise capacitance. This would be interesting to study.

103 Richard Nunley Intestinal Cancer

Richard, age 49, came for his tinnitus in both ears. It was preceded by dental work. He also has chronic low back pain. He is a tall intellectual person who enjoys gardening and would like to be able to do this again but can't bend down because of his ear condition.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine and pancreas**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Sheep liver fluke (Parasite) YES at liver**

Note:These two flukes are not excluding each other, perhaps they are in different places in the liver.

☒ **Pancreatic fluke (Parasite) YES at pancreas**

☒ **Human liver fluke (Parasite) YES at liver and pancreas**

☒ **Human liver fluke metacercaria (Parasite) YES at pancreas**

☒ **Isopropyl Alcohol (Solvent) YES at liver and pancreas**

☒ **Benzene (Solvent) YES**

☒ **Methyl Butyl Ketone, Mineral oil (Solvents) YES**

Note: He has both propanol and benzene. This may explain having all 4 large flukes! He will go off rare meats; he eats very little anyway. He will go off the benzene list, commercial body products and commercial beverages.

Two weeks later

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Adenovirus, Strep pyog and Bacillus anthracus (Pathogens) YES at tooth #17**

I am searching pathogens for cause of tinnitus.

☒ **Sphaerotilus nat (Pathogen) YES**

☒ **Haemophilus infl (Pathogen) YES at teeth 15, 16, 17**

☐ **Pathogens (Remainder) NO**

He needs cavitations cleaned at teeth 15, 16, 17. He will continue parasite program. Note: the usual bacterium for tinnitus, Strep pn, is not present!

Summary: Richard cleared up his cancer promptly but clearing up tinnitus is a lot harder. He will need to clean up his mouth of chronic infection and cleanse his liver of bacteria.

104 Iris Kilpatrick Bone Cancer

Iris was diagnosed with bone cancer a week ago, involving hip, shoulder, and knee. It was first found as a tumor on the kidney. It began with bleeding from the

bowel. She had 2 colonoscopies, but nothing was found.

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine, kidney, bone**
- ☒ **hCG (Pre-Cancer) YES throughout her body**
- ☒ **Fasciolopsis (Parasite) YES at liver and intestines**
- ☒ **Fasciolopsis miracidia (Parasite) YES at bone**
- ☐ **Sheep liver fluke (Parasite) NO**
- ☐ **Pancreatic fluke (Parasite) NO**
- ☒ **Human liver fluke (Parasite) YES at liver and bone**

Note bone invasion.

- ☒ **Isopropyl Alcohol, TCEthylene, Hexane, Xylene (Solvents) YES**

She will go off commercial beverages, cold cereal, shampoo, hair spray and mouthwash. She will start on the *Parasite-Killing Program*.

Twelve days later

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine, hCG (Cancer) NO** Various cancers are gone.
- ☒ **PCB (Toxic Element) YES** Will go off detergents.
- ☒ **Gold, Mercury (Toxic Element) YES**

Tooth metals. Other tooth metals not tested.

- ☒ **Arsenic (Toxic Element) YES**

She is careful to avoid indoor pesticide treatment, has no wallpaper - only other source is stain-proofed carpets - will steam clean.

☒ **Aluminum (Toxic Element) YES**

Will switch to Hain's salt.

☐ **Toxic Elements (Remainder) NO**

She needs to replace tooth metal with metal-free plastic.

Summary: Iris is planning to bring in her recent test results from her clinical doctor's office. She will stay on the parasite program, avoid meat and get all the metal removed from her mouth and replaced with plastic. Her cancer is gone but I hope she finishes this health program.

105 Nancy Hampson Cancer Of The Pancreas and Intestine

Nancy came with her brother for her general poor health. She had learned from a friend how to do a liver cleanse and has already gotten out a lot of stones.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine and pancreas**

Cancer of the pancreas and intestine came as quite a shock to her. She is only 36 years old and has never drunk alcohol. In fact, she has a strange sugar problem; when she eats sugar she gets panic attacks and weird symptoms like partial blindness, dizziness, mood change. (I suspect numerous parasites in the pancreas.) Yet, if she does not eat she gets very shaky and nervous.

☒ **hCG (Pre-Cancer) YES at many body tissues**

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES high at pancreas**

With such numerous eggs, she must have had an adult to release them; perhaps the adult was killed.

☒ **Sheep liver fluke cercaria (Parasite) YES at pancreas**

☒ **Sheep liver fluke metacercaria (Parasite) YES**

☒ **Pancreatic fluke adults, stages (Parasite) YES at liver and pancreas**

☐ **Human liver fluke (Parasite) NO**

I suspect she is full of wood alcohol, which targets the pancreas. Also, note the absence of both large flukes in the liver. How is orthophosphotyrosine being produced? By the stages themselves?

☒ **Wood Alcohol (Solvent) YES at pancreas and liver**

Needs to go off carbonated beverages and sugar substitutes.

☒ **Isopropyl Alcohol, Acetone, Isophorone (Solvent) YES at pancreas and liver**

She drinks Folger's™ decaf and TofuMu™. She will stop all commercial beverages and drink only milk, water and single-herb teas (she doesn't tolerate fruit juice due to sugar in it). She will also start taking Bronson's Digestive Enzymes (6 with lunch and supper, 2 with breakfast) to assist her pancreas. She will start the *Parasite-Killing Program*.

Three weeks later

She has complied with all instructions except that she is still eating cold cereals occasionally. She misses her TofuMu™ and has brought it with her for testing.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

She expressed joy at this news.

☒ **Xylene, Decane (Solvent) YES**

☐ **Solvents (Remainder) NO**

She has gotten rid of the wood alcohol, propanol, acetone, and Isophorone in her system, but now has xylene and decane, undoubtedly from eating cold cereal. She will take the whole family off it.

☒ **Aluminum (Toxic Element) YES**

☒ **Chromate (Toxic Element) YES**

She will stop using aluminum cookware and foil, aluminized salt, deodorant, and regular soap. She will make borax soap concentrate. The chromium source is mysterious since she uses no make-up and there is no water softener.

☒ **Gadolinium (Toxic Element) YES**

Tooth fillings.

☒ **Fluoride (Toxic Element) YES**

Off toothpaste. Sodium fluoride is a well-known metabolic poison; in fact it was widely used in my graduate lessons in understanding metabolism. It inhibits the anaerobic part of general animal metabolisms. Traces of fluoride in organic form are beneficial, and the body may convert some of the inorganic type, but it is inadvisable to expose yourself to the amounts of inorganic fluoride found in toothpaste, even though it is present as a "non-toxic " compound such as stannous fluoride[61]. Fluoride in toothpaste greatly overshadows the fluoride consumed in city water, because I do not see toxicity after stopping toothpaste even when still drinking city water.

☒ **Strontium (Toxic Element) YES**

Off toothpaste.

☒ **Zirconium (Toxic Element) YES**

Off toothpaste and deodorant.

☒ **Thulium (Toxic Element) YES**

Off multi-vitamins. She will get her metal tooth fillings replaced with metal-free plastic.

Summary: All these metals, as well as the solvents, were accumulated in her pancreas. There is a possibility that the chromate will also disappear after she stops the supplements. So we will wait until this is done before searching harder for its source.

106 Lenore Dale Intestinal Cancer and HIV

This is a 34-year-old person who works for a clinical doctor and has already tried a number of alternative health procedures. She has a long list of bizarre symptoms, such as swollen and itching lips, gagging when eating (suggesting AIDS), and chest heaviness (making it even more probable).

- ☒ **Protein 24 (HIV) YES at thymus, vagina and ovaries**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine**
- ☒ **hCG (Pre-Cancer) YES everywhere**

What a shocking realization this brought to her, both HIV and cancer in a single diagnosis. She could hardly bear the news in spite of my assurance that she could eliminate them both within 10 days. Perhaps she was also angry or disbelieving.

- ☒ **Fasciolopsis (Parasite) YES at liver and intestine**
- ☒ **Fasciolopsis eggs (Parasite) YES at intestine, adrenals, saliva**
- ☐ **Sheep liver fluke (Parasite) NO**
- ☐ **Pancreatic fluke (Parasite) NO**
- ☐ **Human liver fluke (Parasite) NO**
- ☒ **Benzene (Solvent) YES at thymus**

Will go off items on benzene list.

- ☒ **Isopropyl Alcohol (Solvent) YES at liver**

Will eliminate propanol. Others not tested. She will start parasite program.

Ten days later

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine, hCG (Cancer) NO**

Both HIV and cancer are gone; she did everything correctly.

☒ **Aluminum Silicate (Toxic Element) YES**

Will disconnect water softener.

☒ **Bismuth (Toxic Element) YES**

Will get rid of fragranced items.

☒ **Radon (Toxic Element) YES**

She will open the vents to the crawl space.

☒ **Thallium, Germanium (Toxic Elements) YES**

Tooth metal pollutant. This coincidence of thallium and germanium is only found when the tooth filling metal has these pollutants. She is very upset about this since she states that she has had weak hands (very weak) for many years already (caused by thallium). She had all her mercury fillings taken out by Dr. S. who is a Huggins Institute trained dentist. Five gold crowns were put back in her mouth and she spent $3,000 on this last fall.

☒ **Gold (Toxic Element) YES**

☒ **Mercury (Toxic Element) YES at tooth #29 and #15**

Tooth #29 has a gold crown. She says this tooth has been bothering her. I then searched for the location of the thallium and found it at tooth #29, 10, and 18. She will ask the dentist to do a fresh panoramic x-ray to search for tattoos. I shone a flashlight in her mouth and could see 2 tattoos. However, these metal pinpoint leftovers might be left from the braces she used to wear. She states she remembers seeing them after the braces were removed.

☒ **PCB (Toxic Element) YES**

Uses Dr. Bronner's Peppermint™ soap - will go off.

Summary: Lenore's case is especially tragic and an early warning sign for all people. She was given 16 mercury fillings starting in early childhood, some of

which were polluted with thallium. This was the probable cause of having a child with microcephaly. In an effort to improve her health, she turned to health brand soap, only to be poisoned with PCBs. Only her strong intelligence and survival instinct kept her from self-destructive anger. Instead, she will probably set herself and her family on the road to good health.

107 Phylis Zink Liver and Breast Cancer and HIV

Phylis is a 46-year-old woman who drove by herself 150 miles for reasons of her history of breast cancer. It was discovered by mammogram. She had a mastectomy and they took out 3 lymph nodes two years ago and has been followed since then by annual mammograms. She has a heart murmur, occasional pain in knees and wrists, and a long history of period-related problems. They have a water softener and use reverse osmosis (R.O.) water for drinking.

- ☒ **Orthophosphotyrosine (Cancer) YES**
- ☒ **Protein 24 (HIV) YES**

Since these results seemed impossible to her and I was afraid she might leave, do nothing about her status, and never return, I suggested she get a clinical test (p24 antigen test) for HIV.

Six weeks later

She waited two weeks before doing the test and it came back NO (*Negative*) for the HIV virus. This was most unfortunate since she waited another month before returning.

- ☒ **Orthophosphotyrosine (Cancer) YES at liver and breast**

The cancer has spread to the liver.

- ☒ **hCG (Pre-Cancer) YES at liver, breast and blood**
- ☒ **Protein 24 (HIV) YES at thymus only**

Perhaps the clinical test didn't find the virus because the lab examines blood

serum, not the white blood cells or their contents. A case must be further advanced for the virus to be so prevalent that the virus is in the blood serum.

☒ **Fasciolopsis (Parasite) YES at intestine, liver, thymus**

Adults in the liver are giving her cancer; adults in the thymus are giving her HIV. However, she has no sensations over the breastbone nor chest tightness.

☒ **Fasciolopsis redia (Parasite) YES at liver and thymus**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒ **Human liver fluke (Parasite) YES high at liver, thymus, bladder, kidney, breast**

☒ **Human liver fluke metacercaria (Parasite) YES high at liver, thymus, kidney, bladder, saliva**

Notice: she could transmit these very tiny infective stages by kissing! She will start on the *Parasite-Killing Program.*

☒ **Benzene (Solvent) YES at liver, thymus, breast, etc.**

Brushes teeth twice a day with Colgate, Crest, and Tom's toothpastes-eats cold cereal daily-go off the entire benzene polluted list.

☒ **Isopropyl Alcohol (Solvent) YES at liver, thymus, breast, etc.**

Remainder not tested. She will check her cosmetics for propanol and make her own hair spray. She will switch shampoo to borax.

Seven days later

She is having some loose bowels, probably due to parasite-killing herbs.

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Regular leaded gasoline, Petroleum ether (Solvent) YES**

Put gas in her car yesterday. She will be much more careful.

☒ **Methyl Ethyl Ketone (Solvent) YES**

Instead of stopping cold cereal, switched to a health brand, will stop.

☒ **Titanium, Thallium/Germanium (Toxic Elements) YES** Tooth fillings.

☐ **Toxic Elements (Remainder) NO**

See dentist immediately to remove all metals; save grindings for me to add to my thallium collection.

Summary: Phylis cleared up her HIV and cancer in 7 days. But will she complete her program of getting well again? Thallium is to the body what termites are to a wood frame house—just a question of time before health collapses.

108 Joe Osborn Skin, Prostate, Intestinal Cancer

Joe is 45 and came in for seemingly minor problems like bursitis, low back pain, and hip pain. But I found cancer present.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine, skin, and prostate**

He showed me a lump under his left armpit the size of a golf ball. He stated he had first noticed it one year ago and had seen his doctor. His doctor had said it was not malignant.

☒ **hCG (Pre-Cancer) YES high throughout his body**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis eggs (Parasite) YES in blood, saliva, etc.**

Remainder not tested.

☒ **Isopropyl Alcohol (Solvent) YES at liver and prostate**

☒ **Benzene (Solvent) YES**

☒ **Carbon Tetrachloride (Solvent) YES**

☐ **Solvents (Remainder) NO**

The news of his cancer came as a shock since his clinical doctor had cleared him of suspicion. He will go off commercial beverages, cold cereal and body products. He will go off the benzene list. He will start parasite program. Note: he has benzene and the intestinal fluke but he does not have HIV virus yet. It is not far away, though.

One week later

Joe still has no appetite. His pains continue. The cyst under his arm is bothering him. He is instructed to put a hot, wet towel under his armpit daily to draw it to the surface.

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **Carbon Tetrachloride (Solvent) YES**

Probably from store-bought drinking water.

☒ **Mercury, Platinum (Toxic Elements) YES**

He is instructed to remove all metal from his mouth. He may begin readiness program (07, peroxy) for liver cleanse to clear his bursitis.

Summary: Joe and his wife made the changes in their family's habits that were necessary to get rid of his cancer and protect the whole family from getting

cancer or HIV illness in the future.

109 Ray Broyles Cancer and HIV

We first saw Ray two years ago. He was age 40 at that time and had just had an unusual experience. He had always been healthy and energetic. Then for no reason he passed out. He began vomiting, felt extremely weak and had other strange symptoms. His regular doctor prescribed a tranquilizer, Oxazepam™, after ruling out numerous possibilities. However, these attacks recurred, and he lost about 10 pounds in a few months. I did not suspect nor test for cancer. I found the parasite, Trichuris, and heavy metals from tooth fillings as well as tungsten from his electric hot water heater. He was put on a parasite program. He became well but did not clear up the metal problems. He did not stay on a maintenance program for killing parasites. We did not see him till recently. He had no further episodes of passing out but was unable to recover from a recent flu.

This time the parasite test revealed *Fasciolopsis* in the liver. He was put back on the parasite-killing recipe. The cancer test, orthophosphotyrosine, was *Positive*, and tungsten was showing its presence in all his body tissues. He soon got rid of his cancer and by changing his water sources and doing dental work he got rid of the tungsten problem. (He stopped all use of electrical frying pans and toasters.) He felt fine, his former self, and was released with food and body product restrictions.

We saw him again a half year later for frequent burping and difficulty swallowing. There was some similarity to his original attacks. There was pain over his chest and heart area, but I did not suspect HIV at that time. The parasite test showed heartworm and dog tapeworm eggs. The cancer test was *Negative*.

He was put on a high dose *Parasite-Killing Program* and dental repair was recommended. This cleared up his health problems, again, temporarily. He was not given food or product restrictions. A half year later he became ill again with prolonged flu and pressure on his chest.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **Protein 24 (HIV) YES**

☐ **Fasciolopsis and all stages (Parasite) NO**

I did not search his tissues, only the white blood cells. Could I have missed a few?

☒ **Sheep liver fluke redia (Parasite) YES at thymus, penis**

☒ **Sheep liver fluke metacercaria (Parasite) YES at pancreas only**

☒ **Pancreatic fluke (Parasite) YES at thymus, pancreas**

☐ **Human liver fluke (Parasite) NO**

☒ **Benzene (Solvent) YES at thymus**

Uses Nivea™ brand cream after shaving - will go off entire list of benzene containing products.

☒ **Wood Alcohol (Solvent) YES high at thymus and pancreas**

Others not tested at this time. He was to switch off commercial beverages and will take Milk Thistle capsules temporarily, to assist the liver. And he will return to a high dose *Parasite-Killing Program* followed by a maintenance program. He must avoid eating meats in restaurants.

Three days later

☐ **Protein 24 (HIV) NO**

Virus is gone but he is still very ill.

☒ **Benzene (Solvent) YES**

Has not stopped eating cold cereals.

Ten days later

His pains are gone. His digestion continues to be a problem. I suspect tapeworm heads have been released in his liver by the solvents; they are shedding eggs. He feels well enough to return to work. He will add Rascal to his daily routine for 2 weeks to kill tapeworms.

☒ **Decane, Methyl Butyl Ketone (Solvent) YES**

Hasn't stopped eating processed foods.

☒ **Toluene (Solvent) YES**

Summary: Ray's patience has paid off, in spite of imperfect compliance. If he had accepted the tranquilizer a few years ago, without pursuing the true cause of his illness, namely parasites and solvents, he would be a permanent invalid today.

110 Gorge Matte Mesothelioma

This is a heavy-set tall man, only 59, but appearing so much older and fatigued. He smokes. He must burp constantly and pass gas for the little comfort he feels. About 3 months ago he suddenly couldn't breathe. There was fluid accumulated in his right lung. He was put in the hospital where he had fluid drained, but it returned. Because of his past work in an asbestos factory, mesothelioma was suspected. When it was found, he was told it was inoperable and untreatable so he is not on chemotherapy or radiation. But one year ago, he had radiation therapy for prostate cancer. That was considered to be corrected. He started smoking again after that because it didn't seem to make any difference to his health - he got cancer anyway. He had quit for 6 years. He feels this is the end for him, but I assured him he had a lot of life left, so he had better quit smoking again.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine, prostate and lung**

☒ **hCG (Pre-Cancer) YES throughout his body**

☒ **Fasciolopsis (Parasite) YES at liver, prostate, and lung!**

One seldom sees adults in the lung, only the developmental stages.

☒ **Isopropyl Alcohol (Solvent) YES at liver, prostate and lung**

He doesn't eat cold cereal. It is probably in his shaving products. He will switch to homemade soap. No other parasites or solvents were tested for at this time

since his appointment time was extra short. He will start on the *Parasite-Killing Program* and avoid picking up new parasites in undercooked meats. He travels 4 hours to reach our office.

Seven days later

His right side is still sore from recent drainage of fluid. He must burp constantly. He hasn't slept decently for 2 years, being awake 4 hours in the night. For 5 years he cleaned his hands daily in mineral spirits. He will increase the digestive enzymes we started him on to double the amount and see if he gets some relief from abdominal pains.

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **hCG (Pre-Cancer) YES throughout his body**
- ☐ **Isopropyl Alcohol (Solvent) NO**

The cancer is gone, but the cancer marker hCG is still present. He only began the *Parasite-Killing Program* two days ago.

- ☒ **Lead (Toxic Element) YES**

Test water - has no root canals but some tooth fillings.

- ☒ **Mercury, Platinum (Toxic Elements) YES**

Tooth fillings.

- ☒ **Fiberglass (Toxic Element) YES**

Will test home air.

- ☒ **Thulium (Toxic Element) YES**

Off supplements.

- ☒ **Asbestos (Toxic Element) YES**

Will test hair blowers and the clothes dryer.

☒ **Barium (Toxic Element) YES**

Teeth? Bus exhaust inhaled during trip to office?

☒ **Zirconium (Toxic Element) YES**

Off deodorant.

☒ **Aluminum Silicate (Toxic Element) YES**

Off regular table salt, onto Hain's sea salt.

☒ **Formaldehyde (Toxic Element) YES**

Has a new large foam mattress. He is instructed to get rid of his foam mattress. Remainder of elements were not tested, since this is as much as he can cope with in the next week. He is instructed to get all dental metal removed.

Two weeks later

He missed an appointment due to transportation problems; this is very unfortunate.

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

He still has a lot of pain over stomach area at surgery site (over the spleen); the digestive enzymes don't help.

☒ **Mineral oil (Toxic Element) YES**

☒ **2 Methyl propanol, Xylene (Solvents) YES**

☐ **Solvents (Remainder) NO**

☒ **Lead (Toxic Element) YES and in hot and cold water**

He must search his cold water line for lead solder joints.

☒ **Fiberglass (Toxic Element) YES**

His daughter works near rolls of it and brings it home on her clothing. She should shed work clothes in the garage before coming into the house.

☒ **Formaldehyde (Toxic Element) YES**

Has a new carpet; test house air.

☒ **Asbestos (Toxic Element) YES**

Changed the dryer belt and discarded hair blower only 2 days ago.

☐ **Zirconium (Toxic Element) NO**

Is off deodorant.

☐ **Aluminum Silicate (Toxic Element) NO**

Now using Hain's Sea Salt.

☒ **PCB (Toxic Element) YES high**

Go off detergent.

☒ **PVC (Toxic Element) YES**

New carpet? He will get started on dental work and continue parasite program.

Summary: Gorge has an unusually long list of toxic elements stuck in his tissues. But he is making progress. Hopefully, he can clean them up before his lungs are completely out of commission.

111 Mick Gammon Myelo Monocytic Leukemia

This is an elderly man with some slowness of movement and thought. His wife was very helpful in telling us about the situation. Four months ago, his CBC showed an abnormality: an extremely low lymphocyte count (8%). They have arrived from Iowa on a snowy day and will be here for 6 days. As I began testing, it was extremely difficult to get a current flow, suggesting PCB toxicity.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **hCG (Pre-Cancer) YES**

It was too difficult to determine the location of his cancer, due to low current levels.

☒ **Fasciolopsis (Parasite) YES at liver**

Other parasites not tested. He will start on a parasite program.

☒ **PCB (Toxic Element) YES**

Will go off detergents and soap and use borax and homemade soap for all purposes.

Acetone, Methyl Butyl Ketone, Methylene Chloride, Ethyl (grain) Alcohol (Solvents) YES

Off alcoholic beverages until recovered.

☒ **Xylene, TCE, Decane, TCEthylene, MEKetone, Isopropyl Alcohol (Solvents) YES**

☐ **Solvents (Remainder) NO**

He will go off commercial beverages, the benzene list and cold cereals. (Note: although he does not have benzene build-up I gave him the benzene list to avoid because the same foods and products have many of the same solvents he tested YES for.) We got a saliva sample to search for parasite stages.

Two days later

☒ **Arsenic (Toxic Element) YES**

Will search out and remove pesticide; will avoid lawn treatments at home.

☒ **Bismuth (Toxic Element) YES**

Off colognes and antacids.

☒ **Aluminum (Toxic Element) YES**

Off deodorant, detergents, aluminum cookware, and regular table salt.

☒ **Beryllium (Toxic Element) YES**

Has an upper denture; we will test it.

☒ **Strontium (Toxic Element) YES**

Off toothpaste.

☒ **Gallium, Nickel, Silver, Samarium, Tantalum, Gold, Mercury, Thallium (Toxic Elements) YES**

Tooth metals. I am astounded to find this much thallium.

☒ **Aluminum Silicate (Toxic Element) YES**

Off regular table salt.

☒ **Europium (Toxic Element) YES**

☒ **Niobium (Toxic Element) YES**

Uses vitamin pills and Chinese herbs.

☒ **Niobium (Toxic Element) YES in vitamin pills**

Will switch to Bronson's Pharm brand.

☐ **Niobium (Toxic Element) NO in Chinese herbs**

May continue using them.

☒ **Thulium (Toxic Element) YES**

In his vitamin pills. At this point, I omitted testing other metals often found in tooth metal to save time.

☒ **PCB (Toxic Element) YES** Off detergents.

☒ **Rubidium (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

Note: This is an exceptionally long list of toxic metals burdening his body and immune system. He is to see the dentist tomorrow if they can take him. Also, he is discouraged over what he can eat. I did not have time to discourse over it.

Two days later

Mr. Gammon appeared healthier today, in better command of his communication; he spoke for himself instead of letting his wife do it for him. The dentist removed all metal yesterday. He will get new plastic dentures at home in Nebraska after calling the Huggins Institute for the name of a dentist. He will start on thioctic acid, 100 mg, taken twice daily for 6 months to remove metal from his tissues.

☒ **PCB (Toxic Element) YES** Has not lessened during his stay, probably in clothing.

☐ **Thallium (Toxic Element) NO** Was in tooth fillings.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

He will continue his parasite program, unless he is ill, and return to it after any illness.

☒ **Uric Acid, Oxalate (Kidney Stones) YES**

Remainder NO. Start on kidney herb recipe.

Summary: Like so many other cancer clients, Mr. Gammon experienced a quantum leap of improved health after the metal was removed from his mouth.

After laundering out the PCBs at home with borax, he may decide to continue on his job instead of retiring.

112 Jonathon Kohl Liver Cancer and HIV

This very young man is here with his family mainly for low energy, but nothing more specific than that. He does not feel well, especially after eating. He is attentive and interested in his health. He has no addictions and no risky behaviors. He has chronic Herpes simplex 1 (cold sores). He sleeps eight hours at night but still can't get up in the morning.

☒ **Protein 24 (HIV) YES at thymus and penis**

This is certainly a shock for all of us; I explained the basis for it as "parasites plus benzene pollution". He took the news in a calm manner.

☒**Orthophosphotyrosine (Cancer) YES at liver**

He has cancer, too, of the liver! His parents are distraught.

☐ **hCG (Pre-Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at liver and thymus**

☒**Sheep liver fluke redia (Parasite) YES at liver and thymus; NO in saliva**

☒ **Sheep liver fluke miracidia (Parasite) YES at liver, thymus, saliva and semen**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒**Human liver fluke (Parasite) YES at liver and thymus**

He will start on the Parasite-Killing Program.

☒**Benzene (Solvent) YES at thymus**

☒**Isopropyl Alcohol (Solvent) YES everywhere**

☒ **Kerosene (Solvent) YES**

He uses kerosene to heat his work area. I suggested electric heat.

☒ **Carbon Tetrachloride, Methyl Ethyl Ketone, TCE, Acetone, TCEthylene (Solvents) YES**

☐ **Solvents (Remainder) NO**

He will be off commercial beverages and the benzene list as well as body products with propanol in them.

Summary: Unfortunately, Jonathon did not return. Perhaps his parents were angry with him. His mother tested NO for HIV, orthophosphotyrosine and hCG; his father complained of chest pains but declined to be tested. No doubt, Jonathon still has several years of moderately good health left. Hopefully, he has made some changes in his product usage.

113 Steven Aust Synovial Cell Sarcoma

Steve is 24 years old and is here from Detroit for a sarcoma (Synovial Cell Sarcoma) on the outer thigh of his left leg. It is about the size of a grapefruit. A left groin lymph node has been surgically removed. He has a catheter in place in preparation for further therapy. He is on pain medicine, blood thinner and tranquilizers.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine, muscle**

Very unusual location.

☒ **hCG (Pre-Cancer) YES everywhere**

☒ **Fasciolopsis (Parasite) YES at liver**

☒ **Fasciolopsis eggs (Parasite) YES at liver, muscle, saliva**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Human liver fluke (Parasite) YES at muscle**

☒ **Isopropyl Alcohol (Solvent) YES everywhere**

☒ **Benzene (Solvent) YES**

Remainder not tested We are short on time; it is 4 PM; I must check dental metal so he can make a dental appointment, if needed, before returning home.

☒ **Arsenic (Toxic Element) YES high everywhere**

They are living in a trailer and have not put pesticide anywhere. I suggested opening the trailer skirting and searching under the trailer. Also steam clean carpets. There is no wallpaper (one small panel in bathroom).

☒ **Bismuth (Toxic Element) YES**

Off aftershave, colognes, all fragrances.

☒ **Cobalt (Toxic Element) YES**

Off detergent.

☒ **PCB (Toxic Element) YES**

Will test well water; off detergent.

☒ **Mercury (Toxic Element) YES**

Tooth fillings. Remainder not tested. He needs all metal removed from his mouth and replaced with metal-free plastic.

Summary: Steve has not returned. Hopefully, he has carried out his instructions and will surprise us with a visit soon.

114 Jason Willy Lung Cancer and HIV

Jason is a 43-year-old man whose medical record, which he brought with him,

gave his diagnosis as "undifferentiated large cell carcinoma of the lung with metastases to the left neck and brain area." More recently, the cancer has spread to the liver. His sister-in-law drove him to our office. Jason smokes, and I reminded him that smoking is incompatible with lung health. He is on Dilantin™ and Decatron™ to prevent brain swelling.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver, thymus, lung, brain**

Note that cancer in the thymus is quite rare.

☒ **Fasciolopsis (Parasite) YES at liver, intestine, lung**

☒ **Fasciolopsis cercaria (Parasite) YES at lung, etc.**

☒ **Sheep liver fluke (Parasite) YES at thymus; NO at liver**

Note: the normal habitat for the Sheep liver fluke is the liver. Is the intestinal fluke keeping it out somehow?

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒ **Isopropyl Alcohol, Benzene (Solvent) YES at liver, thymus, kidney, etc.**

With this critically ill person here from so far away, I made a second office visit possible for him 7 hours later in the same day. He went off all benzene products and propanol products and took a shower in the meanwhile. He also took a massive amount of parasite-killing herbs instead of starting at "day one".

Seven hours later

☐ **Orthophosphotyrosine (Cancer) NO**

His cancer is already stopped. He doesn't believe what I am telling him, but his sister-in-law is ecstatic. He will stay off rare meats.

☒ **Cryptocotyl, Hypodereum con (Parasites) YES**

End box 1.

☒ **Asbestos (Toxic Element) YES high**

☐ **Toxic Elements (Remainder) NO**

He had only one toxic element out of the entire set. They agree to change his clothes dryer belt to a USA model as soon as they get home.

☒ **Candida, CMV, Herpes simplex, Flu (Pathogens) YES**

☐ **Mycoplasma (Pathogen) NO**

Only 5 tests done. Since Jason had 4 out of 5 pathogens as I began to test him, I realized he had extremely low immunity due to having benzene and propanol in his thymus. We will wait until his next visit to test the rest of the pathogens. I did not use the word AIDS when talking to him but this is what he has. And the HIV virus is not far away.

Seventeen days later

He did not keep the appointment, which was scheduled for 10 days earlier. Perhaps he is not committed to surviving. He appears very ill today.

☒ **Protein 24 (HIV) YES**

☒ **Orthophosphotyrosine (Cancer) YES**

He now has his cancer back and HIV in addition. What went wrong? He has been eating meats as usual. He has not checked out his body products for propanol, simply used all of them, nor stayed off benzene-polluted products.

☒ **Fasciolopsis (Parasite) YES at thymus**

☒ **Isopropyl Alcohol (Solvent) YES**

Rubbing alcohol used on his arm at hospital to draw blood yesterday - he is advised to bring own alcohol, Vodka.

☒ **Benzene (Solvent) YES** Hasn't stopped using toothpaste or Vaseline.

☐ **Asbestos (Toxic Element) NO** Changed the dryer belt.

☒ **Trich vag, Bacteroides fr, Chlamyd trach, Campyl pyl, Bacillus cereus, Strep pneu, Proteus mir, Herpes simplex 1, Gardnerella vag, B strep, Adenovirus (Pathogens) YES**

Because he had Bacteroides fr, he must have *Ascaris*, since they are always found together. He is still smoking. I emphasized the importance of stopping. At his first visit, Jason had AIDS but without the HIV virus; the picture of AIDS is seen in the 4 out of 5 YES (*Positive*) tests. At his second visit, the parasites had reached adulthood in his thymus and the virus is present; his AIDS is worsened.

Summary: Maybe I was too harsh with Jason about his smoking, so that he won't come back. But if he doesn't stop he can't survive. It is weeks past his appointment time. I am afraid it is only his sister-in-law who wants Jason to survive, not Jason himself.

115 Ralph Smith Multiple Cancer and HIV

Ralph, age 43, came to our office because of his sarcoidosis, which was diagnosed six years ago, although he had had it earlier than that. At that time, he had pain on the center front chest so that he couldn't breathe deeply. He was put on cortisone for it and the pain was reduced, but it is still minimally present. This location suggests the thymus. He is still on prednisone.

☒ **Protein 24 (HIV) YES at thymus and penis; NO in semen and saliva**

☒ **Orthophosphotyrosine (Cancer) YES at thymus, intestine, lung, bronchi**

He has both cancer and HIV! He stated that he had been tested for HIV antibody twice already, both times with *Negative* results.

☒ **hCG (Pre-Cancer) YES in all tissues**

He is pre-cancerous throughout his body! This was a shock

☒ **Fasciolopsis (Parasite) YES at thymus and liver**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus, liver, semen, penis**

Other flukes not tested. Start on parasite program.

☒**Isopropyl Alcohol (Solvent) YES high at liver**

Since he does not eat cold cereal nor use body products, his only source is shampoo. Considering his high levels, there must be an unknown source of propanol. He will be watchful. He will switch off commercial shampoo.

☒**Benzene (Solvent) YES high throughout his body**

Go off the benzene list. This youngish man had tried many things to improve his health. His medical file is ½ inch thick. It seems incredible that so massive a cancerous state could be missed by clinical routines.

Five weeks later

☐**Protein 24 (HIV) NO**

Very good news.

☒**Orthophosphotyrosine (Cancer) YES at intestine only**

☒ **hCG (Pre-Cancer) YES at intestine, lung, bronchi**

☒**Fasciolopsis (Parasite) YES at intestine and liver; NO at thymus**

☒ **Fasciolopsis cercaria (Parasite) YES at intestine and liver; NO at thymus**

☐ **Benzene (Solvent) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

He is still using his favorite shampoo but will switch.

Summary: Ralph has solved part of his problem, the HIV virus and benzene pollution. But the propanol level was still high and the flukes were still thriving (due to eating hamburgers) so the cancer continued. He is determined, though, to cure it all.

116 Jack Lindsey Colon and Lung Cancer

This 56-year-old man came for his asthma. His breathing is labored and he is on asthma medicine. They have a water softener. He has had colon surgery for cancer and 15 inches were removed. He is also very allergic and is getting allergy shots every week. (He probably has Sheep liver fluke, which causes severe allergies.)

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine and lung**

Surgery had not cured cancer; now in lungs.

- ☒ **hCG (Pre-Cancer) YES at intestine and blood**
- ☒ **Fasciolopsis (Parasite) YES at liver and intestine**

Other flukes not tested.

- ☒ **Ascaris (Parasite) YES at lungs**

Cause of asthma. He will start on the *Parasite-Killing Program*.

- ☒ **Isopropyl Alcohol (Solvent) YES high everywhere**

Other solvents not tested. He will go off commercial body products, rare meats, and cold cereal.

One week later

He has complied with our restrictions perfectly.

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☒ **hCG (Pre-Cancer) YES at intestine only; NO at blood, etc.**
- ☐ **Isopropyl Alcohol (Solvent) NO**

☒ **Benzene (Solvent) YES at kidney, bladder, thymus**

☐ **Solvents (Remainder) NO**

He is using a Vaseline™ chapstick and several cooking oils. He will go off the benzene list of products.

☒ **Arsenic (Toxic Element) YES at lungs**

Remove pesticide from house.

☒ **Cadmium (Toxic Element) YES at lungs**

Plumbing?

☒ **Silver, Mercury, Gallium (Toxic Elements) YES at lungs**

Tooth fillings. Remainder not tested. It is obvious that Jack's corroded tooth metal has accumulated in his lungs, inviting the cancer parasites to reproduce there. He is advised to remove all metal from his mouth and replace it with metal-free plastic.

Summary: Jack, with his wife's help, got rid of his cancer in 1 week. However, Jack still has a precancerous condition at the intestine. We will follow up on him after his dental work.

117 Elsie Avalos Breast, Bronchial and Bone Cancer

This 30-year-old woman came in complaining of the following symptoms: 1) Occasional pain in her left wrist and right leg. 2) She experiences nausea and has a stomach ulcer. 3) Her energy level is moderate to low. 4) She has occasional migraines, usually before her menstrual period. 5) She has cancer in her right breast and is currently being treated with radiation and chemotherapy. She had a mastectomy. 6) Her clinical doctor suspects pneumonia in her left lower lung, and there is something on her x-ray there. The doctor also found some cancer attached to the breast bone.

She is on the following medications: Advil™, Zantac™, Ceclor™, Pepto Bismol™, Zanax™, and Zofran™. She has a water softener at home. She is a tea drinker.

☒ **Orthophosphotyrosine (Cancer) YES at bronchi and bone; NO at breast**

Note: the clinical treatment has eliminated the cancer from her breast.

☒ **hCG (Pre-Cancer) YES high everywhere**

☐ **Protein 24 (HIV) NO**

☒ **Isopropyl Alcohol (Solvent) YES high everywhere**

☐ **Solvents (Remainder) NO**

☒ **Fasciolopsis (Parasite) YES at liver, bronchi, part of the thymus (is set to get HIV); NO at other part of thymus**

One seldom sees an adult developed in the lungs!

☒ **Fasciolopsis miracidia (Parasite) YES at liver, thymus, bone**

Remainder not tested. She will start the *Parasite-Killing Program*. She will go off rare meat, commercial beverages, and cold cereal. She will search out propanol in her body products and throw them out. She will use borax for shampoo.

Note:The cancer has indeed spread to the bronchi of her lungs and the breast bone. The cancer marker, hCG, is throughout her body, in every tissue tested. The solvent propanol is everywhere in her tissues also. Surprisingly, there was NO build-up of other solvents. I'm sure she takes in some benzene with her foods as well, and yet there is no buildup, although benzene is thought of as being more difficult to oxidize. Apparently, her body can detoxify everything except propanol. Certainly, being drenched in propanol as her tissues are, did not inhibit them from oxidizing the other solvents. This is probably the action of aflatoxin, a byproduct of common mold, in her diet.

Twenty days later

She only got to day 6 with the parasite program because her stomach was too upset with the chemotherapy she has been on.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

Cancer is gone.

☒ **Isopropyl Alcohol (Solvent) YES**

She is still using cosmetics that may contain it. She will check.

☒ **Terbium (Toxic Element) YES** Takes several kinds of pills.

☒ **Neodymium (Toxic Element) YES** Pills. She will rotate brands of pills as long as she stays on them.

☒ **Tungsten (Toxic Element) YES**

She is drinking tea with the hot water from coffee maker, will stop. Remainder not tested.

☒ **mono-, di-, tri-Calcium Phosphate (Kidney Stone) YES high**

She will start to drink milk, 3 glasses a day, at least 2% cream. And take magnesium oxide (300 mg), one a day.

☒ **Cysteine, Cystine, Uric acid (Kidney Stones) YES**

She will start on kidney herbs.

Summary: Elsie is luckier than most! She still has the propanol but because the intestinal fluke is gone, all her cancer is gone. Having such good luck could put her off her guard. Hopefully, she will not try to live dangerously.

118 Bill Hutcheson Malignant Adenoma

Bill is in his mid-fifties and is here for his bursitis and unexplained fatigue. He also had a "polyneuropathy" diagnosed a year ago and a list of minor problems. He came with his wife from three states away. Two years ago a tumor was seen on his adrenal gland. It was called "adenoma" but it did not continue to grow so nothing is being done clinically. He has a chronic cough.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at adrenal glands**

☒**hCG (Pre-Cancer) YES at adrenals and blood**

☒**Fasciolopsis (Parasite) YES at pancreas and adrenals**

Not in the liver? Note: adults are seldom seen in the adrenals!

☒**Fasciolopsis redia (Parasite) YES at adrenals**

☒ **Sheep liver fluke (Parasite) YES at one layer of adrenals**

☒**Pancreatic fluke (Parasite) YES at pancreas**

☒ **Human liver fluke (Parasite) YES at adrenals; NO at liver**

He will start on the Parasite-Killing Program.

☒ **Kerosene (Solvent) YES at kidney, spleen, adrenals**

☒**Isopropyl Alcohol (Solvent) YES at adrenals**

☒ **Methylene chloride (Solvent) YES**

☒**Carbon Tetrachloride (Solvent) YES at adrenals**

☐ **Solvents (Remainder) NO**

He will go off commercial beverages and cold cereals and rarely cooked meats.

Three weeks later

He is still fatigued and has a chronic cough.

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒**Formaldehyde (Toxic Element) YES at lungs**

They have recently acquired 2 new sofas and 2 new easy chairs. He is

instructed to move them all into a single room and keep it locked until he is well. (Hopefully, when he is well, he will not be so foolish as to try to live with new furniture.)

☒**Fiberglass (Toxic Element) YES at lungs**

☐ **Toxic Elements (Remainder) NO**

Note: He is to search for a hole in ceiling or wall where bits of fiberglass could blow into the living space. He will bring air samples for testing next time. Note: He had no other toxic element problem, although he has metal tooth fillings and assorted environmental hazards. He may prepare to cleanse his liver by starting on 07 and peroxy, beginning with 1 drop each in a beverage at mealtime (3 times daily) and increasing gradually to 10 drops each.

Summary: Bill conquered his adrenal cancer easily but getting rid of his fatigue, bursitis, cough and neuropathy will require that he clean up his environment of lung-related pollutants. I believe he is motivated, since he has traveled very far.

119 Shawn Halverson Colon, Liver and Skin Cancer

Shawn is a very fair-skinned person, with a reddish hue to her face and neck. She is 69 years old and was brought in by her daughter-in-law for liver cancer. She was told about this office by a cured cancer client. A year ago she had pain over the stomach; ultrasound showed cancer of the liver. A scan then found it in the colon. Surgery removed 1½ feet of colon. Three weeks later the bowel had kinked and was corrected with another surgery. But she refused to take chemo and radiation since she was only given six months to live anyway.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at liver and skin; NO at colon, etc.**

☒**hCG (Pre-Cancer) YES in liver; NO in WBCs**

☒ **Isopropyl Alcohol, Wood Alcohol, Carbon tetrachloride, Benzene (Solvents) YES**

Remainder not tested. She will go off cold cereal, other flavored foods, and

commercial beverages, as well as all body products. She will use our list of safe items.

☒ **Fasciolopsis (Parasite) YES at liver and colon**

Others not tested. She will be off meats, and she will start on parasite program.

Note: Finding the cancer in the skin instead of the colon shows that her earlier surgery removed all of the cancerous part.

One week later

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

She is rid of her cancer at all locations. She is incredulous. She reminded me that four locations of cancer in the liver had been seen. They did an ultrasound, CAT-scan, etc. She is delighted.

☐ **Isopropyl Alcohol (Solvent) NO**

We will now search for the metals and other toxins that facilitated her cancer.

☒**Asbestos (Toxic Element) YES at liver, skin**

Change dryer belt to USA-made brand.

☒**Arsenic (Toxic Element) YES at liver, skin**

Remove ant poison from house.

☒ **Cobalt (Toxic Element) YES at liver, skin**

Switch off detergents and use borax.

☒**Copper (Toxic Element) YES at liver, skin**

A look inside her mouth revealed very discolored and corroded metal. She is advised to replace all metal with metal-free plastic.

☒**Rhenium (Toxic Element) YES**

Tooth fillings.

☒**Mercury (Toxic Element) YES everywhere**

Tooth fillings.

☒**Vanadium (Toxic Element) YES high**

Gas leak in the house. They had a gas leak last year and will get this one taken care of immediately, too. She will continue the parasite program.

Summary: Shawn was a model client - she complied in everything. She made no complaints. She expressed joy at having her life preserved and, moreover, may be healthy again. She is enjoying her new lifestyle. Perhaps she has a lot to live for and appreciated being alive. She is also interested in how all of these pieces fit together to cause cancer. We will see her again after her dental work.

120 Carmen Miller Liver Cancer

Ms. Miller has been diagnosed with fibromyalgia (I suspect it will be a Trichinella infection). It began with numbness of her feet about 1½ years ago. Ten years ago she had Hepatitis A for 5 months. She has pain everywhere. Now her legs, especially shins, are numb, too (I will test for thallium toxicity). She has a sleep problem and heart problems also. In fact, there is a long list of health problems.

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO in WBCs**

☒ **Orthophosphotyrosine (Cancer) YES at one part of liver**

This beginning cancer in her liver came as a shock.

☒ **Fasciolopsis (Parasite) YES at liver and muscle**

Note: It is most unusual for an adult to be present in muscle tissue! This could cause a fibromyalgia no doubt!

☒ **Fasciolopsis eggs (Parasite) YES at liver and throughout muscles**

☒ **Fasciolopsis redia (Parasite) YES at liver and muscle**

☒ **Pancreatic fluke (Parasite) YES at pancreas**

Other flukes not tested.

☐ **Hookworm, 4 kinds, Ascaris, 2 kinds (Parasites) NO**

☒ **Trichinella (Parasite) YES high at muscles**

☐ **Strongyloides (Parasite) NO**

Other parasites not tested.

☒**Isopropyl Alcohol (Solvent) YES high throughout her body**

☒**Benzene (Solvent) YES**

Others not tested. She will switch her body products to our safe kinds. She will go off cold cereals and the whole benzene list and commercial beverages. She has a cat and a dog that are house pets (probably the source of Trichinella). They use well water and a water softener. She is only 27 years old and solvent pollution of the environment has already ruined her health. What will become of the next generations' health? She will start on the *Parasite-Killing Program* and include pets.

Summary: Ms. Miller has not returned. We are waiting to hear from her.

121 Ray Broz Follicular Lymphoma small cleaved cell type

This is a short, 22 year old man, rather emaciated, appearing quite ill. He is fatigued and barely able to get up from a chair and move about. Breathing is difficult, he is grunting at each breath. He is from several states South and came with his wife. His body current is low (I suspect PCBs). He was recently diagnosed with follicular lymphoma small cleaved cell type.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at genital tract, cerebellum**

and high at pancreas

☒**hCG (Pre-Cancer) YES throughout his body**

☒ **Fasciolopsis (Parasite) YES at pancreas, genital tract and cerebellum**

Note: These are unusual locations for the adults.

☒**Fasciolopsis cercaria, redia (Parasite) YES in saliva, etc.**

☒**Pancreatic fluke (Parasite) YES high at pancreas** Other parasites not tested.

☒**Isopropyl Alcohol (Solvent) YES throughout his body**

☒ **Wood Alcohol (Solvent) YES at pancreas**

Remainder not tested. He will start on Bronson's digestive enzymes, 6 with each meal. He will go off commercial beverages, cold cereals and body products. He will start on the *Parasite-Killing Program*.

Two days later

He says he is feeling a lot better. He got a little sleep last night, after taking 12 ornithine. He is still grunting with breathing but only half as much. His body current is very low, suggesting PCBs.

☒**PCB (Toxic Element) YES**

Go off detergents.

☒**Benzalkonium (Toxic Element) YES**

Is already off toothpaste.

☒**Aluminum (Toxic Element) YES**

Will go off table salt, deodorant

☒ **Silver, Gallium, Gadolinium, Tellurium (Toxic Element) YES**

Tooth metals.

☒ **Arsenic (Toxic Element) YES**

Search for pesticide and steam clean the carpets without using stain-proofing.

☒ **Bromine (Toxic Element) YES high**

Has worked with siding and lumber a lot. Go off brominated bread.

☒ **Yttrium (Toxic Element) YES**

Vitamin pills? Will go off vitamins.

☒ **Thallium and Germanium (Toxic Elements) YES**

Polluted tooth mercury. This is an exceptionally long list of metals in his WBCs. He is to see dentist immediately to remove all metal from his mouth. We will now finish the solvent tests.

☐ **Isopropyl Alcohol (Solvent) NO**

Already eliminated it.

☒ **Wood Alcohol (Solvent) YES**

Had orange juice yesterday.

☒ **Petroleum ether, Regular gasoline (Solvents) YES**

In gasoline. Will stop gassing up car.

☒ **Denatured ethyl alcohol (Solvent) YES**

Source unknown.

☒ **Methyl Butyl Ketone, TCEthylene (Solvents) YES**

Processed food.

☒ **Decane, Paint thinner, Acetone (Solvents) YES**

☐ **Solvents (Remainder) NO**

Presumably, some of these solvents date back to the time prior to his restricted diet. He will accelerate their removal with charcoal tablets (take 2, three times a day). Also thioctic acid (100 mg) to remove metals (take 2, three times a day).

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO in WBCs**

☒ **Orthophosphotyrosine (Cancer) YES**

Still has cancer but the precancerous substance, hCG, is apparently eliminated. He is on day 3 of the *Parasite-Killing Program*.

The next day

He appears about the same as yesterday, panting and grunting for breath.

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

Cancer is gone.

☒ **Acetone, Hexane dione (Solvent) YES**

He has been eating desserts in restaurants, will stop.

☒ **Petroleum ether (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

Used regular shampoo. He will get dental work done today. He will take vitamin C (2 tsp. throughout the day), Bronson's digestive enzymes (6 with each meal).

Next day

He has had one half of his dental work done on one side. He could feel an

improvement in breathing and less pressure over the stomach as soon as a particular tooth was pulled.

- ☐ **hCG (Pre-Cancer) NO**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **PCB (Toxic Element) NO**
- ☒ **Thallium (Toxic Element) YES**

Tooth filling.

- ☒ **Aluminum (Toxic Element) YES**
- ☐ **Bromine (Toxic Element) NO**
- ☐ **Benzalkonium (Solvent) NO**
- ☒ **Arsenic (Toxic Element) YES borderline**
- ☒ **Yttrium (Toxic Element) YES**

He will take a Selenium supplement from Bronson's Pharm to recover from arsenic damage.

- ☒ **Cysteine, Cystine, Oxalate (Kidney Stones) YES**
- ☐ **Kidney Stones (Remainder) NO**

Start on kidney herbs to dissolve these crystals.

- ☒ **Moniezia scolex (Tapeworm) YES in muscles and spleen**
- ☒ **Taenia scolex and eggs (Parasite) YES in muscles and spleen**

He will complete dental work tomorrow and leave for home.

Summary: Ray was a model client with a model family to support him. He will probably survive to return and kill his tapeworm stages.

122 Brandi Rosette Cancer and HIV

This 3-month-old baby is ill. She is filled with mucous. She has already had pneumonia once. She frequently does not want to feed - she is on Enfamil™ with iron. She saw her clinical doctor yesterday, he is giving her antibiotic shots twice a week and told her parents he is at a loss to understand her illness. She has very little leg motion. She does not sleep much.

- ☒ **Protein 24 (HIV) YES**
- ☒ **Orthophosphotyrosine (Cancer) YES**

The baby has cancer and HIV, how tragic.

- ☒ **Isopropyl Alcohol (Solvent) YES at liver and thymus**
- ☒ **Benzene (Solvent) YES**

The baby has been on a lotion, Forever Living Aloe Heat Lotion™ since shortly after birth. This lotion tested YES (*Positive*) to both benzene and propanol when rubbed into my arm!

- ☒ **Fasciolopsis (Parasite) YES at liver and thymus**
- ☒ **Fasciolopsis eggs (Parasite) YES at saliva**
- ☒ **Strep pneu, EBV, Influenza, B strep, Proteus, Gardnerella vag, Chlamydia tr, Candida, CMV, Resp Sync v (Pathogens) YES**

One half of box 1 tested. Note: She is YES (*Positive*) to 10 out of 15 pathogens tested, this qualifies as AIDS. She will start on the *Parasite-Killing Program* for

babies.

Mother, Argella

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at liver**

Cancer of the liver is in the mother.

☒ **hCG (Pre-Cancer) YES at one part of liver only; NO in WBCs**

☒ **Isopropyl Alcohol (Solvent) YES**

Will go off body products. Other solvents not tested

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Sheep liver fluke adults (Parasite) YES**

Others not tested. Note: this is unusual, not to have the adults in the liver.But it is nearly always liver cancer where this unusual situation is seen.

Father, Fred

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Benzene (Solvent) YES throughout his body**

☐ **Isopropyl Alcohol (Solvent) NO**

Other solvents not tested. They will keep her off all body products except olive oil. She will get only fruits and vegetables and milk, no crackers and other processed foods. The whole family will go off propanol and benzene polluted foods.

Summary: This case nearly brought tears to the eyes of all of us. They have not returned. Parasites and pollution are claiming the life of this beautiful child. Later: This story has a happy ending. The baby recovered her health; the family was perfectly observant of the rules to keep her healthy. She is now a happy, growing infant.

123 Roberta Vanwart Kidney, Spleen and Intestinal Cancer

Roberta has been our client for 10 years. She is one of our most notable failures, since she has never become well. For this reason, I suspect tapeworm disease. It

has been only recently that I learned how to detect the encysted heads (scolices) of tapeworms buried in some tissue, since it is not present in the white blood cells where I make my initial searches. For this reason, we invited her into our office, specifically, to test.

- ☒ **Taenia solium scolex (Tapeworm) YES at muscle and spleen**
- ☒ **Moniezia scolex (Tapeworm) YES at muscle, intestine and spleen**

I suspect these "bladder cysts" have become eroded by solvent, releasing eggs and some segments into the tissue. I will search for solvents.

- ☒ **Toluene (Solvent) YES**
- ☒ **Isopropyl Alcohol and Benzene (Solvents) YES**

This is unexplained since she has always lived a very careful natural lifestyle. She says she is using commercial shampoo and will switch. The presence of propanol raises the possibility of cancer, and the presence of benzene raises a similar possibility of HIV.

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine, spleen and kidney**
- ☒ **hCG (Pre-Cancer) YES at blood only, not at WBCs**
- ☒ **Fasciolopsis (Parasite) YES high at liver and intestine**
- ☒ **Fasciolopsis redia (Parasite) YES**

Other flukes not tested. She will start on parasite program and avoid meats at restaurants except for fish and seafood. In other respects, her lifestyle appears impeccable. Her parasite program will include *Rascal*, an herbal combination, for 2 weeks. We are out of it, though, and will send it to her.

Two weeks later

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☐ **Benzene (Solvent) NO**

☒ **Kerosene, Gasoline, Ether (Solvents) YES**

☐ **Solvents (Remainder) NO**

She probably got all these together while having gas put in her car this morning. She will be careful to keep car windows closed.

Summary: Roberta did an exemplary job of ridding herself of all solvents and parasites, thereby curing her cancer. She will probably be able to prevent it in the future due to her intelligent approach and determination to be well. She will include Rascal once a week with her parasite maintenance program. We are looking forward to losing Roberta as a client after her tape infestation is gone.

124 Michelle Murdock Stomach and Intestinal Cancer

Michelle is a middle aged, cheerful person quite concerned about her inability to swallow food. The food just won't go down. Her clinical doctor has looked in her stomach more than once and attributes it to a hiatal hernia. She has pain from her throat down to her stomach. Her doctor put her on a medicine, Prilosec™, for it. He also recommended Pepto Bismol.™ She takes a lot of it, but the pain is getting worse.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine, stomach**

Has cancer of the stomach - swallowing often difficult with this condition.

☒ **hCG (Pre-Cancer) YES everywhere**

☒ **Fasciolopsis (Parasite) YES at intestine, liver and stomach**

Note: It is very unusual to see an adult in the stomach!

☒ **Fasciolopsis eggs (Parasite) YES high in stomach, saliva**

☒ **Sheep liver fluke (Parasite) YES at liver**

Had allergies her whole life.

☒ **Pancreatic fluke and stages (Parasite) YES**

☒ **Human liver fluke and metacercaria (Parasite) YES**

She will stop eating rare meat. She will start the *Parasite-Killing Program*.

☒ **Isopropyl Alcohol (Solvent) YES high throughout the body**

She will go off cosmetics that say "Prop" on the label, shampoo and cold cereal.

☒ **Wood Alcohol (Solvent) YES high**

☒ **Benzene (Solvent) YES high**

She will go off all items on the benzene list. Remaining solvents not tested.

Ten days later

Michelle feels much better and can swallow without pain but still has stomach distress.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **TCEthylene, Wood alcohol, Toluene, Isophorone, Hexane, MBKetone (Solvents) YES**

☒ **Styrene (Solvent) YES**

Will stop using styrofoam dishes.

☐ **Solvents (Remainder) NO**

Michelle still has an impressive list of solvents in her. She will stop using processed foods like fake pancakes.

☒ **Mercury, Silver (Toxic Element) YES very high at stomach**

This explains the severe indigestion. She is advised to get all metal out of mouth.

Summary: Michelle discovered the true nature of her problem just in time. We are waiting to see her after her dental work is done.

125 Deborah Hinman Skin Cancer

Deborah is 65 years old and came for her skin cancer which was diagnosed 2 weeks ago. She refused clinical treatments, although she was respectful and even fond of her clinical doctor. She has purple spots the size of quarters all over the backs of her legs. The skin is itchy and red and flakes off. She began getting these about 1 year ago and her doctor told her to use a cortisone cream. She knew that wouldn't be useful and never did it.

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES at liver and skin**

Cause of purple spots?

☒ **Fasciolopsis redia (Parasite) YES at skin**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

She will start on the Parasite-Killing Program.

☒ **Hexane (Solvent) YES at spleen**

☒ **Pentane (Solvent) YES at skin**

☒**Isopropyl Alcohol (Solvent) YES at liver**

☒ **Methylene chloride, Carbon Tetrachloride (Solvents) YES**

☐ **Solvents (Remainder) NO**

She is an avid tea drinker and has only one kidney. She is cautioned about tea drinking since it has too much oxalic acid to be a healthful beverage. She will go off tea. She will switch shampoo and cosmetics and stop eating cold cereals.

One month later

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

Her legs feel very much better. The purple spots are smaller and dimmer. She is on the parasite maintenance program. She has been off rare meats, which she always loved dearly in the past.

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **ME Ketone (Solvent) YES**

☐ **Solvents (Remainder) NO**

☒ **Mercury (Toxic Element) YES**

Remainder not tested. She is advised to get metal tooth fillings replaced by metal-free plastic.

☒ **Campyl fet and Campyl pyl (Pathogens) YES**

These are bacteria living in veins causing varicosities and may be contributing to purple spots.

☒ **Oxalate, Uric acid (Kidney Stones) YES**

Remainder not tested. She may start on kidney herbs - only one half dose - and cutting back even further to begin with if pressure in bladder is noticed. She is still drinking 2 glasses of tea a day but will try to stop.

Summary: Deborah has cleared up her skin cancer and knows how to avoid it in the future. Stopping drinking tea was the most difficult of all the rules she was trying to follow. But her intelligence is strong and she will probably clear up all

her problems.

126 David Adair Lung Cancer and HIV

This is a very ill appearing tall man, with labored breathing and hot hands to the touch. He was concentrating poorly as we greeted each other. His parents drove him here from a neighboring state for his HIV *Positive* diagnosis on the recommendation of a friend. He is extremely lethargic, but not able to sleep. Very little history was taken because he was barely able to sit in a chair.

- ☒ **Protein 24 (HIV) YES at thymus and penis**
- ☒ **Orthophosphotyrosine (Cancer) YES at bronchi**

Also has lung cancer. He was diagnosed HIV positive 5 weeks ago, after several bumps appeared on his right leg. But he had not been well for two years and has moved back to his parents' home.

- ☒ **Benzene (Solvent) YES at thymus**
- ☒ **Methylene chloride (Solvent) YES at thymus**
- ☒ **Acetone (Solvent) YES high at thymus**
- ☒ **Kerosene (Solvent) YES high**

He will go off commercial beverages and drink only milk, water and homemade fruit and vegetable juices. Note: no propanol was found; yet he is producing orthophosphotyrosine in his lung. Could this be an error? Or did I fail to test for propanol? Perhaps it was only present in the liver, not the white blood cells, so I failed to catch it. He was cleaning paintbrushes in kerosene recently; he will never do this again. His parents will cook for him and buy the new products he needs.

- ☒ **Fasciolopsis eggs (Parasite) YES at thymus and penis**
- ☐ **Sheep liver fluke (Parasite) NO**
- ☐ **Pancreatic fluke (Parasite) NO**

He will start parasite program. He will switch from soap and detergent to borax concentrate. He will use only our body products. Note: there is no adult fluke in either liver or thymus; his clinical drug for HIV may have killed it. He will be vegetarian for 3 months.

The next day

He is feeling very ill, barely able to sit for the appointment. His mother is anxious, sitting upright. His father is standing, pacing the floor with his hands together.

- ☐ **Protein 24 (HIV) NO**

- ☐ **Orthophosphotyrosine (Cancer) NO**

Both the virus and cancer are gone. This quick result may be due to his having only fluke eggs in the body at the present time.

- ☒ **Herpes simplex 1, Trich vag, Norcardia, Borellia burg, B strep, A strep, Haemophillus inf, Coxsackie B4, Coxsackie B1, Histoplasma, Campyl pyl, Bacillus cereus, Bacteroides fr, Staph aureus, Plantar wart, Gardnerella, Propiono, Adenovirus, Strep pneu (Pathogens) YES**

- ☐ **EBV, CMV, Flu, Resp Sync Virus, Chlamydia, Shigella, Proteus, Salmonella (Pathogens) NO**

End box 1. Note: he has 19 out of 27 pathogens in an active stage, obviously AIDS. He will use our L-G, 1 tbs. four times a day. Also vitamin C, 3 grams a day. L-G is an immune booster we use for serious viral conditions. They left for home, feeling that a test that shows NO (*Negative*) for HIV without showing any improvement in symptoms must surely be worthless and they must prepare for their son's death.

Eight days later

He is less lethargic today.

- ☐ **Protein 24 (HIV) NO**

- ☐ **Orthophosphotyrosine (Cancer) NO**

☒ **PCB (Toxic Element) YES high**

Off all detergents; may eat on paper plates and cups using plastic cutlery to avoid soap residue on dishes.

☐ **Solvents (ALL) NO**

Is complying very well with instructions.

☒ **CMV, Gardnerella, B strep, Bacteroides fr, Salmonella ent, Histoplasma cap (Pathogens) YES**

☐ **EBV, Flu, Resp Sync Virus, Chlamydia, Shigella, Proteus, (Pathogens) NO**

Note: he has only 6 *Positive*s out of 27 in box 1! He is improving.

☒ **Anaplasma, Strep pyog, Mycobact TB, Shigella dys, Campyl fetus, Strep G, Clostridium sept (Pathogens) YES**

☐ **Mycoplasma, Candida (Pathogens) NO**

End box 2. Note: he has only 7 *Positives* out of 40 in box 2. He is making good progress. I suspect teeth are source of most of the bacteria.

Twelve days later

He looks better. He walks without apparent neuropathy. He is taking his own notes on this visit. He has moved back to his own apartment.

☒ **TCE (Solvent) YES**

Drinks flavored coffee - will stop.

☐ **PCB (Toxic Element) NO**

Uses borax for everything. He is on maintenance parasite program.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **A strep (Pathogen) YES at tooth #17**

Left lower wisdom.

☒ **Klebsiella (Pathogen) YES at tooth #17 and 1**

Upper right wisdom tooth.

☒ **Corynebacterium, Campyl fetus (Pathogens) YES tooth #1**

☒ **Pneumocystis carnii (Pathogen) YES at lungs**

Note: he has only 5 pathogens that are growing, out of 67 tested, and these are mainly at 2 tooth locations. He needs to see dentist for cavitations at teeth #1 and 17.

☒ **Asbestos (Toxic Element) YES**

No clothes dryer or hair blower in apartment - test house air.

☒ **Bismuth (Toxic Element) YES**

Using cologne - he will go off.

☒ **Copper, Mercury (Toxic Elements) YES high**

Tooth fillings.

☒ **Palladium (Toxic Element) YES**

Tooth fillings.

☒ **Arsenic (Toxic Element) YES high**

Remove all pesticide. Remaining toxins not tested. He is advised to remove all metal from his mouth in addition to having cavitations done.

Ten days later

He is smiling now, walking briskly, and taking charge of his own case. He says he has more energy. But his right leg is a problem. He has difficulty walking on

it. It is considered to have neuropathy by his clinical doctor. A new dark spot has appeared beside the old spot on his shin. It is thought to be Kaposi's sarcoma by his clinical doctor. His doctor says he has permanent HIV neuropathy. His breathing is still labored and audible.

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine, hCG (Cancer) NO**
- ☒ **Fasciolopsis (Parasite) YES at skin; NO in thymus, liver, intestine**

Cause of Kaposi's.

- ☒ **Fasciolopsis redia (Parasite) YES at skin, blood, bladder**
- ☒ **Sheep liver fluke cercaria (Parasite) YES at skin, bronchi**
- ☒ **Pancreatic Fluke adults (Parasite) YES at skin, penis and bronchi**
- ☒ **Human liver fluke (Parasite) YES at skin and bronchi**

He has been eating at Arby's™ but will stop. He will go on our 5 day high dose parasite program. Note: the parasites are growing in the skin, causing the purplish lumps to appear. He did not get his cancer or HIV back because he did not have propanol or benzene in him. He must have another solvent, though. Will check.

- ☐ **Moniezia tapeworm head (Parasite) NO**
- ☒ **Herpes 1 (Pathogens) YES at skin**
- ☒ **Resp Sync Virus, B strep, Staph aureus, Adenovirus, Norcardia, Candida (Pathogens) YES at skin and bronchi**

He needs to get his dental work done.

- ☒ **Wood Alcohol, Methylene chloride (Solvents) YES at skin**

He has been drinking an herb tea blend. He will stick to single herbs.

- ☐ **Arsenic (Toxic Element) NO**

Carpets were steam cleaned.

☒ **Asbestos (Toxic Element) YES**

He brought air samples.

☒ **Asbestos (Toxic Element) YES bedroom air, kitchen air**

☐ **Asbestos (Toxic Element) NO living room air, bathroom air**

The kitchen has a radiator, the bedroom is next to the kitchen. We will test the paint on the kitchen radiator for asbestos with a wet towel rubbing.

Nine days later

His breathing is still audible. He has made a dental appointment; is on his way there. He has done a 5 day high-dose parasite program and is on maintenance again.

☒ **Pinworm eggs, Strongyloides larvae (Parasites) YES**

☐ **Parasites (Remainder) NO**

☒ **Petroleum ether, Regular gasoline (Solvents) YES**

Gassed up car this morning. He will be more careful at gas stations.

Seven days later

He appears normal in walking and in energy but his breathing is still audible. His leg is worse, with increased purple blotches.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

☒ **Hexane (Solvent) YES**

He has been using artificial creamer for coffee but will stop.

☒ **Asbestos (Toxic Element) YES**

Brought paint chips from radiator in the kitchen - are YES (*Positive*) for asbestos - remove radiator.

☒ **Campylobacter pyl and Campylobacter fet (Pathogens) YES**

Causes varicose veins. May contribute to purple blotches.

☒ **Salmonella para (Pathogen) YES**

☒ **Strep G, Diplococcus pn, and Staph mitis (Pathogens) YES**

Tooth bacteria.

☒**Mycobacter TB (Pathogen) YES**

Lung bacteria.

☒**Klebsiella, Corynebact diph, Blepharisma, Anaplasma (Pathogens)YES**

He is in process with dental work and appears well enough to repeat the clinical HIV test soon.

One month later

He has not been ill; he looks well. He had part of his dental work done this morning, but there is still quite a bit more to do.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

We will give him a requisition to do his HIV antigen test today.

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒**TCE (Solvent) YES**

Eats flavored croutons - will stop. He is on the parasite maintenance program, 2

times a week.

- ☐ **Herpes zoster, Candida, Measles (Pathogens) NO**
- ☒ **Herpes simplex 1, Mycoplasma (Pathogen) YES at thymus**
- ☒ **CMV (Pathogen) YES**

I picked some possible infections but only got 50% YES (*Positive*), definitely not the picture of AIDS. His legs have healed; his doctors decided not to biopsy after all.

Ten days later

His clinical HIV test results arrived. They are *NEGATIVE*.

Five weeks later

He had remaining cavitations done yesterday and is scheduled for metal removal from dental ware in several weeks. His symptoms of "HIV neuropathy" are probably due to mercury toxicity. He is also very stiff after sitting. He also lost his peripheral vision. He has not had any illness in the past month. He has started drug testing studies at a hospital. His T count is still under 300. He has been on AZT for 6 months.

- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine, hCG (Cancer) NO**
- ☐ **Benzene (Solvent) NO**
- ☒ **Isopropyl Alcohol (Solvent) YES**

Is still using prescription shampoo; will use borax. He will stay on parasite maintenance program. Next time we will check for tapeworm stages and aflatoxins.

Summary: David got rid of his cancer and HIV virus in 24 hours but getting rid of his AIDS was much more difficult. With his parents' assistance and his own stick-to-it-ness he succeeded.

127 Arlette Shapiro Intestinal Cancer

Arlette is only 23 years old and has been diagnosed with Rheumatoid Arthritis because of widespread pain. She has shoulder pain, arm pain, elbow pain, wrist, knee and foot pain. She has already seen another alternative doctor who gave her chelation treatments. She was fairly free of pain during this time. Now her pains are back. The chelation also helped against her migraine headaches. She has a water softener. While with the alternative doctor, she had all the mercury taken out of her teeth. I began by explaining that her shoulder and upper arm pain is caused by gallstones in the liver; she can easily wash them out in one evening and be free of shoulder pain the next day. Her hand and foot pain is due to kidney stones and she can dissolve these out in 3 to 4 weeks with our herbal recipe. That leaves the knee pain, which may indeed be rheumatoid arthritis, namely, tooth bacteria invading her knee joints. She also has cramps with her period.

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine**
- ☐ **hCG (Pre-Cancer) NO**
- ☒ **Fasciolopsis (Parasite) YES at one part of liver**

Other flukes not tested.

- ☒ **Isopropyl Alcohol (Solvent) YES high throughout her body**
- ☒ **Benzene (Solvent) YES**

Other solvents not tested. Arlette will start on parasite program. She will go off the items on the benzene list as well as shampoo and hair spray and cosmetics that list "Prop".

Summary: Arlette's appointment came near the end of this series, so her follow-up results got missed. She has worked so hard on her condition, I believe she will be successful.

128 Susette Ikeda Breast Cancer and HIV

Susette came with her husband, Mark, for simple arthritis, shoulder pain, and shortness of breath. But she had frequent nausea with fatigue attacks, and her arm pain extended into the armpit. Also, her shortness of breath was accompanied by chest tightness. She placed her hand over the breastbone where the thymus gland is located. These were ominous symptoms. She had already heard her husband's bad news of being HIV positive. I explained to her that HIV is not a sexual disease, although it can be transmitted that way.

☒ **Orthophosphotyrosine (Cancer) YES at side of breast**

(The side under the armpit.) She stated the breast was often painful with striking pain running from under the armpit.

☒ **hCG (Pre-Cancer) YES high everywhere**

☒ **Protein 24 (HIV) YES at thymus and vagina**

Susette had a much worse condition than Mark, with both cancer and the HIV virus.

☒ **Fasciolopsis (Parasite) YES at liver and thymus**

☒**Fasciolopsis cercaria (Parasite) YES at liver, thymus, blood, saliva**

☐ **Sheep liver fluke (Parasite) NO**

Other flukes not tested.

☒**Benzene, Isopropyl Alcohol (Solvents) YES high throughout her body**

Other solvents not tested. She will switch off her shampoo and hair spray and use our brands. She will go off the list of benzene polluted products. She will start on the *Parasite-Killing Program*. She will avoid eating rare meats.

Summary: Susette's appointment was one of the last to be included in this book so the follow-up was missed.

129 Ken Stanley Prostate and Intestinal Cancer

Ken, age 70, came with his wife, without a special reason, but only because his family members were riddled with cancer.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine and prostate**

This was a surprise for him, though.

☒ **hCG (Pre-Cancer) YES everywhere and in blood**

☒ **Fasciolopsis (Parasite) YES high at liver, intestine, prostate**

Note: We don't often see adults in the prostate, even in serious prostate disease.

☒ **Fasciolopsis redia, miracidia, cercaria, eggs (Parasite stages) YES high at liver, prostate, saliva, and semen**

Others not tested. Ken had such high levels of fluke stages in his body fluids that we will sample them for microscope observation.

☒ **Isopropyl Alcohol (Solvent) YES high everywhere**

He has been a heavy cold cereal eater.

☒ **Benzene (Solvent) YES high at thymus, etc.**

Remainder not tested. Ken will start on the parasite program. He will go off propanol containing body products and shampoo and cold cereal. He will go off the benzene list of polluted products.

Summary: Ken's follow-up visit was missed due to the cut-off date for this book. He was serious about his health and probably cured himself.

130 Joshua Kohn Prostate Cancer

Joshua's problems began 6 years ago. He is about 45 now. He had mysterious illnesses, one after another, that could not be diagnosed but which went away

eventually, on their own. He has kept excellent notes which he brought in and it is evident that he is suffering severe parasitism that may even elude me. (I only have about 120 specimens for testing.)

- ☐ **Protein 24 (HIV) NO**

- ☒ **Orthophosphotyrosine (Cancer) YES at prostate**

- ☒ **hCG (Pre-Cancer) YES high throughout his body**

He has cancer; this did not shock him, considering his history.

- ☒ **Fasciolopsis (Parasite) YES high at liver and intestine**

- ☒ **Fasciolopsis redia (Parasite) YES high at saliva, etc.**

Others not tested. We will get a saliva sample for microscope observation. He will start on the *Parasite-Killing Program*.

- ☒ **Isopropyl Alcohol (Solvent) YES high everywhere**

He will go off commercial shampoo and shaving chemicals, also cold cereal.

Two weeks later

- ☐ **Orthophosphotyrosine, hCG (Cancer) NO**

He is free of cancer and we can direct our attention to his testicular pain problems.

- ☒ **Styrene (Solvent) YES**

Stop using styrofoam.

- ☒ **Carbon Tetrachloride (Solvent) YES**

Drinks Magic Springs Natural Drinking Water™ - will go off.

- ☒ **Xylene (Solvent) YES**

Probably in drinking water. He will switch to his regular faucet water. He may

begin on kidney program but continue parasite maintenance program.

Summary: Joshua cleared up his prostate cancer in 2 weeks and is enjoying the new body care products. He does not miss the old polluted ones. He was astonished and dismayed that purchased drinking water may be more polluted, by far, than city water.

131 Joanne Semak Intestinal and Cervical Cancer

Elsie is 56 and came in because of an abnormal PAP test. She is scheduled for a colonoscopy in 10 days. She would like an alternative.

- ☐ **Protein 24 (HIV) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine, cervix**
- ☒ **hCG (Pre-Cancer) YES throughout her body**
- ☒ **Fasciolopsis (Parasite) YES at intestine and liver**

Others not tested. She will start on parasite program.

- ☒ **Isopropyl Alcohol, Toluene, TCEthylene, Wood alcohol (Solvents) YES**
- ☐ **Solvents (Remainder) NO**

She will stop using commercial beverages and cold cereal. She will switch off her shampoo and hair spray and use our varieties.

- ☒ **Mercury, Nickel (Toxic Elements) YES**

She will get metal removed from her mouth as soon as possible.

Summary: Can she accomplish all this and improve the appearance of her cervix in 10 days? Not likely. She needs to postpone surgery for several weeks. Her final results were not ready in time for this book.

132 Elsa Elizondo Not Cancer

Elsa is 71 years old and came in for urinary tract problems. She is from a Midwest state. They have a cat. She has frequent bronchial problems but nobody in the home smokes.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

There is no cancer, not even pre-cancer in her.

☒ **(Ascaris) Roundworm of cats and dogs, Roundworm of horses (Parasites) YES**

She will treat the cat with our herbal program. She herself will start a kidney program.

Six weeks later

She feels better in many ways. Her energy is up.

☒ **Fasciolopsis (Parasite) YES at intestine**

☒ **Fasciolopsis miracidia (Parasite) YES at intestine, saliva**

☒ **Fasciolopsis redia and eggs (Parasite) YES at intestine, saliva, and blood**

Others not tested. Note how heavily infected with intestinal fluke stages she is. Certainly, kissing would be infectious. But they are not in the liver to cause cancer, nor in the thymus to cause HIV disease.

☒**Mothballs (Solvent) YES**

Will discard.

☒**Methylene chloride, Carbon tetrachloride (Solvents) YES**

She will stop using commercial beverages and flavored foods.

☒ **Gasoline (Solvent) YES**

She will be more careful at gas stations.

☐ **Solvents (Remainder) NO**

Note: there is no propanol or benzene, so she is safe from cancer and HIV. But the solvents she has in her are causing her parasite stages to progress and multiply.

☒ **PCB (Toxic Element) YES**

Off detergent.

☒ **Palladium (Toxic Element) YES high**

☒ **Mercury (Toxic Element) YES high**

Others not tested. These could come only from tooth fillings. She is advised to have them all replaced with metal-free plastic. She will start parasite program.

Summary: Elsa's case was included here to show how the stage is often set for cancer without having any serious symptoms. Parasites have learned not to alert us. But a simple increase in consumption of moldy food (contains aflatoxin) such as apple cider vinegar or nuts could cause a propanol build-up in her and then cancer.

133 Kim Maddox Breast Cancer and Near HIV

Kim is a middle age mother of several children. She has had a mole on her breast enlarge and get red and sore. The breast felt full and uncomfortable. It is the same breast where she had many breast infections while nursing babies. The mole is now scaling and flaking.

☒ **Orthophosphotyrosine (Cancer) YES**

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis cercaria, miracidia (Parasite) YES at breast and blood**

She will start on parasite program.

Eight days later

- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**

Continue parasite program.

One month later

She is fatigued and feels pressure on her chest.

- ☒ **Fasciolopsis (Parasite) YES at thymus; NO in liver and elsewhere**
- ☒ **Fasciolopsis cercaria (Parasite) YES at thymus and edge of breast**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Protein 24 (HIV) NO**
- ☒ **Mycoplasma, CMV (Pathogens) YES**
- ☒ **Benzene (Solvent) YES**

Uses a toothpaste that contains a special essential oil.

- ☒ **Isopropyl Alcohol, Acetone (Solvent)s YES**

Note: The adult fluke is not in the liver and there is no cancer, in spite of the presence of isopropanol. The adult fluke and cercaria are in the thymus (one part of it) and yet the HIV virus is not present. Does HIV only come with redia in the thymus? She is advised to stop using essential oil products and go off the entire benzene pollution list as well as shampoo and commercial beverages.

Six days later

- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☒ **Benzene (Solvent) YES**

Still uses products containing the same essential oil.

- ☐ **Isopropyl Alcohol, Acetone (Solvent) NO**

Note: She is very fond of essential oil products and does not wish to go off them. She sees that she got rid of her cancer the first time without going off them and this proves to her keen mind that she does not absolutely have to go off it.

Seven days later

- ☐ **Solvents (ALL) NO**

She is off essential oil products.

Summary: Hopefully Kim hasn't ruined her health by having benzene in her thymus for a prolonged time. She just loved her essential oil products and wished the companies making them no harm. Perhaps she stopped in time. She is a conscientious, health-minded, intelligent person.

One week later

She has had a Herpes attack and feels critical of my methods since she feels she should be well by now. She is also losing her hair and has pressure on the chest.

- ☒ **Fasciolopsis (Parasite) YES at one part of the thymus**

- ☒ **Fasciolopsis cercaria (Parasite) YES at the same part of the thymus and edge of the breast**

- ☐ **Fasciolopsis other stages (Parasite) NO**

- ☐ **Protein 24 (HIV) NO**

- ☐ **Orthophosphotyrosine (Cancer) NO**

Note: She has the setting for HIV, with adults in the thymus, but does not show the virus. Perhaps it is at its very beginning. Perhaps the redia stage must also be present.

- ☒ **Benzene (Solvent) YES**

Is using Tom's toothpaste instead of the one with an essential oil; will switch to baking soda.

- ☒ **Isopropyl Alcohol (Solvent) YES**

- ☒ **Acetone (Solvent) YES**

She will go back on parasite program and give up all toothpaste and body products this time.

One week later

- ☐ **Fasciolopsis and all stages (Parasite) NO**

- ☒ **Benzene, Acetone (Solvents) YES**

Returned to products with essential oils.

- ☐ **Isopropyl Alcohol (Solvent) NO**

She is accustomed to pure borax shampoo now and likes it.

One week later

- ☐ **Solvents (ALL) NO**

Including benzene. She has gone off her essential oil products and wants to inform the manufacturer of their benzene pollution. She is justifiably angry about this.

One month later

- ☒ **PCB (Toxic Element) YES**

  Does not like using borax for dishes so went back to detergent but will go back to borax.

One week later

She still has breast pain.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **PCB (Toxic Element) YES**

Prefers detergent. I reminded her to continue on parasite maintenance program and stay off the entire benzene list.

Final Summary: We need many more persons like Kim who are so shocked that health foods and health products are polluted that it simply is unbelievable. Hopefully, she will turn her anger on the correct culprits after she has accepted the truth.

134 Lydia Massey Pancreatic, Intestinal, Uterine Cancer

Lydia is with her husband and needs to be checked for carrier status of the intestinal fluke. Her intelligence is impressive; she includes herself in the health picture of Gerry!

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES high at pancreas, uterus and intestine!**

She has a high level of cancer in the pancreas and yet was not noticeably ill. However, she has had chronic stomach problems with frequent nausea. She was not too surprised.

☒ **hCG (Pre-Cancer) YES throughout her body**

☒ **Isopropyl Alcohol (Solvent) YES high throughout her body**

☒ **Benzene (Solvent) YES**

☒ **Fasciolopsis (Parasite) YES at liver**

Others not tested. She will start on parasite program. She will go off the benzene list of products and foods. She will go off regular shampoo and use borax. Note: Lydia is in a much more advanced cancerous state than her husband.

135 Shirley Stafford Liver Cancer and HIV

Shirley has a healthful lifestyle, without alcohol or nicotine. But she developed a pain over the upper mid-chest (she put her hand right over the thymus gland) and visited her regular doctor. The doctor wanted her to have a mammogram. Her left arm feels heavy. She also has low back pain that runs down her left leg.

- ☒ **Protein 24 (HIV) YES at thymus and vagina**

This was almost self-evident, considering the chest pain. My explanations seemed odd to her. She has no known risk factors.

- ☒ **Orthophosphotyrosine (Cancer) YES at liver only**

She has cancer of the liver as well.

- ☒ **Fasciolopsis (Parasite) YES at liver and thymus; NO at intestine**

- ☒ **Fasciolopsis redia (Parasite) YES**

Others not tested. She will start on parasite program.

- ☒ **Benzene (Solvent) YES**

Go off all items on the benzene list.

- ☒ **Isopropyl Alcohol (Solvent) YES at one part of the liver only; NO at WBCs!**

Note: I could have easily missed the propanol if I had not searched the liver for it. She will go off shampoo and use ours.

Two weeks later

Shirley has not been ill since the last visit. Her arm feels normal now: it had felt heavy before. The pain over her breastbone is gone now.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Kerosene (Solvent) YES**

Be more careful when pouring it.

☐ **Solvents (Remainder) NO**

☒ **Asbestos (Toxic Element) YES**

Will test home air. Suspect washing machine belt.

☒ **Formaldehyde (Toxic Element) YES**

New recliner chair and foam pillows.

☒ **Mercury (Toxic Element) YES at thymus**

☐ **Toxic Elements (Remainder) NO**

She is advised to replace her metal tooth fillings with metal-free plastic ones. She will do away with new furniture.

Two weeks later

Her low back pain is unimproved. She has brought 2 belts for testing. One of the belts was YES for asbestos. She will start on kidney herbs for low back pain.

Two weeks later

She has scheduled her dental work.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **hCG (Pre-Cancer) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

She began using Listerine™; will stop.

☒ **Arsenic (Toxic Element) YES**

☐ **Asbestos (Toxic Element) NO**

The new belt is asbestos free. She will remove pesticide from home.

Summary: It is always a delight to work with a client who can dispose of new furniture or carpets without regrets when health is at stake. Our culture teaches us to value our material things, not our health. Shirley was inspiring to our office with her ease of choosing health before gold crowns and expensive new furniture.

136 Helen Douthet Cancer and HIV

We have seen Helen in the past five years for painful joints, high blood pressure, and thyroid problems, but was in reasonably good health. After a long absence, she arrived at the office looking very pale and thin. She has just returned from the Mayo Clinic. She said they were unable to diagnose her with anything significant in spite of her critical condition. She had not made an appointment but was only purchasing vitamins. I coaxed her to take my first test panel.

☒ **Orthophosphotyrosine (Cancer) YES at thymus, bone marrow, liver, intestine and brain!**

☒**Protein 24 (HIV) YES at thymus, brain, pancreas, blood**

She has widely disseminated disease. How could this be missed by clinical medicine?

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus, bone marrow and liver**

☒ **Fasciolopsis redia (Parasite) YES at thymus, bone marrow, and blood**

☒**Benzene (Solvent) YES**

She will begin parasite program immediately and go off benzene and isopropyl alcohol containing products and return in 2 days for a follow-up. She seemed too ill to do more testing now.

Two days later

She looks exceedingly ill, can barely walk.

☒**Orthophosphotyrosine (Cancer) YES at thymus, intestine**

☒ **Protein 24 (HIV) YES at thymus and bone marrow**

Notice how both illnesses have shrunk their territory in her body.

☒**Fasciolopsis miracidia (Parasite) YES**

Continue parasite program.

☒**Benzene (Solvent) YES high**

The level is much higher than two days ago, she has obviously had a recent high exposure. She has brought some cans, her water, and an air sample to test.

☒**Benzene (Solvent) YES in Scotchguard™ for fabrics (a spray can), laundry room air (laundry room has an odor), and in her filtered water at sink (purified drinking water)**

☐ **Benzene (Solvent) NO in Carbona™ spot remover, Energine™ cleaning fluid and plain cold tap water**

In view of the possibility that the purified drinking water is contaminated with benzene, she will use purchased drinking water. She does not trust her tap water. She is still an emergency case and needs to follow-up in 3 days.

Three days later

She seems a bit better.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis redia (Parasite) YES at thymus, bone marrow**

She has had discomfort over her middle abdomen to the point of pain during this week.

☒**Benzene (Solvent) YES and in WD40™**

Uses on exercise bike - will stop.

Four days later

She is still very ill but feels some improvement. She has partly cleaned the house of chemicals. She has had a "full" feeling on front of neck, still noticeable.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

She will not eat pork or beef and will not handle meat in the house. She does not eat turkey or chicken because of her sensitivity to Salmonella (gets sick right away).

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Benzene (Solvent) YES high**

She is using facial cleanser, a heating pad, shower water, shampoo, polysorbate 80. She will stop until we test each one for benzene.

☒ **Strep pyog, Pseudomon aer, Diplococc pn, Gaffkya (high), Clostridum (high) (Pathogens) YES**

Remainder not tested. Note: all five of these are typically found in teeth. She has a mouth full of metal - mostly gold. She had too many infections (5 out of 6 tests), so I did not continue testing. The implication of AIDS was obvious. She resisted suggestion of dental work. But she will call the dentist regarding cavitations at teeth #1 and #32. I tried to impress on her the need for speedy removal of tooth infections and benzene.

Four days later

Although Helen is not interested in removing the metal from her mouth, she has just returned from seeing the dentist. The dentist found no x-ray evidence of any tooth abscess or cavities, but Helen did have several cavitations cleaned. She is feeling better for the first time.

☒ **Benzene, xylene, acetone, wood alcohol, Isopropyl alcohol (Solvents) YES**

She will switch to grain alcohol as general cleanser and continue parasite program.

Three days later

She is still getting some low days. She still weighs under 100 pounds but feels she may have gained 1 pound.

☐ **Benzene, ether, Isopropyl alcohol (Solvents) NO**

☒**Dipetalonema, Echinococcus, E. hist, Echinoporyph, Fishoedrius (Parasites) YES**

☒**Pancreatic Fluke (Parasite) YES**

Remainder: NO (Box 1). She tested YES for cholesterol crystals and needs to cleanse her liver of gallstones.

Five days later

She is feeling better than 1 week ago, but she still has her ups and downs.

☒ **Fishoedrius, Myxosoma (Parasites) YES**

☒ **Necator (human hookworm) (Parasite) YES high**

☒**Moniezia (Parasite) YES high**

Tapeworm head, probably escaping from its cyst after solvent action.

☒ **Leishmania mex, Taenia sag (Parasites) YES**

☐ **Parasites (Remainder) NO**

☒ **Mycoplasma (Pathogen) YES high (systemic)**

Probable cause of general aching.

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus**

☒ **Isopropyl Alcohol (Solvent) YES high**

Went back to using commercial shampoo.

☐ **Benzene (Solvent) NO**

☐ **Solvents (Remainder) NO**

Stay on parasite maintenance program.

Five days later

☒ **Benzene (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

Using untested body chemicals. Will stop.

Six weeks later

☐ **Protein 24 (HIV) NO**

☐ **Orthophosphotyrosine (Cancer) NO**

☒ **TCE (Solvent) YES**

Off commercial beverages.

☐ **Solvents (Remainder) NO**

Stay on parasite program.

Six weeks later

She is very much better. She has been on chelation treatment for 1 week. She is on a parasite maintenance program.

- ☐ **Solvents (ALL) NO**
- ☐ **Protein 24 (HIV) NO**
- ☐ **Orthophosphotyrosine (Cancer) NO**
- ☐ **Fasciolopsis and all stages (Parasite) NO**
- ☒ **Sheep liver fluke (Parasite) YES**
- ☐ **Pancreatic fluke (Parasite) NO**

She will stay off rare meat.

Summary: Helen had a very close brush with death. Her great dependence on body chemicals of all kinds (lotions, etc.) contributed to this near tragedy. At one point her weight was 93 pounds, and I feared we had seen her for the last time. If she had followed her friends' advice to hospitalize herself or had returned to the Mayo Clinic, she would not have survived. Although she appeared well at the last visit, her failure to remove dental metal could shipwreck her health in the future.

137 Gail Lima Kidney, Bladder Cancer

Gail is a health-minded woman, age 51, who came from Michigan with her husband. She had a long list of problems in spite of eating organic food, very little meat, had no vices and didn't even drink carbonated beverages. She had tinnitus in her left ear, dry skin and lips, tight neck and shoulder so as to give her headaches. Her heart frequently began to pound for no reason. Her knees and wrists were weak and painful. She had low back pain and gas pains and foot pain. She didn't sleep well and felt anxious most of the time. Her energy level and concentration were low. She suffered from panic attacks and depression. She said she had hypoglycemia, chronic fatigue and Candida, 3 modern diseases that

suggested parasites and pollution. I will check for tapeworm later.

☒ **Orthophosphotyrosine (Cancer) YES at intestine, bladder and kidney**

What a surprise and what an unusual place to have cancer (the kidney).

☒**hCG (Pre-Cancer) YES in part of the liver; NO in WBCs**

Note: she said she had recently gone to her regular doctor for burning during urination but he looked at her urinalysis and said she was fine. He wanted to arrange an appointment with a psychiatrist for her but she declined. This viewpoint of her doctor's could have been based on her numerous symptoms and health orientation, suggesting hypochondria. Upon checking the urinalysis she brought with her, it showed numerous bacteria, WBCs and cloudiness. She did indeed have a urinary tract infection besides cancer.

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

☒ **Fasciolopsis eggs (Parasite) YES at intestine, blood, bladder, kidney**

☒ **Sheep liver fluke metacercaria (Parasite) YES at blood, bladder and kidney**

We will get a urine specimen and search for these.

☐ **Pancreatic fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

☒**Mineral oil (Toxic Element) YES**

She uses no lotions or salves however.

☒ **Methyl Ethyl Ketone, Denatured ethyl alcohol, Grain alcohol, Isophorone, TCEthylene, Toluene, Hexane, Regular gasoline, Pentane, Methyl chloride, Carbon tetrachloride (Solvents) YES**

☒**Isopropyl Alcohol (Solvent) YES at liver and everywhere**

☒ **Benzene (Solvent) YES at thymus**

As each new YES (*Positive*) result was obtained for the solvents, it was more incredible than the last. How could a health-conscious person who drank no carbonated beverages and ate no cold cereal be so toxic with solvents, including the very worst: benzene and carbon tetrachloride? She uses no cosmetics or household cleaners of a toxic kind. When I asked her what she had drunk and eaten the previous day from morning to night, she showed me containers of powders and foil packages of powders. She has been drinking 1½ quarts of a Sunrider product called Nuplus. This seems an unlikely source, but I will analyze it at once. She is also using packets of Vitalite powders. She will go off all beverages except milk, spring water or tap water, fresh squeezed fruit and vegetable juice and single herb teas. She will switch shampoo to borax concentrate. She will start on parasite program.

Six weeks later

- ☐ **Protein 24 (HIV) NO**
- ☐ **hCG (Pre-Cancer) NO**
- ☒ **Orthophosphotyrosine (Cancer) YES at intestine, bladder, kidney**

She still has her cancers. How could a seriously health-conscious person fail to get rid of her cancers in 6 weeks when others get rid of theirs in 6 days?

- ☒ **Isopropyl Alcohol (Solvent) YES throughout her body!**
- ☒ **Carbon Tetrachloride (Solvent) YES**
- ☒ **Mothballs (Solvent) YES**
- ☒ **Cedar Mothballs (Solvent) YES**

Cedar mothballs no doubt have paradichlorobenzene added.

- ☒ **Mineral oil (Toxic Element) YES**

Uses a commercial lotion. Others not tested due to numerous *Positives*. She is obviously consuming heavily polluted food. She states she has not stopped using her Sunrider supplement powder and other beverage powders because she believes so strongly in them. Upon testing, they were extremely polluted. She

will stop using them, although they give her "energy". She also did not switch cosmetics and shampoo to our brands but will do so at once.

BLOOD TEST	Result	Comment
1. Lymphs	very low (13.1%)	bone marrow toxin
2. Potassium	very low (3.8)	adrenals
3. CO2	very high (29)	toxin in the air, we will search house for it
4. Calcium	very low (8.8)	She drinks no milk for fear of toxins in it! She will start on plain yogurt and some milk. 3 cups 2%/day. Also magnesium oxide, 300 mg, 1/day and Vitamin D from Bronsons, 3/day.
5. Phosphate	high (4.5)	dissolving bone. See calcium for recommendations.

☒**Vanadium(Toxic Element) YES**

Gas leak in her house.

☒**Arsenic (Toxic Element) YES**

Steam clean carpets. They will tend to these immediately when they get home.

Summary: Gail was extremely disappointed in her health-food powders. She didn't stop using them because she trusted them. Hopefully, she will conquer this life-threatening emotion and get herself well.

138 Harold Light Intestinal and Prostate Cancer

Harold is 66 and has always been hard working and active. Now he has

shortness of breath, back pain, leg pain, high blood pressure and diabetes. He was put on diabetes medicine 6 months ago, but decided he would rather correct his condition than stay on drugs and eventually need insulin. They have a water softener but live in an apartment complex so they can't disconnect it. They will start getting water for cooking from a different source.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine, prostate, urine**

He recalls he has had a number of colon polyps removed over the years.

☒ **hCG (Pre-Cancer) YES at intestine, prostate, blood, urine; NO in WBCs**

Note: again, the WBCs (the immune system) did not show hCG, although it is rather widespread. Is there a problem with his WBCs? Or is it in the nature of hCG not to notify the immune system?

☒ **Fasciolopsis (Parasite) YES at liver, intestine**

☒ **Fasciolopsis eggs (Parasite) YES at liver, intestine, prostate, and blood**

Others not tested.

☒ **Isopropyl Alcohol (Solvent) YES**

☒ **Benzene (Solvent) YES**

Others not tested. He will start on the *Parasite-Killing Program* and stop using shampoo and shaving chemicals. He will switch to electric shaver. He will go off the benzene list and cold cereal.

Summary: Harold was showing the typical health deterioration that is considered part of aging. It is actually parasitism and pollution. Pollution with solvents and heavy metals fosters the parasitism. We hope he will stay committed to his purpose to choose a wiser path than drugs and debility.

139 Jerry Thomas Bone and Intestinal Cancer

This 51-year-old man came in because of his bone cancer. It started 3 years ago. He began passing blood; he had a tumor on his kidney; the kidney was removed. He has spots on the lungs, which were discovered two years ago. He was put on interferon for 9 months; it wasn't working so they took him off again. Then his leg showed cancer 1 year ago, and he had surgery to remove a tumor in his left leg. In May of 1992 he was on chemotherapy, but it didn't help. Another doctor took over at this point. (This is renal cell cancer.) He also has high blood pressure and has been on medication for it for 3 years. There is a water softener in his home; he will turn it off. He uses coffee, tea, chocolate, beer, hard liquor and tobacco.

☐ **Protein 24 (HIV) NO**

☒ **Orthophosphotyrosine (Cancer) YES at intestine and bones; NO at lungs and bronchi**

☒ **hCG (Pre-Cancer) YES everywhere**

☒**Isopropyl Alcohol (Solvent) YES everywhere**

Off commercial body products and cold cereal.

☐ **Benzene (Solvent) NO One week later**

☐ **Isopropyl Alcohol (Solvent) NO**

☐ **Orthophosphotyrosine, hCG (Cancer) NO**

His cancer has stopped. We are now focused on healing his lesions.

☒**Barium (Toxic Element) YES at bones**

He has been spending time in a bus garage; he will avoid it from here on.

☒**Cadmium (Toxic Element) YES at bones**

The galvanized plumbing is very old. We will test his water.

☒ **Formaldehyde (Toxic Element) YES at bones**

Get rid of foam mattresses.

☒ **PVC, Lutetium (Toxic Elements) YES**

Garage?

☒**Rubidium, Zirconium (Toxic Elements) YES**

☒**Holmium (Toxic Element) YES**

Hand cleaner?

☒**Mercury, Platinum (Toxic Elements) YES**

Tooth fillings.

☐ **Toxic Elements (Remainder) NO**

Summary: Jerry got rid of his cancer in one week, in spite of his addictions. I did not mention them, to increase the chance of his coming back to the office and surviving. But he has certainly made a sincere effort in every other way.

Finale

I hope you reach the same conclusions as I did from these case histories:

- **Cancer is simply a side effect** of parasite infestation and solvent accumulation. It is not a permanent, mortal disease.

- **It is amazing how easy** the cancer side effect is to cure—*Fasciolopsis buski* is one of the first to succumb to the parasite-killing herbs—but it often doesn't bring relief, because the problems that started the initial tumor growing haven't been corrected.

- **Cancer blinds us** to our real problems, like seeping dental metal and plastic, toxic body products, hidden pollution in our favorite foods, and toxins in our environment. These destroy our lives.

- **No matter what kind of cancer you have**, a complete program of lifting the burdens on your immune system will miraculously clear it up.

- **Tumors will shrink** if you remove the dozen or so causes that contribute to them. These causes are not mysterious, just more parasites and toxins.

It seems quite clear that ALL cancers are alike, although different organs are picked to be the target. Cancers typically start with tumor formation, due to about a dozen causative factors. These factors cause numerous mutations, which are the focus of many current microbiological studies. The tumors turn malignant with the invasion by *Fasciolopsis* and isopropyl alcohol.

How To Test Yourself

This chapter describes how to make and use the electronic device that lets you do the same tests that I did, and that led to the discoveries in this book.

It is natural to be skeptical that you can accumulate isopropyl alcohol from your shampoo, or that there is anything toxic in soft drinks, or you should change your house plumbing, or you should remove your gold crowns. But you can look for toxins in all these items for yourself, and you may luckily find that you do not have them!

It is only from years of experience testing every product clients brought in, or that I sampled from the grocery and drug store, that I make generalizations like "all cold cereals have toxic solvents," or "all meat has parasites."But obviously no one can test them all. Maybe your brand is OK! Or perhaps it is not. Unless you test for yourself you must rigorously follow the advice in this book.

Remember these tests can only say **YES** there is something in this food (or water sample or air sample or pill or potion) that my white blood cells (indicating your immune system) are busy removing. Or **NO** my white blood cells are not working on this[62]. And except for very high amounts, it is hard to say how much of a bad effect the toxin is having. But with repeated testing you can even find that out. Suppose your hair spray tests YES (*Positive*) in your immune system five minutes after using it, but not after twenty minutes. This, you may feel, is an acceptable level of toxicity. Or you may find it tests YES even though you washed it out of your hair yesterday. That would be a strong indication that you are accumulating at least some of the toxins from your hair spray in your body, and not only must you not use it, you must find a way to reduce your levels! Again, your own tests will be better than my general advice; but without them, you must follow my advice to get well.

All of the results obtained in this book can be duplicated by a person with skills at the high school level. No knowledge of electronics is required.

When possible, we include Radio Shack catalog numbers to describe materials. This is for convenience only. Equivalents are usually available at any

electronics store.

A videotape is available that demonstrates how to make and use a Syncrometer®(see *Sources*).

Leads come in many different lengths and are carried by all electronics stores.

Leads

If you are new to electronics you will need to know what a *lead* is. A lead is simply a wire used to connect two parts electrically. The method of clipping the lead to the component (part) determines its name. An *alligator clip test lead* uses a small metal clothespin for connecting, while a *mini-hook clip lead* is like a small, spring-loaded crochet hook. The mini-hook is best for attaching to a wire, the alligator clip is best for larger connections like to the test surfaces.

The testing device consists of four parts:
the test surfaces, probe and handhold, speaker, and circuit. These are connected by leads. The first item to construct is the test surfaces.

Test Surfaces

You will need two plates to set test samples on. The plates that hold the samples are intentionally separated from the main circuit because, unless you add shielding, the frequencies on the test plates may interfere with the circuit.

Materials needed:

shoebox
aluminum foil
stiff paper
2 bolts and nuts
nail
4 alligator clip test leads (3 very short, 1 about 24 inches)
2 ordinary light switches

Acceptable

Cut two 3½-inch squares out of stiff paper such as a cereal box. Cover them with slightly larger squares of aluminum foil, smoothed evenly and tucked snugly under the edges. You have just made yourself a set of open capacitors.

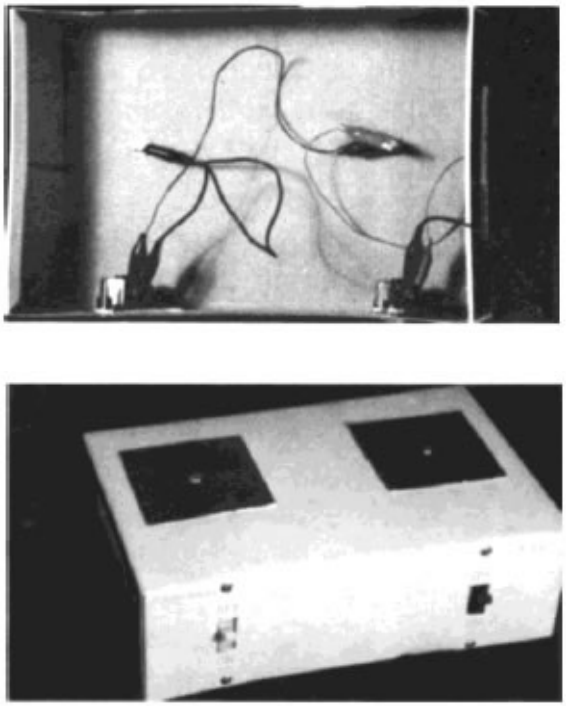

Fig. 79 Test surfaces

Mount these on the bottom of a shoebox turned upside down. They should be at least two inches apart. Make a hole through each with a small nail, and enlarge with a pencil point until you can fit a small bolt through. Use a washer and a nut to tighten them down. The bolt should be at least one inch long, to make it easy to clip leads to inside the box.

Mount two ordinary light switches on the front side of the shoebox, one in front of each plate. Cut 1 by ½ inch rectangular holes to let the toggle through. Remove the screws that came with the switch, then insert the switch from inside so that OFF is when the toggle is UP (this is the reverse of how most light switches are oriented). Push a pin from the inside through the screw holes, enlarge them, and replace the screws from the outside. If the shoebox is too shallow, flex the "ears" off the switches.

On the shoebox, label the left plate "Substances" and the right plate "Tissues". Label the toggle for each plate with an "OFF" and "ON".

Using a short alligator clip test lead, attach the tissue plate bolt to the tissue switch at one screw terminal. If there are three screw terminals, one will be green for ground—do not use it; use the other two. Attach the other screw terminal on the tissue switch to the substance plate bolt. Attach the substance plate bolt to the substance switch at one screw terminal. Finally attach a long alligator clip test lead to the other substance switch screw terminal. The other end will be attached to the circuit when you build it.

Choose either the "Acceptable" or the "Best" construction technique. You do not have to do both.

Best

Use a large plastic project box instead of the shoebox. Do not use project boxes with metal lids. If you cannot find all plastic boxes, remove the metal top and mount the test plates to the bottom. Use insulating sleeves and solder all connections.

Probe And Handhold

These are what you grasp when testing. The places to attach the probe and handhold are described with the circuit instructions.

Acceptable

For the probe use an empty ballpoint pen (no ink) with a metal collar by the point. Connect a two or three-foot alligator clip test lead to this collar. For the handhold use a cheap metal can opener (the kind that fills your hand) with a second alligator clip test lead attached.

Best

The Archer Precision Mini-Hook Test Lead Set has a banana plug for the probe on one end and a mini-hook on the other end for easy attachment to the circuit. Tape a long, new pencil to the probe; this makes it easier to hold. The best handhold is simply a 4-inch piece of ¾ inch copper pipe (which a hardware store could just saw off for you) connected to the circuit with a three-foot alligator clip test lead.

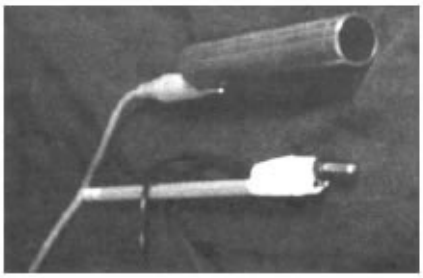

Fig. 80 Handhold and probe

Item discussed	**Radio Shack Cat. No.**
banana plug probe	Precision Mini-Hook Test Lead Set (contains two, you only need one) 278-1160A

Speaker

Hearing is believing. The sound made when you test substances lets you know if you have a YES (*Positive*) or NO (*Negative*). The better the sound quality the easier it is to hear the difference.

The speaker in the *200 in One Electronic Project Lab,* Cat. No. 28-265 (if you select this method of building the circuit) is not satisfactory. However, Cat. No. 28-262 is satisfactory, and no extra speaker is needed.

Acceptable

You may hook the circuit up to your stereo system. Make sure you ask an expert to make the attachment. The leads (wires) you need to do this depend on the terminals your stereo has, but the end of the lead to the circuit should have either alligator clips or mini-hooks for easy attachment. Turn the bass all the way down, and the treble all the way up when you use it. Headsets do not work.

Best

The Archer Mini Amplifier Speaker is inexpensive and small (about the size of a transistor radio), making it easy to take with you. It needs a 9-volt battery. Remove the screw at the center back of the speaker using a Phillips screwdriver to gain access to the battery compartment. Also get a 1/8 inch phono jack. Plug the phono jack into the receptacle marked "INPUT", and unscrew the plastic housing on the jack to expose the two posts for attaching wires. Each post should have a small hole in it to attach a mini-grabber lead. If there are no holes use

alligator clip leads, but slip a piece of plastic tape between the posts to make sure the alligator clips do not touch each other.

Fig. 81 Attaching the speaker

Item discussed	**Radio Shack Cat. No.**
speaker	Archer Mini Amplifier Speaker 277-1008C
1/8 inch phono jack	Two-conductor Phone Plugs 274-286A (package of 2, you only need 1)
AC/DC adapter (optional)	273-1455C

You are now ready to build the main circuit.

I describe four ways to make a Syncrometer®, the circuit you can use to test yourself and products:

- **The Easy Way:** buy the *200 in One Electronic Project Lab* by Science Fair, Cat. No. 28-265 or Cat. No. 28-262, at Radio Shack for about $50.00; follow the instructions for connecting *The Electrosonic Human*, then modify the connections as described below
- **The Economical Way:** just buy the parts at Radio Shack for about $35.00, and follow the detailed instructions below (no soldering required)
- **The Rugged Way:** use the parts list, schematic and your electronic expertise
- **The Dermatron Way:** I discovered this method by making some modifications to a commercially available $750.00 ViTel.™A Dermatron is a device invented decades ago to measure body resistance (as opposed to skin resistance which is what lie detectors measure). If you own one you

already have the circuit, probe, handhold, speaker and test surfaces. You will just be preparing an additional switch.

Select the most suitable method for your level of experience. You don't have to do all four!

The Easy Way Circuit

Build The Electrosonic Human (in the *200 in One Electronic Project Lab* by Science Fair, Cat. No. 28-265, at Radio Shack). It's easy and fun. If your kit has a different catalog number you may have different connection numbers.

Instead of connecting the probe to terminal T2, just clip it directly to terminal 137, and remove the 137-T2 wire. Similarly, clip the handhold to terminal 76 and remove the 76-26 and 25-T1 wires. This also removes the 4.7K resistor which is not necessary.

If you are using Cat. No. 28-262, you may connect the speaker as described. With Cat. No. 28-265, eliminate the Project Lab speaker by removing 53-173 and 54-174. Connect your speaker instead. *Positive* (the short post, if using the 1/8 inch phono jack) goes to 53, and *Negative* (long post) goes to 54.

Later, when you use the probe to press against your knuckle you may find it painful. In this case try substituting the .005 microfarad capacitor for the .01 microfarad capacitor in the circuit.

Finally, alligator clip the lead from the test plate shoebox to terminal 50.

Turn the control switch on and keep turning the potentiometer to nearly the maximum. (This reduces the resistance.)Make sure you have good batteries installed. Turn the speaker on. Test the circuit by briefly touching the probe to the handhold. The speaker should produce a sound like popping corn. If it does not, check that your alligator clips are not bending the spring terminals so much that other wires attached there are loose. Finally, turn switches OFF.

The Economical Way Circuit

This is a one-hour project, have fun building it!

Materials needed:

shoebox	pointed knife
tape	cheap wire stripper (if needed)
nail	paper clip

Parts List

	Item	Radio Shack Catalog Number
a	Ordinary light switch	
b	Potentiometer (variable resistor), 50k ohms	271-1716
c	Knob to fit the potentiometer	274-428 (package of 2, you only need one, or just wind some masking tape around the shaft in a wad)
d	.1 microfarad ceramic disk capacitor	272-1432A
e	.0047 microfarad ceramic disk capacitor (.005 will do)	272-130
f	MPS2907 PNP silicon transistor or equivalent	276-2023
g	Audio output transformer 900 CT: 8 ohm	273-1380
h	3 size AA batteries	
i	Battery holder for 4 AA's (3 AA battery holder will do)	270-391 has 2 wires coming away from it, one red (for +), one black (for -).
j	.Micro clip test jumpers	278-017 (you need 6 packages of two)

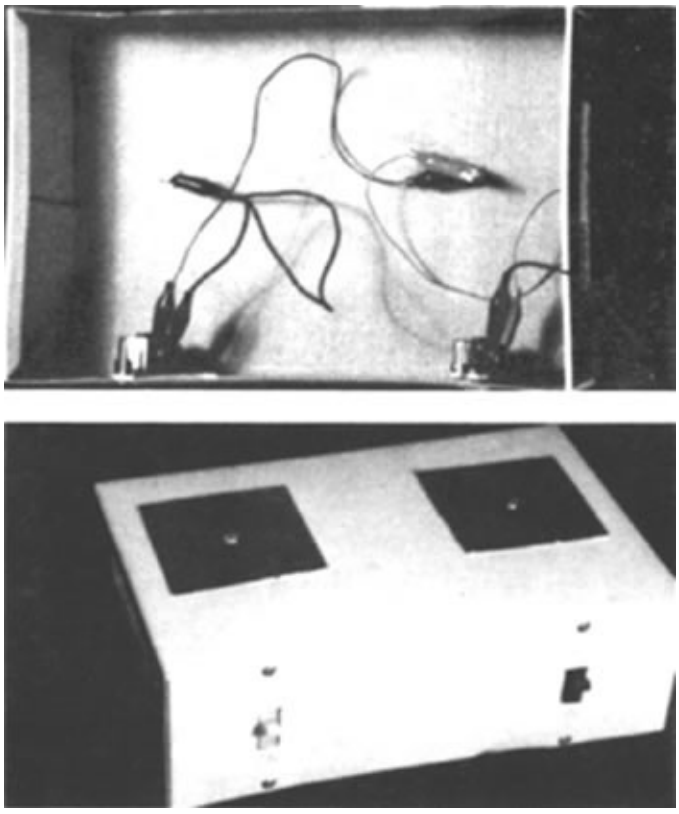

Fig. 82 Finished Economical Way circuit

Directions

1. Get a shoebox, save the lid, photocopy the picture in this book and tape it to the bottom (inside) of the box.

Paste This In The Box

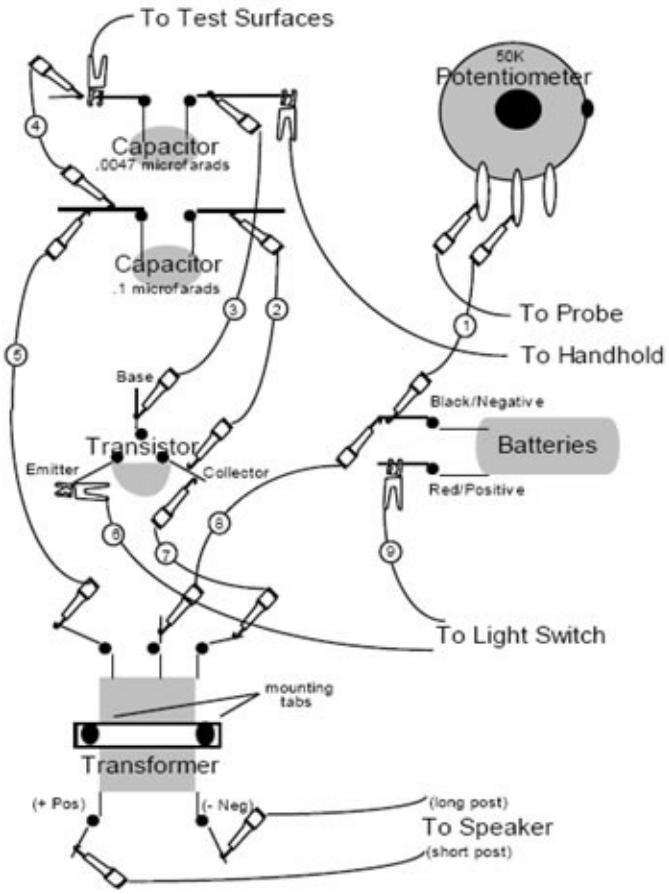

Fig. 83 Parts-layout and connections

2. Mount the light switch (a) just like you did for the test plates on the front of the shoebox. Mount it in the regular way so that ON is UP and label the box clearly. Turn light switch OFF before continuing.

3. Pierce a hole with a large nail or pencil for the shaft of the potentiometer (b), and a smaller hole for the tab on the side of the potentiometer (the tab keeps the potentiometer from rotating when you turn the switch). Remove the nut and washer from the base of the potentiometer shaft, insert the shaft into the hole from the inside of the shoebox. Trim the excess cardboard around the shaft with a knife. Replace the washer, nut, and tighten securely.

4. Attach the knob (c) to the shaft. Use a very small screwdriver or pointed knife to tighten.

5. Pierce holes in the box with a pin for the .1 microfarad capacitor (d) and the .0047 microfarad capacitor (e). Push the wires of each capacitor through the holes from the outside. When the ceramic part is almost touching the box, bend

the wires inside to keep it in place. The capacitors look very much alike, so be careful not to switch them (open one capacitor package at a time and put the part directly in place, double checking the diagram).

6. Pierce the holes for the transistor (f). Examine the transistor. Hold it in your left hand with the flat side on the left and wires pointing up at you. Notice that the center wire is the "base". Bend the base wire away to the left slightly so you will be able to insert the transistor into the triangle of holes. A diagram on the transistor package tells you that the top wire is the "collector" and the bottom wire is the "emitter". Insert the transistor from the outside of the box so each wire goes where it is supposed to, and bend the wires sideways to secure.

7. Pierce seven holes for the transformer (g). There should be 2 wires on one side and 3 on the other. All wires should have the ends bared and available for connections. If they are not, strip away ¼ inch of insulation and twist the strands together on each wire to keep them neat (practice using the wire stripper, first, on a different piece of wire). Notice that the transformer has 2 little mounting tabs. Push them through the box and bend them down with a knife or screwdriver on the inside to keep the transformer firmly in place or tape the transformer to the outside of the box. Then thread the 5 wires through their respective holes.

8. Prepare the battery holder (i) by cutting the wires to no more than two inches. Bare the ends of the wires for ¼-inch. You will only use three batteries, so in one of the battery slots, fill the space with a paper clip. Straighten one end of the paper clip. Hook the other end to the spring, and thread the straight part through the hole on the other side. Then bend the straight part down on the outside, out of the way.

Now to connect everything.

9. Next, insert three AA size batteries (h) in the holder (i) (note the plus (+) and minus (-) ends are marked on the holder). Notice that one wire is red (for *Positive*) and one is black (for *Negative*). Don't let the bared ends of the two wires touch. Pierce the holes for the battery wires and insert from the outside. Tape the battery holder to the outside of the box. If your batteries get warm remove them and recheck your connections.

10. Use 9 micro clip test jumpers (j) to make the nine connections drawn. Note that connection 6 needs an alligator clip lead to the light switch. Pull on

each connection after you make it, and stuff the extra wire through a slit made in the side of the shoebox with scissors. Make slits wherever you need them. Then clip the lead from your test plate shoebox to the capacitor where shown. Next attach the probe and handhold where shown. Finally attach the speaker where shown. In the picture there are both mini-hook and alligator clips depicted, but it is not important which kind you use, only that you make secure connections.

11. Test the circuit. Turn the speaker on, and the volume half way. Turn the Syncrometer® (light switch) ON. Test the circuit by briefly touching the probe to the handhold. The speaker should produce a sound like popping corn (readjust speaker volume to a comfortable level). If you hear nothing, go over each step carefully. Make sure the batteries are fresh. Recheck all connections, especially ones made to stripped wires. Replace the lid and turn the shoebox over so it sits on its lid.

12. Label the potentiometer. Turn the knob almost fully clockwise. Mark the box where the line on the knob points. Grasp the handhold in one hand and press the probe with your thumb. Listen to the pitch. Now turn the knob almost fully counter-clockwise, mark the box, and listen to this pitch. Whichever pitch is higher label MAX (maximum) on the box.

13. You did it! Turn off the speaker and Syncrometer®.

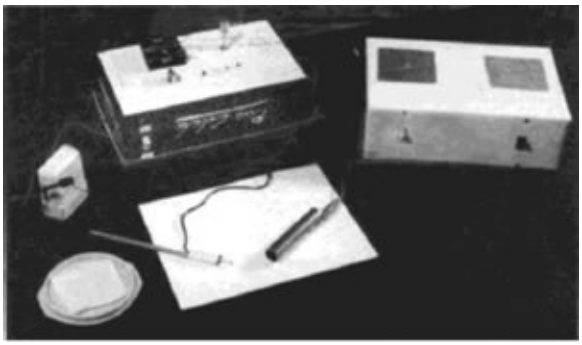

Fig. 84 Economical Way circuit and connections

After you have used the Syncrometer® for a while you may wish to take your device to an electronics shop and ask someone to mount the components in an all plastic box and solder the connections. This would let you travel with it in your suitcase without mashing it into a jumbled mess of wires.

The Rugged Way Circuit

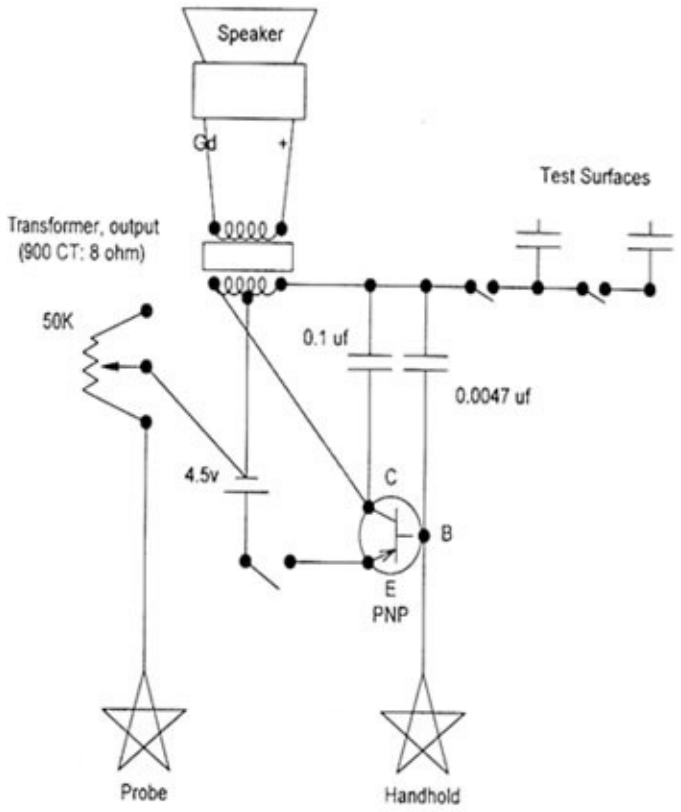

Fig. 85 Schematic

The Dermatron Way

Mount an ordinary light switch in a shoebox as described for The Test Surfaces. This will be called the "tissue switch". Choose one of your test plates as the "substance plate."Your existing switch to that plate is equivalent to the "substance switch."Using an alligator clip, connect the substance plate to one screw terminal on the light switch. Using another alligator clip connect the other screw terminal to your other test surface (the "tissue plate").

You were probably trained to listen for a slight current increase when testing substances. The concept was if the substance was anywhere in the body there would be higher conductance.

You must retrain yourself to listen for something more obvious, *resonance*. Resonance will occur when a substance and a tissue specimen are placed on your test plates that precisely match a body tissue and substance. With the additional information of where the substance has accumulated in the body, you can make much more accurate determinations how problems originate.

You now have the following equipment:

- Electronic circuit with speaker
- Test surfaces
- Probe and handhold

You are ready to learn to use them.

Troubleshooting

Don't reduce the size of the copper pipes. Keep all wires as short as possible. Use fresh batteries. Don’t try to make the Syncrometer® all in one box. The test plates are separate for a reason. Keep the lead to the test plate box short, however, and neither it nor the wires to the speaker should pass near other electrical components like the batteries.

Using The Syncrometer®

Fill a saucer with cold tap water. Fold a paper towel four times and place it in this dish. It should be entirely wet.

Cut paper strips about 1 inch wide from a piece of white, unfragranced, paper towel. Dampen a paper strip on the towel and wind it around the large metal handhold to completely cover it. The wetness improves conductivity and the paper towel keeps the metal off your skin.

- Turn the Syncrometer® and speaker to ON.
- Start with the substance and tissue switches OFF.
- Test the plate connections, if you haven't done so recently.

Touch the handhold to the substance plate briefly, then the tissue plate. There should be no crackle from the speaker. Turn the substance switch ON. Touch both plates briefly again. Only the substance plate should crackle. Now turn the

tissue switch ON. Both plates should crackle. Turn both plate switches OFF again. Check your connections once a week.

Pick up the handhold, squeeze it free of excess water.

Pick up the probe in the same hand, holding it like a pen, between thumb and forefinger.

Dampen your other hand by making a fist and dunking your knuckles into the wet paper towel in the saucer. You will be using the area on top of the first knuckle of the forefinger or middle finger to learn the technique. Become proficient with both. Immediately after dunking your knuckles dry them on a paper towel folded in quarters and placed beside the saucer. The degree of dampness of your skin affects the resistance in the circuit and is a very important variable that you must learn to keep constant. Make your probe as soon as your knuckles have been dried (within two seconds) since they begin to air dry further immediately.

With the handhold and probe both in one hand press the probe against the knuckle of the other hand, keeping the knuckles tightly bent. Press lightly at first, then harder, taking one second. Count it out as "a thousand and one."Repeat the probe a half second later at the same location. There is an additive effect. The first probe opens your cells' conductance channels. The second probe tests to hear if they are indeed open.; These are considered the two halves of a single complete probe. All of this takes less than three seconds. Don't linger because your body will change and your next probe will be affected.

Subsequent probes are made in exactly the same way. As you develop skill, your probes will become identical. Plan to practice for one to two hours each day. It takes most people at least twelve hours of practice in order to be so consistent with their probes that they can hear the slight difference when the circuit is resonant.

For reference you may wish to use a piano. The starting sound when you touch down on the skin should be F, an octave and a half above middle C. The sound rises to a C as you press to the knuckle bone, then slips back to B, then back up to C-sharp as you complete the second half of your first probe. If you have a multi-tester you can connect it in series with the handhold or probe: the current should rise to about 50 micro amps. If you have a frequency counter the frequency should hit 1000 Hz.

You should reach C-sharp just before the probe becomes painful. Adjust the potentiometer to make this possible. Mark the box STD (standard) at this setting. We will call this the *standard* state. Two things change the sound of the probe even when your technique is identical:

1. The patch of skin chosen for probing will change its properties. The more it is used, the redder it gets and the higher the sound goes when you probe. Move to a nearby location when the sound is too high to begin with, rather than adjusting the potentiometer.

2. Your body has cycles, which make the sound go noticeably higher and lower. If you are getting strangely higher sounds for identical probes, stop and probe every five minutes until you think the sound has gone down to standard. This could take five to twenty minutes. Learn this higher sound so you can avoid testing during this period. Nervousness or excitement raises the sound. Eating may lower it. A method is given in lesson one to determine whether you are in the standard state for testing.

3. You may also find times when it is impossible to reach the necessary sound without pressing so hard it causes pain. You may adjust the potentiometer if that helps. Or wait for your body to return to standard. Remember to set the potentiometer back to STD later. There will be times when the STD pitch is higher than usual (especially in younger persons). Exchanging the .0047 microfarad capacitor for a .01 microfarad capacitor helps fix this.

All tests are momentary.

This means less than one second. It is tempting to hold the probe to your skin and just listen to the sound go up and down, but if you prolong the test you must let your body rest ten minutes, each time, before resuming probe practice!

For our purposes, it is not necessary to locate acupuncture points.

Syncrometer® Resonance

The information you are seeking is whether or not there is resonance in the circuit. If there is the test is YES (*Positive*). You hear resonance by comparing the second probe to the first. You are not merely comparing pitch. Resonance is a tone quality in addition to a higher pitch. During resonance a higher pitch is

reached faster; it seems to want to go infinitely high. If there is resonance it will be heard as the probe pressure nears maximum, as a rule.

Remember more electricity flows, and the pitch gets higher, as your skin reddens or your body changes cycle. These effects are not resonance.

Resonance is a small extra hum at the high end of the probe. As soon as you hear it, stop probing. Your body needs a short recovery time (10 to 20 seconds) after every resonant probe. The longer the resonant probe, the longer the recovery time to reach the standard level again.

Using musical notes, here is a NO (*Negative*) result: F-C-B-C# (first probe) F-C-B-C# (compare, it is the same sound). Here is a YES (*Positive*) result: F-C-B-C# (first probe) F-D (stop quickly because you heard resonance). (In between the first and second probe a tissue will be switched in per lessons below.)

It is not possible to produce a resonant sound by pressing harder on the skin, although you can make the pitch go higher. To avoid confusion it is important to practice making probes of the same pressure. (Practice getting the F-C-B-C# tune.)

Lesson One

Purpose: To identify the sound of resonance in the circuit.

Materials: Potentized (homeopathic) solutions. Prepare these as follows: find three medium size vitamin bottles, glass or plastic, with non-metal lids. Remove any shreds of paper sticking to the rim. Rinse well with cold tap water. Then rinse again with filtered tap water.

Pour filtered cold tap water into the first bottle to a depth of about ½ inch. Add 50 little grains of table salt. Replace the lid. Make sure the outside is clean. If not, rinse and dry. Now shake hard, holding it snugly in your hand. Count your shakes; shake 120 to 150 times. Use elbow motion so each shake covers about an eight-inch distance. Shaken samples are different from unshaken ones, that's why this is so important. When done label the bottle on its side and lid: SALT #1. Wash your hands (without soap).

Next, pour about the same amount of filtered water into the second and third bottles. Open SALT #1 and pour a small amount, like ¼ to ½ of a teaspoon (do not use a spoon) into the second and third bottles. Close all bottles. Now shake

the second bottle the same as the first. Clean it and label it SALT #2. Do the same for the third bottle. Label it SALT #2 also and set aside for Lesson Three.

These two solutions have unique properties. SALT #1 always resonates. Use #1 to train your ear. SALT #2 shouldn't resonate. Use #2 to hear when you have returned to your standard state.

Method: Place SALT #2 on the substance plate and SALT #1 on the tissue plate.

1. Turn the Syncrometer® and speaker ON.

2. Start with both the substance and tissue switches OFF.

3. Make your first probe (F-C-B-C#).M

4. Immediately flip the substance switch ON and repeat the probe. Use only one half second to operate the switch. This is why these switches are mounted "upside down", because it is faster to move the toggle down. The result should be a NO (*Negative*). If the second probe sounds even a little higher you are not at the standard level. Wait a few more seconds and go back to step 2.

5. If the first result was NO, you may immediately flip the tissue switch ON. (Again do this within one half second.)This time the circuit was resonating. Learn to hear the difference between the last two probes.

6. The skin must now be restedWhen SALT #1 is placed in the circuit there is always resonance whether you hear it or not. Therefore, always take the time to rest the skin.

7. How can you be sure that the skin is rested enough? Any time you want to know whether you have returned to the standard level, you may simply test yourself to SALT #2 (just do steps 2, 3 and 4). While you are learning, let your piano also help you to learn the standard level (starts exactly at F). If you do not rest and you resonate the circuit before returning to the standard level, the results will become aberrant and useless. The briefer you keep the resonant probe, the faster you return to the standard level. Don't exceed one half second when probing SALT #1. Hopefully you will soon hear resonance within that time.

This lesson teaches you to first listen to the empty plate, then to SALT #2, then to SALT #1. In later lessons you simply use two probes, substance and substance-plus-tissue, because we assume you checked for your standard level.

Practice hearing resonance in your circuit every day.

White Blood Cells

Checking for resonance between your white blood cells and a toxin is the single most important test you can make.

Your white blood cells are your immune system's first line of defense. In addition to making antibodies, interferon, interleukins, and other attack chemicals, they also "eat" foreign substances in your body and eliminate them. By simply checking your white blood cells for toxins or intruders you save having to check every other tissue in your body. Because no matter where the foreign substance is, chances are some white blood cells are working on removing it.

It took me two years to find this ideal indicator, but it is not perfect. **Tapeworms are a notable exception.** They can be encysted in a particular tissue, which will test *Positive*, while the white blood cells continue to test *Negative*. **Freon is another notable exception.** Also, when bacteria and viruses are in their latent form, they do not show up in the white blood cells. Fortunately, in their active form they show up quite nicely. Again, when toxins or invaders are not plentiful, they may not appear in the white blood cells, although they can be found in a tissue.

Making A White Blood Cell Specimen

Obtain an empty vitamin bottle with a flat plastic lid and a roll of clear tape. The white blood cells are not going into the bottle; they are going on the bottle. The bottle simply makes them easy to handle. Rinse and dry the bottle. Make a second specimen on a clean glass slide if available.

Fig. 86 A White Blood Cell Specimen

Squeeze an oil gland on your face or body to obtain a ribbon of whitish matter (not mixed with blood). Pick this up with the back of your thumbnail. Spread it in a single, small streak across the lid of the bottle or the center of the glass slide. Stick a strip of clear tape over the streak on the bottle cap so that the ends hang over the edge and you can easily see where the specimen was put (see photo). Wipe the lid beside the tape to make sure no white blood cells are uncovered. Apply a drop of balsam and a cover slip to the slide preparation. Both types of preparation will give you identical results. The bottle type of white blood cell specimen is used by standing it on its lid (upside down). The lid is used because it is flat, whereas the bottom of most bottles is not.

Lesson Two

Purpose: To add a white blood cell specimen to the circuit and compare sound.

Method:

1. Turn the Syncrometer® and speaker ON.

2. Start with both the substance and tissue switches OFF.

3. Place the white blood cell specimen on the substance plate.

4. Listen to the first probe.

5. Immediately (one half second) turn the substance switch ON and probe again.

6. There should be no difference in sound levels and no resonance.

7. Make sure both plate switches are again OFF.

8. Treat yourself to some junk food. Reserve a piece in a sealed plastic bag.

9. Move your white blood cell specimen to the tissue plate. Place the junk food sample on the substance plate.

10. Listen to the first probe.

11. Immediately (one half second) turn the substance switch ON and probe again. (Remember this should not resonate yet, if you hear any difference you are not at the standard state.)

12. Immediately turn the tissue switch ON and probe a third time. Does this resonate? (If it does, your white blood cells are busy removing the junk food for you.)

Lesson Three

Purpose: To determine your percent accuracy in listening for resonance.

Materials: the SALT #1 and two SALT #2 solutions you made for Lesson One.

> **Method:** move the SALT #1 and SALT #2 labels to the bottom of the bottles so you can not tell which bottle is which.

1. Turn the Syncrometer® and speaker ON.

2. Start with both the substance and tissue switches OFF.

3. Mix the bottles up, select one at random, and place it on the substance plate.

4. Make your first probe.

5. Turn the substance switch to ON and make your second probe.

6. Resonance indicates a SALT #1, no resonance indicates SALT #2. Check the bottom. Remember to rest after the SALT #1, whether or not you heard resonance.

Repeat steps 3 through 5 a number of times. Work toward getting three out of three correct. Practice every day.

Trouble shooting:

a) If you repeat this experiment and you keep getting the same bottles "wrong", start over. You may have accidentally contaminated or mislabeled the outside of the bottle, or switched bottle caps.

b) If you get different bottles wrong each time, the plates may be contaminated. Wash the outside of the bottles and rinse with filtered water and dry. Wipe the plates very well, too, with filtered water and dry.

c) If all the bottles read the same, your cold tap water is polluted. Change the filter.

Preparing Test Substances

It is possible to prepare dry substances for testing such as a piece of lead or grains of pesticide. They can simply be kept in a plastic bag and placed on the test plate. However, I prefer to place a small amount (the size of a pea) of the substance into a ½ ounce bottle of filtered water. There will be many chemical reactions between the substance and the water to produce a number of test substances all contained in one bottle. This simulates the situation in the body.

Within the body, where salt and water are abundant, similar reactions may occur between elements and water. For example, a strip of pure (99.9% pure) copper placed in filtered water might yield copper hydroxide, cuprous oxide, cupric oxide, copper dioxide, and so forth. These may be similar to some of the reaction products one might expect in the body, coming from a copper IUD, copper bracelet or copper plumbing. Since the electronic properties of elemental copper are not the same as for copper compounds, we would miss many test results if we used only dry elemental copper as a test substance.

Impure Test Substances

It is not necessary to have pure test substances. For instance, a tire balancer made of lead can be easily obtained at an auto service station. Leaded gasoline and lead fishing weights also make good test substances for lead. There is a disadvantage, though, to using impure test substances. You are including the extra impurities in your test. If your lead object also has tin in it, you are also testing for tin. Usually, you can infer the truth by some careful maneuvering. If you have searched your kidneys for leaded gasoline, fishing weights and tire

balancers and all 3 are resonant with your kidneys, you may infer that you have lead in your kidneys since the common element in all 3 items is lead. (You will learn how to specify a tissue, such as your kidneys, later.)

Using pure chemicals gives you certainty in your results. You can purchase pure chemicals from chemical supply companies (see *Sources*). Your pharmacy, a child's chemistry set, a paint store, or biological supply company can also supply some.

The biggest repository of all toxic substances is the grocery store and your own home.

You can make test substances out of your hand soap, water softener salt, and laundry detergent by putting a small amount (1/16 tsp.) in a ½ ounce glass bottle and adding about 2 tsp. filtered water. (Or for quick testing just put them dry or wet in a sealed plastic baggie.) Always use a plastic measuring spoon.

Check the items in Toxic Elements (see *The Tests*) to see where they are commonly found. For instance, arsenic is in carpets, stuffed furniture and wallpaper, originating in the pesticide put there. Here are some suggestions for finding sources of toxic products to make your own toxic element test. If the product is a solid, place a small amount in a plastic bag and add a tablespoon of filtered water to get a temporary test product. For permanent use put it in a small amber glass bottle. If the product is a liquid, pour a few drops into a glass bottle and add about 2 tsp. filtered water. Keep all toxic substances in glass bottles for your own safety. Small amber glass dropper bottles can be purchased by the dozen at drug stores (also see *Sources*).

Aflatoxin: scrape the mold off an orange or piece of bread; wash hands afterward.

Acetone: paint supply store or pharmacy.

Arsenic: 1/16 tsp. of arsenate pesticide from a garden shop. A snippet of flypaper.

Aluminum: a piece of aluminum foil (not tin foil) or an aluminum measuring spoon.

Aluminum silicate: a bit of salt that has this free running agent in it.

Asbestos: a small piece of asbestos sheeting, an old furnace gasket, 1/4 inch of a clothes dryer belt that does not say "Made in USA", or a crumb of building material being removed due to its asbestos content (ask a contractor).

Barium: save a few drops from the beverage given clients scheduled for an x-ray. Lipstick that has barium listed in the ingredients.

Benzene: an old can of rubber cement (new supplies do not have it). A tsp. of asphalt crumbs from a driveway.

Benzopyrenes: a piece of toast, hot dog, or flame cooked food. This substance fades in a day, use it while fresh.

Beryllium: a piece of coal; a few drops of "coal oil" or lamp oil.

Bismuth: use a few drops of antacid with bismuth in it.

Bromine: bleached "brominated" flour.

Cadmium: scrape a bit off a galvanized nail, paint from a hobby store.

Cesium: scrape the surface of a clear plastic beverage bottle.

CFC's (Freon): ask an electronics expert for a squirt from an old aerosol can that used Freon as a cleaner. (Squirt into water, outdoors, put the water in a sample bottle.)

Chromate: scrape an old car bumper.

Cobalt: pick out the blue and green crumbs from detergent. A sample of cobalt containing paint should also suffice.

Chlorine: a few drops of pure, old fashioned Clorox.™

Copper: ask your hardware clerk to cut a small fragment off a copper pipe of the purest variety or a ¼ inch of pure copper wire.

Ergot: a teaspoon of rye grains, or rye bread. Add grain alcohol to preserve.

Ether: automotive supply store (engine starting fluid).

Ethyl alcohol (grain alcohol): the purest "drinking" alcohol available.

Everclear™ in the United States, Protec™ (potable) in Mexico.

Fiberglass: snip a fragment from insulation.

Fluoride: toothpaste with fluoride.

Formaldehyde: purchase 37% at a pharmacy. Use a few drops only for your sample.

Gasoline: gas station (leaded and unleaded).

Gold: ask a jeweler for a crumb of the purest gold available or use a wedding ring.

Kerosene: gas station.

Lead: wheel balancers from a gas station, weights used on fishing lines, lead solder from electronics shop.

Malonic acid: fresh orange juice.

Mercury: a mercury thermometer (there is no need to break it), piece of amalgam tooth filling.

Methanol: paint supply store (wood alcohol).

Nickel: a nickel plated paper clip, a washed coin.

Patulin (apple mold): cut a sliver of bruised apple that has turned brown, wash and peel first to avoid the benzene in the spray that may be on the peel.

PCB: water from a quarry known to be polluted with it (a builder or electrical worker may know a source).

Platinum: ask a jeweler for a small specimen.

Propyl alcohol: (actually, isopropyl alcohol, not n-propyl alcohol) rubbing alcohol from pharmacy. Use a few drops only, discard the rest. Do not save it.

PVC: glue that lists it in the ingredients (polyvinyl chloride).

Radon: leave a glass jar with an inch of filtered water in it standing open in a basement that tested *Positive* to radon using a kit. After 3 days, close

the jar. Pour about 2 tsp. of this water into your specimen bottle.

Silicon: a dab of silicon caulk.

Silver: ask a jeweler for a crumb of very pure silver. Silver solder can be found in electronics shops. Snip the edge of a very old silver coin.

Sorghum mold: 1/8 tsp. sorghum syrup.

Styrene: a chip of styrofoam.

Tantalum: purchase a tantalum drill bit from hardware store.

Tartrazine: (yellow food dye) some yellow jello or orange cheese.

Tin: scrape a tin bucket at a farm supply. Tin solder. Ask a dentist for a piece of pure tin (used to make braces).

Titanium: purchase a titanium drill bit from a hardware store.

Toluene: a tube of glue that lists toluene as an ingredient.

Tungsten: the filament in a burned out light bulb.

Urethane: a piece of plastic foam from new furniture or packaging material. (This will also contain formaldehyde.)

Vanadium: hold a piece of dampened paper towel over a gas stove burner as it is turned on. Cut a bit of this paper into your specimen bottle and add 2 tsp. filtered water.

Xylene: paint store or pharmacy.

Zearalenone: combine leftover crumbs of three kinds of corn chips and three kinds of popcorn.

This list gets you off to a good start. Since few of these specimens are pure, there is a degree of logic that you must apply in most cases. If you are testing for barium in your breast, a *Positive* result would mean that a barium-containing lipstick tests *Positive* and a barium-free lipstick is *Negative*.

A chemistry set for hobbyists is a wonderful addition to your collection of test specimens. Remember, however, the assumptions and errors in such a system. A test for silver using silver chloride might be *Negative*. This does not mean there

is no silver present in your body; it only means there is no silver chloride present in the tissue you tested. You are bound to miss some toxins; don't let this discourage you. There is more than enough that you can find.

The most fruitful kind of testing is, probably, the use of household products themselves as test substances. The soaps, colognes, mouthwash, toothpaste, shampoo, cosmetics, breads, dairy products, juices and cereals can all be made into test specimens. Put about 1/8 tsp. of the product in a small glass bottle, add 2 tsp. filtered water and ¼ tsp. grain alcohol to preserve it. If you test *Positive* to these, then you shouldn't use them, even if you can not identify the exact toxin or pathogen.

Finally, there is the error from the filtered water you are using. Test it by tasting it, then searching your white blood cells for it. If you find it there, change the filter and repeat the test. Make a test sample of this water alone.

Lesson Four

Purpose: To determine toxicity of your household products.

Materials: Prepare samples of what you ate at your last meal. Also prepare samples of the soap, shampoo, shaving cream and other products you last put on your body.

Method: Listen for resonance between your white blood cells and the daily foods and products you use.

1. Place your white blood cell specimen on the tissue plate.

2. Place your first sample on the substance plate.

3. Test for resonance.

4. Make two piles. Things that resonate go in the TOXIC pile, things that don't go in the SAFE pile. Don't be surprised if your health brand shampoo "flunks" the test. And if your vitamin C flunks, I hope you write a letter to the manufacturer!

Making Organ Specimens

To test for toxic elements or parasites in a particular organ such as the liver or

skin, you will need either a fresh or frozen sample of the organ or a prepared microscope slide of this organ. Meat purchased from a grocery store, fresh or frozen, provides you with a variety of organ specimens. Chicken, turkey, beef or pork organs all give the same results. You may purchase chicken gizzards for a sample of stomach, beef liver for liver, pork brains for brain, beef steak for muscle, sweet breads for thymus, tripe for stomach lining. Other organs may be ordered from a meat packing plant.

Trim the marrow out of a bone slice to get bone marrow. Scrub the bone slice with hot water to free it of marrow to get a bone specimen. Choose a single piece of meat sample, rinse it and place it in a plastic bag. You may freeze it. To make a durable unfrozen sample, cut a small piece, the size of a pea, and place it in an amber glass bottle (½ oz.). Cover with two tsp. filtered water and ¼ tsp. of grain alcohol (pure vodka will do) to preserve it. These need not be refrigerated but if decay starts, make a fresh specimen.

Pork brains from the grocery store may be dissected to give you the different parts of the brain. Chicken livers often have an attached gallbladder or piece of bile duct, giving you that extra organ. Grocery store "lites" provides you with lung tissue. For kidney, snip a piece off pork or beef kidney. Beef liver may supply you with a blood sample, too. Saliva, urine and semen may be your own. Use less than ¼ tsp. of each fluid. Add about 2 tsp. (10 ml) filtered water and a small amount (¼ tsp.) of grain alcohol to preserve them. <u>This dilution of natural fluids is essential to get correct results.</u>

I use ½ oz amber glass bottles with Bakelite caps (see *Sources*) to hold specimens. After closing, each bottle is sealed with a Parafilm™ strip to avoid accidental loosening of the cap. However, plastic bags or other containers would suffice.

To make a specimen of skin, use hangnail bits and skin peeled from a callous, <u>not a wart</u>. A few shreds will do. Remember, they must be very close to the test plate when in use; add 2 tsp. filtered water and ¼ tsp. grain alcohol.

Making a Complete Set of Tissue Samples

My original complete set was made from a frozen fish. As it thawed, different organs were cut away and small pieces placed in bottles for preserving in cold tap water and grain alcohol. In this way, organs not available from the grocery store could be obtained. The piece of intestine closest to the anus corresponds to

our colon, the part closest to the stomach corresponds to our duodenum. The 2 layers of the stomach and different layers of the eye, the optic nerve and spinal cord were obtained this way.

Another complete set of tissue samples were obtained from a freshly killed steer at a slaughter house. In this way the 4 chambers of the heart were obtained, the lung, trachea, aorta, vein, pancreas, and so forth.

Purchasing a Complete Set of Tissue Samples

Slides of tissues, unstained or stained in a variety of ways for microscope study give identical results to the preparations made by yourself in the ways already described. This fact opens the entire catalog of tissue types for your further study. See "microscope slides and equipment" in *Sources* for places that supply them.

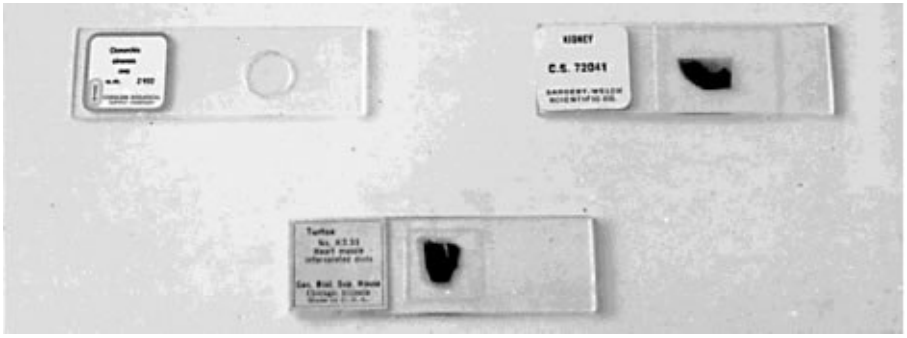

Fig. 87 Some purchased parasite and tissue slides

You now have a set of organ samples, either fresh, frozen, preserved or on slides. You also have a set of test substances, whether chemical compounds, or elements, or products. Your goal is to search in your own organs and body tissues for the substances that may be robbing you of health.

Keeping yourself healthy will soon be an easy, daily routine.

Body Fluid Specimens

The human body emits a wide range of frequencies. Body fluids retain these frequencies and always resonate. To reduce this effect you must dilute all body fluids before using them. Then you will only hear resonance with substances that are actually in the body fluid.

Each of these fluids should be prepared by putting about ¼ tsp. in a ½ oz amber glass bottle. Add about 2 tsp. filtered water and ¼ tsp. grain alcohol for preservation. It is important *not* to shake the specimen, but to mix gently.

Urine. It is desired to have a pure, uninfected urine sample as a tissue specimen. Since this cannot be proved with certainty, obtain several urine samples from different persons whom you believe to be healthy and make several test specimens in order to compare results. Label your specimens Urine A (child), Urine B (woman), Urine C (mine), and so forth.

Semen. A sample from a condom is adequate. Aged specimens (sent by mail, unpreserved and unrefrigerated) work well also. Use one to ten drops or scrape a small amount.

Blood. One to ten drops of blood should be used. A bit of white paper towel for swabbing may be used. Clotted or chemically treated blood is satisfactory. A blood smear on a slide is very convenient.

Milk. Cow's milk is too polluted with parasites and chemicals to be useful. Electronically, a dead specimen is equivalent to a live specimen, so that pasteurization of the milk does not help. A human milk specimen is preferred.

Saliva. Use your own, if you have deparasitized yourself and test *Negative* to various fluke stages. Otherwise find a well friend or child.

You Will Now Be Able to Test in Three Different Ways!

When you test with a substance on one plate and nothing on the other, you are searching your entire body for that substance. Such a test is not very sensitive, but it lets you pick out your worst toxins.

By putting a tissue sample on the other plate you are testing for the substance specifically in that tissue in your body, and this is much more sensitive. The tissue need not be the white blood cells. To find mercury in your kidneys you would use a mercury sample on one plate, and a kidney sample on the other. The technique is the same as when you use white blood cells.

If you put a substance on each plate, a resonating circuit means the two samples have something in common. For example, if you have mercury on one plate and some dental floss on the other, a *Positive* result indicates mercury in the floss.

Lesson Five

Purpose: To watch substances travel through your body.

Materials: Prepare a pint of brown sugar solution (white sugar has isopropyl alcohol pollution) using filtered water. Use about 1 tsp. brown sugar, 1/8 tsp. vitamin C (to detoxify sorghum mold), and a pint of filtered water. Do not shake it; gently mix. Make a sample bottle by pouring about ½ inch into a clean used vitamin bottle. Rinse and dry the outside of the sample bottle. Finally wash your hands with plain water.

Method:

Test your skin for the presence of brown sugar, using the newly made sample bottle and your skin specimen. It should not be there (resonate) yet.

Prepare a paper applicator by tearing the corner from a white unfragranced paper towel. Fold it to make a wick.

Dip the paper wick in the pint of sugar water and apply it to the skin of your inner arm where you can rub freely. Rub it in vigorously for about 10 seconds (otherwise it takes minutes to absorb). Leave the shredded wick on the skin and tape it down with a piece of clear tape about 4 inches long (this increases the time you have to work). Quickly wash your fingers.

Place your skin tissue specimen on one plate and the sugar specimen bottle on the other plate.

Probe for resonance every 5 seconds. As soon as you hear resonance, implying that the skin has absorbed the sugar solution (which may take a full minute), replace the skin specimen with one of liver and listen for resonance again. There should be none, yet.

Alternate between the skin and liver. Soon the skin will be clear and the liver will resonate. Also check the pancreas and muscles to see how quickly sugar arrives there.

Check white blood cells and kidneys. It should <u>not</u> appear here (unless it is polluted with a toxin).

After five to ten minutes the sugar will be gone from all of these tissues and your experiment is ended. Wash your arm with plain water.

Notice that you have only a few minutes to get all your testing done after the skin has absorbed the test substances.

Lesson Six

Purpose: To verify the isopropyl alcohol and benzene lists.

Method: We will use the Syncrometer® to test for a toxin in a product. Assemble the products named in the isopropyl alcohol list and benzene list ... as many as you can find. Also make sample bottles of benzene and isopropyl alcohol.

1. Place the isopropyl alcohol test substance on one plate and your products, in turn, on the other.

2. Listen to the current with only one of the plates in the circuit. Then listen with both plates in (the test plate switch ON). This method can detect one part per quadrillion in concentrations. It is not as sensitive as the skin test (Lesson Five).

3. Repeat, with the benzene test substance.

Even tiny amounts of solvents are toxic! They must not be consumed or be left in our environment.

I have found that too many unsuspected products test *Positive* to benzene. This is such a global tragedy that people must protect themselves by using their own tests. Rather than assurances, regulatory agencies should provide the consumer with cheap and simple tests (dip sticks and papers so we need not lug our Syncrometers® around). Even if some test should fail, not all tests would fail to find an important pollutant like benzene. It would come to public attention much faster than the present debacle has.

1) Salmonella, Shigella, aflatoxin, ergot, zearalenone, patulin test sticks; 2) ozonator; 3) Lugol's; 4) vitamin C powder; 5) sodium/ potassium salt; 6) fresh powdered herb spices; 7) food zapper; 8) benzene, isopropyl alcohol, wood alcohol test sticks; 9) heavy metals and lanthanides test sticks.

Fig. 88 Table of the future.

Lesson Seven

Purpose: To test for the presence of aluminum in your brain and your foods.

Materials: An aluminum measuring spoon, a tsp. of free flowing aluminized salt, a square inch of aluminum foil, a package of pork brain from the grocery store, kept frozen. (Other animal sources will do). Or a stained slide of cerebrum, cerebellum or other brain tissue.

Method:

1. Cut a piece of brain tissue (about 1 tsp.) and place in a plastic bag.
2. Place the aluminum samples in separate plastic bags. Add filtered water to each, about 1 tbs. Keep all surfaces and your hands meticulously clean (do not use soap).
3. Place the aluminum sample on one plate and the brain sample on the other plate.
4. Probe for resonance. If the circuit resonates <u>you</u> have aluminum in <u>your</u> brain.
5. If your aluminum specimen actually has cadmium or copper in it, you are <u>also</u> testing for these in your brain. Repeat the aluminum test with other aluminum objects. If they <u>all</u> resonate, you <u>very, very likely</u> have aluminum in your brain. If you can, test yourself to cadmium and copper, separately.

If you don't have these in your brain, the aluminum test result is even more likely to be correct.

6. Of course, it would be desirable to have absolute certainty about this. To achieve this, purchase pure aluminum or an Atomic Absorption Standard. These are available from chemical supply companies.

   If you do have aluminum in your brain, where is it coming from?

7. Leave your purest aluminum test substance on one plate, and replace the brain sample with these items, testing them one at a time. Remember to rest after each *Positive* result.

- a teaspoon of cottage cheese or yogurt taken from the top of a container of a foil-capped variety
- a piece of cream cheese or butter that was wrapped in foil
- a chip of bar soap or a bit of hand lotion
- a piece of cake or rolls baked in an aluminum pan
- a piece of turkey skin or hot dish that was covered with aluminum foil
- anything baked with baking powder
- a carbonated beverage from aluminum can

Alternative Lesson:

To test for dental metal in your tissues. Use a piece of amalgam from an old tooth filling. This tests for the rest of the alloys in amalgam fillings as well as mercury. If you can't get a piece of mercury amalgam, use a mercury thermometer (don't break it, just put the bulb on the plate). Choose tissues like kidney, nerves, brain, liver, in addition to white blood cells.

I have never dissected human tissues and subjected them to confirmatory laboratory tests. It seems reasonable that because skin and tongue are directly provable, that other tissues work similarly.

Testing Someone Else

Seat the person comfortably with their hand resting near you. Choose the first knuckle from the middle or first finger just like you do for yourself. Since you are touching this person, you are putting yourself in the circuit with the subject.

To exclude yourself, you need to add inductance to yourself. A coil of about 10 microhenrys, worn next to the skin, works well and is easily made. Obtain insulated wire and wrap 24 turns around a ballpoint pen (or something about that size), closely spaced. Cut the ends and tape them down securely. Keep it in a plastic bag, even when in your pocket. A commercial inductance of 4.7 microhenrys, worn touching your skin also works well. It can be worn on a string necklace. (Remember to remove the necklace when testing yourself.) The inductance acts as an RF (radio frequency) choke, limiting the alternating current that can flow through you while testing another person.

Test your inductor in this way. Repeat Lesson One with the coil next to your body. No resonance, even to SALT #1, should occur. If it does, make the coil bigger. Remove the inductor when you are not testing others.

Lesson Eight

Purpose: To detect aluminum in the brain of another person.

Materials: same as previous lesson, you wear the inductor.

Method:

1. Place the aluminum sample on one plate and the brain sample on the other plate.
2. Give the other person the handhold. You use the probe. Hold their finger steady in yours.
3. Probe the other person for resonance. The first probe is with only one plate in the circuit. The second is with both plates in the circuit. Resonance implies there is aluminum in the person's brain.

Saliva Testing

This may become your most useful test. The saliva has in it a bit of almost everything toxic that is in you. But it is not the first tissue to carry the HIV virus or a bit of a tapeworm stage. Nevertheless, orthophosphotyrosine, *Salmonella*, mercury in your kidneys, aluminum in the brain all show up in the saliva, too. And saliva can be sent by mail or stored in the refrigerator. It should be frozen for long storage to prevent mold invasion. Or it may have grain alcohol added to preserve it. This test is not as sensitive as having the person present in the circuit, though.

To make a saliva specimen, place a two-inch square piece of white, unfragranced paper towel (tear, don't cut) in a lightweight zippered baggie. Hold the open baggie near your mouth. Don't touch the paper towel with your fingers. Drool or spit onto the paper towel until half of it is damp. Zip it shut. Before testing, add enough filtered water to dampen the whole piece of paper.

Lesson Nine

Purpose: To search for shingles or *Herpes*.

Materials: A saliva specimen from the person being tested; they may be thousands of miles away. Also a specimen of the virus as a test substance. This can be obtained from someone else's lesions—one droplet is enough, picked up on a bit of paper towel. the whole thing, towel and all, can be pushed into a glass bottle for preserving. Water and alcohol should be added. It can also be put on a slide, labeled *Herpes, homemade*. A homeopathic preparation of the virus does not give accurate results for this kind of testing, due to the additional frequency imposed on it by potentizing. (However, homeopathic preparations can be used if the potency matches the tissue frequency where it resides. Hopefully, some way of using homeopathic sources will soon be found.)

Method: Place the saliva specimen in its unopened baggie on one plate. You may wish to open it briefly, though, to add enough filtered water to wet all the paper and add ¼ tsp. grain alcohol to sterilize or preserve it.

Place the virus specimen on the other plate and test as usual (like Lesson Six). A *Positive* result means the person has active *Herpes*.

The main disadvantage of saliva testing is that you do not know which tissue has the pathogen or the toxin. You can only conclude that it is present. Usually this is enough information to carry out a corrective program.

Surrogate Testing

Although saliva testing is so easy, it is also possible to use an adult as a surrogate when testing a baby or pet. The pet or baby is held on the lap of the surrogate. A large pet may sit in front of the person. The handhold is held by the surrogate and pressed firmly against the body of the baby or pet. It can be laid flat against the arm, body or leg of a baby and held in place firmly by the whole hand of the adult. The paper covering should be wet. For a pet, the end is held firmly pressed against the skin, such as between the front legs or on the belly. The other hand of the adult is used for testing in the usual way. The adult must wear an inductor for surrogate testing as well as you, the tester.

An ill or bedridden person may be tested without inconvenience or stress. He or she rests their whole hand on the skin of your leg, just above the knee. A wet piece of paper towel, about 4 inches by 4 inches is placed on your leg, to make better contact. You must use an inductor for yourself with this method. You may now proceed to probe on your hand instead of the ill person's.

Lesson Ten

Purpose: To test for cancer.

Materials: Orthophosphotyrosine. Here are three ways to obtain some:

1. Order a pure sample from a chemical company (see *Sources*). Place a few milligrams (it need not be weighed) in a small glass bottle; add 2 tsp. filtered water and ¼ tsp. grain alcohol.

2. All persons with cancer have orthophosphotyrosine in their saliva as well as in the cancerous tissue. Obtain a saliva specimen from a person who has active cancer. Freeze it if you can't prepare it immediately. Keep such specimens well marked in an additional sealed plastic bag. Persons who have recently been treated clinically for cancer are much less likely to have orthophosphotyrosine in the saliva.

3. There is still another way to prepare an orthophosphotyrosine test sample. Common snails from a fish tank or outdoor snails are the natural hosts for *Fasciolopsis buski* (human intestinal fluke) stages. The stages will produce orthophosphotyrosine when the snails are fed fish food polluted with isopropyl alcohol. Over half the fish food cans I purchased had isopropyl alcohol pollution.

Buy several brands of fish food. Test them for isopropyl alcohol and benzene. Obtain some snails, put them in a tank, feed them isopropyl alcohol polluted fish food. (Feed a separate group of snails benzene polluted fish food to obtain samples of HIV.) After two days put each snail in a zippered plastic bag, and test them individually against someone diagnosed with cancer or their saliva. The snails that the person or saliva tests *Positive* to have orthophosphotyrosine. Put these snails in the freezer to kill them humanely, then crush them and place in a specimen bottle with 50% grain alcohol to preserve. The bottles can be kept sealed and at room temperature.

Similarly, your benzene snails can be tested against someone known to be HIV *Positive*. Saliva does not show the virus in early infections. Any snails that test *Positive* can be used to prepare an HIV test specimen in the same way. The fish food must be tested for both benzene and isopropyl alcohol pollution, and separated appropriately, or you run the risk of making specimens that have both orthophosphotyrosine and HIV.

Method:

1. Test for cancer by placing the test sample you just made (any of the three) on one plate and a white blood cell sample on the other plate.

2. If you resonate with both samples in the circuit you have cancer. Immediately, search for your cancer in your breast, prostate, skin, lungs, colon, and so forth.

As you know by now, you can confirm the cancer by testing yourself to isopropyl alcohol and the human intestinal fluke in the liver. you should eliminate isopropyl alcohol from use and zap all parasites. Keep testing yourself for cancer until it is gone. It should take less than one hour. Also take the herbal parasite program plus Mop Up. Continue to test yourself for isopropyl alcohol and the intestinal fluke in the white blood cells; make sure they are gone. Also test yourself for *Ascaris*, copper, and Freon.

Lesson Eleven

Purpose: To test for HIV.

Materials: Purchase a few milligrams of Protein 24 antigen (a piece of the HIV virus core) or the complete HIV virus on a slide. You may use the vial unopened if only one test specimen is needed. To make more specimens, use

about 1 milligram per ½ ounce bottle. Add 2 tsp. filtered water and ¼ tsp. grain alcohol. Or prepare an HIV specimen from snails as described in the previous Lesson.

Method: Search in the thymus (throat sweet breads), vagina and penis for the virus because that is where it will reside almost exclusively for the first year or two. If you don't have those tissue specimens, you could search in urine, blood, saliva, or white blood cells, but only a *Positive* result can be trusted. Also search for the human intestinal fluke and benzene in the thymus. Of course, a *Positive* test in these tissues is very significant. If you are *Positive*, zap parasites immediately. You should test *Negative* in less than an hour. Remove benzene polluted items from your lifestyle. Also test yourself to several varieties of popcorn, brown rice, and corn chips as an indication of zearalenone, which must be eliminated in order to get well. Follow up on yourself every few days to be sure your new found health is continuing. Test yourself for Freon.

Lesson Twelve

Purpose: To test for diseases of all kinds.

Materials: Use slides and cultures of disease organisms. Homemade preparations of strep throat, acute mononucleosis, thrush (*Candida*), chicken pox, *Herpes* 1 and 2, eczema, shingles, warts, measles, yeast, fungus, rashes, colds, sore throats, sinus problems, tobacco virus, and so forth can all be made by swabbing or scraping the affected part. A plastic spoon or bit of paper towel works well. Put a small bit on a slide. Add a drop of balsam and a cover slip. Or put the towel in a bottle; add water and alcohol as described previously. Microscope slides can greatly expand your test set (see *Sources*).

Method: Test yourself for a variety of diseases, using your white blood cell specimen first. Then search in organs like the liver, pancreas, spleen. Notice how many of these common illnesses don't "go away" at all. They are alive and well in some organ. They are merely not making you sick!

Lesson Thirteen

To test for AIDS.

Materials: Benzene sample, slides of tissue samples like thymus, liver, pancreas, penis, and vagina. Also a collection of disease specimens such as the

ones used in the previous lesson.

Method: Search in the thymus for benzene. If it is *Positive* throughout the day, you are at risk for developing AIDS, although you may not be ill. Search other tissues for benzene. The more tissues with benzene in them the more serious the situation. Immediately search all your body products and foods for benzene.

Stay off benzene polluted items forever.

Tally up the diseases you tested *Positive* for in Lesson Twelve. Test at least ten. If you had more than half *Positive* you already have AIDS. (50% is my standard, you may set your own; an ideal standard for defining a healthy person should be 0% *Positive*.) Immediately take 900 mg of vitamin B_2.

Lesson Fourteen

Purpose: To test for aflatoxin.

Materials: Do not try to purchase a pure sample of aflatoxin; it is one of the most potent carcinogens known. Having it on hand would constitute unnecessary hazard, even though the bottle would never need to be opened. Simply make specimens of beer, moldy bread, apple cider vinegar, and any kind of peanuts using a very small amount and adding filtered water and grain alcohol as usual.

Method: Test yourself for these. If you have all of them in your white blood cells and the liver then you very, very probably have aflatoxin built up. Next, test your daily foods for their presence in your white blood cells. Those that test *Positive* must be further tested for aflatoxin. Notice the effect of vitamin C on aflatoxin in your liver. Find a time when your liver is *Positive* to aflatoxin (eat a few roasted peanuts from a health food store and wait ten minutes). Take 1 gram vitamin C in a glass of water. Check yourself for aflatoxin every five minutes. Does it clear? If not, take 5 or 10 grams vitamin C. How long does it take?

Lesson Fifteen

Purpose: To test for parasites.

Method: If you test *Positive* to your pet's saliva, you have something in common–a parasite, no doubt. You must search your muscles and liver for these,

not saliva or white blood cells, because they are seldom seen in these. Zap yourself for parasites until you no longer test *Positive* to your pets' saliva.

Tapeworms and tapeworm stages can not (and should not) be killed with a regular frequency generator. Each segment, and probably each scolex in a cysticercus has its own frequency and might disperse if your generator misses it. Only zapping kills all and is safe for tapeworms. However, the zapper current does not penetrate and kill an intact cysticercus stage. You must use the Mop Up program.

Be sure to treat your pet on a daily basis with the pet parasite program.

Lesson Sixteen

Purpose: To see how sensitive your measurements can be. (How much of a substance must be present for you to get a *Positive* result?)

Materials: filtered water, salt, glass cup measure, 13 new glass bottles that hold at least ¼ cup, 14 new plastic teaspoons, your skin tissue sample, paper towel.

Method: Some of the best measurement systems available today are immunological (such as an ELISA assay) and can detect as little as 100 fg/ml (femtograms per milliliter). A milliliter is about as big as a pea, and a femtogram is 1/1,000,000,000,000,000th (10^{-15}) of a gram!

1. Rinse the glass cup measure with filtered water and put one-half teaspoon of table salt in it. Fill to one cup, stirring with a plastic spoon. What concentration is this? A teaspoon is about 5 grams, a cup is about 230 ml (milliliters), therefore the starting concentration is about 2½ (2.5) gm per 230 ml, or .01 gm/ml (we will discuss the amount of error later).

2. Label one clean plastic spoon "water" and use it to put nine spoonfuls of filtered water in a clean glass bottle. Use another plastic spoon to transfer one spoonful of the .01 gm/ml salt solution in the cup measure to the glass bottle, stir, then discard the spoon. The glass bottle now has a 1 in 10 dilution, and its concentration is one tenth the original, or .001 gm/ml.

3. Use the "water" spoon to put nine spoonfuls of filtered water in bottle #2. Use a new spoon to transfer a spoonful of salt solution from bottle #1 to bottle #2 and stir briefly (never shake). Label bottle #2 ".0001 gm/ml".

4. Repeat with remaining bottles. Bottle #13 would therefore be labeled ".000000000000001 gm/ml." This is 10^{-15} gm/ml, or 1 femtogram/ml.

5. Do the skin test with water from bottle #13 as in Lesson Five. If you can detect this, you are one hundred times as sensitive as an ELISA assay (and you should make a bottle #14 and continue if you are curious how good your sensitivity can get). If you can not, try to detect water from bottle #12 (ten times as sensitive as ELISA). Continue until you reach a bottle you can detect.

Calculate the error for your experiment by assuming you could be off by as much as 10% when measuring the salt and water adding up to 20% error in each of the 13 dilutions. This is a total error in bottle #13 of 280%, or at most a factor of 3. So bottle #13 could be anywhere from 0.33 to 3 femtogram/ml. if you can detect water from bottle #13, you are definitely more sensitive then an ELISA, in spite of your crude utensils and inexpensive equipment! Note that the starting error of using 2.5 gm instead of 2.3 gm only adds another 10% error.

If you want to calculate how many salt molecules you can detect, select the concentration at the limit of your detection, and put 2 drops on a square inch of paper towel and rub into your skin. Assume one drop can be absorbed. If you can detect water from bottle #13, you have detected 510,000 molecules (10^{-15} fg/ml divided by 58.5 gm/M multiplied by 6.02x1023 molecules/M divided by 20 drops/ml). Water in bottle #12 would therefore have 10 times as many molecules in one drop, and so forth. Even if your error is as much as a factor of 2 (100%), you can still get a good idea of what you can measure.

Atomic absorption standards start at exact concentrations; it is easy to make a more exact dilution series with them. When testing for iridium chloride by this skin test method, I was able to detect 3025 molecules!

Troubleshooting:

Always extend your set until you get a *Negative* result (this should happen by at least bottle #18). If you always "detect" salt, then you shook the bottle!

Never try to reuse a bottle if you spill when pouring into it. Get another new bottle.

Sensitivity of Pollutant-In-Product Testing

Get some slides of *Salmonellas* and *Shigellas* and find some milk that tests

Positive to at least one. Make a dilution series of the milk up to bottle #14, being careful not to shake the bottles. Start with 2 drops of milk in bottle #1. Use an eyedropper to deliver 2 drops to subsequent bottles. Begin testing at bottle #14, using the slide that tested *Positive*. You will learn to search by frequency later. My sensitivity was routinely around bottle #12, for a variety of pathogens. It was the same for toxic elements starting with standard solutions, about 1000 µg/ml, showing this method is less sensitive than skin testing.

Lesson Seventeen

Purpose: To test for fluke disease.

A small number of intestinal flukes resident in the intestine may not give you any noticeable symptoms. Similarly, sheep liver flukes resident in the liver and pancreatic flukes in the pancreas may not cause noticeable symptoms. Their eggs are shed through the organ ducts to the intestine and out with the bowel movement. They hatch and go through various stages of development outdoors and in other animals. But if you become the total host so that various stages are developing in your organs, you have what I term *fluke disease*. I have found that cancer, HIV, diabetes, endometriosis, Hodgkin's disease, Alzheimer's disease, lupus, MS and "universal allergy syndrome" are examples of fluke disease.

You can test for fluke disease in two ways: electronically and by microscope observation.

Materials: Cultures or slides of flukes and fluke stages from a biological supply company (see *Sources*) including eggs, miracidia, redia, cercaria, metacercaria. Body fluid specimens to help you locate them for observation under a microscope.

Method: Test for fluke stages in your white blood cells first. If you have any fluke stages in your white blood cells you may wish to see them with your own eyes. To do this, you must first locate them. Place your body fluid samples on one plate, your parasite stages on the other plate, and test for as many as you were able to procure, besides adults. After finding a stage electronically, you stand a better chance of finding it physically with a microscope.

Microscopy Lesson

Purpose: To *observe* fluke stages in saliva and urine with a microscope.

Materials:

a. A low power microscope. High power is not needed. A total of 100x magnification is satisfactory for the four common flukes, *Fasciolopsis, sheep liver fluke, human liver fluke*and *pancreatic fluke.*

b. Glass slides and cover slips.

c. A disposable eyedropper.

d. For sanitation purposes (wiping table tops, slides, microscope and your hands) a 50% to 70% alcohol solution (not rubbing alcohol!) is best. Dilute 95% grain alcohol 7 parts alcohol plus 3 parts water. Vodka or 76% grain alcohol can be used undiluted.

e. Formaldehyde, 20%. Formaldehyde 37% is commonly available at pharmacies. Dilute this with equal parts of filtered water to get 18½%, which is close enough to 20%, for the purpose of "fixing" (killing) the specimens. Store in a glass bottle in the garage, away from sunlight. Label. Specimens that are fixed properly do not lose their life-like appearance.

f. Iodine solution. This is only useful for the urine specimens. Lugol's iodine and tincture of iodine are both useful. Ask a pharmacist to prepare *Lugol's Iodine Solution* for you, as follows:

- 44 grams (1½ oz) iodine crystals
- 88 grams (3 oz) potassium iodide crystals

Dissolve both in 1 liter (quart) filtered water. This may take a day of frequent shaking.

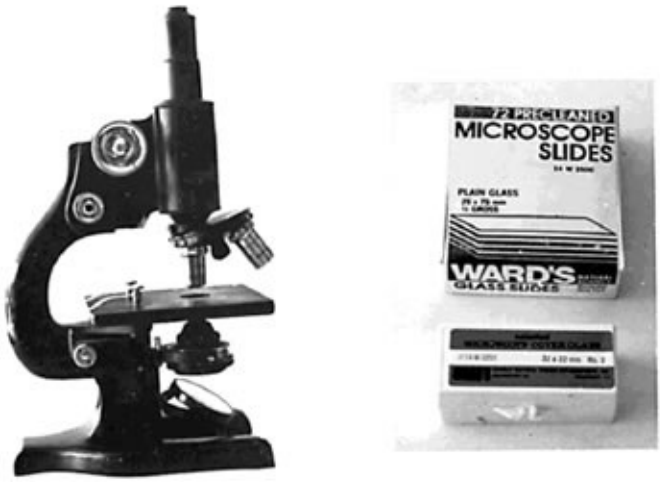

Fig. 89 Microscope, slides and cover slips.

Method for saliva:

1. Pour the 20% formaldehyde into a small amber bottle or other receptacle to a depth of about 1/8 inch. Keep tightly closed.

2. The person to be tested is asked to salivate into the bottle so the organisms are immediately "fixed" without undergoing cooling first. The total volume should be about double the original amount of formaldehyde used. Make a mark on the container so the subject knows how much to produce. The resultant concentration of formaldehyde will be about 10%.

3. Shake the bottle a few times. Set it aside for 24 hours to settle (less if testing is urgent).

4. With a dropper, draw up some of the bottom settlings. Put one drop on a slide and apply a cover slip.

5. View under low power of microscope. Compare objects you observe with specimens obtained on slides from biological supply companies.

Note: Persons with HIV and moderate AIDS will show about one to ten parasite stages per slide. It requires several hours of searching. Persons with HIV and severe AIDS show 10 or more fluke stages per slide; this makes the task of finding them much easier. Persons with terminal untreated cancer have many more fluke stages than relatively well persons.

Method for urine:

1. Prepare bottles of formaldehyde fixative ahead of time. Put about ¼ to ½ inch of 20% formaldehyde in each. Keep tightly closed.

2. Add freshly voided[63] urine from cancer or HIV sufferers to the formaldehyde in approximately equal amounts, resulting in a 10% formaldehyde solution. Shake immediately. Let settle several hours. The sediment has a higher number of fluke stages. Cancer victims with cervical or prostate cancer will show higher numbers of stages in urine than other cancer types.

3. Staining the slide is optional. It helps to outline fluke stages slightly. Prepare Lugol's solution as described above.

Slides may be stained in either of these two ways:

• Put a drop of "fixed" urine on a slide. Add a drop of 50% Lugol's (dilute 1:1 with filtered water). Apply cover slip.

• Put a drop of "fixed" urine on a slide. Apply cover slip. Add 1 to 3 drops of 50% Lugol's to edge of cover slip and allow it to seep in.

Note: persons who have been treated for cancer or HIV using any of the known drugs may show only 1 to 2 fluke parasite stages per drop of saliva or urine. For this reason, you may need to search through 20 or more slides to find flukes. Very ill persons may show up to 10 parasites per drop (slide).

Taking Pictures Of What You See

You may be unsure of what you see even if you have the microscope slides of labeled flukes and their stages to study and compare. In real life, they vary so much in shape and size that absolute identification is difficult without experience. Unfortunately in a few hours, just as you are getting proficient, your magnificent specimens will be drying out and unfit for observation. To preserve them longer you can seal the edges by painting around the cover slip with fingernail clear enamel. Or dribble hot sealing wax along the edges and then place them in sealed plastic bags (one per bag). Melt sealing wax in a metal jar lid. Make an applicator from a piece of coat hanger wire bent in the shape of a small square to fit around the cover slip and a handle.

Or take photographs. To take pictures of what you see under the microscope you will need a photomicrographic camera, which costs $200.00 and up (see *Sources*). It is easy to use. Remember to label your pictures so you know which

slide they came from.

Even photographs do not scientifically prove identity of parasite stages, but it is very good evidence. Proof would require that the saliva or urine sample could be cultured and seen to produce the known parasite stages. Hopefully, this will soon be done.

The Tests

It is tempting to think that the 300+ tests I use are definitive, and by getting rid of the parasites, toxins, solvents, pathogens and fungi we are guaranteed good health. But there are far more of each of these than we will ever have samples of. Fortunately, we think we know the major culprits. If you clean these up, then you can expect most, if not all, of your symptoms to go away.

I see food mold, solvent pollution, metal pollution, and parasitism as being the major threats to our health at this time. Molds prevent the liver from detoxifying solvents. Solvents induce parasites to invade animals and tissues that they have never gotten a foothold in before, causing cancer, HIV/AIDS and a number of other modern diseases. Metal lowers glutathione levels, and with it your immunity to these diseases. These events are totally unsuspected, with virtually no federal research dollars being spent on them compared to the grants for viral and bacterial research. Meanwhile, our beef and poultry supplies are being quietly overrun by parasites, exposing us to new levels of hazard. Even our pets are newly parasitized and can infect us, too!

Although you may think your only goal is to get the human intestinal fluke out of your liver so that orthophosphotyrosine stops being produced, it is just as important to completely clean up your body. This allows you not only to stop the tumors from metastasizing, but to shrink and eliminate them, so that you can become completely well.

Cancer

Although there are no true clinical cancer tests, there are more than two dozen markers.[64] Each can identify a particular cancer with reasonable accuracy. Recently, orthophospho-tyrosine has been found to be reliable for many kinds of human malignancies.

The orthophosphotyrosine sample was prepared by dissolving several milligrams in 10 ml filtered water and kept permanently sealed in a ½ ounce amber glass bottle. The hCG sample was similarly prepared.

HIV

There are a variety of antibody tests used clinically, which detect whether you have made antibodies to the HIV virus. Obviously, you must have had the virus at some time in the past in order to make the antibodies. And since nobody ever gets rid of the virus once they have it (unless they de-parasitize), it is a perfectly adequate diagnostic test.

But if you kill the intestinal fluke and its stages, thereby eliminating the virus, you do not stop making the antibodies. For this reason another type of clinical test is needed. Protein 24 (P24) antigen is an actual piece of the HIV virus itself. The P24 test, therefore is testing for the actual virus, not antibodies to it. It is like taking a small piece of elephant skin to the zoo to search for elephants. I selected the clinical P24 test to clinically prove the absence of the HIV virus, because the antibody test would remain *Positive* even after the HIV virus is gone.

Another clinical test, PCR-HIV1-RNA (quantitative) also tests for the presence of virus itself. It seeks out the nucleic acid that is specific for the virus. Bear in mind, however, that both the P24 test and PCR tests are still chemical in nature, and are affected by factors, which may allow false results to occur. The laboratory test method, of course, tries to take this into account.

My electronic test uses the same P24 antigen, one half milligram dissolved in 3 ml filtered water permanently sealed in a ½ ounce amber glass bottle.

I have also used a slide with lung tissue infected with HIV and got identical results.

Parasites

I test for about 120 different parasites or stages of parasites. (They are divided into Box 1 and Box 2, which you may see, referred to in the case histories.)Below is a list of the parasites. They are on slides purchased from biological supply companies. Some are cultures in small vials. Most of them are whole mounts of the adult stage. Some are slides of eggs and other stages.

They are searched for in the white blood cells. This means that encysted forms such as tapeworm cysticercus and Toxoplasma cysts are missed because the immune system is not attacking them. They have to be searched for separately in the tissue suspected (muscles, eyes, etc.).

The importance of testing for a list of parasites is not to cure cancer. *Fasciolopsis buski*, the human intestinal fluke, has already been identified in my research as the critical cancer parasite. It is the remainder, however, that are undoubtedly contributing to your inability to regain your health. Tracking their demise as you stay on the parasite-killing recipe lets you see your progress.

Parasite	Comment
Acanthamoeba culbertsoni	
Acanthocephala	worm
Anaplasma marginale	sporozoa from cows
Ancylostoma braziliense (adult)	hookworm (from dogs and cats)
Ancylostoma caninum	dog hookworm, causes fatigue, anemia, muscle ache
Ancylostoma duodenale male	hookworm
Ascaris eggs	common roundworm of cats and dogs
Ascaris larvae in lung	common roundworm of cats and dogs
Ascaris lumbricoides	common round worm of cats, dogs, humans. Brings with it *Bacteroides fragilis* and *Coxsackie* viruses. Eggs bring *Rhizobium leguminosarum, Mycobacterium avium* .
Ascaris megalocephala	roundworm of horse
Babesia bigemina	
Babesia canis smear	sporozoa of dog blood
Balantidium coli cysts	
Balantidium sp. trophozoites parasitic ciliate	
Besnoitia	sporozoa in lung
Blastocystis hominis	yeast in intestine
Capillaria hepatica	roundworm in liver, from rats and cats
Chilomastix cysts	from rats
Chilomastix mesnili (trophozoites)	flagellate in intestine (from rat)
Chilomonas	ciliate
Clonorchis metacercariae	human liver fluke stage
Clonorchis sinensis	human liver fluke adult
Clonorchis sinensis eggs	
Cryptocotyle lingua (adult)	fluke of sea gull
Cryptosporidium parvum	a coccidian, causes diarrhea
Cysticercus fasciolaris	cyst stage of *Taenia taeniaeformis* , tapeworm of pets

Dientamoeba fragilis	a trichomonad, not an amoeba
Dipetalonema perstans	round worm
Diphyllobothrium erinacei (Mansoni) scolex	tapeworm of dogs and cats (head)
Diphyllobothrium latum (scolex)	fish tapeworm (head)
Dipylidium caninum	dog tapeworm
Dipylidium caninum (scolex)	dog tapeworm (head)
Dirofilaria immitis	heartworm of dogs, causes pain over heart, irregular heartbeat in humans
Echinococcus granulosus	small tapeworm (pets)
Echinococcus granulosus (cysts)	tapeworm *cysticercus*, brings *Streptomyces sp* . fungus.
Echinococcus granulosus (eggs)	small tapeworm, stage
Echinococcus multilocularis	tapeworm of pets
Echinoporyphium recurvatum	fluke of poultry
Echinostoma revolutum	flatworm of water foul
Eimeria stiedae	sporozoa of rabbit
Eimeria tenella	sporozoa of large intestine
Endamoeba gingivalis trophozoite	amoeba of gums
Endolimax nana trophozoites, cysts	protozoan
Entamoeba coli cysts	amoeba in small and large intestine
Entamoeba histolytica trophozoites	common amoeba in intestine
Enterobius vermicularis	human pinworm
Eurytrema pancreaticum	common fluke of pancreas (from pigs and cattle), causes diabetes
Fasciola hepatica	sheep liver fluke of mammals, adult
Fasciola hepatica cercariae, eggs, metacercariae, miracidia, rediae	sheep liver fluke stages
Fasciolopsis buski	human intestinal fluke, adult
Fasciolopsis buski eggs, miracidia, rediae	human intestinal fluke stages. Brings with it HIV.
Fasciolopsis cercariae	human intestinal fluke stage. Brings with it HIV.
Fischoedrius elongatus	liver fluke of cats
Gastrothylax elongatus	fluke
Giardia lamblia (trophozoites)	common flagellate in intestine
Giardia lamblia cysts	common flagellate in intestine

Gyrodactylus	a fluke
Haemonchus contortus	large stomach roundworm of domestic animals
Haemoproteus	sporozoa, causes bird malaria
Hasstile sig. tricolor (adult)	rabbit fluke
Heterakis	round worm of chickens
Heterophyes heterophyes	fluke of intestine (from crawfish)
Hymenolepis cysticercoides	small tapeworm of pets
Hymenolepis diminuta	small tapeworm of pets
Hypodereum conoideum	fluke of poultry
Iodamoeba butschlii trophozoites and cysts	small amoeba of colon
Leishmania braziliensis	flagellate
Leishmania donovani	infects spleen and liver (from hamsters)
Leishmania mexicana	protozoa
Leishmania tropica	flagellate, infects skin
Leucocytozoon	sporozoa, causes bird malaria
Loa loa	a heart parasite, causes irregular heartbeat
Macracanthorhynchus	spiny headed worm of pig
Metagonimus	fluke of intestine
Metagonimus Yokogawai	a liver fluke
Moniezia (scolex)	large tapeworm of domestic animal (head)
Moniezia expansa	large tapeworm of domestic animals
Monocystis agilis	sporozoa from earth worm
Multiceps serialis	dog tapeworm
Myxosoma	sporozoa from fish gill
Naegleria fowleri	parasite of brain
Necator americanus	human hookworm
Notocotylus quinqeserialis	fluke of intestine (from muskrat)
Onchocerca volvulus	roundworm
Paragonimus Westermanii adult	lung fluke (from pets)
Passalurus ambiguus	rabbit pinworm
Pigeon tapeworm	
Plasmodium cynomolgi	malaria of monkey
Plasmodium falciparum smear	sporozoa of blood, causes malaria
Plasmodium vivax smear	sporozoa of blood, causes benign malaria
Platynosomum fastosum adult	Cat liver fluke
Pneumocystis carinii	sporozoa of the lung from rat
Prosthogonimus macrorchis (eggs)	fluke
Sarcocystis	sporozoa of muscles

Schistosoma haematobium	blood fluke
Schistosoma mansoni	blood fluke of veins
Stephanurus dentalus (ova)	roundworm
Stigeoclonium	
Strongyloides (filariform larva)	human threadworm, causes migraine headache
Taenia pisiformis	tapeworm of cats
Taenia pisiformis (cysticercus)	tapeworm of cats, stage
Taenia saginata (cysticercus)	beef tapeworm, stage
Taenia solium (cysticercus)	pork tapeworm, stage
Taenia solium (scolex)	pork tapeworm
Toxocara (eggs)	roundworm of cats
Toxoplasma (human strain)	sporozoa of mice, cats, etc.; causes eye disease
Trichinella spiralis (muscle)	roundworm, invades muscles, causes myalgia (from pets)
Trichomonas muris	flagellate of rat
Trichomonas vaginalis	protozoa of genital tract
Trichuris sp.	whipworm
Trypanosoma brucei	blood parasite (from rat)
Trypanosoma cruzi	blood flagellate (from mouse)
Trypanosoma equiperdium	causes sleeping sickness
Trypanosoma gambiense	blood flagellate, causes African sleeping sickness (from rat)
Trypanosoma lewisi	blood flagellate of rat
Trypanosoma rhodesiense	blood flagellate, causes sleeping sickness (from rat)
Urocleidus	a fluke

Toxic Elements

I call a substance "toxic" if it can be found in your white blood cells (the immune system). The concept is that if something is found in the white blood cells, it must be harmful to your body or at least useless. Even if the substance isn't harmful, if it preoccupies your immune system, it is a handicap to your body.

Some of the test items, like aluminum silicate, are compounds, not simply elements. Since there are thousands upon thousands of toxic chemicals in our environment and there would be no way of testing them all, my system of using the elements instead of the compounds is a short cut. For this reason, the test is

far from perfect. For example, a person may test *Positive* to aluminum silicate but show no aluminum in the white blood cells. So, if I had tested only for aluminum, I would have missed the problem.

Sometimes, toxic elements are present in an organ, but are not present in the white blood cells. For example, there may be mercury stored in the pancreas, but not be showing in the white blood cells at the time I'm testing. I interpret this as reflecting low levels of the toxin. Ideally, a test would search all your organs, but this would be too time-consuming for my technology.

Most of the toxic elements are metals, heavy metals and lanthanides. But some are not; examples are PCBs and formaldehyde.

Some important elements are missing, like iron, zinc and manganese. This is because I never could find them present in the white blood cells, and I finally gave up searching for them.

The most important thing to do after finding the toxic element in your body is to track down the source of it in your environment. Is it in food, air, drugs, vitamins? To test a pill or food, it is put in a plastic bag with filtered water added and tested the same way as the elements. To test the air in a person's home, an open glass jar, containing filtered water, is set out for 3 days in the room to be tested. Fine particles and gas molecules stick to dust in the air and fall into the water. The jar is then used like any other test solution.

Alternatively, a dust sample can be obtained by wiping the kitchen table or counter with a dampened piece of paper towel, two inches by two inches square. It is then placed in a plastic baggie.

Below is a list of the 70 or so toxic elements in the test. Most of them were obtained as atomic absorption standard solutions and are, therefore, very pure. This prevents mistakes in identifying a toxin. They were stored in ½ ounce brown glass bottles with Bakelite caps and permanently sealed with plastic film since testing did not require them to be opened. The exact concentration and the solubility characteristics are not important in this qualitative test. The main sources of these substances in our environment are given beside each item.

Toxic Substance	**Sources**
Aflatoxin B	beer , bread, apple cider vinegar , moldy fruit, nuts
Aluminum	cookware, deodorant , lotions, soaps
Aluminum silicate	salt, water softener

Antimony	fragrance in lotions, colognes
Arsenic	pesticide , "treated" carpet, wallpaper
Asbestos	clothes dryer belt , hair blower, paint on radiators
Barium	lipstick , bus exhaust
Benzalkonium chloride	toothpaste
3,4 Benzopyrene	flame cooked foods, toast
4,5 Benzopyrene	flame cooked foods, toast
Beryllium	hurricane lamp s, gasoline , dentures, kerosene
Bismuth	colognes, lotions, antacids
Bisphenol-A	dental plastic
Boron	
Bromine	bleached "brominated" flour
Cadmium	galvanized water pipes, old tooth fillings
Cerium	tooth fillings
Cesium	clear plastic bottles used for beverages
Chlorine	from Chlorox™ bleach
Chromium	cosmetics , water softener
Cobalt	detergent , blue and green body products
Copper	tooth fillings, water pipes
Dysprosium	paint and varnish
Erbium	packaging for food, pollutant in pills
Europium	tooth fillings
Europium oxide	tooth fillings, catalytic converter
Fiberglass	dust from remodeling or building insulation
Formaldehyde	foam in mattresses and furniture, paneling
Gadolinium	tooth fillings
Gallium	tooth fillings
Germanium	with thallium in tooth fillings (pollutant)
Gold	tooth fillings
hafnium	hair spray, nail polish , pollutant in pills
Holmium	usually found in presence of PCBs
Indium	tooth fillings
Iridium	tooth fillings
Lanthanum	computer and printing supplies
Lead	solder joints in water pipes
Lithium	printing supplies
Lutetium	paint and varnish
Maleic acid	dental plastic
Maleic Anhydride	dental plastic
Malonic acid	certain plants, dental plastic.
D-malic acid	dental plastic
Mercury	tooth fillings

Methyl Malonic acid	dental plastic
Molybdenum	auto supplies
Neodymium	pollutant in pills
Nickel	tooth fillings, metal glasses frames
Niobium	pollutant in pills, foil packaging for food
Palladium	tooth fillings
Platinum	tooth fillings
Polychlorinated biphenyl PCB	detergent , hair spray, salves
Polyvinyl chloride acetate (PVC)	glues, building supplies, leaking cooling system
Praseodymium	pollutant in pills
Radon	cracks in basement cement, water pipes
Rhenium	spray starch
Rhodium	tooth fillings
Rubidium	tooth fillings
Ruthenium	tooth fillings
Samarium	tooth fillings
Scandium	tooth fillings
Selenium	
Silver	tooth fillings
Sodium fluoride	toothpaste
Strontium	toothpaste, water softener
Tantalum	tooth fillings
Tartrazine	yellow food dye in cheese, jello, etc.
Tellurium	tooth fillings
Terbium	pollutant in pills
Thallium acetate	pollutant in mercury tooth fillings
Thorium nitrate	earth (dust)
Thulium	pollutant in some brands of vitamin C
Tin	toothpaste
Titanium	tooth fillings, body powder
Tungsten	electric water heater , toaster , hair curler
Uranium acetate	earth (dust)
Urethane	plastic teeth and dental resins
Vanadium pentoxide	gas leak in home, dental metal and dental plastic
Ytterbium	pollutant in pills
Yttrium	pollutant in pills
Zirconium	deodorant , toothpaste

Elements like erbium and terbium have only recently come into use. They were formerly called Rare Earth Elements but now are called *Lanthanides*. There are 15 of them: lanthanum cerium, praseodymium, neodymium, samarium, europium, gadolinium, terbium, dysprosium, holmium, erbium, thulium,

ytterbium, lutetium, and promethium.

All except promethium are in my test for toxic elements. You can see from the case histories that we have lanthanides in our bodies, widely distributed. They are in our processed foods, in our supplements and medicines, and in our tooth fillings, whether plastic or metal. Is it a good idea for the human species to eat elements that we know nothing about? Several of them absorb UV (ultraviolet) light. Should we be absorbing UV light in this manner when we already have a biological means (riboflavin, vitamin B_2) of doing this that took millions of years to evolve? Some of them have special magnetic properties (gadolinium and samarium). Some of them are phosphors; they give off light when irradiated. A number of them are known to "home in" on cancerous tumors. This is not understood. Why are they in our tablets and capsules? Who is making these polluted products? Evidently, the traditional safeguards against massive pollution don't work. It should be possible to make a test strip that detects Rare Earth Elements as a group, since they have very similar properties. Government agencies should supply them because it is in the public interest to keep society healthy. The public must not rely on reassurances by industry or government that food or body products are pure and safe. People must be able to test them for themselves.

Solvents

This is a list of all the solvents in the test together with the main source of them in our environment. These are chemicals, very pure, obtained from chemical supply companies, unless otherwise stated. Those marked with an asterisk (*) were the subject of a recent book *The Neurotoxicity of Solvents* by Peter Arlien-Soburg, 1992, CRC Press.

Solvent	Source
1,1,1, Trichloro ethane* (TCE)	flavored foods
2, 5-Hexane dione*	flavored foods
2 Butanone* (methyl ethyl ketone)	flavored foods
2 Hexanone* (methyl butyl ketone)	flavored foods
2 Methyl propanol	
2 Propanol (propyl alcohol)	see the isopropyl alcohol list
Acetone	store-bought drinking water, cold cereals, pet food, animal feed

Acetonylacetone (2,5 hexanedione)	flavored foods
Benzene	see the benzene list
Butyl nitrite	
Carbon tetrachloride	store-bought drinking water, cold cereals, pet food, animal feeds
Decane	health food cookies and cereals
Denatured alcohol	obtained from pharmacy
Dichloromethane* (methylene chloride)	store-bought orange juice, herb tea blends
Gasoline regular leaded	obtained at gasoline station
Grain alcohol	95% ethyl alcohol obtained at liquor store
Hexanes*	decaffeinated beverages
Isophorone	flavored foods
Kerosene	obtained at gasoline station
Methanol (wood alcohol)	colas, artificial sweeteners, infant formula
Mineral oil	lotions
Mineral spirits	obtained from paint store
Paradiclorobenzene	mothballs
Pentane	decaffeinated beverages
Petroleum ether	in some gasolines
Styrene*	styrofoam dishes
Toluene*	store-bought drinking water, cold cereals
Trichloroethylene* (TCEthylene)	flavored foods
Xylene*	store-bought drinking water, cold cereals

Pathogens

Pathogens are mostly bacteria and viruses, but also may include molds and yeasts. Most of them are on slides, some are preserved cultures; all are purchased from biological supply companies (see *Sources*). They are safe for you to handle.

Bacteria or Virus	**Comment**
Adenovirus	causes common cold
Alpha streptococcus	respiratory infection
Bacillus anthracis	causes anthrax in cattle
Bacillus cereus	
Bacillus megaterium	soil

Bacterium acnes	causes acne
Bacteroides fragilis	always found with *Ascaris*
Beta streptococcus	causes respiratory infection
Blepharisma	
Bordetella pertussis	"whooping cough"
Borellia burgdorferi	Lyme disease
Campylobacter fetus smear	stomach and vein disease
Campylobacter pyloridis	stomach and vein disease
Candida albicans (pure powder)	common yeast, causes thrush
Capsules of bacteria	
Caulobacter vibrioides	
Central spores (bacillus smear)	
Chlamydia trachomatis	eye disease
Clostridium acetobutylicum	
Clostridium botulinum	
Clostridium perfringens	*Clostridium* species inhabit cancerous tumors enabling their growth by changing RNA to DNA. Naturally present in colon. Occur in crevices under tooth fillings, dairy products.
Clostridium septicum (human blood)	
Clostridium sporogenes	
Clostridium tetani	
Corynebacterium diptheriae	causes diphtheria
Corynebacterium xerosis	causes stiffness
Coxsackie virus B-1	always found with Bacteroides fragilis
Coxsackie virus B-4	always found with Bacteroides fragilis
Crithidia fasciculata	
Cytomegalovirus (CMV) antigen	

Cytophaga rubra	
Diplococcus pneumoniae	respiratory illness
Eikanella corrodens	
Enterobacter aerogenes	intestinal bacterium
Epstein Barre virus (EBV)	fatigue, found with Strep G[65]
Erwinia carotovora	
Escherichia coli (E. coli)	intestinal bacterium
Gaffkya tetragena	causes respiratory infections
Gardnerella vaginalis	ovarian and genital tract infection
Haemophilus influenzae	bacterial meningitis, infects joints
Hepatitis B antigen	
Herpes simplex 1	causes "cold sores"
Herpes simplex 2	causes genital herpes
Herpes Zoster	"shingles"
Histomonas meleagridis (liver)	
Histoplasma capsulatum	
Human papilloma plantar wart #4	wart
Human papilloma virus #4	wart
Influenza A and B (flu shot)	
Klebsiella pneumoniae	causes pneumonia
Lactobacillus acidophilus	present in tumors and under tooth fillings; can change RNA to DNA
Lactobacillus casei	
Leptospira interrogans	spirochete, causes arthritis
Measles antigen	
Mumps antigen	
Mycobacterium	

avium-intracellulare complex	causes lymph node enlargement, found in tumors
Mycobacterium phlei	in dog saliva and in soil
Mycobacterium tuberculosis (infected nodule)	causes tuberculosis
Mycoplasma	chronic cough
Neisseria gonorrhea	causes gonorrhea
Neisseria sicca	soil
Nocardia asteroides	Parkinson's Disease, heart disease
Proteus mirabilis	urinary tract pathogen
Proteus vulgaris	in oxalate kidney stones
Pseudomonas aeruginosa	found in open wounds
Respiratory syncytial virus	
Rhizobium meliloti	
Rhizobium leguminosarum	forms nitroso compounds, found in tumors
Salmonella enteriditis	intestinal infection, pollutes dairy
Salmonella paratyphi	
Salmonella typhimurium	causes food poisoning, pollutes dairy
Serratia marcescens	occurs in water, soil, milk
Shigella dysenteriae	causes diarrhea, pollutes dairy
Shigella flexneri	depression, pollutes dairy products
Shigella sonnei	
Sphaerotilus natans	
Spirillum serpens	
Staphylococcus aureus	skin bacterium which is common cause of infections, tooth abscesses, heart disease
Staphylococcus epidermidis	infects skin and mucous membranes
Streptococcus lactis	occurs in milk
Streptococcus mitis	lung infection, tooth infection and cavities, abscesses

Streptococcus pneumoniae	pneumonia and inner ear disease
Streptococcus pyogenes	found in abscesses
Streptococcus sp. group G	sore throats, found with Eurytrema
Streptomyces sp.	inhibits RNA and protein formation
Terminal spores bacillus smear	
Tobacco mosaic virus	occurs in tobacco
Treponema pallidum	causes pain over overies
Trichomonas vaginalis	genital tract infection
Troglodytella abrassari	
Veillonella dispar	

Mycotoxins

Mycotoxin	found in	associated with
Aflatoxin	fruit, grains, nuts	cancer
Citrinin		
Citreoviridin		
Cytochalasin B	pasta	mental illness
Ergot	whole grain products, honey, alcoholic beverages	cancer
Griseofulvin		
Kojic acid	coffee, potatoes	diabetes
Ochratoxin	cancer	
Patulin	apples and other fruit	cancer
Sorghum	sorghum products	purpura, stroke
Sterigmatocystin	pasta, grains	mental illness
T2-toxin	dried beans	kidney disease, hypertension (high blood pressure)
Zearalenone	chips, popcorn, brown rice	AIDS

Kidney Stones

In this test we search in the kidney for seven kinds of crystals or stones.

Stone	Comment
Cysteine	sulfur containing
Cystine	sulfur containing
Dicalcium phosphate	also causes common arthritis, hardening of arteries, spurs
Monocalcium phosphate	also causes common arthritis, hardening of arteries, spurs
Tri-calcium phosphate	also causes common arthritis, hardening of arteries, spurs
Oxalate	cause of lower back pain 95% of the time
Uric acid	also causes gout and arthritis

Stones begin as tiny crystals, much too tiny to be seen by x-ray. They get deposited in the tiny tubules that make up the kidney, partly blocking the flow of liquid. This leads to "water holding" in your tissues. As more crystals are formed, they begin to deposit in other organs, too, such as joints of feet and hands and the interior of arteries, causing hardening. The usual symptoms are low back pain, pain running down the leg, foot pain, hand pain and gout.

Oxalic acid crystals cause pain in the lower back. Uric acid causes pain in the toes. The phosphates cause pain in the other joints (arthritis). But crystals do not cause pain by themselves. Bacteria find these nutritious deposits, and ultimately, it is they and their refuse that cause pain.

By causing partial blockage, these deposits prevent heavy metals from passing out through the kidneys. Mercury and nickel from tooth fillings are constantly being excreted through the kidney tubules. But as the kidneys get older and the deluge of toxic compounds gets higher, the toxins just attach themselves to the deposits already there. Soon, a pile-up of toxins occurs in the kidney.

The treatment is the same for all persons. It is a combination of herbs and nutritional substances, which, together, can dissolve all the 7 kinds of stones. The recipe is quite long (see Kidney Cleanse). The reason for this is so the individual kinds of stones don't have to be dissolved separately. This recipe dissolves all the stones in three weeks.

Notice that some very sick or elderly people are told to take half a dose only. Persons with a history of kidney stones, who know they have large stones, are also told to drink half a dose daily. Persons with sensitive stomachs may not tolerate these herbs; they could try killing their parasites first.

It is fair to say that we <u>all</u> develop kidney stones; although they may remain

very tiny and cause no pain.

Gallstones

We all have gallstones, so I do not test for this anymore.

Stone	Comment
Cholesterol crystals (encased in bile)	Accumulate in your liver bile ducts.

The Liver Cleanse is recommended many times in the Case histories. This will get rid of gallstones, without surgery!

Blood Tests

There are many blood tests that can be performed by a clinical laboratory. In the case histories I do not list all that were done (I typically ordered about 60), but only the ones that I thought significant. Here are some I refer to in the case histories:

Test	Comment
Alk. Phos.	Alkaline phosphatase, bone enzymes. Goes up with bone disease, cancer.
Amylase	An enzyme produced by the pancreas. It should not be in the blood.
Atyp lymphs	Atypical lymphocytes. Misshaped.
Baso	Basophils, a variety of white blood cells. When over 1% is suggestive of cancer.
Blasts	Immature white blood cells, should not be in the blood.
BUN	Blood urea nitrogen. Body waste - controlled by kidneys and liver - too low, due to malonic acid, too high due to bacterial invasion.
Ca125	A cancer marker for ovarian cancer.
Calcium	Too low (below 9.0) if parathyroid problem. Too high (above 10.0) if thyroid problem. May appear normal (9.5), when problem is in both glands.
Chloride	Electrolyte, controlled by adrenal glands.
Cholesterol	High amounts are indicative of blocked bile ducts in the liver, preventing excretion. Low levels reflect liver problems as in cancer.
CO2	Total carbonate. Too low in acid, too high in alkaline conditions.
Creatinine	Body waste derived from our muscles - controlled by kidneys and should be 0.9 to 1.0 mg/dl.
Eos	Eosinophils. Variety of white blood cell; increase with parasitism and allergies. Should be less than 3% of white blood cells.
Estrogen	A major women's hormone. Should not be higher than 100 pg./ml, except in pregnancy.
FBS	Fasting blood sugar (glucose). Blood sugar level measured in the morning in the fasted state. Should not be under 85 mg/DL; controlled by liver, pancreas, adrenals.
Ferritin	A form of iron that is usually high in cancer sufferers

GGT, SGOT, SGPT	Liver enzymes, go up with liver damage.
Hemoglobin	The oxygen carrying part of the red blood cell.
Iron	Should be about 100 mcg/dl, is lowered by copper metal.
LDH	Lactic dehydrogenase, goes up with tumor growth, with muscle stress such as heart stress. Malonic acid elevates.
Lymphs	Lymphocytes. The white cells whose job it is to eat and destroy viruses, and make antibodies. Should be about 25% of white blood cells.
MCV	Mean cell volume (average size of red blood cells). When over 100 suggests pernicious anemia. Corrects itself when *Ascaris* and hookworm are killed.
Monocytes	Rise when you are sick.
Phosphates	Should be less than 4 mg/DL in adults. Higher levels show bone dissolution is occurring. Children should have higher levels.
Platelet count	Goes up with parasitism and minute bleeding. Should be 250 thousand/cu mm. Over 400 thousand/cu mm is extremely high. Causes blood to clot.
Potassium	Should be no less than 4.4 meq/L. An electrolyte
PSA	Prostate specific antigen. A prostate cancer —marker‖; it should be less than 4.1 ng/ml.
RBC	Red blood cell count. Below 4.4 million per cubic mm is low. Over 4.7 is due to toxicity from cobalt or vanadium.
Seg	Segmental white blood cells. Those white cells whose job it is to eat and destroy bacteria. Should be about 70% of white blood cells.
Total protein	Blood protein made by the liver; sum of albumin and globulin. Ratio affected by cobalt and vanadium.
Triglycerides	Blood fat, too high with kidney problems, too low in cancer.
Uric acid	Body waste. Too low in glutamine deficiency and in bacterial invasion of organs. Too high in folic acid deficiency.
WBC	White blood cell count. Low levels are below 5,000 per cubic mm.

Building A Zapper

Being able to kill your bacteria and other invaders with electricity becomes much more of a panacea when you can do it all in three 7-minute sessions. No need to single out specific frequencies or to sweep through a range of frequencies one kHz at a time. No matter what frequency it is set at (within reason), it kills large and small invaders: flukes, roundworms, mites, bacteria, viruses and fungi. It kills them all at once, in 7 minutes, even at 5 volts.

How does it work? I suppose that a *Positive* voltage applied anywhere on the body attracts negatively charged things such as bacteria. Perhaps the battery voltage tugs at them, pulling them out of their locations in the cell doorways (called *conductance channels*). But doorways can be negatively charged too. Does the voltage tug at them so they disgorge any bacteria stuck in them? How would the *Positive* voltage act to kill a large parasite like a fluke? None of these questions can be answered yet.

Other fascinating possibilities are that the intermittent *Positive* voltage interferes with electron flow in some key metabolic route, or straightens out the ATP molecule disallowing its breakdown. Such biological questions could be answered by studying the effects of *Positive* frequencies on bacteria in a lab.

The most important question, of course, is whether there is a harmful effect on you. I have seen no effects on blood pressure, mental alertness, or body temperatures. It has never produced pain, although it has often stopped pain instantly. This does not prove its safety. Even knowing that the voltage comes from a small 9-volt battery does not prove safety, although it is reassuring. The clotting of red blood cells, platelet aggregation and functions that depend on surface charges on cells need to be investigated. But not before you can use it. Your safety lies in the short period of exposure that is necessary. Viruses and bacteria disappear in 3 minutes; damaged tapeworm stages,flukes, roundworms in 5; and mites in 7. One need not go beyond this time, although no bad effects have been seen at any length of treatment.

The first seven-minute zapping is followed by an intermission, lasting 20 to 30 minutes. During this time, bacteria and viruses are released from the dying parasites and start to invade you instead.

The second seven-minute session is intended to kill these newly released viruses and bacteria. If you omit it, you could catch a cold, sore throat or something else immediately. Again, viruses are released from the dying bacteria. The third session kills the last viruses released.

Do Not Zap If You Are Pregnant Or Wearing A Pacemaker.

These situations have not been explored yet. Don't do these experiments yourself. Children as young as 8 months have been zapped with no noticeable ill effects. For them, you should weigh the possible benefits against the unknown risks.

That is all there is to it. Almost all. The zapping current does not reach deep into the eyeball or testicle or bowel contents. It does not reach into your gallstones, or into your living cells where *Herpes* virus lies latent or *Candida* fungus extends its fingers. To reach deeper, the herbal parasite program must be added to the zapper treatment.

Killing The Surviving Pathogens

The interior of gallstones may house parasites inaccessible to the zapping. Eliminate this source of reinfection by flushing them out with liver cleanses. Use ozonated oil in the Liver Cleanse for greater effectiveness.

Although the center of the bowel contents is often unaffected, which lets bowel bacteria like *Shigella*, *Escherichia coli (E. coli)* and parasite stages survive, sometimes it is nearly all sterilized by zapping. This results in considerable shrinkage of the bowel movement. Eliminate remaining parasites and bacteria with a single dose (2 tsp.) of Black Walnut Hull tincture, Extra Strength.

The zapper current travels mainly along the intestinal wall where bacteria are scurrying to cross over into your body. Even "good" bacteria are no longer good when they are crossing the wall.

So zapping kills mostly "bad" bacteria. The good news is that perfect bowel habits often result in a few days. Evidently, the good bacteria are benefited by killing the invasive ones. Homemade yogurt and buttermilk (see *Recipes*) are especially good at recolonizing the bowel. But it does not seem wise to culture yourself with special commercial preparations, which are often polluted, and risk

getting parasite stages again when you can become normal so soon anyway. Besides, *acidophilus* bacteria are able to change RNA into DNA and are often found in a growing tumor!

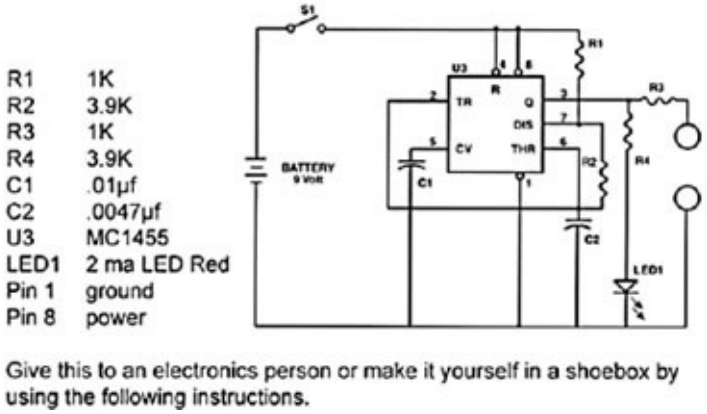

Fig. 90 Zapper schematic.

When a large number of parasites, bacteria and viruses are killed, it can leave you fatigued. Try to give yourself a low-stress day after your initial zapping. But there are no significant side effects. I believe this is due to the second and third zapping which mops up bacteria and viruses that would otherwise be able to go on a feeding frenzy with so much dead prey available.

Remember, too, that newly killed large parasites, like *Ascaris* worms and tapeworm larvae, still house their eggs that remain quite alive, unreachable by zapper current or herbs. Only cysteine and ozonated oil can reach them before they are set free in your body (see the Mop Up program).

To build your zapper you may take this list of components to any electronics store (Radio Shack part numbers are given for convenience).

Zapper Parts List

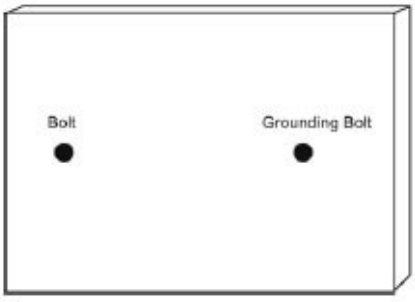
Item	Radio Shack Catalog #
large shoebox	
9-volt battery	
9-volt battery clips	270-325 (set of 5, you need 1)
On-Off toggle switch	275-624A micro mini toggle switch
1 KΩ resistor	271-1321 (set of 5, you need 2)
	271-1123

3.9 K Ω resistor	(set of 2, you need 2)
low-current red LED	276-044
.0047 uF capacitor	272-130 (set of 2, you need 1)
.01 uF capacitor	272-1065 (set of 2, you need 1)
555 CMOS timer chip	276-1723 (set of 2, you need 1)
8 pin wire-wrapping socket for the chip	276-1988 (set of 2, you need 1)
short (12") alligator clip leads	any electronics shop, get 6
micro clip test jumpers	278-017 (you need 2 packages of 2)
2 bolts, about 1/8" diameter, 2" long, with 4 nuts and 4 washers	hardware store
2 copper pipes, ¾" diameter, 4" long	hardware store
sharp knife, pin, long-nose pliers	

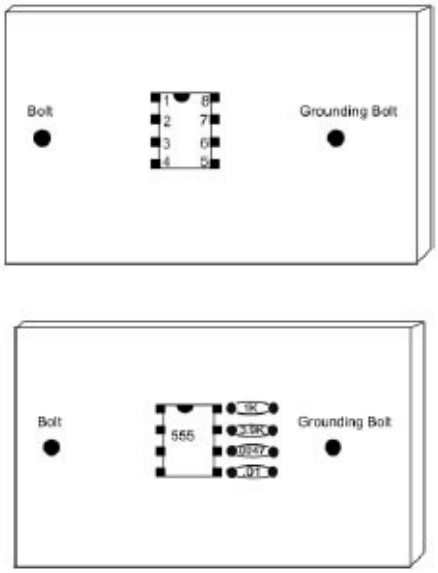
Hints for absolute novices: Don’t let unusual vocabulary deter you. A "lead" is just a piece of wire used to make connections. Label components as you remove them from the package. Practice using the micro clips. If the metal ends are L-shaped bend them into a U with the long-nose pliers so they grab better. Chips and chip holders are very fragile. It is wise to purchase an extra of each in case you break the connections.

Assembling The Zapper

1. You will be using the lid of the shoebox to mount the components. Save the box to enclose the finished project.



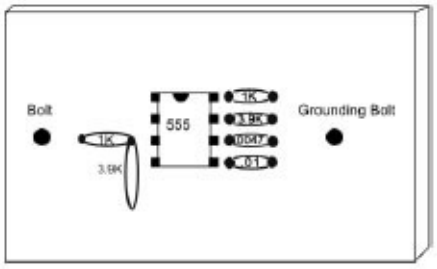
2. Pierce two holes near the ends of the lid. Enlarge the holes with a pen or pencil until the bolts would fit through. Mount the bolts on the outside about half way through the holes so there is a washer and nut holding it in place on both sides. Tighten. Label one hole "grounding bolt" on the inside and outside.



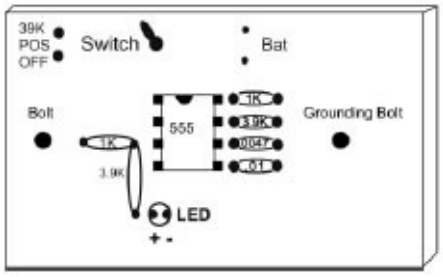
3. Mount the 555 chip in the wire wrap socket. Find the "top end" of the chip by searching the outside surface carefully for a cookie-shaped bite or hole taken out of it. Align the chip with the socket and very gently squeeze the pins of the chip into the socket until they click in place.

4. Make 8 pinholes to fit the wire wrap socket. Enlarge them slightly with a sharp pencil. Mount it on the outside. Write in the numbers of the pins (connections) on both the outside and inside, starting with number one to the left of the "cookie bite" as seen from outside. After number 4, cross over to number 5 and continue. Number 8 will be across from number 1.

5. Pierce two holes ½ inch apart very near to pins 5, 6, 7, and 8. They should be less than 1/8 inch away. (Or, one end of each component can share a hole with the 555 chip.) Mount the .01 uF capacitor near pin 5 on the outside. On the inside connect pin 5 to one end of this capacitor by simply twisting them together. Loop the capacitor wire around the pin first; then twist with the long-nose pliers until you have made a tight connection. Bend the other wire from the capacitor flat against the inside of the shoebox lid. Label it .01 on the outside and inside. Mount the .0047 uF capacitor near pin 6. On the inside twist the capacitor wire around the pin. Flatten the wire from the other end and label it .0047. Mount the 3.9 K Ωresistor near pin 7, connecting it on the inside to the pin. Flatten the wire on the other end and label it 3.9. Mount the 1 K Ωresistor and connect it similarly to pin 8 and label it 1K.



6. Pierce two holes ½ inch apart next to pin 3 (again, you can share the hole for pin 3 if you wish), in the direction of the bolt. Mount the other 1 K Ωresistor and label inside and outside. Twist the connections together and flatten the remaining wire. This resistor protects the circuit if you should accidentally short the terminals. Mount the 3.9K Ωresistor downward. One end can go in the same hole as the 1K resistor near pin 3. Twist that end around pin 3 which already has the 1K resistor attached to it. Flatten the far end. Label.



7. Next to the 3.9K Ωresistor pierce two holes ¼ inch apart for the LED. Notice that the LED has a *Positive* and *Negative* con-nection. The longer wire is the anode (*Positive*). Mount the LED on the outside and bend back the wires, labeling them + and - on the inside.

8. Near the top pierce a hole for the toggle switch. Enlarge it until the shaft fits through from the inside. Remove nut and washer from switch before mounting. You may need to trim away some paper with a serrated knife before replacing washer and nut on the outside. Tighten.

9. Next to the switch pierce two holes for the wires from the battery holder and poke them through. Attach the battery and tape it to the outside.

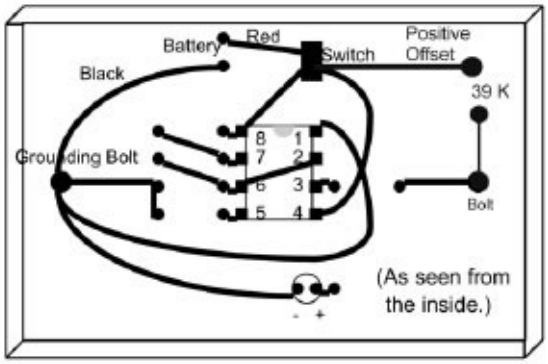
NOW TO CONNECT EVERYTHING

First, make holes at the corners of the lid with a pencil. Slit each corner to the hole. They will accommodate extra loops of wire that you get from using the clip

leads to make connections. After each connection gently tuck away the excess wire.

1. Twist the free ends of the two capacitors (.01 and .0047) together. Connect this to the grounding bolt using an alligator clip.

2. Bend the top ends of pin 2 and pin 6 (which already has a connection) inward towards each other in an L shape. Catch them both with an alligator clip and attach the other end of the alligator clip to the free end of the 3.9K Ωresistor by pin 7.



3. Using an alligator clip connect pin 7 to the free end of the 1KΩ resistor attached to pin 8.

4. Using two micro clips connect pin 8 to one end of the switch, and pin 4 to the same end of the switch. (Put one hook inside the hole and the other hook around the whole connection. Check to make sure they are securely connected.)

5. Use an alligator clip to connect the free end of the other 1K Ωresistor (by pin 3) to the bolt.

6. Twist the free end of the 3.9KΩ resistor around the plus end of the LED. Connect the minus end of the LED to the grounding bolt using an alligator clip.

7. Connect pin number 1 on the chip to the grounding bolt with an alligator clip.

8. Attach an alligator clip to the outside of one of the bolts. Attach the other end to a handhold (copper pipe). Do the same for the other bolt and handhold.

9. Connect the minus end of the battery (black wire) to the grounding bolt with an alligator clip.

10. Connect the plus end of the battery (red wire) to the free end of the switch using a micro clip lead. If the LED lights up you know the switch is ON. If it does not, flip the switch and see if the LED lights. Label the switch clearly. If you cannot get the LED to light in either switch position, you must double-check all of your connections, and make sure you have a fresh battery.

11. Finally replace the lid on the box, loosely, and slip a couple of rubber bands around the box to keep it securely shut.

12. Wrap handholds in one layer of wet paper towel before using. Grasp securely and turn the switch on to zap.[66]

• Optional: measure the frequency of your zapper by connecting an oscilloscope or frequency counter to the handholds. Any electronics shop can do this. It should read between 20 and 40 kHz.

• Optional: measure the voltage output by connecting it to an oscilloscope. It should be about 7 to 8 volts.

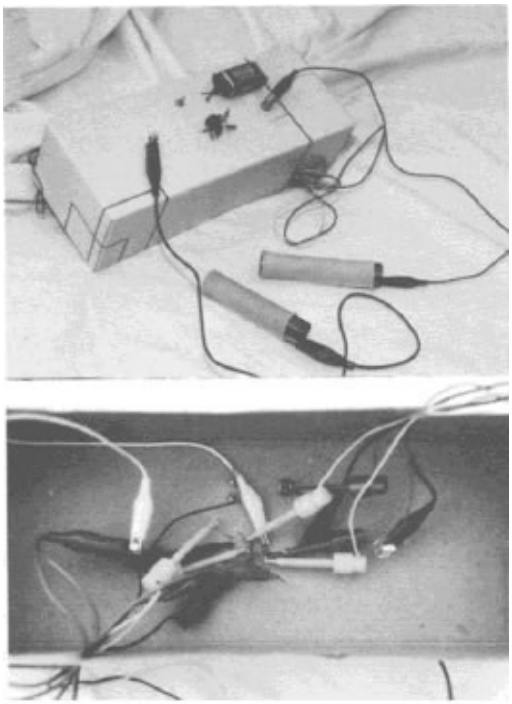


Fig. 91 Finished zapper, outside and inside.

• Optional: measure the current that flows through you when you are getting zapped. You will need a 1 KΩ resistor and oscilloscope. Connect the grounding bolt on the zapper to one end of the resistor. Connect the other end of the resistor to a handhold. (Adding this resistor to the circuit decreases the current slightly, but not significantly.) The other handhold is attached to the other bolt. Connect the scope ground wire to one end of the resistor. Connect the scope probe to the other end of the resistor. Turn the zapper ON and grasp the handholds. Read the voltage on the scope. It will read about 3.5 volts. Calculate current by dividing voltage by resistance. 3.5 volts divided by 1 KΩ is 3.5 ma (milliamperes).

Testing The Zapper

Trying the zapper on an illness to see "if it works" is not useful. Your symptoms may be due to a non-parasite. Or you may reinfect within hours of zapping. The best way to test your device is to find a few invaders that you currently have (see Lesson Twelve). This gives you a starting point. Then zap yourself. After the triple zapping, none of these invaders should be present.

Recipes

Read old recipe books for the fun and savings of making your own nutritious food. Change the recipes to avoid processed and malonic acid-containing ingredients.

Note: the latest products to fall victim to benzene pollution are **cornstarch** and **baking soda**. You can still use these if they are pure (see *Sources*). Besides this, the new practice of spraying fruits and vegetables with petroleum products to keep them fresh looking has polluted them with benzene. Produce treated this way has an extra glossy appearance and may even be slightly sticky. Carefully avoid such produce. It does not wash off. Peeling is necessary.

Ask your grocer if the produce they carry has been sprayed for "freshness"; ask the health food storeowner, too.

Fig. 92 Glossy fruit and vegetables

Beverage Recipes

Anything made from the malonate-free list in your own juicer is fine. Experiment with new combinations to create different flavorful fruit and vegetable juices. Consider the luxury of preparing gourmet juices, which satisfy your own individual palate instead of the mass-produced, polluted varieties sold at grocery stores. Remember to wash all fruit, and peel, before juicing. This removes the ever-present pesticides, common fruit mold, and the new food sprays.

Lemonade

1-cup fresh lemon juice, 1-cup honey, 1½-quarts water. Bring honey and water to a boil if you plan to keep it several days. Then add lemon juice and store in the refrigerator. Confectioner's sugar is an optional sweetener.

All honey and maple syrup should have vitamin C added to it as soon as it arrives from the supermarket. This detoxifies mold. Warm it first; then stir in ¼ tsp. per pint.

Green Goodness

head lettuce
grapefruit

Other varieties of lettuce, as well as parsley and spinach, tested *Positive* for benzene. This was also the case for health food store greens, no doubt due to the new practice of spraying for "freshness." If in doubt, ozonate the greens for 20 minutes; then rinse in water with baking soda added. Blend lettuce in juicer or blender to make ¼ cup. Add grapefruit and blend again to make 1 cup. Strain.

Green Drink

cabbage, kale, Swiss chard, turnip greens, or any other broad-leafed edible tops.

grapefruit, lemon, apple, pear, pineapple (strawberries and grapes are too moldy to risk).

Don't use rhubarb or nonedibles! Swiss chard and beet leaves contain a lot of oxalic acid. One leaf of each is enough. Change variety daily.

Blend greens to make ¼ cup. Add fruit to make a total of one cup. Blend together.Strain.

Kill Fertilizer Parasites

Remember to soak all greens and unpeeled vegetables in Lugol's solution for one minute to kill Ascaris and tapeworm eggs. They may be present from the manure used for fertilizer and they don't wash off!

Fresh Pineapple Juice

Peel a pineapple. Remove all soft spots. Cut it into cubes. Extract the juice by putting the pineapple through a blender or juicer. There will be very little pulp. Strain the juice and serve it on ice with sprigs of mint. Makes about 1½ cups of juice. Mix the pulp with an equal amount of clover honey and use as topping (kept in freezer) for homemade ice cream, pancakes, or yogurt.

Remember, all dairy products get sterilized.

This includes butter, cream, cheese. If it hasn't been boiled or baked, don't eat it. Add a pinch of salt while boiling. After cooling, it gets baking soda and vitamin C added.

Maple Milk Shake

For each milk shake, blend or shake together: 1 glass of milk and 2 tablespoons maple syrup.

Yankee Drink

Mix together 1 gal. water, 3 cups honey, ½ cup fresh lemon juice or distilled white vinegar, and 1 tsp. ginger.

Hot Vanilla Milk

Add one inch of vanilla bean and one tsp. honey to a glass of milk and bring to a near boil. You may add a pinch of cinnamon or other pure spice. You may even use vanilla extract.

Mark's Lemon-oil Drink

Scrub one lemon; blend it whole, rind, seeds and all. Strain and discard pulp. Add 1 tbs. olive oil and enough honey and water (1½ cup) to make it tasty. Read the label on the lemon packaging; avoid those that have been sprayed for longer shelf life. Ask your grocer if the information is not by the bin of lemons.

If you are not sure about this, peel the lemon with a sharp knife; you will still get limonene, the active ingredient. Use only one whole lemon a day.

Cream Shake

One egg yolk, one cup of half and half. Honey to sweeten and cinnamon or nutmeg. Blend. Drink only once a day.

Red Milk

One part fresh beet juice (use a juicer) and three parts sterilized half and half milk. Add vitamin C and spice.

Note: Raw beet juice is a liver tonic; start with 1/8 cup only.

Half And Half

Mix equal parts whipping cream and milk or water.

C-Milk

Cold milk can absorb a surprising amount of vitamin C powder without curdling or changing its flavor. Try ½ tsp. in a glass of cold milk.

Buttermilk-C

Stir 1 tsp. vitamin C powder into a glass of milk, more if it won't develop flakes. Add a pinch of salt (pure salt). Additional seasoning may be pepper and herbs or a fenuthyme capsule. Stir and enjoy.

Raw Certified Milk

You may be lucky enough to find this at your health food store. Raw milk has a special factor, lactoferrin. This factor is missing from the liver, spleen and bone marrow in cases of anemia and cancer. One glass of raw milk replenishes it for over a week! Surprisingly, boiling for 10 seconds does not destroy it! Add a pinch of salt before boiling. It is not present in ordinary pasteurized milk.

Moose Elm Drink - also known as Slippery Elm

For very sensitive stomachs when nothing wants to stay down:

1 tbs. moose elm powder

cold (boiled) milk

Start by making a paste as if it were cocoa. Gradually add milk, water or whipping cream to consistency desired. Sweeten with confectioner's sugar or honey. This is very like cocoa; can be drunk hot or cold. Sip one cup a day.

Alginate/Intestinal Healer

For intestines that are sore from surgery, blockage, or inflammation. This beverage is not meant to be digested; it forms a gelatinous ribbon right through the intestine, giving bulk and absorbing toxins along the way. Consume 1 cup a day in tablespoon amounts that you add to soup, stew, pudding, pie, or bouillon.

Bring 2 tsp. sodium alginate powder and 1 pint water to a boil. Stir with wooden spoon handle. Use slow heat – it could take an hour. Add to soup, stew, moose elm beverage, pudding or pie. Consume one to two cups per day.

Food Recipes

Despite the presence of malonic acid, aflatoxins, benzopyrenes, and solvents in many foods, it is possible to have a delicious and safe diet. Many persons need to gain weight, and with the emphasis in today's society on losing weight, consider yourself lucky in this respect. Help yourself to lots of butter, whipping cream, whole milk, avocados, and olive oil. Never throw away the skin or fat in meats. Make your own preserves and baked goods, including breads. Remember, when you are recovering from a major illness it is essential not to diet to lose weight. You must wait two years after you are recovered to try to lose weight.

All milk should be sterilized...

by boiling it for 10 seconds with a pinch of salt. The salt raises the temperature just enough to kill Rhizobium leguminosarum, a dangerous tumor causing bacterium. After cooling, add baking soda, 1/8 tsp. per pint. Follow by the same amount of vitamin C. If it makes mucous, you already have a chronic respiratory infection. Try to clear this up.

Daily Foods

Dairy products should contain at least 2% fat to enable you to absorb the calcium in them.

Change brands every time you shop to prevent the same pollutants from building up in your body. Choose plastic, not waxed paper containers.

If frying or cooking with fat,[67] use only olive oil, butter or lard (the BHT and BHA preservatives in lard are OK except for seizure sufferers), or chicken fat, or turkey fat simply scooped up from the roaster pan and chilled in the refrigerator. Mix them for added flavor in your dishes. Never use margarine, Crisco, or other hydrogenated fats. Do not cook over flames or grill, even when electric.

Kosher brands are superior. Search till you find one.

Fig. 93 Olive Oils

Eat lots of **fresh fruits and vegetables.** Wash them off only with cold tap water, not commercial food "wash." Scrub hard with a stiff bristled brush. Then cut away blemishes. Always peel potatoes so you can see the dark spots underneath. Modern dirt is full of chemicals and is toxic to you. Where spraying of fruits, vegetables and greens is permitted, peel everything and don't buy small-leafed greens; they can't be washed free of benzene. Emphasize head lettuce and cabbage.

Be sure to drink plenty of **plain water** from your cold faucet throughout the day, especially if it is difficult for you to drink it with your meals. If you don't like the taste of your own tap water, try to get it from a friend with newer plumbing. Use a glass bottle from a grocery store to transport it (the solvent from a plastic water bottle does not rinse out). Never drink water that has been run through a water softener or copper plumbing or has traveled through a long plastic hose. Don't drink water that has stood in a container for a day. Dump it and rinse the container. To further improve flavor and to dechlorinate attach a

small faucet filter made of carbon only. Or buy a filter pitcher (see *Sources*). Don't drink water that has stood in the filter pitcher very long, either.

Regular **table salt** is made of sodium chloride plus impurities, to which a free-running agent is added. Avoid all these by purchasing pure sodium chloride. Keep it free running by adding long grain white rice to it. Sodium chloride is a blood salt. We have a built in sensor that tells us when we have too much in our food. Potassium chloride is a tissue salt. It runs low readily if we have poor adrenal function and don't get enough fruits and vegetables. A blood test always shows both your sodium and potassium levels. It is wise to use a sodium/potassium salt mixture so they stay in balance. A good mixture is: 2 parts sodium chloride and 1 part potassium chloride. A higher proportion of potassium chloride should be approved by your health adviser who will check your blood levels. Another wise rule is to use salt either in cooking or at the table, but not both places. This cuts down on the total consumed.

Because commercial **cold cereals** are very convenient, but have solvents, here are three replacements.

Three Granolas

Granola One
7 cups rolled oats
1 tsp. salt (pure variety)
1 cup wheat germ (fresh, not defatted)
½ cup honey
½ cup sunflower seeds, immaculate quality
½ cup milk with pinch of vitamin C added
½ cup melted butter (already boiled with vitamin C added)
1 cup raisins, rinsed in vitamin C water

Mix dry ingredients together. Mix liquid ingredients and add gradually, while tossing until thoroughly mixed. Place in large ungreased pans and bake in slow (250°) oven. Stir occasionally, baking until brown and dry, usually 1-2 hours. Store in airtight container in freezer.

Granola Two
6 cups rolled oats
½ cup raw wheat germ
1 cup sesame seeds

1 cup sunflower seeds (raw, unsalted)
1 tsp. cinnamon
½ cup melted butter
½ cup honey

Preheat oven to 250°. Toss all ingredients in mixing bowl. Spread thinly on a baking sheet and bake 20-25 minutes. Stir often in order to brown evenly. When golden, remove and let cool. Makes 12 cups.

If you would like to add nuts to your granola recipes, rinse them in cold tap water first, to which vitamin C powder has been added (¼ tsp. per pint). Rub off the skins. This removes aflatoxins and malonate.

Granola Three (Stove Top or Dry Roast)

It is cooked quickly right on top of the stove. The quick, sautéing gives a deep-roasted flavor to the ingredients. The brown sugar melts just a bit, slightly coating each flake.

2 cups raw rolled oats
1/3 cup or more of wheat germ
1/3 cup or more of sesame seeds
1/3 cup or more of sunflower seeds
1/3 cup or more of shredded coconut
¼ cup (packed) brown sugar treated with vitamin C.
¼ tsp. (heaping) salt

1. Use a large, heavy skillet (enamel or glass). Place the oats in the skillet, turn on the heat to medium-low, and stir them constantly for 5 minutes, as they begin to roast.

2. Add wheat germ, sesame seeds, sunflower seeds, and coconut. Keep both the heat and the stirring action constant for ten or more minutes.

3. Sprinkle in brown sugar and salt. Cook for 2-5 more minutes, still stirring. Remove from heat, cool, and store in an airtight container.

   Note: this yields about 3½ cups. You can double the amounts, but it is recommended that you make smaller batches more frequently instead, for greater freshness.

Peanut Butter

Fig. 94 Light colored, roasted peanuts in the shell had no aflatoxin.

Use fresh unsalted roasted peanuts—they will be white on the first day they arrive at the health food store from the distributor. (Ask when they will arrive.) Or shell fresh roasted peanuts yourself, throwing away all shriveled or darkened nuts. Grind, adding salt and vitamin C (¼ tsp. per pint) as you go. Take your own salt shaker with built in vitamin C to the health food store where you grind it. For spreadability, especially for children, mix an equal volume of cold butter, previously boiled, to freshly ground peanut butter. This improves spreadability and digestibility of the hard nut particles. This will probably be the most heavenly peanut butter your mouth has ever experienced.

Spreadable Butter

Bring one-quarter pound of butter to a boil in a saucepan. Add a pinch of salt. Count to ten, while it bubbles. Add a pinch of vitamin C. Then add olive oil in equal amount or to suit. Reheat and pour into a butter bowl. Do not save any liquid that separates at the bottom. Refrigerate.

Sweetening and Flavoring

Brown Sugar. Although I am prejudiced against all sugar from a health standpoint, my testing revealed no benzene, isopropyl alcohol, wood alcohol. However it does contain sorghum mold and must be treated with vitamin C to detoxify it. Add ¼ tsp. to a 1-pound package; knead until well mixed.

Fig. 95 Safe Sweetening

Confectioner's sugar. This is dextrose or glucose, the same as blood sugar (cane sugar is sucrose). It needs no digestion and can be assimilated much more easily, especially in liver disease. Commercial varieties I tested has no solvents or mold.

Maple syrup. Boil to kill mold spores. Then add vitamin C, ¼ tsp. per pint, to detoxify mycotoxins. Keep refrigerated and use promptly.

Flavoring. Use maple, vanilla (both natural and artificial), and any pure spice. They are free of molds, solvents and malonate.

Honeys. Get at least 4 flavors for variety: linden blossom, orange blossom, plain clover and local or wild flower honey Add vitamin C to newly opened jar to detoxify ergot mold (¼ tsp. per pint). Since jars must be sterilized, purchase your honey in bulk from a health food store.

Jams and jellies. They are not safe unless homemade.

Fruit syrup. Use one package frozen fruit, such as cherries, blueberries or raspberries. Let thaw and measure the amount in cups (it might say on the package). Add an equal amount of clover honey to the fruit. Also add ¼ tsp. vitamin C powder. Mix it all in a quart canning jar and store in the refrigerator. Use this on pancakes, cereal, plain yogurt and homemade ice cream too. Use to make your own flavored beverages in a seltzer maker. If you wish to use fresh fruit, bring it to a boil to sterilize. Use it up in a few days or boil to sterilize it again.

Note for diabetics

Diabetics must not use artificial sweeteners. Nor can they use all the sweeteners listed. Try stevia powder instead.

Preserves

Keep 3 or 4 kinds on hand, such as peach, pineapple, and pear. Peel and chop the fruit. It should not have any bruises. If you use a metal knife, rinse the fruit lightly afterwards. Add just enough water to keep the fruit from sticking as it is cooked (usually a few tablespoons). Then add an equal amount of honey, or to taste and heat again to boiling. Put in sterile jars in refrigerator. Make lemon marmalade the same way, slicing the fruit and peeling thinly. Be sure the lemons were not sprayed! Always add vitamin C powder to a partly used jar to inhibit mold. Never use up partly molded fruit by making preserves out of it. Never use "soft" (actually moldy) bananas to make banana bread. Never make guacamole out of soft (actually moldy) avocados. Throw them out.

Kumquat Marmalade

If you feel starved for "orange" flavor, you will love this recipe.

2½ cups water
2½ quarts whole kumquats, stems removed
2 whole grapefruits
1 lemon
5 or 6 cups powdered sugar
½ tsp. vitamin C

Wash the kumquats, grapefruits, lemon, and put through a food processor until coarsely chopped. Bring the water to a boil, add the fruit, and bring to a boil again. Then cook on low heat, uncovered, about 35 minutes. Stir with wooden spoon occasionally and pick out any seeds that rise to the surface. Stir in sugar according to your taste, again bringing to a boil. Simmer an additional 20 minutes. Stir in vitamin C. Ladle into sterilized glass jars. Cover with plastic lids (see *Sources*).

There are many uses for marmalade besides being good with bread and butter. Try adding to cooked, mashed yams, on homemade ice cream, etc.

C Dressing

½ cup olive oil
¼ cup fresh lemon juice or white distilled vinegar
1 tsp. thyme, fenugreek or both. (Capsules are freshest. The combination is

available as Fenuthyme, see *Sources.*)
1 tsp. vitamin C powder
½ tsp. brown sugar

Combine the ingredients in a clean salad dressing bottle. Shake. Refrigerate. The basic recipe is the oil and vinegar in a 2:1 ratio. After mixing these, add any pure spice desired. Or add home made cottage cheese for a creamy texture.

Pasta Pizza Sauce or Red Sauce

Here are two sauces that are excellent on pasta, pizza or salads.

3 red peppers, chopped or in chunks
1 small onion
3 tbs. olive oil
salt to taste
1 cup water
¼ cup white distilled vinegar

Sauce No. 1: Sauté peppers and onion in olive oil for a few minutes. Add generous sprinkling of salt and a cup of water and bring to a boil. Cover pan, lower burner heat and cook for three to five more minutes. Mash (or put into blender) and add vinegar. Blend for a few seconds and add salt (if by taste more is needed). May be kept up to a month in refrigerator if stored in a glass jar with plastic or wooden lid.

Sauce No. 2: Same as Sauce No. 1 except that when a sprinkling of salt is put into pan also add a ½ capsule each of Cloves , fenuthyme, and turmeric.

Sour Cream-C

2 cups heavy whipping cream, boiled 10 seconds with a pinch of salt and chilled
¼ tsp. citric acid
¼ tsp. vitamin C powder
1 tsp. fresh onion juice or other seasoning (optional)

Stir until smooth, refrigerate 2 hours.

Yogurt

Buy a yogurt maker. Be sure to use boiled milk and add vitamin C. When

done add fresh blueberries, strawberries, or peaches. Use plain yogurt as starter.

Cottage Cheese "Paneer"

This tastes much better than regular cottage cheese. It's more easily digested, too. Don't throw away the liquid that remains (whey) since it has all the calcium of the milk in it. It is often referred to as "poor-man's beer", drink ice cold on a hot day.

1/8 tsp. salt
½ gallon milk
juice of 2 lemons

Put milk and salt in saucepan or wok and bring to boil for 10 seconds. Add juice of 1 lemon for each quart of milk. Stir and allow to boil for another few seconds. When curdled, strain through thin cloth (cheesecloth or thin dishtowel) and squeeze all liquid out until desired consistency. Should be very dry if it is to be cut into squares for vegetable dishes, but not too dry if to be used like cottage or cream cheese. Makes 1 cup.

Cottage Cheese "Zuppe"

Drop a carton of cottage cheese into a saucepan and cover with milk or cream. Add 1/8 tsp. baking soda, salt, pepper, garlic and any other herbs. Stir and boil for 20 seconds. When cool, add vitamin C (1/8 tsp. per pint).

Cottage Cheese Cake

This is an excellent way to get more protein into your diet, especially important if you are mostly vegetarian.

1 cup cottage cheese (dry variety)
1 egg
1 tsp. honey or confectioner's sugar
1 tsp. butter
cinnamon

If dry cottage cheese is not available, drain the regular variety. The dryer the cottage cheese the chewier the cheese cake gets. But if you prefer a custard-like consistency, you could use the regular 4% cream cottage cheese without

draining; simply blend it for smoothness.

Mix all ingredients and pour into a small glass pie pan with or without a pie shell. Do not use graham crackers or ready-made crust. Sprinkle heavily with cinnamon. Bake at 350º till firm and slightly browned, about 15 to 20 minutes.

Soups

All home made soups are nutritious and safe, provided you use no processed ingredients (like a bouillon cube), or make them in metal pots. Use herbs and pure salt to season. The salt should be added during boiling, not at the end, to raise the boiling temperature and kill more bacteria. Always add a dash of vitamin C or vinegar to draw out calcium from soup bones for you to absorb. Soups are great for the finicky appetite.

Cheese Soup

4 cups home made chicken broth
¾ pound uncolored sharp cheddar cheese, grated or cut up
¼ tsp. vitamin C
1 tsp. freshly grated nutmeg (from whole nutmeg)
1 or 2 potatoes, peeled, cooked and cut into small pieces
1 cup of cream or half and half (unboiled is fine)
salt (pure variety)

Bring all to a boil. After a minute turn the burner to low, cover pan with a lid and cook slowly for at least 20 minutes.

Fish and Seafood recipe

Any kind of fish or seafood is acceptable, provided it is well cooked. Don't buy food that is already in batter. The simplest way to cook fish is to poach it in milk. It can be taken straight from the freezer, rinsed, and placed in ¼ inch of milk (unboiled is fine) in the frying pan. Add a dash of vitamin C and heat until it is cooked. Turn over and repeat. Throw away the milk. Serve with fresh lemon and herbs.

Baked Apples

Peel and core carefully. Remove all bruises (this is where the mycotoxin,

patulin, is). Cut in bite-sized pieces, add a minimum of water and cook or bake minimally. Add a squirt of lemon juice when done. Serve with cinnamon, whipping cream and honey. Make sure you eat the seeds, too.

Ice creams...

from the grocery store are loaded with benzene and other solvents. Fortunately there are ice cream makers that do everything (no cranking)! Or try our recipe, which uses a blender. Be sure not to add store bought flavors, except vanilla or maple. For lemon flavoring use grated lemon rind. (Buy unsprayed lemons only.)

5-Minute Ice Cream

(Strawberry) Use 2 half-pints of heavy whipping cream (boiled, chilled, and vitamin C-ed), 1 package of frozen strawberries (about 10 oz.), and 1/2 cup clover honey. Pour frozen strawberries into blender. Pour whipping cream and honey over them. Blend briefly (about 10 seconds), not long enough to make butter! Pour it all into a large plastic bowl. Cover with a close fitting plastic bag and place in freezer. Prepare it a day ahead. Try using other frozen fruits, such as blueberries and cherries. Keep a few berries out of the blender and stir them in quickly with a non-metal spoon before setting the bowl in the freezer. There are many ice cream recipes to be found in old cookbooks. Avoid those with processed foods as ingredients. You may add nuts if you rinse them in vitamin C water.

Cookies, cakes and pies

Bake them from scratch, using unprocessed ingredients. Use simple recipes from old cookbooks.

Seven Day Sample Menu

Because processed foods have many toxins, you must cook as much from scratch as possible. So for convenience sake, keep your meals simple in preparation. You may want to prepare ahead and refrigerate your dressings and toppings. Or you could make a hot soup for dinner, refrigerate, and eat the leftovers for lunch. Don't save leftovers more than two days. Make sure they are

covered. Try baking several potatoes at one time, refrigerate and put them in a salad the next night. Variety is the spice of life, so combine the allowed foods in the most creative ways you can imagine. And don't forget herbs and spices; learn to use them from old cookbooks. When cooking grains, remember to add a bit of salt to raise the boiling temperature.

	Breakfast	Lunch	Dinner
Day 1	Oatmeal and honey with milk, half n' half or whipping cream Banana Water Milk ½ cup Green Drink	Fresh ground peanut butter and preserve sandwich Chicken soup Milk Water Lemon Oil Drink	Orange Roughy fish Fresh green beans with butter Baked potato with Sour Cream-C topping Pie (homemade) Milk Olive leaf tea (*Sources*)
Day 2	Egg (limit 2) Biscuit Fried potatoes 1 glass milk Green Drink	Chicken sandwich with sour cream dressing Cucumber sliced in vinegar, or avocado Lemon Oil Drink Water Milk	Homemade bean or lentil soup Sardines Dinner roll and butter Salad with homemade dressing Ice cream (homemade) Olive Leaf Tea
Day 3	Wheatena cooked with raisins, salt and milk Banana Green Drink ½ cup milk Water	Tuna sandwich with olive oil Soup Milk Water Olive Leaf Tea	Baked sweet potato with butter and sweetening Fresh spinach w/lemon Bread and butter Chopped, peeled pear or other fruit and whipping cream Cream Shake Water
Day 4	French toast with maple syrup Green Drink Milk Water	Avocado and sour cream sandwich Bread and butter Lemon Oil Drink Water	Lobster or sautéed shrimp Fresh asparagus Potatoes, any style Milk Olive Leaf Tea
Day 5	Cooked cereal 1 glass milk Sliced banana with whipping cream and honey 1 glass water Green Drink	Cold potato salad with C Dressing Soup Custard pudding Water Milk Olive Leaf Tea	1 can sardines or salmon in easy-open can (can openers shed metal) Salad of head lettuce, grapefruit, avocado with homemade dressing Bread with butter Ice-cream or Cream Shake Water
Day 6	Pancakes Banana or chopped fruit with cream Milk Water	Homemade peanut butter sandwich Lemon Oil Drink Milk Water	Well roasted turkey (dressing must not have celery) Mashed potatoes and gravy(save the gravy for next breakfast) Cranberry sauce (fresh or canned) Salad or coleslaw with C-dressing

	Green Drink		Milk Olive Leaf Tea
Day 7	2 Eggs and homemade biscuit with gravy Milk Fruit juice Green Drink	Salmon sandwich (from flip top can) Olive Leaf Tea Milk Water	Potatoes au gratin Turkey leftovers Cob of Corn Bread and butter Pie (optional) Cream Shake

Take most of your supplements with food. Powders can be mixed with a little food and gulped down at the beginning of the meal.

Too Sick To Cook, Too Tired To Eat

Pick three meals from the sample menu that need no cooking and eat them every day, rotating as much as possible.

Recipes for Natural Body Products

You can use just borax (like 20 Mule Team Borax™) for all types of cleaning including your body, laundry, dishes and your house! You don't need all those products you see in commercials for each special task!

Even if you have dry skin, difficult hair or some other unique requirement, just pure borax will satisfy these needs. A part of every skin problem is due to the toxic elements found in the soaps themselves. For instance aluminum is commonly added as a "skin moisturizer". It does this by impregnating the skin and attracting water, giving the illusion of moist skin. In fact you simply have moist aluminum stuck in your skin, which your immune system must remove. While borax won't directly heal your skin or complexion, it does replace the agents that are causing damage, so that healing can occur.

Borax Liquid Soap

An empty 1 gallon jug
1/8 cup borax powder
Plastic funnel

Funnel the borax into the jug, fill with hot tap water. Shake a few times. Let settle. In a few minutes you can pour off the clear part into dispenser bottles. This is the soap!

Easier way: use any bottle, pour borax powder to a depth of a ½ inch or so. Add water. Shake. When you have used it down to the undissolved granules, discard them and start over.

Keep a dispenser of borax soap by the kitchen sink, bathroom sink, and shower. It does not contain aluminum as regular detergents and soaps do, and which contribute to Alzheimer's disease. It does not contain PCBs as many commercial and health food varieties do. It does not contain cobalt (the blue or green granules), which causes heart disease and poisons the bone marrow. Commercial detergents and non-soaps are simply not safe. Switch to homemade bar soap and borax for all your tasks! In fact, you could add a tbs. of homemade liquid soap to the borax to make it sudsy. Borax inhibits the bacterial enzyme *urease* and is therefore antibacterial. It may even clear your skin of blemishes and stop your scalp from itching.

For Laundry

Borax (½-cup per load). It is the main ingredient of non-chlorine bleach and has excellent cleaning power without fading colors. It can be combined with homemade soap for extra cleaning power. Your regular laundry soap may contain PCBs, aluminum, cobalt and other chemicals. These get rubbed into your skin constantly as you wear your clothing. For bleaching (only do this occasionally) use original chlorine bleach (not "new improved" or "with special brighteners", and so forth). Don't use chlorine if there is an ill person in the house. For getting out stubborn dirt at collars, rub in homemade bar soap first; for stains, try grain alcohol, vinegar, baking soda (check old recipe books for stain removal tricks).

For Dishes

Don't believe your eyes when you see the commercials where the smiling person pulls a shining dish out of greasy suds. Any dish soap that you use should be safe enough to eat because nothing rinses off clean. Regular dish detergents, including health brands, are now polluted with PCBs. They also contain harmful chemicals like cobalt. Use borax for your dishes. Or use paper plates and plastic (not styrofoam) cups.

In The Dishwasher

Use 2 tsp. borax powder straight or pre-dissolved in water. If you use too much it will leave a film on your dishes. Use vinegar in the rinse cycle to reduce film.

In The Sink

Use a dishpan in the sink. Use ¼ cup borax and add a minimum of water. Also keep a bit of dry borax in a saucer by the sink for scouring. Don't use any soap at all for dishes that aren't greasy and can be washed under the faucet with nothing but running water. Throw away your old sponge or brush or cloth because it may be PCB contaminated. Start each day by sterilizing your sponge (it harbors Salmonella) or with a new one while the used one dries for three full days. Clean greasy pots and pans with a paper towel first. Then use homemade bar soap.

Shampoo

Borax liquid is ready to use as shampoo, too. It does not lather but feels slippery between your fingers (If it is not slippery, the concentration is too low. Check the recipe). It goes right to work removing sweat and soil without stripping your color or natural oils. It inhibits scalp bacteria and stops flaking and itching. Hair gets squeaky clean so quickly (just a few squirts does it) that you might think nothing has happened!

Make a bottle of borax liquid to fill your soap dispensers and shampoo bottle. Use citric acid to rinse and condition

Fig. 96 Borax and citric acid for the shower.

You will soon be accustomed to non-lathery soap. Rinse very thoroughly because you should leave your scalp slightly acidic. Take a pint container to the

shower with you for rinsing. Put ¼ tsp. citric (not ascorbic) acid crystals (see *Sources*) in it. For long hair use a quart of rinse. Only **citric acid** is strong enough to rinse the borax out, lemon juice and vinegar are not. After shampooing, fill the rinse container with water and pour over your head. Your hair should feel instantly silky. Rinse your whole body, too, since citric acid is also anti-bacterial. All hair shampoo penetrates the eyelids and gets into the eyes although you do not feel it. It is important to use this natural rinse to neutralize the shampoo in your eyes. (Some people have stated that citric acid makes their hair curlier or reddens it. If this is undesirable, use only half as much citric acid.) Citric acid also conditions and gives body and sheen to hair. A single squirt of homemade liquid soap (see *Recipes*) added to borax liquid makes it quite lathery if you need time to adjust to plain borax.

Baking Soda Shampoo

1 tbs. baking soda
1 cup very hot water

Place both in a plastic container and stir with your fingers until dissolved. Scoop it up over your hair by hand; if you pour it, too much runs off.

Hair Spray

I don't have a recipe that holds your hair as well as the bottle of chemicals you can buy at the store. Remarkably, a little lemon juice (not from a bottle) has some holding power and no odor! Buy a 1-cup spray bottle. Squeeze part of a lemon, letting only the clear juice run into the bottle. Fill with water. Keep it in the refrigerator. Make it fresh every week. Spraying with just plain water is nearly as good! For shinier hair, drop a bit of lemon peel into the bottle.

Homemade Soap

A small plastic dishpan, about 10" x 12"
A glass or enamel 2-quart sauce pan
1 can of lye (sodium hydroxide), 12 ounces
3 pounds of lard (BHT and BHA are OK here)
Plastic gloves
Water

1. Pour 3 cups of very cold water (refrigerate water overnight first) into

the 2-quart saucepan.

2. Slowly and carefully add the lye, a little bit at a time, stirring it with a wooden or plastic utensil. (Use plastic gloves for this; test them for holes first.) Do not breathe the vapor or lean over the container or have children nearby. Above all use no metal. The mixture will get very hot. In olden days, a sassafras branch was used to stir, imparting a fragrance and insect deterrent for mosquitoes, lice, fleas, ticks.

3. Let cool at least one hour in a safe place. Meanwhile, the unwrapped lard should be warming up to room temperature in the plastic dishpan.

4. Slowly and carefully, pour the lye solution into the dishpan with the lard. The lard will melt. Mix thoroughly, at least 15 minutes, until it looks like thick pudding.

5. Let it set until the next morning; then cut it into bars. It will get harder after a few days. Then package.

If you wish to make soap based on olive oil, use about 48 ounces. It may need to harden for a week.

Liquid Soap

Make chips from your homemade soap cake. Add enough hot water to dissolve. Add citric acid to balance the pH (7 to 8). If you do not, this soap may be too harsh for your skin, while it is excellent for cleaning the sink.

Skin Sanitizer

Make up a 5 to 10% solution of food grade alcohol. Food grade alcohols are grain or cane (ethyl) alcohol. Only the large size Everclear bottle (750 ml or 1 liter) is free of isopropyl or wood alcohol contaminants. Purchase at a liquor store. Next, find a suitable dispenser bottle. Mark it with a pen at about one tenth of the way up from the bottom. Pour 95% grain alcohol (190 proof) to this mark and add water to the top. If using 76% grain alcohol, mark your bottle one tenth of the way up but only add water to the ¾ full mark. Keep shut. You may add a chip of lemon peel for fragrance.

Use this for general sanitizing purposes: bathroom fixtures, knobs, handles, canes, walkers, and for personal cleanliness (but use chlorine bleach for the toilet

bowl once a week). Always clean up after a bowel movement with wet toilet paper. This is not clean enough, though. Follow with a stronger damp paper towel. This is still not clean enough; use a final damp paper towel with skin sanitizer added. After washing hands, sanitize them too, pouring a bit on one palm and put finger tips of the other hand in it, scratch to get under nails, repeat on other hand. Rinse with water. Remember to keep the toilet lid down, while flushing or a spray of *E. coli* will fill the bathroom air, settling on toothbrushes and in water glasses.

Wash your hands if you merely touch the toilet seat.

Do not use this recipe, nor keep any bottles of alcohol in the house of a recovering alcoholic.

Deodorant

Your sweat is odorless. It is the entrenched bacteria feeding on it that make smells. You can never completely rid yourself of these bacteria, although they may temporarily be gone after zapping. The strategy is to control their numbers. Here are several deodorants to try. Find one that works best for you:

Vitamin C water. Mix ¼ tsp. to a pint of water and dab it on.

Citric Acid water. Mix ¼ tsp. to a pint of water and dab it on.

Only a few drops of these acids under each armpit are necessary. If these acids burn the skin, dilute them more. Never apply anything to skin that has just been shaved!

Lemon juice. This acid is not as strong, use what you need.

Cornstarch. Many people need only this. Dab it on.

Use only unpolluted cornstarch (see *Sources*).

Baking soda has been deleted as a deodorant because benzene was found in many boxes (see *Sources* for safe varieties).

Pure alcohol (never rubbing alcohol). The only food grade alcohol is grain or cane (ethyl) alcohol. Dab a bit under each arm and/or on your shirt or blouse. If

the alcohol burns, dilute it with water. Be very careful not to leave the bottle where a child or alcoholic person could find it. Pour it into a different bottle!

Pure zinc oxide. You may ask your pharmacist to order this for you. She or he may wish to make it up for you too, but do not let them add anything else to it. It should be about 1 part zinc oxide powder to 3 parts water. It does not dissolve. Just shake it up to use it. After you get it home, you can add cornstarch to it to give it a creamy texture. Heat 3 tsp. cornstarch in 1 cup of water, to boiling, until dissolved and clear. Cool and add some to the zinc oxide mixture (about equal parts). Store unused starch mixture in the refrigerator. Only make up enough for a month. (Yes, this is the same zinc oxide that is used to make the dental cement, ZOE.)

Alcohol and zinc oxide. This is the most powerful deodorant. Apply alcohol first, then the zinc oxide.

Remember that you need to sweat! Sweating excretes toxic substances, especially from the upper body. Don't use deodorant on weekends. Go to the sink and wipe clean the armpits like our grandparents did. These homemade deodorants are not as powerful as the commercial varieties—this is to your advantage.

Brushing Teeth

Buy a new toothbrush. Your old one is soaked with toxins from your old toothpaste. Use food-grade hydrogen peroxide (see *Sources)* if you have only plastic fillings. Dilute it from 35% to 17½% by adding water (equal parts). Store hydrogen peroxide only in polyethylene or the original plastic bottle. Use 4 or 5 drops on your toothbrush. It should fizz nicely as oxygen is produced in your mouth. Your teeth will whiten noticeably in six months.

Before brushing teeth, floss with monofilament fish line (2 or 4 pound). Double it and twist for extra strength. Rinse before use. Or clean up the commercial varieties of floss by soaking in water for a half hour, then drying with a towel. Do not choose waxed or flavored varieties since benzene does not wash off.

Fig. 97 Fishing line is a substitute for dental floss

Floss and brush only once a day because even this small trauma invites bacteria and fungus into your blood. If this leaves you uncomfortable, you may use a water pick or simply rub your teeth by hand with a dry cloth towel (paper towels have mercury contamination). Make sure that nothing solid, like powder, is on your toothbrush; it will scour and scratch the enamel. Salt is corrosive—don't use it for brushing metal teeth. Plain water is just as good.

Baking soda is no longer recommended (unless ordered from *Sources*) because it was found to be polluted with benzene.

When battling tooth infection, alternate colloidal silver and white iodine solutions (five drops on brush), and brush twice a day.

For Dentures

Use salt water. It kills all germs and is inexpensive. Salt water plus grain alcohol or food-grade hydrogen peroxide makes a good denture-soak. Rinse well.

Mouthwash

A few drops of food grade hydrogen peroxide added to a little water in a glass should be enough to make your mouth foam and cleanse. Don't use hydrogen peroxide, though, if you have metal fillings, because they react. Don't use regular drug store variety hydrogen peroxide because it contains toxic additives. Health

food store varieties contain solvents from the bottling process. (See *Sources* for a good hydrogen peroxide*)*. Never purchase hydrogen peroxide in a bottle with a metal cap.

For persons with metal tooth fillings just use plain hot water. A healthy mouth has no odor! You shouldn't need a mouthwash! If you have breath odor, it is probably *Clostridium* growing in the crevice between a tooth filling and the tooth. At least, search for a hidden tooth infection by getting a panoramic x-ray and visiting your dentist.

Contact Lens Solution

A scant cup of cold tap water brought to a boil in glass saucepan. After adding ¼ tsp. pure salt and boiling again, pour into a sterile canning jar. Refrigerate. Freeze some of it.

Lip Soother

For dry, burning lips. Heat 1 level tsp. sodium alginate, plus 1-cup water until dissolved. After cooling, pour it into a small bottle to carry in your purse or pocket (refrigerate the remainder). Dab it on whenever needed. If the consistency isn't right for you, add water or boil it down further. You can make a better lip soother by adding some lysine from a crushed tablet, vitamin C powder, and a vitamin E capsule to the alginate mix. If you have a persistent problem with chapped lips, try going off citrus juice.

Foot Powder

Use a mixture of cornstarch and zinc oxide poured into a tall saltshaker with large holes in the lid. Add long rice grains to fight humidity. You may also try arrowroot or potato starch. If you don't have zinc oxide use plain cornstarch.

Skin Healer Moisturizer Lotion

1 tsp. sodium alginate
1 cup water

Make the base first by heating these together in a covered, non-metal pan until completely dissolved. Use low heat–it will take over an hour. Use a wooden spoon handle to stir. Set aside. Then make the following mixture:

¼ tsp. vitamin C (ascorbic acid)
¼ tsp. lysine
2 tbs. pure vegetable glycerin
2 vitamin E capsules (400 units or more, each)
1 tsp. olive oil
1 tbs. lemon juice from a lemon or ¼ tsp. citric acid (this is optional)
1 cup water

Heat the water to steaming in a non-metal pan. Add vitamin C and lysine first and then everything else. Pour into a pint jar and shake to mix. Then add the sodium alginate base to the desired thickness (about equal amounts) and shake. Pour some into a small bottle to use as lip soother. Pour some into a larger bottle to dispense on skin. Store remainder in refrigerator. (See *Sources* for sodium alginate and vegetable glycerin. Sodium alginate is also available in capsule form at some health food stores.)

Other Skin Healers

Vitamin C powder (ascorbic acid, not the same as citric acid). Put a large pinch into the palm of your hand. With your other hand pick up a few drops of water from the faucet. Rub hands together until all the powder is dissolved and dispensed. It may sting briefly. Do this at bedtime, especially for cracked, chapped hands. Include lips if they need it.

50% Glycerin. Dilute 100% vegetable glycerin with an equal amount of water. This is useful as an after shave lotion.

Vitamin C liquid. Mix ¼ tsp. vitamin C powder in one pint water (opened capsules will do). This is useful as an after-shave lotion and general skin treatment.

Cornstarch. (Unpolluted, see *Sources*.) Use on rashes, fungus, moist or irritated areas and to prevent chafe.

Combining several of these makes them more effective.

Dry skin has several causes: too much water contact, too much soap contact (switch to borax), low body temperature, not enough fat in the diet, or parasites.

Massage Oil

Instead of using ANY oil, which may be benzene polluted, make yourself a cornstarch solution:

4 tsp. cornstarch
1 cup water

Boil starch and water until clear, about one minute.

Sunscreen Lotion

Purchase PABA (see *Sources*) in 500 mg tablet form. Dissolve 1 tablet in grain alcohol. Grind the tablet first by putting it in a plastic bag and rolling over it with a glass jar. It will not completely dissolve even if you use a tablespoon of the alcohol. Pour the whole mixture into a 4-ounce bottle of homemade skin softener. Be careful not to get the lotion into your eyes when applying it. A better solution is to wear a hat or stay out of the sun.

Nose Salve

(When the inside of the nose is dry, cracked and bleeding.) Pour ½ tsp. pure vegetable glycerin into a bottle cap. Add ½ tsp. of water. To apply, use a plastic coffee stirrer or straw. Cut a slit in the end to catch some cotton wool salvaged from a vitamin bottle and twist (cotton swabs, cotton balls and wooden toothpicks are contaminated with mercury, which in turn is polluted with thallium). Dip it into the glycerin mixture and apply inside the nose with a rotating motion. Do each nostril with a new applicator.

Quick Cornstarch Skin Softener

4 tsp. cornstarch
1 cup water

Boil starch and water until clear, about one minute.

Use only <u>unpolluted</u> cornstarch (see *Sources*).

Cornstarch Skin Softener

3 tsp. pure cornstarch
1 cup water

1 tsp. Vitamin C powder (ascorbic acid); or 5 capsules, 1000 mg each

Boil starch and water until clear, about one minute. Add vitamin C and stir until dissolved. Cool. Pour into dispenser bottle. Keep refrigerated when not in use.

After Shaves

Vitamin C. ¼ tsp. vitamin C powder, dissolved in 1 pint water.

Vegetable glycerin. Equal parts glycerin and water or to suit yourself

Personal Lubricants

Heat these together: 1 level tsp. sodium alginate and 1 cup water in a covered non-metal pan until completely dissolved. Use very low heat and stir with a wooden spoon handle. It takes a fairly long time to get it perfectly smooth. After cooling, pour into a small dispenser bottle. Keep refrigerated.

Or, boil 4 tsp. cornstarch and 1 cup water until completely dissolved in a covered saucepan. Use non-metal dishes and a non-metal stirring spoon. Cool. Pour some into dispenser bottle. Keep refrigerated. This is many people's favorite recipe.

Baby Wipes

Cut paper towels in quarters and stack in a closeable plastic box. Run tap water over them; drain the excess. Add 1 tsp. grain alcohol and/or borax liquid on top. Close. Put a dab of the Quick Cornstarch Softener recipe on top of each wipe as you use it.

People Wipes

¼ tsp. powdered lysine
¼ tsp. vitamin C powder (you may open capsules)
¼ cup vegetable glycerin
1 cup water

Prepare wipes by cutting paper towels in quarters. Use white, unfragranced towels that are strong enough to hold up for this use. Fold each piece in quarters

again and stack in a plastic zippered baggy. Pour the fluid mixture over the stack and zip. Store a bag full in the freezer to take on car trips. If you want to keep them a month or more, add 1 tbs. grain alcohol to the recipe.

For bathroom use, dampen a roll of paper towels under the cold tap first. Then pour about ¼ cup of the mixture over the towel roll around the middle. Store in plastic shopping bag or stand in plastic wastebasket.

Recipes For Natural Cosmetics

Eyeliner and Eyebrow Pencil

Get a pure charcoal pencil (black only) at an art supply store. Try several on yourself (bring a small mirror) in the store to see what hardness suits you. You may need to wet it with water or a vitamin E perle first. Don't put any chemicals on your *eyelids*, since this penetrates into your eye. To check this out for yourself, close your eye tightly and then dab lemon juice on your eyelid. It will soon burn! Everything that is put on skin penetrates. Otherwise the nicotine patch and estrogen patch wouldn't work. Not even soap belongs on your eyelids! Charcoal pencils are cheap. Get yourself half a dozen different kinds so you can do different things.

You could also use a capsule of activated charcoal. Empty it into a saucer. Mix glycerin and water, half and half, and add it to the charcoal powder until you get the consistency you like. Use a brush for eyelashes; use a finger for eyebrows.

Lipstick

Beet root powder (see *Sources*)
100% vegetable glycerin

Combine 1 tsp. vegetable glycerin and 1 tsp. beet root powder in a saucer. Stir until perfectly smooth. Then add ½ tsp. of vitamin E oil. Snip open vitamin E capsules or buy vitamin E oil (see *Sources*). Very thick olive oil can be substituted. Apply liberally with your finger or a lipstick brush. Do not purse or rub your lips together after application. To make the lipstick stay on longer, apply 1 layer of lipstick, then dab some cornstarch over the lips, then apply another layer of lipstick. Store in a small glass or plastic container in the

refrigerator, tightly covered in a plastic bag.

Face Powder

Use cornstarch from the original box. You may also try arrowroot starch or potato starch. Use your fingers or a tissue to apply because applicators can carry bacteria.

Blush (face powder in a cake form)

Add 50% glycerin to cornstarch in a saucer to make a paste. Slowly add beet root powder to the desired color. To darken it try part of a charcoal capsule. A drop of food grade alcohol will also darken it. To make 50% glycerin, add equal parts of glycerin and water. Try to make the consistency the same as your brand name product, and you can even put it back in your brand name container.

Recipes For Household Products

Floor Cleaner

Use washing soda from the grocery store. You may add borax and boric acid (to deter insects except ants). Use white distilled vinegar in your rinse water for a natural shine and ant repellent. Do not add bleach to this. For the bathroom floor use plain bleach water—follow the label. Never use chlorine bleach if anybody in the home is ill or suffers from depression. Use grain alcohol (1 pint to 3 quarts water) for germ killing action instead of chlorine.

Furniture Duster and Window Cleaner

Mix equal parts white distilled vinegar and water. Put it in a spray bottle.

Furniture Polish

A few drops of olive oil on a dampened cloth. Use filtered water to dampen.

Insect Killer

Use boric acid powder (not borax). Throw liberal amounts behind stove,

refrigerator, under carpets and in carpets. Since boric acid is white, you must be careful not to mistake it for sugar accidentally. Keep it far away from food and out of children's reach. Buy it at a farm supply or garden store (or see *Sources*). It will not kill ants.

Ant Repellent

Spray 50% white distilled vinegar on counter tops, windowsills and shelves and wipe, leaving residue. Start early in spring before they arrive, because it takes a few weeks to rid yourself of them once they are established. If you want immediate action, get some lemons, cut the yellow outer peel off and cover with grain alcohol in a tightly closed jar. Let stand at least one hour. Use 1 part of this concentrate with 9 parts water in a spray bottle. Mix only as much as you will use because the diluted form loses potency. Spray walls, floors, carpets wherever you see them. The lemon solution even leaves a shine on your counters. Use both vinegar and lemon approaches to rid yourself of ants.

To treat the **whole house**, pour vinegar all around your foundation, close to the wall, using one gallon for every five feet. Expect to damage any foliage it touches. Reapply every six months.

Flower and Foliage Spray

Use food-grade hydrogen peroxide. See instructions on bottle.

Moth Balls

I found this recipe in an old recipe book. Mix the following and scatter in trunks and bags containing furs and woolens: ½ lb. each rosemary and mint, ¼ lb. each tansy and thyme, 2 tbs. powdered Cloves.

Carpet Cleaner

Whether you rent a machine or have a cleaning service, don't use the carpet shampoo they want to sell, even if they "guarantee" that it is all natural and safe. Instead add these to a bucket (about four gallons) of water and use it as the cleaning solution:

Rinse water

Wash water ¼ cup grain alcohol
1/3 cup borax 2 tsp. boric acid
¼ cup white distilled vinegar or
4 tsp. citric acid 1 bottle povidone iodine (optional)

Borax does the cleaning; alcohol disinfects, boric acid leaves a pesticide residue, and the vinegar or citric acid give luster. Povidone iodine kills parasite eggs. If you are just making one pass on your carpet, use the borax, alcohol, boric acid, and iodine. Remember to test everything you use on an unnoticed piece of carpet first.

Health Improvement Recipes

Black Walnut Hull Tincture

This new recipe is four times as strong as the previous one, so it is called **Black Walnut Hull Tincture <u>Extra Strength</u>**.

Your largest enamel or ceramic (not stainless steel, not aluminum) cooking pot, preferably at least 10 quarts
Black Walnuts, in the hull, each one still at least 50% green, enough to fill the pot to the top
Grain alcohol, about 50% strength, enough to cover the walnuts
Vitamin C powder, 1 tsp. plus 1 tsp. per quart of tincture
Plastic wrap or cellophane
Glass jars or bottles

The Black Walnut tree produces large green balls in fall. The walnut is inside, but we will use the whole ball, uncracked, since the active ingredient is in the green outer hull.

Rinse the walnuts carefully, put them in the pot, and cover with the alcohol. Sprinkle on 1 tsp. vitamin C. Seal with plastic wrap and cover tightly. Let sit for three days. Pour into glass jars or bottles, discarding walnuts, and add more vitamin C (1 tsp. per quart). This will keep the color green. If the glass jar has a metal lid, put plastic wrap over the top before screwing on the lid. Potency is strong for several years if unopened, <u>even if it darkens slightly</u>. Refrigerate after opening.

You have just made Extra Strength Black Walnut Hull Tincture. It is stronger than the concentrate made with just a few Black Walnuts in a quart jar (my earlier recipe), because there are more walnuts per unit liquid. In addition, you will not dilute it before use (although when you take it, it will usually be in water).

When preparing the walnuts, rinse only with cold tap water. You may need to use a brush on areas with dirt. If you are not going to use all of them in this batch, you may freeze them in a zippered plastic bag. Simply refrigerating them does not keep them from turning black and useless. The pot of soaking walnuts should not be refrigerated. Nor does the final tincture need refrigeration until after it is opened.

Exposure to air does cause the tincture to darken and lose potency. To reduce air exposure, fill the pot as much as possible, without touching the plastic wrap, while still keeping a snug fitting lid. Even more importantly, the glass jars or bottles you use to store your tincture should have as little air space as possible, without touching the plastic wrap on top. A large jar should be divided into smaller ones when you are ready to use it. The idea is not to have partial jars, with a lot of air space, sitting for longer than a month or so. To regain some green color, add several tsp. vitamin C, close jar tightly, and let stand 1 day.

There are several ways to make a 50% grain alcohol solution. Some states have Everclear™, 95% alcohol. Mix this half and half with water. Other states have Everclear™ that is 76.5% alcohol. Mix this two parts Everclear™, to one part water. Do not use vodka or the flask-size Everclear; it must be ¾ liter or 1 liter. Smaller bottles have wood alcohol or isopropyl alcohol pollution.

Remember, never use any kind of purchased water to make tincture or you will pollute it yourself.

Black Walnut Hull Tincture (Regular Strength)

This is the potency I used originally. It is included here in case you prefer it or wish to treat a pet. The Extra Strength recipe is four times as potent as the original recipe, so it must be diluted in quarters. (Similarly, if you have a lot of the Regular Strength left and want to use it in place of Extra Strength, simply take four times as much.)

Black Walnut Hull Tincture Extra Strength

Grain Alcohol, about 10%

Mix one part extra strength tincture with three parts of the 10% alcohol. Store in glass containers same as described above.

There are several ways to make a 10% grain alcohol solution. Some states have Everclear™, 95% alcohol. Mix this one part Everclear to nine parts water. Other states have Everclear that is 76.5% alcohol. Mix this one part Everclear to seven parts water.

Recipe for a small family:

Fill a quart jar with the green balls. Cover with 50% alcohol. Add 1 tsp. vitamin C. Use a plastic bag to cover jar before closing tightly with lid. Let stand on kitchen counter. After 3 days, pour liquid into small glass bottles. Add another ¼ tsp. vitamin C powder to the top of each before closing. The strength of this will be half of the concentrate. So you would need to double the amount taken in the recipe.

Black Walnut Hull Extract (Water Based)

This recipe is intended for alcoholic persons: cover the green balls in the 10-quart (non-metal) pot with cold tap water. Heat to boiling, covered. Turn off heat. When cool, add vitamin C, cover with plastic wrap, and the lid. Let stand for 1 day. It will be darker than the tincture. Do not dilute. Pour into freezable containers. Refrigerate what you will use in two days and freeze the rest. Add vitamin C after thawing or during refrigeration (1 tsp. per quart).

Important Note: do not use bottled or purchased water to make this tincture or you could pollute it with isopropyl alcohol!

For use: in programs calling for Extra Strength Black Walnut Hull Tincture use four times as much of this water based recipe (8 tsp. instead of 2 tsp. Extra Strength).

Quassia recipe

Add 1/8-cup quassia chips to 3 cups water. Simmer 20-30 minutes. Pour off 1/8-cup now and drink it fresh. Refrigerate remainder. Drink 1/8-cup, 4 times/day, until a total of ½-cup of chips is consumed. Flavor with spices.

Bowel Program

Bacteria are always at the root of bowel problems, such as pain, bloating and gassiness. They can not be killed by zapping, because the high frequency current does not penetrate the bowel contents.

Although most bowel bacteria are beneficial, the ones that are not, like *Salmonellas, Shigellas,* and *Clostridiums* are extremely detrimental because they have the ability to invade the rest of your body and colonize a trauma site or tumorous organ. These same bacteria colonize a cancer tumor and prevent shrinking after the malignancy is stopped.

One reason bowel bacteria are so hard to eradicate is that we are constantly reinfecting ourselves by keeping a reservoir on our hands and under our fingernails.

So the first thing to do is **improve sanitation**. Use 50% grain alcohol in a spray bottle at the bathroom sink. Sterilize your hands after bathroom use and before meals.

Second, use **betaine hydrochloride** to kill *Clostridium* (2 tablets 3 times a day).

Third, use **turmeric** (2 capsules 3 times a day, this is the common spice), which I find, helps against *Shigella*, as well as *E. coli*. Expect orange colored stool.

Fourth, use **fennel** (2 capsule 3 times a day).

Fifth, use **digestive enzyme tablets** with meals as directed on the bottle. (But only as long as necessary, because these frequently harbor molds.)

Sixth, use a single 2 tsp. dose of **Black Walnut Hull Tincture Extra Strength**. Add it to a ½ glass of water or fruit juice and sip over a fifteen-minute period. Stay seated until any side effect from the alcohol wears off.

Seventh, <u>if you are constipated</u>, take **Cascara Sagrada** (an herb, start with one capsule a day, use up to maximum on label), **extra magnesium** (300 mg magnesium oxide, 2 or 3 a day), and drink **a cup of hot water** upon rising in the morning. This will begin to regulate your elimination.

Eighth, take **Lugol's** solution, 6 drops in ½ cup water 4 times a day. This is

specifically for *Salmonella*.

It can take all eight to get rid of a bad bacteria problem in a week. Afterward, you must continue to eat only sterile dairy products. Note that the Kidney Cleanse is often effective with bowel problems. Try it also.

You will know you succeeded when your tummy is flat, there is not a single gurgle, and your mood improves!

Enemas

If you should fail to have a bowel movement in a single day it is a serious matter. An ill person cannot afford to fill up further with the ammonia, the toxic amines, and toxic gasses that bowel bacteria produce. Fortunately, enemas are very easy to do. Do an enema before going to bed.

There are several kinds of enema equipment available in pharmacies; most important is NEVER to use anyone else's equipment, no matter how "sterilized" it is guaranteed to be. Get your own. Do not use the equipment used by a professional bowel-cleanser. It is impossible to completely avoid cross-contamination. You must completely avoid it.

A Fleet™ bottle, obtained at your local pharmacy, will do for a starter (other equipment, like shown below, is available, see *Sources*). This is a squeeze bottle with a plastic applicator for insertion. Dump the contents since you are unable to test it for toxins. Refill with warm tap water.

The lubricant can be made in 5 minutes.

4 level tsp. cornstarch
1 cup water

Bring this to a boil and cook for about one minute. Set in the refrigerator to cool quickly. Pour a tsp. or more on top of a plastic bag for convenience in use. The only other lubricants are olive oil and castor oil.

For many of us, the rectum and sigmoid colon have ballooned out into a pocket due to past times of constipation. This is called a *diverticulum.* It is just a few inches from the anus so it is quite accessible by enema.

The diverticulum walls are quite weak due to constant overstretching. But in just a few weeks of daily cleansing, the pocket will shrink and may even

disappear.

Parasites and bad bacteria can escape being killed if they are in the diverticulum. Your entire bowel health can be turned around by killing the invaders of this diverticulum. Two ways of killing rectal parasites are with Lugol's or Black Walnut Tincture enemas.

Lugol's Enema

(Not for persons who are allergic to iodine.) Add 1 tsp. of Lugol's iodine to 1 quart of very warm water; pour into cup-size Fleet™ bottle (giving yourself 4 doses), or enema apparatus. Administer enema slowly and hold internally as long as possible.

Enzyme Enema

Mix a capsule of digestive enzymes with plain enema water. You may also crush a tablet.

Black Walnut Hull Extra Strength Enema

Add 1 to 4 tsp. of Black Walnut Hull Extra Strength to 1 quart of very warm water. Repeat as above.

Do an enema daily for one week to improve bowel function, alternating the above varieties. If you have none of these solutions available, use plain salt water, 1 tsp. per quart. In the absence of salt, use plain water. Remember, you must move your bowels or cleanse at least once a day.

Giving Yourself The Perfect Enema

Any drop you spill and everything you use to do the enema will somehow contaminate your bathroom. Yet you must leave it all perfectly sanitary for your own protection. So follow these instructions carefully.

Fig. 98 Enema container, tube, pinchcock

Spread out a large plastic trash bag on the bathroom floor. Place a plastic grocery bag beside it and a paper plate on it. Set a chair nearby, too. The trash bag is for you to lie on. Lie on your back if you have nobody to help you.

Instructions on commercially available enema bottles advise you to be on your knees. This may be workable for the small squeeze-bottle of ready-made solution you can purchase. It is quite impossible, though, if you are elderly, have painful knees or are simply ill and must try to take in a whole quart from a complex apparatus.

Test the apparatus first, in the bathroom sink to see how it works. Wipe away the grease that comes with it on the applicator; it is sure to be a petroleum product and be tainted with benzene.

Pour a tablespoon of olive oil into the paper plate for the lubricant.

After filling the container with the enema solution, run some through the tubing until the air is out of it and close the pinchcock. Place it on the grocery bag.

Insert the applicator tube as far as you comfortably can. Then lift the container with one hand while opening the valve with the other. The higher you lift it, the faster it runs. Take as much time as you need to run it in. You may wish to set the container on the chair. Very warm liquid is easier to hold. Don't force yourself to hold it all. At any time you may close the valve, withdraw the applicator, and place it on the grocery bag.

Cleaning up the apparatus, the bathroom, and yourself: This topic is seldom discussed, but very important. Notice that some bowel contents have entered the container by reflux action, which is unavoidable. Consider the whole apparatus contaminated. For this reason you must never, never use anybody else's

apparatus, no matter how clean it looks.

First, wipe the applicator tube. Then fill the container and run it through the hose into the toilet. Repeat until it appears clean; this is appearance only; you must now sterilize it. Fill it with water and add Lugol's iodine or povidone iodine until intensely red in color. Place the end of the tube in the container to soak. Empty and wipe the outside of the tube with paper. Do not dry the container. Store in a fresh plastic bag. Throw away the trash bag, grocery bag and paper plate. Clean the sink with chlorine bleach. Then wash your hands with skin sanitizer.

If all went well, you may risk taking the next enema on your bed. If not take a shower and stick to the floor location.

Kidney Cleanse

½ cup dried Hydrangea root
½ cup Gravel root
½ cup Marshmallow root
4 bunches of fresh parsley
Goldenrod tincture (leave this out of the recipe if you are allergic to it)
Ginger capsules
Uva Ursi capsules
Vegetable glycerin
Black Cherry Concentrate, 8 oz
Vitamin B_6, 250 mg
Magnesium oxide, 300 mg or ¼ cup Green Drink beverage

Measure ¼ cup of each root and set them to soak, together in 10 cups of cold tap water, using a non-metal container and a non-metal lid (a dinner plate will do). After four hours (or overnight) add 8 oz. black cherry concentrate, heat to boiling and simmer for 20 minutes. Drink ¼ cup as soon as it is cool enough. Pour the rest through a bamboo strainer into a sterile pint jar (glass) and several freezable containers. Refrigerate the glass jar.

Find fresh parsley at a grocery store that does not spray its produce (ask the owner). Boil the fresh parsley, after rinsing, in 1 quart of water for 3 minutes. Drink ¼ cup when cool enough. Refrigerate a pint and freeze 1 pint. Throw away the parsley.

Dose: each morning, pour together ¾ cup of the root mixture and ½ cup parsley water, filling a large mug. Add 20 drops of goldenrod tincture and 1 tbs. of glycerin. Drink this mixture in divided doses throughout the day. Keep cold. Do not drink it all at once or you will get a stomachache and feel pressure in your bladder. If your stomach is very sensitive, start on half this dose.

Save the roots after the first boiling, storing them in the freezer. After 13 days when your supply runs low, boil the same roots a second time, but add only 6 cups water and simmer only 10 minutes. This will last another 8 days, for a total of three weeks. You may cook the roots a third time if you wish, but the recipe gets less potent. If your problem is severe, only cook them twice.

After three weeks, repeat with fresh herbs. You need to do the Kidney Cleanse for six weeks to get good results, longer for severe problems.

Also take:

• Ginger capsules: one with each meal (3/day).

• Uva Ursi capsules: one with breakfast and two with supper.

• Vitamin B_6 (250 mg): one a day.

• Magnesium oxide (300 mg): one a day.

Take these supplements just before your meal to avoid burping.

Some notes on this recipe: this herbal tea, as well as the parsley, can easily spoil. Heat it to boiling every fourth day if it is being stored in the refrigerator; this resterilizes it. If you sterilize it in the morning you may take it to work without refrigerating it (use a glass container).

When you order your herbs, be careful! Herb companies are not the same! These roots should have a strong fragrance. If the ones you buy are barely fragrant, they have lost their active ingredients; switch to a different supplier. Fresh roots can be used. Do not use powder.

• Hydrangea *(Hydrangea arborescens)* is a common flowering bush.

• Gravel root *(Eupatorium purpureum)* is a wild flower.

• Marshmallow root *(Althea officinallis)* is mucilaginous and kills pain.

• Fresh parsley can be bought at a grocery store. Parsley flakes and dried parsley

herb do not work.

• Goldenrod herb works as well as the tincture but you may get an allergic reaction from smelling the herb. If you know you are allergic to this, leave this one out of your recipe.

• Ginger from the grocery store works fine; you may put it into capsules for yourself (size 0, 1 or 00).

There are probably dozens of herbs that can dissolve kidney crystals and stones. If you can only find several of those in the recipe, make the recipe anyway; it will just take longer to get results. Remember that vitamin B6 and magnesium, taken daily, can prevent oxalate stones from forming. But only if you stop drinking regular tea or cocoa. Tea has 15.6 mg oxalic acid per cup[68]. A tall glass of iced tea could give you over 20 mg oxalic acid. Switch to herb teas. Cocoa and chocolate, also, have too much oxalic acid to be used as beverages.

Remember, too, that phosphate crystals are made when you eat too much phosphate. Phosphate levels are high in meats, breads, cereals, pastas, and carbonated drinks. Eat less of these, and increase your milk (2%), fruits and vegetables. Drink at least 2 pints of water a day.

Cleanse your kidneys at least twice a year.

You can dissolve all your kidney stones in 3 weeks, but make new ones in 3 days if you are drinking tea and cocoa and phosphated beverages. None of the beverage recipes in this book are conducive to stone formation.

Liver Herbs

Don't confuse these liver herbs with the next recipe for the Liver Cleanse. This recipe contains herbs traditionally used to help the liver function, while the Liver Cleanse gets gallstones out.

6 parts comfrey root, *Symphytum officinale* (also called nipbone root)
6 parts tanner's oak bark, *Quercus alba* (white oak bark)
3 parts gravel root, *Eupatorium purpureum* (queen of the meadow)
3 parts Jacob's staff, *Verbascum thapsus* (mullein herb)
2 parts licorice root, *Glycyrrhiza glabra*
2 parts wild yam root, *Dioscorea villosa*

2 parts milk thistle herb, *Silybum marianum*
3 parts walnut bark, *Juglans nigra*, (Black Walnut bark)
3 parts marshmallow root, *Althea officinalis* (white mallow)
1 part lobelia plant, *Lobelia inflata* (bladder pod)
1 part skullcap, *Scutellaria lateriflora* (helmet flower)

Mix all the herbs. Add ½ cup of the mixture to 2 quarts of water. Bring to a boil. Put lid on. Let sit for six hours. Strain and add sweetening such as vegetable glycerin or honey. Drink two cups a day for six to eight weeks. Put the strained herbs in the freezer and use them one more time.

Liver Cleanse

Cleansing the liver of gallstones dramatically improves digestion, which is the basis of your whole health. You can expect your allergies to disappear, too, more with each cleanse you do! Incredibly, it also eliminates shoulder, upper arm, and upper back pain. You have more energy and increased sense of well-being.

Cleaning the liver bile ducts is the most powerful procedure that you can do to improve your body's health.

But it should not be done before the parasite program, and for best results should follow the kidney cleanse.

It is the job of the liver to make bile, 1 to 1½ quarts in a day! The liver is full of tubes (*biliary tubing*) that deliver the bile to one large tube (the *common bile duct*). The gallbladder is attached to the common bile duct and acts as a storage reservoir. Eating fat or protein triggers the gallbladder to squeeze itself empty after about twenty minutes, and the stored bile finishes its trip down the common bile duct to the intestine.

For many persons, including children, the biliary tubing is choked with gallstones. Some develop allergies or hives but some have no symptoms. When the gallbladder is scanned or x-rayed nothing is seen. Typically, they are not in the gallbladder. Not only that, most are too small and not calcified, a prerequisite for visibility on x-ray. There are over half a dozen varieties of gallstones, most of which have cholesterol crystals in them. They can be black, red, white, green or tan colored. The green ones get their color from being coated with bile. Notice in the picture how many have imbedded unidentified objects. Are they fluke

remains? Notice how many are shaped like corks with longitudinal grooves below the tops. We can visualize the blocked bile ducts from such shapes. Other stones are composites—made of many smaller ones—showing that they regrouped in the bile ducts some time after the last cleanse.

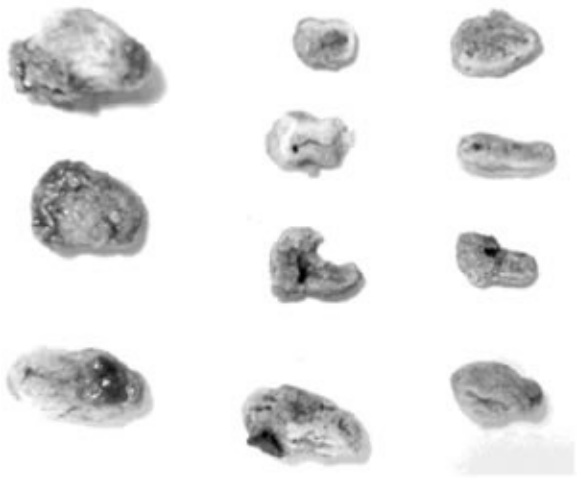

Fig. 99 These are gallstones.

At the very center of each stone is found a clump of bacteria, according to scientists, suggesting a dead bit of parasite might have started the stone forming.

As the stones grow and become more numerous the back pressure on the liver causes it to make less bile. It is also thought to slow the flow of lymphatic fluid. Imagine the situation if your garden hose had marbles in it. Much less water would flow, which in turn would decrease the ability of the hose to squirt out the marbles. With gallstones, much less cholesterol leaves the body, and cholesterol levels may rise.

Gallstones, being porous, can pick up all the bacteria, cysts, viruses and parasites that are passing through the liver. In this way "nests" of infection are formed, forever supplying the body with fresh bacteria and parasite stages. No stomach infection such as ulcers or intestinal bloating can be cured permanently without removing these gallstones from the liver.

For best results, ozonate the olive oil in this recipe to kill any parasite stages that may be released during the cleanse.

Cleanse your liver twice a year.

Preparation.

- You can't clean a liver with living parasites in it. You won't get many stones, and you will feel quite sick. Zap daily the week before, or get through the first three weeks of the *Parasite-Killing Program* before attempting a liver cleanse. If you are on the maintenance parasite program, you are always ready to do the cleanse.

- Completing the kidney cleanse before cleansing the liver is also highly recommended. You want your kidneys, bladder and urinary tract in top working condition so they can efficiently remove any undesirable substances incidentally absorbed from the intestine as the bile is being excreted.

Ingredients

Epsom salts	4 tablespoons
Olive oil	half cup (light olive oil is easier to get down), and for best results, ozonate it for 20 to 30 minutes, first
Fresh pink grapefruit	1 large or 2 small, enough to squeeze 2/3 to 3/4 cup juice
Ornithine	4 to 8, to be sure you can sleep. Don't skip this or you may have the worst night of your life!
Large plastic straw	To help drink potion.
Pint jar with lid	
Black Walnut Tincture, any strength.	10 to 20 drops, to kill parasites coming from the liver.

Choose a day like Saturday for the cleanse, since you will be able to rest the next day.

Take no medicines, vitamins or pills that you can do without; they could prevent success. Stop the parasite program and kidney herbs, too, the day before.

Eat a no-fat breakfast and lunch such as cooked cereal, fruit, fruit juice, bread and preserves or honey (no butter or milk). This allows the bile to build up and develop pressure in the liver. Higher pressure pushes out more stones.

2:00 PM. Do not eat or drink after 2 o'clock. If you break this rule you could feel quite ill later.

Get your Epsom salts ready. Mix 4 tbs. in 3 cups water and pour this into a jar. This makes four servings, ¾ cup each. Set the jar in the refrigerator to get ice

cold (this is for convenience and taste only).

6:00 PM. Drink one serving (¾ cup) of the ice cold Epsom salts. If you did not prepare this ahead of time, mix 1 tbs. in ¾ cup water now. You may add 1/8 tsp. vitamin C powder to improve the taste. You may also drink a few mouthfuls of water afterwards or rinse your mouth.

Get the olive oil (ozonated, if possible) and grapefruit out to warm up.

8:00 PM. Repeat by drinking another ¾ cup of Epsom salts.

You haven't eaten since two o'clock, but you won't feel hungry. Get your bedtime chores done. The timing is critical for success.

9:45 PM. Pour ½ cup (measured) olive oil into the pint jar. Squeeze the grapefruit by hand into the measuring cup. Remove pulp with fork. You should have at least ½ cup, more (up to ¾ cup) is best. You may top it up with lemonade. Add this to the olive oil. Also, add Black Walnut Tincture. Close the jar tightly with the lid and shake hard until watery (only fresh grapefruit juice does this).

Now visit the bathroom one or more times, even if it makes you late for your ten o'clock drink. Don't be more than 15 minutes late. You will get fewer stones.

10:00 PM. Drink the potion you have mixed. Take 4 ornithine capsules with the first sips to make sure you will sleep through the night. Take 8 if you already suffer from insomnia. Drinking through a large plastic straw helps it go down easier. You may use oil and vinegar salad dressing, cinnamon, or brown sugar to chase it down between sips. Take it to your bedside if you want, but drink it standing up. Get it down within 5 minutes (fifteen minutes for very elderly or weak persons).

Lie down immediately. You might fail to get stones out if you don't. The sooner you lie down the more stones you will get out. Be ready for bed ahead of time. Don't clean up the kitchen. As soon as the drink is down walk to your bed and lie down flat on your back with your head up high on the pillow. Try to think about what is happening in the liver. Try to keep perfectly still for at least 20 minutes. You may feel a train of stones traveling along the bile ducts like marbles. There is no pain because the bile duct valves are open (thank you Epsom salts!). **Go to sleep**, you may fail to get stones out if you don't.

Next morning. Upon awakening take your third dose of Epsom salts. If you

have indigestion or nausea wait until it is gone before drinking the Epsom salts. You may go back to bed. Don't take this potion before 6:00 am.

2 Hours Later. Take your fourth (the last) dose of Epsom salts. You may go back to bed again.

After 2 More Hours you may eat. Start with fruit juice. Half an hour later eat fruit. One hour later you may eat regular food but keep it light. By supper you should feel recovered.

How well did you do? Expect diarrhea in the morning. Use a flashlight to look for gallstones in the toilet with the bowel movement. Look for the green kind since this is proof that they are genuine gallstones, not food residue. Only bile from the liver is pea green. The bowel movement sinks but gallstones float because of the cholesterol inside. Count them all roughly, whether tan or green. You will need to total 2000 stones before the liver is clean enough to rid you of allergies or bursitis or upper back pains permanently. The first cleanse may rid you of them for a few days, but as the stones from the rear travel forward, they give you the same symptoms again. You may repeat cleanses at two-week intervals. Never cleanse when ill.

Sometimes the bile ducts are full of cholesterol crystals that did not form into round stones. They appear as "chaff" floating on top of the toilet bowl water. It may be tan colored, harboring millions of tiny white crystals. Cleansing this chaff is just as important as purging stones.

How safe is the liver cleanse? It is very safe. My opinion is based on over 500 cases, including many persons in their seventies and eighties. None went to the hospital; none even reported pain. However it can make you feel quite ill for one or two days afterwards, although in every one of these cases the maintenance parasite program had been neglected. This is why the instructions direct you to complete the parasite and kidney cleanse programs first.

CONGRATULATIONS

You have taken out your gallstones without surgery! I like to think I have perfected this recipe, but I certainly can not take credit for its origin. It was invented hundreds, if not thousands, of years ago, THANK YOU, HERBALISTS!

This procedure contradicts many modern medical viewpoints. Gallstones are

thought to be formed in the gallbladder, not the liver. They are thought to be few, not thousands. They are not linked to pains other than gallbladder attacks. It is easy to understand why this is thought: by the time you have acute pain attacks, some stones are in the gallbladder, are big enough and sufficiently calcified to see on x-ray, and have caused inflammation there. When the gallbladder is removed the acute attacks are gone, but the bursitis and other pains and digestive problems remain.

The truth is self-evident. People who have had their gallbladder surgically removed still get plenty of green, bile-coated stones, and anyone who cares to dissect their stones can see that the concentric circles and crystals of cholesterol match textbook pictures of "gallstones" exactly.

Lugol's Iodine Solution

It is too dangerous to buy a commercially prepared solution. It is certain to be polluted with isopropyl alcohol or wood alcohol. Make it yourself or ask your pharmacist to make (not order) it for you. The recipe to make 1 liter (quart) is:

44 gm (1½ ounces) iodine, granular
88 gm (3 ounces) potassium iodide, granular

Dissolve the potassium iodide in about a pint of the water. Then add the iodine crystals and wait till it is all dissolved. This could take a few hours with frequent shaking. Fill to the liter mark (quart) with water. Keep out of sight and reach of children. Do not use if allergic to iodine. Be careful to avoid bottled water for preparation.

White Iodine

88 gm potassium iodide, granular

Add potassium iodide to one quart or one liter cold tap water. Potassium iodide dissolves well in water and stays clear; for this reason it is called "white iodine." Label clearly and keep out of reach of children. Do not use if allergic to iodine.

Vitamin D Drops

1 gram cholecalciferol (see *Sources*)

10 cups olive oil

Mix in a non-metal container. It may take a day of standing to dissolve fully. Refrigerate. Ten drops contain 40,000 IU. Use within a year. This is enough for 250 people, each getting 10 cc. (2 tsp.). The dosage for adults during dental work or with bone disease is: one drop (no more, no less) daily, placed on tongue or on bread, for 3 weeks only. After 21 days use 2 drops a week only. You can get too much of this.

1. Shook, Dr. Edward E., *Advanced Treatise in Herbology*, Trinity Center Press, 1978, p. 172.

2. Cancerous cells are thought to have a special property called *malignancy*. This belief is based on scientific experiments, which show that when cells are cultured in the laboratory, they become malignant in an orderly progression from initiation, through promotion, finally transformation. Transformation is irreversible. The tissue is now "malignant" and cannot be changed back. But is this really what happens in the human body?

3. C. H. Barlow, *The Life Cycle of the Human Intestinal Fluke, Fasciolopsis buski* (Lancaster) Am. J. Hyg. Monog. No. 4, 1925.

4. The Latin names are *rediae* (plural) and *redia* (singular). I have used simplified spelling, "redia", for both the singular and the plural, more like English usage.

5. Perhaps it is the changed electrical charge or magnetic force of these damaged organs that permits further development of the fluke stages. Perhaps it is merely low immune surveillance. Perhaps the dying cells of a damaged organ provide food for the baby stages. Only further scientific study will reveal the truth.

6. Again, I am simplifying the Latin *cercaria* (singular) and *cercariae* (plural) to one case.

60. This is a cancer marker for ovarian cancer.

61. The Merck Index (10th Ed.) states the solubility of stannous fluoride is about 30%. Thus there is a high probability of forming sodium fluoride, the metabolic poison.

62 Testing in the white blood cells is the best way I have found to both diagnose and predict illness. You will also be taught how to test any other part of the body.

63 Urine that has cooled even slightly below body temperature does not show miracidia and redia in their original shapes.

64 Stewart Sell, MD, Diagnostic Uses of Cancer Markers, The Female Patient, Vol. 9, August 1984.

65 Link between EBV, Strep G and Eurytrema made by Paul Grose, 1995.

66 I have not detected the copper in the handholds penetrating the skin. Perhaps this is due to the high frequency circuit used. Non-copper handholds are now available from commercial providers.

67 Earlier I state it is best to be a seafood vegetarian. This is still true. But fat that has been rendered is quite safe.

68 Taken from Food Values 14ed by Pennington and Church 1985.

*1 Answer: all of them.

What is a Cure?

The word "cure" in the title was chosen, rather than "treatment," because it is scientifically accurate.

When the true cause of an illness has been found and, by removing it, the illness can be stopped or prevented, a true cure has also been found. When the cause is not found but the symptoms can be removed, helpful as this is, you have only found a treatment.

New and more effective ways to kill the HIV virus, however important, are merely treatments. I confronted the inconsistencies within the "facts" as they are presented by regular clinical researchers. The inconsistencies are huge and glaring. They led to the paths of inquiry taken in this book. My research was a search for the causes of HIV and AIDS diseases. I searched for ways to remove their causes. Then I observed whether this would actually lead to relief from these diseases. I did not search merely for relief from the diseases as regular clinical research does.

Syncrometer® technology, described in the *Syncrometer® Science Laboratory Manual,* available from the same publisher, makes such searches for causes and cures possible. Hopefully, others will repeat my investigations and extend my findings.

You Can Be HIV-Negative

In 6 Weeks... just like these people.

Electricity can now be used

to kill bacteria, viruses and parasites in minutes, not days or weeks as antibiotics and antivirals require. The device is called a zapper.

If you have been suffering from HIV infection or AIDS related illness, learn to build the zapper and also the new plate-zapper to stop it immediately. They supply immune power in a safe and inexpensive way without interfering with any treatment you are now on.

Body Electricity

is another newly discovered force that can be harnessed to search out and destroy specific bacteria and viruses, at any location. I call it *homeography*. With this natural method you can help yourself or your friends recover without overstepping the boundaries of medicine or any other profession.

53 CURED Cases The First Year

Cure, not treatment, is the subject of this book. In 1991 I discovered the source of HIV. Once the source became clear the cure became obvious. But would it work? After curing 53 cases in a row, all who used this method, I could wait no longer to present these findings. Since that time

many more have been cured, too many to be added to this book. Most important is adding yourself to that list! This book will tell you how.

Remaining Causes of AIDS

In the past five years I discovered the remaining causes of AIDS. They are not infinite or unmanageable. There are only five altogether. With these removed you will get well even before the viral load plummets.

You May Not Have Time

to read this entire book first if you are sick with AIDS. You may wish to skip the part about how HIV infection is caused and go directly to the *HIV Curing Recipe*. If your situation is much more advanced, go to the *2-Week Program* for advanced AIDS. Order your supplies (see *Sources*). Follow the recipes exactly; they were carefully worked out for you. After you have eliminated the virus, you can turn your attention to getting well from AIDS. Read the case histories to see how easy it is to stop even terminal AIDS. Learn from them to avoid mistakes.

In addition you may zap the virus with electricity and eliminate it that way. Build or purchase a zapper immediately. Add the new plate-box attachment for directed zapping, called *plate-zapping*.

You may also turn on your own body's electricity to remove both the virus and the causes of AIDS. It is the new science of homeography.

For the most rapid progress do all three at the same time.

Does this mean you can cancel your appointment with your clinical doctor? No, it does not. Although you will not need antiviral drugs after you test **Negative** and stay **Negative** with this "natural" program, you may still need antibiotics and clinical support for your AIDS. AIDS is a different disorder. Keep clinical help by your side until you no longer need it.

In this book you will learn to cure both HIV and AIDS.

Remember that doctors are kind, sensitive, compassionate people. They want the best for you. They have no way of knowing about the true cause and cure of HIV or AIDS since it has not been published in their journals. I chose to publish it for you so that it would come to your attention the fastest and also because there is no place in the scientific literature where a truly novel discovery can be published even if it is based on repeatable scientific observations.

Notice to the Reader

The opinions and conclusions expressed in this book are mine, and unless indicated otherwise, mine alone. They are based on my scientific research and on specific case studies involving my patients. Be advised that every person is unique and may respond differently to the treatments described in this book. On occasion I have provided dosage recommendations. Again, remember that we are all different and any new treatment should be applied in a cautious, common sense way.

The treatments outlined herein are not intended to be a substitute for other forms of conventional medical treatment. In fact, they are completely compatible. Please feel free to consult with your physician or other health care provider.

I have indicated throughout this book the existence of pollutants in food and other products. These pollutants were identified using a testing device of my invention known as the Syncrometer®. Complete instructions for building and using this device are contained in the *Syncrometer® Science Laboratory Manual*. Therefore anyone can repeat the tests described and verify the data.

The Syncrometer® is more accurate and versatile than the best existing testing methods. A method for determining the degree of precision is also presented (in the *Manual*). However at this point it only yields **Positive** or **Negative** results, it does not quantify. The chance of a false **Positive** or a false **Negative** is about 5%, which can be lessened by test repetition.

It is in the public interest to know when a single bottle of a product tests **Positive** to a serious pollutant. If one does, the safest course is to avoid all bottles of that product entirely, which is what I repeatedly advise. These recommendations should be interpreted as intent to warn and protect the public, not to provide a statistically significant analysis. It is my fervent hope that manufacturers use the new electronic techniques in this book to make purer products than they ever have before.

Acknowledgments

I would like to express my sincere gratitude to **Frank Jerome, DDS**. for the loan of his parasite slide collection. If he had not made a slide of *Fasciolopsis buski* in his student years and if he had not stored his slides carefully for three decades, finally to loan them to me in a generous offer, none of these discoveries would have been made. Furthermore, most of these HIV/AIDS patients could not have regained their health without his development of a new metal-free dentistry.

A very special thank you is due **Mary L. Austin, Ph.D.** now deceased, for her daily support and who, up to the age of 97, had an amazing open-mindedness. Another special thank you goes to my son, **Geoffrey**, whose suggestions, computer expertise, help with instrumentation, and editing was indispensable.

In 1996, the collaboration with **Patricia Gorzen** made possible our discovery of dental toxins seeping from plastic restorations. Switching to tooth extraction led to improved survival for many terminally ill patients. Since 1999, the assistance of **Dr. Erika Hüther**, visiting from Germany, led to our discovery of azo dyes as the cause of CD4 to CD8 ratio dysregulation. She also assisted in finding the co-parasite, *Paragonimus*, that links HIV disease to AIDS. Her contribution is greatly appreciated.

The oral surgeon, **C.D. Benjamin Arechiga, C.M.F.**, of Mexico, developed a new more meticulous amalgam cleanup and our good success rates are partly due to this innovation. I appreciate his contribution to this method.

Finally, Mexico itself is to be commended for its forward-looking policy. It may yet be a savior to its industrialized neighbors by providing a permissive environment for creative and dedicated therapists who fill the gap between new research discoveries and older entrenched means of treating disease. I am grateful to Mexico.

A New Challenge

From Time Immemorial Healthy People Have Held Sick People Hostage.

The Witch Doctor, Medicine Man and Woman, Herbalist and modern Clinician are all alike in this respect. They wish to keep information surrounding illness and wellness to themselves and away from the layperson so that a profession of medicine can grow and become lucrative. The Herbalist did not tell which herbs could relieve colds or bring on a woman's menstrual period (birth control) for fear that the people in need would get them for themselves and not need (nor pay) the Herbalist. The modern medical profession overlooks information on prevention; it tries to make self-help and simple treatments illegal. All for the same purpose: to build and aggrandize their profession. This seems inappropriate, especially where communicable or widespread illness is involved. This example is taken from a text on herbology:

> This [bath] is a safe and sane procedure and will prove most beneficial to those who are obese and desire to reduce safely. In combination with the internal treatment with decoction of *Fucus*, this course is worth considerable to very stout people, and should not be sold too cheaply. It is a grave mistake to put this scientific treatment in the same class as the many advertised nostrums on the market. It is also a mistake to let your patient know what you are using. If any do make this mistake, he will lose his client who will straight away go to a drugstore for supplies.[1]

I believe hostage holding of the sick is immoral, fundamentally unethical, and needs to be stopped.

Besides the moral issue, there is a practical issue. It would benefit society much more if the sick person were quickly rescued and helped back to productivity. A healthy society benefits each of us immensely. Likewise, an ill society injures us immensely, even when it is half a planet away. With this book, I hope to give away as many secrets as I can about the cause and the cure of low

immunity, AIDS and the HIV virus, letting the truth come first and "professional concerns" come last.

The human species can no longer afford to make a business out of illness. Global travel reduces our planet to the size of our backyards. In order to keep our own backyards clean, the neighbors must keep theirs clean. So it is with keeping our bodies free of viruses and bacteria. We *all* must be free of them. The concept of health as a narrow professional concern is obsolete.

This book is intended as a gift to humanity. I make a plea to the public and private sector of the medical community not to suppress this information but to disperse it regardless of liability or embarrassment from the simplicity and newness of the cure, provided only that it meets your standard of truth. As skeptical as you may be, if you cannot review the data presented here with the care and understanding it deserves, you should abstain from criticism until you have studied it.

Awareness Is Not What We Need

Which of us has not crashed into a closed glass door at some time? We believed it was open. The doorknob, the doorframe was visible, but our belief was stronger. We laughed in surprise at our mistake. It was not too costly. The AIDS mistake is very, very costly.

I recently tested eight young Africans for the HIV virus. Six were well, pursuing their studies or business. Two had illness, yet I found all eight had HIV/AIDS disease. All had benzene accumulation. All were parasitized by the larval stages of *Fasciolopsis buski*. And all had accumulated a large quantity of heavy metals and azo dyes in their bodies. This had already destroyed a significant fraction of their immune power, although they could not feel it.

To date I have tested many more samples of African drinking water than I had five years ago, both by Syncrometer® and by analytical laboratories. They were **Positive** for benzene as before. What does this mean for us?

If scientists, doctors, governors continue to believe this is irrelevant, that traces of benzene in our food and beverages could not matter, nor traces of heavy metals and azo dyes, then we will continue to crash through the door of disaster.

Following these authoritative professionals come the activists and lay people who believe in them. It is a cascade of disasters with great social implications.

In the United States, traces of benzene pollute bottled water, bottled beverages, water that is chlorinated with liquid bleach that is intended for laundry use, our produce (via pesticide), our breads via baking grease (actually petroleum grease), and in general via solvent extracted flavors and colors. Traces of heavy metals and dyes pollute all sprayed produce and water that has laundry bleach added to it. Our path runs parallel to the African path.

Will the United States follow the African lead to annihilation? The trend will eventually become irreversible. It is unthinkable. Yet, six out of the eight Africans I tested, believe they are being spared. Most Americans believe they are being spared.

"Positively Aware"[2] is a journal for HIV Positive persons. I recommend it for anyone who feels safe from this disease. Some recent topics were Lost Youth, One in 62 Young Injectors, The Joys of Safer Sex, and HIV Drug Companies Sue South African Government. The journal is full of drug ads. These drugs kill the HIV viruses coursing in the blood. They do not kill the source of the viruses, a common human parasite that has taken on a new life cycle. The Syncrometer® easily spots the parasites in the genital organs, in the thymus and bone marrow. Eventually even the space under the skin becomes packed with larval stages. The Syncrometer® "sees" them as easily as an infrared camera picks up a warm body. Superior technology can make it easy, but very difficult if belief interferes with rational thinking and declines its use.

I could cry on every page when I read "Positively Aware". It is appropriate to sympathize and to cry. The tragedy is not just in the loss of human beings; it is in the journal itself, the very title. Nobody who writes it or reads it has an iota of real awareness, despite its assertive title. Even the editors of the magazine die of AIDS!

Their subscribers, and all affected people, need true awareness. That starts with a willingness to study new data, such as presented here, and which can lead to an understanding of the causes of HIV and AIDS diseases.

The Beginning: A New Concept

It is popularly believed that the HIV virus causes AIDS. But that is not true. My electronic studies prove otherwise. An unusual kind of parasitism brings the virus: a parasitism that is conditioned by the same environmental pollutants that cause AIDS. If ordinary biologists, like myself and hundreds of others, were allowed—in fact encouraged—to do the research in this disease they would have

had its mysteries solved in just a few years. That would have brought its victims a true cure. It would also be shedding light on what is happening to the biosphere, which brings us new diseases such as this.

By allowing only high-tech "medical" research to be done, and excluding the rich diversity of biological research, the educational advantage of our nation's biologists goes unused.

In this way, a similar path has been chosen for AIDS as for cancer research. It does not hold promise. The science of biology holds much more promise. Shouldn't we sit up and pay attention to who is choosing the research path? The members of the AIDS community are exceptionally well informed. They are capable of understanding the research choices we could make, if only they were allowed.

HIV is a *virus*.
AIDS is a *condition*.

Sometimes they occur together.
Sometimes they occur separately.

HIV stands for Human Immunodeficiency Virus.
AIDS stands for Acquired Immune Deficiency Syndrome.

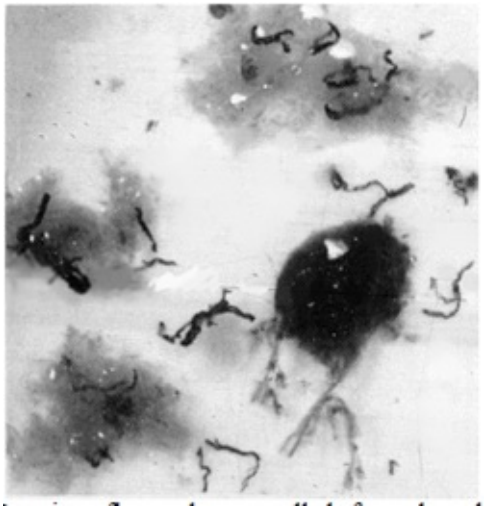
The HIV Virus

This is the source of the HIV virus

Fig. 1 Human intestinal fluke (Fasciolopsis buski)

This parasite typically lives in the intestine where it might do little harm, causing only colitis, Crohn's disease, irritable bowel syndrome, or perhaps nothing at all. But if it invades a different organ, like the liver, uterus, kidneys, or thymus, it does a great deal of harm. If it establishes itself in the thymus, it causes HIV/AIDS! It only establishes itself in the thymus in some people. These people have *benzene* in their bodies. All HIV patients (100%) have both benzene and a larval stage of the intestinal fluke in their thymuses. The solvent benzene is responsible for letting the fluke establish itself in the thymus. In order to get HIV, you must have both the parasite and benzene in your body.

Fig. 3 Human intes-tinal fluke, typical size



Parasites float when expelled from bowel. "Black hairy legs" are strings of eggs.

Fig. 2 Five flukes in various stages of decay

The HIV virus belongs to this fluke.

Many of us have this fluke parasite in our intestines. Humans are the natural host for this parasite. But they are seldom preserved well enough for you to identify in the toilet bowl. Later, when you have learned how to kill them in the intestinal tract in a way that keeps them better preserved, you will have a chance to see and recognize them.

When this fluke is killed, together with its eggs and larval stages, the HIV virus disappears from the human body in 24 hours. Surprisingly, even latent viruses that are stuck in our (human) chromosomes, right beside our genes disappear. From this it can be concluded that the virus belongs to the parasite. The virus must be replenished by the fluke to persist.

IT IS NOT DIFFICULT to kill this parasite and all its stages.

In fact, the intestinal fluke and all its eggs and stages can be killed with an

herbal recipe in six days, or less when electricity and homeography are used, too. These are explained further in the chapter *Killing Parasites*. The time, of course, depends on how many flukes and fluke stages you have. Read the early case histories, where only herbs were used, to follow the fate of the HIV virus. Compare them to the later case histories when electricity and homeography were added.

AIDS IS A CONDITION

AIDS reflects the condition of your white blood cells. We write them as WBCs. They are your immune system. There are a variety of them. The *phagocytes* are expected to eat bacteria, dead refuse and toxins. There are two kinds of phagocytes, the **neutrophils** and the **macrophages**. Other white blood cells are expected to destroy viruses. They are your *lymphocytes*, particularly **CD4** and **CD8** cells. Your WBCs are expected to make some powerful big-parasite killers: benzoquinone ("BQ"), rhodizonic acid ("RZ"), glyoxal, glyoxylic acid, and hydroxybutyric acid as well as others not yet discovered. We will discuss these later. But none of this is happening. There is very serious damage to all these immune functions.

Why?

If you have AIDS, your phagocytes have stopped eating anything, no bacteria, no refuse, no toxins. And the lymphocytes are filled to capacity with HIV viruses but are not able to kill them. In fact, they are full of flu viruses, SV 40 viruses and fungus too, but cannot kill anything. SV 40 stands for *Simian Virus Forty*. The chief fungus is *Potato Ring Rot*. And these problems are only the tip of the iceberg.

All this damage does not come from a single virus or toxin. The damage is vast and complex. But a new technology I call Syncrometer® science has made it possible to analyze the different parts of these two diseases, HIV and AIDS, and find their true causes.

The phagocytes have stopped eating anything because of four toxins—but only four.

The lymphocytes cannot kill viruses (any viruses) because they are full of mercury and thallium, not other metals.

The CD4 lymphocytes themselves get killed by a dye—a single one. The CD8 lymphocytes get multiplied as if they had cancer—again by a single dye. It is the same dye seen in cancer.

At first this immune damage happens at only a few organs but more and more follow this fate until every organ I study, dozens, show the same terrible acquired immune deficiency. When these deficiencies reach the thymus, the whole process is accelerated. It is like when a fire reaches and overcomes the water sprinkler system, a key location for protection.

These five immunity destroyers can be removed. It is not an insurmountable task. In fact, it can be done at the same time as killing your intestinal flukes so no time is wasted. In six weeks you can be a whole new person. In fact, you can see a turnabout in your health in two weeks.

The Thymus Gland And AIDS

The "T" in T-cells comes from the word *thymus.*

The thymus is located under the top of your breastbone. It is just below the thyroid gland.

To find these glands:

- Look in the mirror and turn your head from side to side.
- Notice a V-shape is formed at the front of your neck as you do this. Put your finger in the hollow at the bottom of this V. Your thyroid gland is on both sides of this V.
- Move downward from this hollow about 1½ inches to a raised flat area shaped like a baseball plate. This is the top of your breastbone (sternum). Your thymus is under this, stretching down and up, depending on its size.

The thymus is the home for your T-cells. They were "taught" there what to attack, whom to help and which cells to kill. But something goes wrong here. The T-cells that are sent out "into the world", namely your body, to protect you have garbled instructions and many defects.

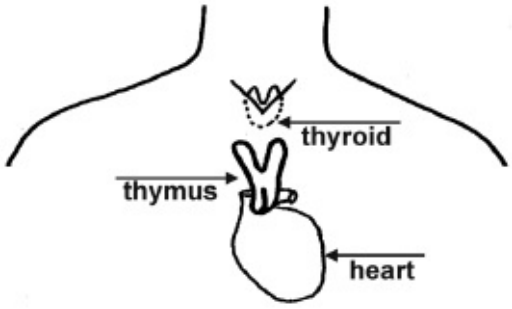


Fig. 4 Drawing of thymus gland

An HIV victim also has fewer white blood cells, about 3500 instead of 5000. This develops gradually. Maybe not enough are being made in the bone marrow. Maybe something is killing them. Maybe both. The true cause of this is not yet known to clinical science. But the Syncrometer® finds the same common toxin to be at fault, **benzene**.

The lymphocyte percentage for an AIDS sufferer is a little higher than normal; about 30% instead of 20%. A higher percentage of lymphocytes is the hallmark of any viral disease.

> We normally have at least 5000 white blood cells in a cubic mm. (a very small dot) of blood. They are all made in the bone marrow. About 70% turn into neutrophils, which can phagocytize (eat). Another 10% turn into macrophages, huge cells that eat anything and shy away from nothing. They are the piranhas of our defensive WBC fleet. The remaining 20%, about 1000, grow up to be lymphocytes, our virus eaters. Nearly all of these, about 900, are sent to be "trained" for this in the thymus, and are called T-cells. The others are trained "at home" in the bone marrow, and are called B cells. Of the 900 T-cells, there should be about twice as many T-helpers (T4's) as T-suppressors (T8's), about 600 T4's to 300 T8's. They are also called CD4s and CD8s. Three names for each!

But now there are about equal numbers of helpers and suppressors, about 500 of each. Fewer and fewer helpers and more and more suppressors is a flag signaling HIV/AIDS disease. What could be happening to the thymus and the bone marrow to give such a picture?

Two things are happening. Not enough white blood cells are being made. And

something is causing the T-helpers in the thymus to die an early death. Why? The bone marrow has a killer chemical on the loose, just where white blood cells are being born. **And the thymus is being invaded by the intestinal fluke.** The thymus is a small gland and the intestinal fluke is a large parasite! The thymus has a lot of work to do (like a taxi-dispatching station for white blood cells) and the flukes are eating its food and leaving their wastes in it. It is like having a bus full of people inside the tiny waiting room of the taxi station.

The same thing will soon happen to the bone marrow; a special class of dyes, called azo dyes, will flood it and the intestinal fluke stages will invade here, too.

The fluke will bring its own "personal" bacteria, *Bacillus cereus*, to the thymus. These bacteria make a special toxin called *tyramine*. Tyramine will make the thymus allergic! Allergic to a common food substance that arrives every day. Allergies consume **immune power** of the special kind called *complement* C_3. Now the thymus, already burdened by benzene and the intestinal fluke, must share its immune power with yet another consumer. The more that is eaten of this food the slimmer the immune power becomes. Soon other parasites cannot be excluded. Paragonimus arrives. Eurytrema arrives bringing the SV 40 virus. All these events started with the Fasciolopsis fluke. And as you read the case histories a fascinating story is revealed.

Again, in each case, the real culprit is **benzene**.

Benzene

Benzene is a *solvent*. It is an extremely toxic solvent. We would not expect to find benzene anywhere in our environment. It is even monitored in gasoline. It is prohibited in dry cleaning fluids and rubber cement. How could it be present in your body?

Benzene is the main cause of AIDS

What is a solvent? A solvent is a substance that can dissolve grease. There are many solvents used in industries but none dissolves grease as fast as benzene.

The living body is made of greases! Fats and oils make up the brain and spinal cord, all our nerves and the protective covering of every living cell. Benzene can dissolve them!

Different toxins accumulate in different organs. This is called *organotropism*. As an example, if you drink a beverage polluted with wood alcohol, which is another solvent, it goes to your pancreas first. This organ makes your insulin and regulates your blood sugar. People with "low blood sugar" or chronic fatigue actually do have wood alcohol in their pancreas. Did they really drink polluted beverages? I find wood alcohol is a pollutant in carbonated beverages, artificial sweetener and many other foods. At first your body can detoxify it; this is when your body is young and strong like a child's. But as you keep drinking the wood alcohol, the pancreas wears out, the wood alcohol begins to pile up there and do a lot of harm. It weakens the pancreas so much that any parasite can live there. The immunity of the pancreas is being lowered. Bacteria, viruses, fungi, metal dissolved from tooth fillings, chemicals from the air you breathe and food you eat can now find a home in your pancreas. Is it any wonder that this leads to diabetes? Wood alcohol also accumulates in the eyes. Sometimes they burn and itch. Now the eyes let parasites in to multiply, like *Toxoplasma* from cats. The eyes also let in toxins from food or your environment and we call it **allergies**. The real culprit in this case is wood alcohol! It accumulates in the pancreas and eyes.

Benzene accumulates in the thymus!

If you eat the tiniest bit of benzene accidentally, like eating a cracker while you are pumping gasoline into your car, it goes directly to your thymus (the cracker can absorb benzene-containing gasoline fumes). If you rub the tiniest bit of benzene into your skin in the form of skin lotion containing petroleum products, it is found in the thymus a half-minute later! You can easily see this with a Syncrometer®. And in another half-minute it is in the bone marrow. Of course, the white blood cell phagocytes that are in your thymus immediately begin to eat it up and get it out of the thymus. But something strange happens to phagocytes that have eaten benzene. They stop. They can eat no more—a rather sensible result! Nor can they eat anything else that they would normally devour and kill.

Just as wood alcohol accumulates in the pancreas and eyes, benzene accumulates in the thymus and bone marrow.

Without being able to phagocytize in the thymus and bone marrow everything

else is soon allowed to land there. The mercury from metal tooth fillings, the copper from your copper water pipes, the silicone from your toothpaste, the dyes from your candy and jello can all be found in your thymus after benzene damage has been done. It is as if the front and backdoors to your house have been opened, letting in all comers.

Squatters Arrive

Soon the thymus is full of bits of your toothpaste, your hand lotion, your hair spray, your processed food, and your drinking water. Each of these has traces of azo dyes, heavy metals and myriads of other chemicals in them. Before the benzene damage, these loitering chemicals would have been phagocytized (eaten up) and escorted to the liver, to the kidney, and out of your body with the urine. Now they are left behind in the thymus and bone marrow and remain there, accumulating to higher and higher levels. Benzene keeps coming. The total WBC count (which includes your T-cells) falls lower and lower. Three special "squatters" arrive, also to be trapped in the helpless thymus: asbestos, metals and PCBs. I will discuss these soon. The thymus can't keep them out. It is helpless because benzene has knocked out its phagocytizing capability. This means that the white blood cells belonging to the thymus cannot eat its enemies. From metals to E. coli germs, they would normally all have been eaten. Then they could not harm you. They would be taken away and dumped into your bladder. Here is a drawing, copied from an electron microscope picture of a macrophage (one kind of phagocyte) reaching out for E. coli bacteria. Long thin pseudopods (arms) would go out hunting for your body's enemies—its breakfast. Now it must stop.

When you watch one of these phagocytes in action (this is called Live Blood Analysis) you can see that there is no action; they can barely move.

Benzene is not the only toxin that destroys phagocytizing ability. There are three more—but only three! This seems fortunate in view of the hundreds of thousands of toxic things in our environment. They are asbestos, magnetic metals called **lanthanides** and PCBs.

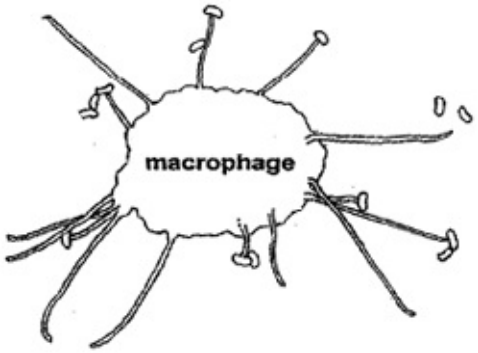

Fig. 5 Phagocytosis brings in E. coli for breakfast

Slowly, these three toxins accumulate along with benzene, each adding its own specific damage to phagocytosis.

Benzene is most important, though, because it harms the bone marrow, too, where baby white blood cells are being born. There will now be fewer phagocytes and less T-cells created. Their numbers go down at the same time as the remainder loses their phagocytizing ability.

Pathogens Attack

Meanwhile, the bacteria and viruses, which are hidden in our bodies, have been quietly waiting. Waiting for their chance to come out of hiding. Waiting for their chance to grow and multiply, as all living things must do to survive. When the phagocytes are muzzled and the WBC level falls low enough, they seize their opportunity. Look at the long list of **pathogens** (bacteria and viruses), which have come out of hiding in many of the case histories. Your body is a huge warehouse of pathogens and parasites. You have accumulated them in a lifetime. Chicken pox, mumps, measles, strep, flu, colds! Even TB, EBV, CMV, Treponema (syphilis), Mycoplasma, Toxoplasma, and the fungus Pneumocystis. Even Herpes, Candida, and Baker's yeast. Even cMyc, RAS and SV 40 implicating oncoviruses.

Oncoviruses are tumor-causing viruses that have joined your chromosome DNA as if they belonged there. This lets them be multiplied by you. But only if a trigger is present. cMyc (avian myelocytomatosis virus) actually comes from the common blood fluke, *Schistosoma,* but it spreads to us, the host. RAS (murine sarcoma virus) comes from plain bread yeast that we eat in live form if bread is under baked. And SV 40 (simian virus) comes from Eurytrema, the pancreatic fluke.

Each one of these pathogens once entered and is still in your body somewhere! Nothing ever disappears completely. It just hides and waits. It is carefully bottled up. Some pathogens are hiding inside specially made capsules. They won't come out of their capsules until they know they will be safe from your phagocytes and T-cells. Some are in a latent form or dormant state in which they patiently wait for your T-cell count to go down and phagocytes to be muzzled. Then they emerge. Some come from hiding in tooth crevices, like clostridiumbacteria. These give us mouth odor. Clostridium makes dreadful odors. Some come from hiding in the nerve centers, like Herpes and Shingles. That is why we get genital warts and painful blisters. Some come from the digestive tract, like Salmonella and Shigella bacteria. They give us bloating and gas. Some come from the genital organs, like Treponema and Neisseria (gonorrhea). Some come from the lung, like *Pneumocystis carinii*. Even fungus and yeast can grow in humans as if we were bread or fruit. Now they come out and flourish, too, producing their deadly mycotoxins, like **zearalenone**.

We are accustomed to thinking that we "pick up" our infections. Certainly, we do keep picking up new strains. But we already have in us all the bacteria and viruses that could make us very ill if our immunity drops. They are not making us sick now because our immune system keeps eating them as fast as they might emerge. Most of them did not even make us sick when we originally picked them up because they were few in number and our immune system was strong at that time, too.

Now that the T-cell count is gradually going down and the phagocytes have been disarmed, your Pandora's box of pathogens is opening, letting out one after another, until the body is seething with infectious organisms. Is it any wonder that you are getting sick?

Of course our white blood cells must do more than just eat, or phagocytize our enemies. They must kill them, too, and then spit them out or hand them on to other white blood cells to take to the bladder. We will see what interferes with this part of our protection later.

Yet, the human body is surprisingly tough and strong. It will put up a good fight. It may take 10 years before it begins to lose the battle. Then it is called *AIDS*, Acquired Immune Deficiency Syndrome, acquired from polluting the thymus and bone marrow with hundreds of bits of garbage without having a way to remove them. The body's garbage disposal utility is gone.

The Garbage Dump

This garbage was thought to be "progress." We are led to believe that "new, improved" foods and potions of any kind are "better". When we see this label on a package we automatically reach for it. It may indeed, be doing a "new, improved" job on the dishes because cobalt is added to make spots invisible but cobalt, a toxic metal, is doing a "new, more toxic" job on your body. "New, improved" taste in your coffees and herb teas are due to adding flavor extracts to them, which also adds the solvents used in extracting! "New, improved" taste in cereals is due to added flavors, which are extracts, again bringing solvents to these foods.

The less that is done to a food, the less chance there is to pollute it. But, of course, such matters should not be left to chance. Processed foods should be tested before they arrive in the grocery store, at least for the five immune-lowering toxins they might have. This was never necessary before. We could count on the good common sense of bakers, cooks, canners, and manufacturers. But all these professions have become much more complex. Bakers don't know what is in their ready-mixes, cooks don't know what is in their ingredients, and manufacturers don't know what their extraction solvents are. All these details are considered off limits to anyone inquiring (it is after all, mere "housekeeping") and even beneath consideration of management! It is left to the technician. Technicians must keep the processing machinery working. They are "given" the solvents, chemicals and cleaners that "must" be used to keep it all working. So, choices important to our health are made by machinery manufacturers; not doctors, researchers or even owners of companies. We must protect ourselves!

Simpler is better

Tests exist for benzene, PCBs, lanthanides, heavy metals, asbestos, and azo dyes. The consumer no longer needs to stand by helplessly wondering if the water or some food is making the family sick. These tests only need to be correctly chosen and applied. This field of endeavor is very much needed now.

Not only food, but also body products, our artificial teeth, and our household products have become polluted with these same five immunity-destroyers.

Which Came First?

As we review the scene of the HIV virus growing and thriving in the presence

of benzene we can't help wondering, which came first? The virus or the toxin? I do not really know, although I made a case for benzene coming first, damaging the thymus by destroying its white blood cells' phagocytizing ability. This then allowed the fluke eggs and stages to settle there, growing their own virus, specifically the HIV virus. The virus, in turn, infects us, but again, only when benzene is present. Benzene affects the enzyme that permits viruses to join our chromosomes. We will see the details later. Yet an equal case can be made for the parasite coming first.

We are all parasitized. This is the case for all animals. Being larger than most we can even host more than other animals. Having less instinct than others we cannot get rid of our parasites regularly as others do. In our belief that we are civilized, advanced, and even superior to our animal neighbors, we have handicapped ourselves. When we learn to purge ourselves as the animals (and primitive peoples) do, we see large flukes about the size of a nickel, small flukes the size of lentils, and sometimes Ascaris worms, like threads, the same as are vomited up by our cats and dogs. They are in our bowel contents.

We must learn to recognize them again. And we will, in the next chapter. What we cannot recognize are the larval stages, the microscopically small forms that do not look like the adult at all and that have landed in our organs, not the bowel contents. For that we need the Syncrometer® device. When we see how many larval stages are thriving in us we can easily understand how parasites might reach the thymus first.

Regardless of which came first, it is the coincidence of Fasciolopsis larval stages and benzene that results in the HIV virus population explosion. The Syncrometer® will let us see it happen.

Co-Parasites And Co-Viruses

By the time we are adults in our twenties, we are already quite parasitized. We are merely not sick yet. The commonest fluke parasites are *Fasciolopsis buski*, *Fasciola hepatica*, *Paragonimus Westermanii*, *Eurytrema pancreaticum* and *Clonorchis sinensis*. The commonest roundworms are *Ascaris lumbricoides, Ascaris megalocephala* and *Strongyloides* varieties.

Paragonimus and Eurytrema team up with Fasciolopsis in HIV/AIDS.

Eurytrema, Clonorchis and Strongyloides team up with Fasciolopsis in cancer. Eurytrema contributes the virus SV 40 in both cancer and HIV/AIDS. That is why cancer and HIV/AIDS have much in common. Teamwork is not necessarily

intentional. Two parasites or viruses can share a space, our bodies, the way a cat and dog can share their owner's home.

Together, a trio of parasites can bring symptoms quite different from either one alone. And larval stages bring symptoms quite different from adults. All this leads to confusion of the doctors, parasitologists and researchers who are accustomed to the classical symptoms they were taught to expect.

But a new technology allows us to see all these events as they happen.

Let us spy on the white blood cells with a Syncrometer® to see how the Paragonimus-Fasciolopsis partnership works.

Watching The Thymus

Technology has become so advanced in the fields of communication, TV, optics, and imaging that any application of these new fields to biology is likely to bring leaps of progress in our understanding.

The simple application of a voltmeter to the human body brought us the EKG and the EEG from which a great deal of knowledge was gained.

Magnetic resonance and CT (computerized tomography, pronounced cat) scanning techniques brought us the ability to "look inside" our bodies and "see" density differences in our tissues.

By applying a one-transistor amplifier to our bodies and using a pair of open-plate capacitors in the circuit, we have created a radio receiver-like station, which includes the body. Now we can "listen in" to the frequency patterns that are "in tune" (on the capacitors) with the body's patterns.

This device is called a Syncrometer®.

> Instructions for building and using one are given in the *Syncrometer® Science Laboratory Manual* by this author.

In this way we can detect and identify things at specific locations in the body, even in the chromosomes. With this device we can watch the thymus or any other organ, as the parade of parasites and toxins come and go. In previous books I tracked the benzene to its outside sources: toothpaste, ice cream, store

bought bread, bottled water. Since then I have also tracked it to *Paragonimus* flukes, a totally inside source. Let us "tune in."

We "hear" the white cells spitting bleach at the Paragonimus family—its eggs and stages. It is regular bleach, hypochlorite, one of our immune system's weapons. They are doing this in different organs where this parasite resides. In 20 minutes nothing is left of the Paragonimus family. We can no longer "pick up" on their frequency pattern. Are they merely stunned or paralyzed? We check every hour. Suddenly, at all these organs a fungus grows in exactly the same place. Pneumocystis is there now, not Paragonimus at all!

Fig. 6 Potato Ring Rot mold hidden in potatoes

The white blood cells seem furious. They attack again with a different weapon. But still, another new fungus takes its place, this time common Potato Ring Rot. We eat this every day in our under-baked potatoes. It can grow in us, too. But our WBCs can destroy and eat it. Soon all fungus is gone, the deck is cleared, everything is clean again and the white blood cells go searching for new enemies. Fasciolopsis and all the other parasites are attacked the same way. Only the fungus is different for each parasite variety.

We cannot avoid getting these parasites in ourselves because we eat them constantly. We eat all the spores, too, that provide the fungi that will consume any dead parasites.

Let us watch now what is happening in an HIV/AIDS patient. The white blood cells are spitting bleach at a Paragonimus lair we have singled out with our Syncrometer®. It takes longer but soon the whole family is gone. A few hours later, the same location is occupied by a Pneumocystis patch, as before, then by Potato Ring Rot. The white blood cells are devouring this now but it takes too long. The fungus is already inside the phagocytes but yet it isn't dead. This is puzzling. The fungus starts to make its mycotoxin, **zearalenone**. And minutes later, the zearalenone is being "detoxified" into benzene! This is the same

benzene that is so deadly! It lingers, too, much too long. It will soon stop phagocytosis there, as a small "pond" of benzene develops. It is creating a huge hazard, like a lighted match near a gasoline can. Benzene happens to be the critical solvent that triggers the HIV virus. This virus is merely a latent virus in a different parasite some distance away and not as common as Paragonimus. It is Fasciolopsis. If the benzene lingers long enough and spreads far enough to reach the Fasciolopsis, its HIV virus will be triggered out of its sleep (latency). HIV will be activated. The Syncrometer® can now "hear" the virus, in louder and louder resonance. It begins to multiply the way *Herpes* does when we supply its special triggers. Now HIV can spread to our bodies.

We can see that many HIV viruses are produced and escape into us. Some enter our chromosomes because benzene can trigger them in as well as out of our genome, using an "integrase" enzyme. The benzene caused the sudden appearance of this enzyme.

But we are huge animals, compared to these tiny parasites. All we need to do is kill most of them when they are still quite manageable. Instead, in our ignorance, we are eating and absorbing the very trigger for the virus. And we are too arrogant to admit parasitism, or to use herbs to fight them.

Anyone can learn to use the Syncrometer® and watch this scene going on in our own and others' bodies.

Endogenous Benzene

Endogenous means self produced or internally produced. No biologist or biochemist could suspect or even believe that benzene could be produced by a living organism, neither plant nor animal.

Yet the Syncrometer® clearly reveals benzene being formed wherever zearalenone is present. Zearalenone is present wherever Potato Ring Rot is growing. Potato Ring Rot is a fungus that grows wherever a *Paragonimus* parasite has been killed. *Paragonimus* is plentiful alongside *Fasciolopsis buski, Fasciola hepatica* and others. It is more plentiful in HIV victims for reasons not understood. But while it is alive it does not grow Potato Ring Rot, so the mycotoxin zearalenone is not produced, nor benzene. But dare to kill *Paragonimus* and within hours the deadly fungal growth takes over the carcass. This fungus makes the estrogenic toxin zearalenone, and this leads to benzene production on the spot.

Would it be better not to kill *Paragonimus* parasites? The body's instinct is to

kill everything foreign, everything that attacks you, competes with you, or takes up your space. It is a precious instinct. Yet, could benzene production be nature's intent? Or has Mother Nature gone awry in this instance? I believe we were meant to digest old dead refuse, so that fungus could never take over. But for HIV victims this kind of digestion is lacking.

We make lots of digestive juices in the stomach and in the pancreas. We are regularly flooded with it at mealtime. The Syncrometer® detects hydrochloric acid (HCl), pepsin, trypsin, lipase, RNAse, DNAase and even asparaginase sweeping into every tissue in children. But in middle age there is much less. The tissues, even the stomach itself, go without HCl and digestive juices for brief periods of time. Now killing *Paragonimus* leads to benzene production whereas in childhood it didn't. Of course the body can detoxify these traces of benzene at first. And some is eaten by white blood cells. But this stops their phagocytizing ability. Although it is a wise response by the white cells the entire burden is then shifted to detoxification instead of removal. Benzene is detoxified first into **phenol**. Benzene released in and around the thymus from killed paragonimuses gets changed to phenol. But phenol, although not a solvent, is a powerful tissue destroyer; now the thymus will begin to shred and lose bits of itself into the circulation.

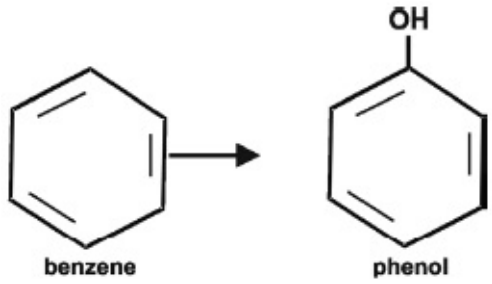

Fig. 7 Benzene is detoxified to phenol

Still, the body has been dispatching its parasites and disposing of the remains, including benzene and phenol, for eons of time. It did not lead to AIDS. It only led to gradually declining body functioning and overall aging.

But in this century it leads to AIDS. The total amount of benzene to be removed or detoxified has been doubled or worse in this century. We have dumped it on our food (pesticide), even mixed it in our food (baking grease, flavors and colors) in wholesale amounts. We have fumed it into our air (exhaust, colognes, cigarette smoke). Every liter (quart) of air in an office or even outside in a meadow has its benzene, detectable by regular chemical

methods. This means a few parts per trillion.

With this huge increase in benzene how can a fragile, phagocytizing white blood cell escape destruction? How can a nation's immunity escape gradual destruction? How can global immunity escape destruction? We cannot rest; a way must be found.

The body has always managed to get rid of its endogenous (internal) benzene and allowed us a lifespan of 70 to 80 years. But adding exogenous (external) benzene has given us AIDS, driving our lifespan down to about 40 years. We must fight back on both fronts. We can clean up our food and environment, the exogenous sources. We can kill our personal parasites regularly, our endogenous sources, so they cannot mature to the point of laying eggs and outrunning the body's ability to kill them.

Eurytrema Brings SV 40 Virus

The pancreatic fluke inhabits the pancreas of cattle. All milk and beef products have some stages of it. But when we host this parasite it is not restricted to the pancreas. It can thrive wherever there are tissues with low immunity. This is the thymus and bone marrow for an HIV/AIDS victim.

Spying on a Eurytrema lair we see it is constantly releasing the SV 40 virus but only if *gallic acid* is present. Gallic acid is the trigger for this virus. Gallic acid comes from a common food preservative, **propyl gallate**. It is also found naturally in certain foods. We will see how SV 40 aids and abets the HIV virus in some mysterious way. Because they interact, I call these viruses "co-viruses" and the parasites "co-parasites." Not all the details are clear but some are very obvious to anyone using a Syncrometer®.

Parasites Plus Benzene

Let us review for a minute:

1. The HIV virus is an infection of the parasite, human intestinal fluke. It is not a human virus. It only infects us incidentally when we host this parasite in us.

2. Benzene in our bodies weakens the thymus gland where our T-cells are cloned and programmed. T-cells are lymphocytes, our virus-eating white blood cells. Benzene also weakens the bone marrow where our T-cells are originally made. Benzene blocks the white blood cells' ability to phagocytize, causing

AIDS, an acquired immune deficiency.

When the thymus has benzene accumulated so phagocytosis stops, fluke parasites accumulate in and around it, just as toxins do.

3. There are many fluke parasites. In addition to *Fasciolopsis buski*, the human intestinal fluke, there are four other very common flukes: sheep liver fluke, pancreatic fluke, human liver fluke, and Paragonimus, the lung fluke. Paragonimus and Eurytrema have a special relationship to Fasciolopsis. Paragonimus provides an endogenous pathway to benzene production. And benzene triggers the HIV virus out of latency in Fasciolopsis larval stages. Eurytrema provides a special virus, SV 40, to both HIV/AIDS sufferers and cancer victims. This links cancer to HIV and AIDS.

L to R: lung fluke (6X); sheep liver fluke (3X); pancreatic fluke (5X, causes diabetes, nucleates our cancerous tumors and brings SV 40 virus); and human liver fluke (5X).

Fig. 8 Four common flukes

4. Three more immunity blockers arrive: PCBs, metals (like thulium, holmium and mercury), and asbestos. They, too, destroy the white cells' phagocytizing ability. But besides stopping phagocytosis the white blood cells develop other defects.

More Immune Defects

Azo dyes, in our foods and body products, act on our lymphocytes. Outright killing of CD4 cells by Fast Garnet dye and overgrowth of CD8 cells by Fast Green dye are two effects. Other dyes do more damage and need study.

Certain food substances called **allergens** or **antigens** specifically target the thymus after Fasciolopsis arrives there. One is **apiol**. Another one is **gallic acid**. And all along, the harsh chemical, **phenol**, has been damaging the thymus simply because it is the detoxification product of benzene which accumulates there.

These allergens use up all the **complement C_3** in the thymus. C_3 is necessary for "killer" action by white blood cells. So yet another immune defect is occurring.

We will also see that many of our strongest immune **weapons** are not being made.

- Benzoquinone and rhodizonic acid are overwhelmed by our two main *Ascaris* varieties that would normally be killed by them.
- Glyoxal is overwhelmed by Eurytrema, the pancreatic fluke. Glyoxylic acid is overwhelmed by Strongyloides.
- L-G and L-A are overwhelmed by heavy metals, both those naturally made in the body and those like mercury and thallium coming from dental amalgam.
- Betaglucan is overwhelmed by PCBs.
- Interleukin 12 is missing when holmium (a PCB co-toxin) is present.
- Interleukin 2 is missing when L-G is missing.
- Interferon is missing when RAS is present.

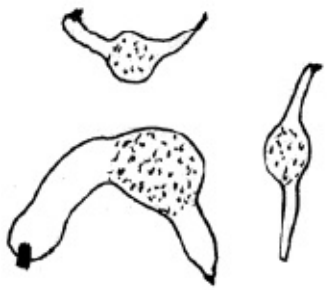
We will discuss these later.

But benzene starts it all. It increases parasitism. Parasites and viruses thrive in its presence leading to more immune damage.

In spite of all this, the body responds with the speed of an arrow, minutes, when the good things are supplied and the bad ones removed. Soon the body can be functioning normally again.

There are many more flukes that can parasitize us. There is Prosthogonimus, a fluke from chickens; Cryptocotyle, a fluke from sea gulls; Platynosomum, a cat liver fluke; Echinostoma, a fluke that rests itself on our neuro-muscular junctions causing ALS and fibromyalgia; Acanthocephala, (still quite

mysterious);Echinoporyphium, cause of kidney disease, and several blood flukes, the Schistosomes.



Appears as black dots (mid region) in toilet bowl, about ¾-inch long.

Fig. 9 Acanthocephala

If we have a few of these, they don't make us very sick. But when they have a population explosion, swarming in one of our organs, we get sick. Perhaps solvents cause such population explosions. Solvents could dissolve away the eggshells forcing them all to hatch. Hatch in your body! Normally, this would not happen. The eggs produced by the adult, thousands every day, are passed into the intestine to exit with the bowel movement. But if they are forced to hatch before they exit, they swim away, into your body!

Even strange and rare parasites are becoming more common, no doubt due to new solvents that are entering and polluting our bodies.

Flukes

Size about 1/10mm.

Fig. 10 Fasciolopsis egg

To understand HIV disease you should understand the basic facts about the human intestinal fluke. Its scientific name is *Fasciolopsis buski*. Fluke means "flat", and flukes are one of the families of flatworms. It is as flat as a leaf. This

lets it sandwich itself in between your tissues without your noticing it…without causing a disturbance or pain. The parasite is not unknown; it has been studied since at least 1925.[3] This study was done in China. Since then it was often believed to exist only in China and tropical countries. Yet specimens for study in Parasitology classes come from the local abattoir, from pigs and cattle (even wild deer and moose)!

This parasite has stages that it must go through to keep reproducing. The first stage is the egg. The adult produces millions of eggs. They pass out of us with the bowel movement. The adult, though, stays tightly stuck to our intestine (or liver causing cancer, uterus causing endometriosis, thymus causing AIDS, or brain contributing to Alzheimer's disease).

Most of us get little lesions in our intestines from time to time. These tiny sores allow the eggs, which are microscopic in size, to be pulled into the blood stream (other parasite eggs get into the blood this way, too).

Some of these eggs actually hatch in the intestine or in the blood. The microscopic hatchlings are called *miracidia* and are the second stage. They swim about with their little swimmer-hairs. And of course, the liver whose job it is to dispose of toxins and intruders will receive them and kill them as the blood arrives from the intestine. They have no chance to survive in healthy people.

Fig. 11 Miracidia hatching

Flukes And Solvents

But something special happens to people who have solvents in their bodies. The liver is unable to kill these tiny fluke stages. These baby stages are actually allowed to make their home in the liver and other tissues. It is as if the immune system has no power to kill them. The flukes begin to multiply in people with solvents in their bodies! The miracidia (hatchlings) start to make little balls inside themselves, called *redia*[4]. But each redia (ball) is alive! It pops itself out of the miracidia and begins to reproduce itself. Forty redia can each make 40 more redia! And all of this out of one egg!

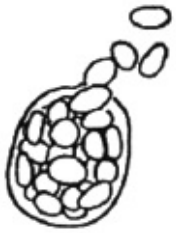


Fig. 12 "Mother" redia bearing "daughter" redia

Fig. 13 Miracidia expelling "mother" redia

This parasite is laying eggs and producing millions of redia right in your body! These redia are swept along in your blood, landing in whatever tissue lets them in. Smokers' lungs, breasts with benign lumps, prostate glands full of heavy metals, a thymus loaded with benzene are examples of tissues that give the redia their landing permits. Perhaps it is the changed electrical charge or magnetic force of these damaged organs that permits further development of the fluke stages. Perhaps it is merely low immune surveillance. Perhaps the dying cells of a damaged organ provide food for the baby stages. Only further scientific study will reveal the truth.

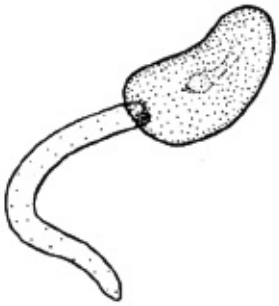

Fig. 14 Cercaria

Multiplying continues at a hectic pace, generation after generation. Redia are nesting in numerous organs. Suddenly they change their shape. They sprout a tail and can swim again.

Now they are called *cercaria*[5].

The cercaria only need to find a place to attach. After they glue themselves to your tissue, their tails disappear and they begin to grow a "cocoon".

Now they are called *meta*cercaria. Normally, this would happen on a leaf growing near a pond, so the metacercaria develop an extremely thick shell around themselves to withstand the winter. Does the presence of the solvent benzene in your body dissolve this tough shell? That would remove the last barrier to the fluke completing its entire life cycle anywhere in your body!

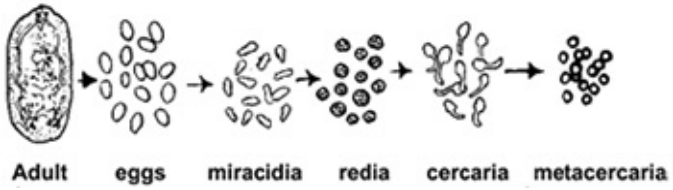

Fig. 15 Life cycle of a fluke

After the shell is gone, they grow into adult flukes in your tissue. NOT IN THE INTESTINE BUT IN YOUR THYMUS! IN YOUR BONE MARROW! IN YOUR SKIN! Now the cycle is complete. From egg to miracidia to redia to cercaria to metacercaria and then the adults! And all of them eating and sucking and devouring your vital body fluids.

But this is not normal for flukes. This is:

Stage	Normal Life Cycle
1 Egg	Expelled with bowel movement onto soil. Washed by rain into ponds.
2 Miracidia	Hatches from egg in water. Has cilia, can swim vigorously and must find intermediate snail host in one to two hours or may be too exhausted to invade.
3 Redia	Develop inside miracidia as little balls until expelled. Those are "mother" redia, and each one bears "daughter" redia for up to 8 months, all still inside the snail, and living on the fluids in the lymphatic spaces. Similarly, daughter redia are continually developing cercaria.
4 Cercaria	Have a tail, use it to exit from snail and swim to a plant. If the snail is feeding on a plant, cercaria can latch onto plant with sucker mouth and start to encyst (form a "cocoon") within minutes. Tail breaks off and swims away to dissolve.
5 Metacercaria	Two-walled cysts. The outer wall is very sticky. But as you eat the plant it is stuck to, the least pressure will break it, leaving the cyst in the mouth. The "almost unbreakable" inner cyst wall protects it from chewing, and the keratin-like coat prevents digestion by stomach juices. However when it reaches the duodenum, contact with intestinal juices dissolves away the cyst-wall and frees it. It then fastens itself to the intestinal lining and begins to develop into an adult.
	Lives in your intestine and can produce 1000 eggs per bowel movement and live many

6 Adult	years.

Fig. 16 Fasciolopsis' normal life cycle

As you can see, humans typically are the host for just the adult stage, and then only in the intestine. But can you imagine the havoc in your body if you did the snail's job, too? Suppose the host, the human, has solvent in his or her body so that the millions of eggs start hatching before they can exit from the bowel. They simply swim in hordes into the blood stream. They may be searching for a snail but certainly a living tissue of yours will serve as well! To survive they must avoid being killed and eaten by your white blood cells. So a tissue where the white blood cells are inactivated by asbestos, thulium, PCBs, or benzene is the choice. They have found a home! In you!

The solvents may be hexane, pentane, xylene, toluene, wood alcohol, carbon tetrachloride, isopropyl alcohol, as well as benzene. All of these are found in bottled water, processed food, and popular body products!

Xylene and toluene accumulate in the brain so the fluke parasites choose the brain for their breeding place. Here they produce their redia and cercaria and eventually adults! Wood alcohol accumulates in the pancreas and eyes, making these organs the fluke breeding grounds. Isopropyl alcohol accumulates in the liver, making the liver the place where the stages develop into adults. And benzene accumulates in the thymus and bone marrow so that the intestinal fluke is raised up to adulthood in these small organs instead of the spacious intestine.

In this book you will learn how to kill it.

Many persons who have an adult fluke in the thymus feel a burning sensation or "tightness" over the breastbone. But some persons feel nothing at all. And some persons with "tightness" there do not have this parasite. So having a symptom here, while very suggestive of this fluke, does not prove you have it. However, it would be very wise to go on a parasite-killing program immediately, such, as I will describe to you later.

The HIV virus is brought into the body by an

intestinal fluke stage inhabiting the benzene-damaged thymus.

All cases of HIV seen in my office since 1990 had benzene in their thymuses. Benzene had stopped phagocytosis there by the white blood cells. The thymus had PCBs as well as the azo dyes, Fast Garnet and Fast Green. It had heavy metals, including the magnetic ones and the metals in amalgam!

No case of HIV was seen without benzene in the thymus.

All cases of AIDS also had other flukes in their thymuses. Progression from early HIV/AIDS to advanced illness brought with it much more intense parasitism and more immune defects. There was very little BQ (benzoquinone), or RZ (rhodizonic acid), or G (glyoxal), or GA (glyoxylic acid) anywhere, and no L-G, L-A, interleukin 2, or interferon.

Weapons Of Mass Destruction

Early in the last century, before medical research had become a business and a monopoly, a young man graduated with a Ph.D. in chemistry and biochemistry. He was William F. Koch.[6] His first postgraduate job was in a hospital where cancer patients were being treated, quite futile, then, as now. He put his chemistry to work, during free time, and found methyl guanidine in their urine, a most unlikely chemical, and in large quantities. This was more than surprising because it was the same chemical he had found in the dogs he worked with so recently for his Ph.D. degree. They had been deprived of their parathyroid glands. This coincidence kept him glued to cancer research for the rest of his life, using his own earnings to do it.

He went on to get an M.D. in order to pursue this lead. He felt that this chemical should have been oxidized by a healthy person. He was eventually led to a concept of disease in general, not just cancer, that involved missing oxidations by the body. Young persons, he postulated, had strong oxidation capability in their body chemistry. Sickly and older persons lacked something. This "something" was a very strong oxidizer. Other workers, starting with Otto Warburg in Germany, were studying a similar peculiarity: cancerous tumors did not consume oxygen, as they should.

He decided to try substituting other oxidizers; maybe the beleaguered organ

could use them instead. He had chosen benzoquinone first and was instantly successful! Even though it was an industrial chemical, very powerful and of course toxic in any large amount, the body could use it. His theory was supported. He cured very many cancer cases with a single shot of 1 microgram of benzoquinone. The smallness of the quantity is astounding and important, just as it is for vitamins A, D, B_{12}, hormones and ultra trace minerals. Larger doses are damaging.

He tried another oxidizer, rhodizonic acid, and was again successful. He tried them in combination and was even more successful. Then he tried "glyoxilide" (composition of this is not clear) and was so successful for numerous diseases, that he had his results independently verified, documented in a number of books, and used in a court trial. His books are in libraries.

He was shocked, as you and I would be, with such miraculous results. It was certainly worth pursuing this approach. He continued to search for the body's own "natural" high-powered oxidizer. This would surely be the body's "cannon" of force that could restore the body's own ability to destroy its tumor growths and cure many of its other diseases. He never found it. At least he never thought so.

The Syncrometer®, however, detects actual benzoquinone and rhodizonic acid as well as glyoxal and glyoxylic acid (perhaps his "glyoxilide"?), in every organ of a young person's body! But in smaller amounts than he could detect, and it is lacking in diseased organs or an older person's body. We have abbreviated them BQ, RZ, G, and GA. When a shot of BQ (1 microgram) or RZ is given, miracles happen to cancer patients. (See the book, *The Cure For All Advanced Cancers*, case histories #1, #6, and #7. All this urgently needs more research.)

BQ is, in fact, our natural high-powered oxidizer, a cannon of force, as are RZ and others. Dr. Koch would be more than gratified to know this. We owe him a huge debt.

The Syncrometer® shows that these immune weapons can kill our large parasites, our flukes, our roundworms, including *Ascaris* of two kinds. Even when they are beyond attack by the WBCs!

It is this kind of "natural immunity" that is missing in HIV/AIDS patients, besides the defects in phagocytes and lymphocytes and the lack of complement C_3.

Yet, we do not need to procure BQ or RZ, glyoxal or glyoxylic acid, nor take them. We can send an electronic message in the form of homeographic drops to your body to make them. The body does so promptly. It will overcome the Ascaris, kill flukes at the same time, and then keep on making these immune system **weapons** for you at any location that you choose.

We would, of course, choose to return BQ and RZ as well as G and GA to your thymus and the bone marrow first. Both organs can be re-armed with their natural cannons in a day. I will describe the details later.

We will also use L-G to clear out heavy metals like mercury, thallium and all the others that come from amalgam. We will use L-A to clear out the "natural" heavy metals, such as oxidized selenium and germanium, chromium and nickel, copper, cobalt and vanadium. This will let the WBCs make interleukin 2 again. Soon the AIDS is stopped and you are recovering.

Killing the parasites, removing benzene, and supplying immune weapons is a powerful three-pronged approach against HIV/AIDS.

Purge The Parasite, Cure HIV

When the benzene is gone but Fasciolopsis is still there, will HIV continue to appear? No! The virus simply vanishes, gone back to being latent. Benzene is the necessary trigger for HIV viruses to come out of this parasite and spread to our bodies. But, of course, we plan to kill Fasciolopsis anyway and not live in constant danger.

Even when the virus has become "ours" by slipping into our chromosomes, benzene is the necessary trigger that allows it to multiply and spread.

Fortunately, flukes are much easier to kill than roundworms like Ascaris or even certain bacteria. There are four ways to kill the intestinal fluke: an herbal way, electrical zapper way, the homeographic way, and simple starvation. Neither can do a perfect job by itself. Yet a good job must be done, so it is best to use all four ways of killing them. The exact recipe and other techniques will be described in the next chapter. But don't wait until you have all the supplies—start immediately with any method you obtain.

Look at the case histories. It is not unusual for someone to have a dozen or more parasites out of the 120 parasites I have samples of and can test for. You can assume that you, too, have a dozen different parasites. We are heavily parasitized beings! Our bodies are large enough to provide food and shelter for

lots of these free loaders. If they were settled on the outside where we could see them, like lice or ticks, we would rid ourselves in a flash. Nothing is more distasteful to the imagination than hordes of biting, chewing, crawling, sucking creatures on our flesh. But what about in our flesh? We cannot see inside ourselves, so we have mistakenly assumed that nothing is there.

To get well, you should do three things:

1. Rid your body of immunity destroyers: benzene (this would also remove phenol), asbestos, metals, PCBs, and azo dyes (including Fast Garnet the CD4 killer, and Fast Green the CD8 elevator).
2. Restore your immune weapons: BQ, RZ, G, GA, L-G, and L-A.
3. Kill Fasciolopsis and other parasites, together with their stages.

Killing Parasites

We have been taught to believe that every parasite is so unique that a different drug is required to kill each one. The better drugs, such as Praziquantel and Levamisole or even Flagyl and Piperazine, can each kill several worm varieties. But this is just not practical when dozens of different parasites are present.

Herbal Parasite Remedies

The Native American peoples knew that humans are parasitized. Other native peoples from the Arctic to Antarctic knew that we are parasitized like other animals. They had frequent purgings that included diarrhea or vomiting to rid themselves of their slimy invaders. Many cultures continued such practices right up to my own childhood. I remember being forced to swallow a spoonful of sulfur and molasses! How dreadful it seemed. But it reduced the body's burden of worms and other parasites that we all have. **Where have we gone astray? Why have we forsaken these wise practices?** I have seen that eczema is due to round worms. Seizures are caused by the roundworm, Ascaris, getting into the brain. Depression is caused by bacteria (*Clostridium botulinum*) that get into the hypothalamus in the brain. Asthma is caused by Ascaris in the lungs. Diabetes is caused by the pancreatic fluke, Eurytrema.Migraines are caused by the threadworm, Strongyloides. Much human heart disease is caused by dog heartworm, Dirofilaria. And the list goes on. "Rare genetic" diseases, including muscle disorders, ALS, and even Tay Sachs are caused by less common parasites, such as Echinostoma, Gastrothylax, and Echinoporyphium.

Getting rid of all these parasites would be absolutely impossible using clinical medicines that can kill only one or two varieties each. Such medicines also tend to make you quite ill. Flagyl™ is used for amoebas and Giardia; when the correct dosage is used, it can cause extreme nausea and vomiting. Quinine for malaria (another parasite disease) is quite toxic. Imagine taking 10 such drugs to kill a dozen of your parasites! Good news, perhaps, for the drug makers but not for you.

Yet three herbs can rid you of over 100 types of parasites! And without so much as a headache! Without nausea! Without any interference with any drug that you are already on! Does this sound too fantastic? Just too good to be true? They are nature's gift to us. The herbs are:

- **Black Walnut Hulls** (from the Black Walnut tree)
- **Wormwood** (from the Artemisia shrub)
- **Common Cloves** (from the clove tree)

These three herbs must be used together. Black Walnut Hull and wormwood kill adults and developmental stages of at least 100 parasites. Cloves kill the eggs. Only if you use them together will you rid yourself of parasites. If you kill only the adults, the tiny stages and eggs will soon grow into new adults. If you kill only the eggs, the million stages already loose in your body will soon grow into adults and make more eggs. They must be used together as a single treatment.

It is the green hull surrounding the nut of the Black Walnut tree that has this miraculous parasiticide. After it has turned black, it is useless. The large green balls fall to the ground early in the fall. In a week or two they will be black and decaying. Therefore, anyone wishing to make parasiticide must be careful not to let the critical time for harvesting pass.

I encourage everyone to make their own parasiticides and to take back the responsibility for keeping themselves and their families free of these tiny monsters. The recipe for Black Walnut Hull tincture is given in *Recipes*.

Note that it is a tincture (extracted using ethyl alcohol), not an ordinary extract (which uses water). The Black Walnut extract that is available from herb companies is not potent as a parasiticide. It is black, not pale green, indicating that the critical harvesting time had passed. Of course there is no time to make your own if you are ill. See the chapter on *Sources*.

These three herbs, taken together, can cure HIV infection.

Fig. 17 Cloves, black walnut, and wormwood

You will only need one 1 oz. (30 ml) bottle of the Extra Strength tincture to get started. If you have family members you will need more. And if you are very ill you will also need more. While you are waiting for it to arrive, get your other two herbs ready: wormwood and cloves.

Wormwood consists of the leaves of the Artemisia shrub. My recommendation is that you grow it yourself if you have any space to do so. Wormwood seed is available from seed catalogs (see *Sources*).

The amount you need to eliminate HIV is very small, yet you cannot do without it. But the FDA (Food And Drug Administration) has regulated it as toxic! It is therefore unavailable in concentrated form from herb companies. The evidence for toxicity accepted by the FDA must have been hearsay. I have heard of only one case of intolerance (intestinal cramps) in 10 years. Not so much as a headache or nausea[7] should be expected. The toxic level must be much higher than is needed to kill these parasites.

This shrub is called wormwood for good reason: it kills worms! There is quite a bit of confusion over which Artemisia is the true wormwood. Books and nurseries can be wrong, even though they assure you they are correct! Buy *Artemisia absinthium* for your garden. Wormwood goes back to antiquity and is mentioned in the Bible.

If you grow your own, dry the leaves when they are in their prime. The leaves are greenish gray and quite bitter. Nobody would accidentally eat too much of them. For a child, crumble a leaf and measure ¼ tsp.; stir this into honey.

Wormwood capsules are available as a combination of Artemisia and other herbs.

The third herb necessary to eliminate HIV is cloves. This is the common spice used in baking. It needs to be ground up in order to release its parasite-killing properties. You can buy a can of whole cloves and grind them in a blender or grinder. Store bought "ground cloves" do not work! Their parasite-killing properties have evaporated long ago. Ground cloves from a health food store or herb shop may not work either! They may have been ground years ago. Don't take a chance; grind your own. Remember, the responsibility of the cloves is to kill eggs. Eggs are the hardiest stage of a parasite. If an herb company were to grind cloves and fill capsules with them right away and store the capsules in closed bottles, the potency of the herb would be protected. Don't take these details for granted. You must question your source and get a satisfactory answer or grind your own.

Fig. 18 Food Grinder

You will need about 100 capsules of cloves. To make your own, purchase size 00 (double zero) capsules at a health food store. Don't try to mix cloves straight in water! It is much too strong. You may try mixing it with eggnog or coconut beverages (see *Recipes*). Recently, the essential oil of cloves has become available, which may be substituted for ground cloves. You will need one half-ounce bottle (see *Sources*).

You now have:

- One 1 oz. (30 ml) bottle of pale green Black Walnut Hull tincture Extra Strength. This is six teaspoons, enough for three weeks if you are not very ill.
- One bottle of wormwood capsules (each capsule with 200-300 mg of wormwood) or ½ cup of *Artemisia* leaves gathered from a friendly neighbor's shrub.
- One bottle of freshly ground cloves (each capsule with 400-500 mg cloves), or ¼ cup bulk powdered cloves, or one half-ounce bottle of the essential oil of cloves.

These will be taken together to kill *Fasciolopsis buski*, the source of the HIV virus.

Two additional items, *ornithine* and *arginine*, improve this recipe. Parasites produce a great deal of ammonia as their waste product. Ammonia is their equivalent of urine and it is set free in our bodies by parasites in large amounts.

Ammonia is very toxic, especially to the brain.[8] I believe this causes insomnia and other sleep problems at night and anxiety by day. By taking ornithine at bedtime, you will sleep better.[9] Arginine has similar ammonia reduction effects but must be taken in the morning because it gives alertness and energy.

Do not try to substitute drugs for herbs. **Drug parasiticides can be extremely toxic, even in the small doses needed. Nor do they kill all the stages.** Here is a clipping that describes them.

Common Drugs For Parasitic Infections

Infection	Drug	Adult Dosage	Pediatric Dosage
Amebiasis			
asymptomatic	Iodoquinol	650 mg tid x 20d	30-40 mg/kg/d, 3 doses x 20d
symptomatic	Metronidazole	750 mg tid x 10d	35-50 mg/kg/d, 3 doses x 10 d
	followed by Iodoquinol	650 mg tid x 20d	30-40 mg/kg/d, 3 doses x 20d
Blastocystis	Metronidazole	750 mg tid x 10d	
	or Iodoquinol	650 mg tid x 20d	
Dientamoeba	Iodoquinol	650 mg tid x 20d	40 mg/kg/d, 3 doses x 20d
Giardia	Quinacrine HCl	100 mg tid p.c.x5d	6 mg/kg/d, 3 doses p.c.x5d
	or Metronidazole	250 mg tid x 5d	15 mg/kg/d, 3 doses x 5 d

Names & Adverse Effects of Common Drugs

Drug: **Iodoquinol** Trade Name: **Yodoxin**
Adverse Effects: Occ: rash, acne, slight enlargement of thyroid gland, nausea, diarrhea, cramps and anal pruritus. Rare: optic atrophy, loss of vision, peripheral neuropathy after prolonged use in high dosage (months), Iodine sensitivity.
Drug: **Metronidazole** Trade Name: **Flagyl**
Adverse Effects: Freq: nausea, headache, dry mouth, metallic taste. Occ: vomiting, diarrhea, insomnia, weakness, stomatitis, vertigo, aparesthesia, rash, dark urine, urethral burning. Rare: seizures, encephalopathy, pseudo-membranous colitis, ataxia, leukopenia, peripheral neuropathy, and pancreatitis.
Drug: **Quinacrine HCl** Trade Name: **Atabrine**
Adverse Effects: Freq: dizziness, headache, vomiting, diarrhea. Occ: yellow staining of skin, toxic psychosis, insomnia, bizarre dreams, blood dyscrasias, urticaria, blue and black nail pigmentation, psoriasis-like rash. Rare: acute hepatic necrosis, convulsions, and severe exfoliative dermatitis, ocular effects similar to those caused by chloroquine.

Fig. 19 Some clinical parasiticides

I have not found a better combination than Black Walnut, cloves, and

wormwood for *Fasciolopsis buski*, but a few more herbs can kill them, too, particularly in hard to reach places.

A Meadow Of Health

I have found that herbs go preferentially to certain organs, called a **tropism**. Herbalists in the past knew which herbs were good for the brain, lung, and so forth, and my experience is that they were generally correct. These herbs went preferentially to the organs they were said to be good for!

If you had a master list of all the herbs in the world, and which organs each one was good for, then you could pick out the ones you needed. The more you could take, the more powerful the effect would be.

Here is a list that will get you off to a good start. For convenience, the chart includes some non-herbal products. Notice that an herb that kills a parasite at one organ may not kill it at another organ. So the search is on for reliable, detailed information.

Organ	Parasite or Pathogen	Herb
adrenals	*Echinoporyphium recurvatum*	cardamom
all body organs together	*Fasciolopsis buski*	6 watercress tablets (*Nasturtium officinale*), 6 fresh apricot, peach or nectarine seeds for 6 days
anterior pituitary	Prions	6 fresh apricot seeds for 6 days, birch bark tea, fennel seed (freshly ground), horseradish, licorice root powder, sage leaves, raw nopales (cactus)
blood	Fasciola	coriander
breast	Fasciola	mullein
breast	Paragonimus	mullein
breast	*	mullein
cerebrum	*Echinostoma revolutum*	white thyme
cerebrum	Macracanthorhynchus	oregano oil
cerebrum	Prions	myrrh, Lugol's iodine
eye	Fasciola	wormwood
eye muscles	*Fasciolopsis buski*	fennel seed (freshly ground), anise seed (freshly ground), nutmeg, Watercress, 6 apricot seeds for 6 days
hypothalamus	Strongyloides	chaparral, coriander
hypothalamus	*	wormwood
kidneys	*Echinoporyphium recurvatum*	jalapeno seeds, BQ drops**, watercress, fresh apricot seeds
kidneys	*	cardamom, parsley, hydrangea, goldenrod, nutmeg

lumbar spine	*Echinostoma revolutum*	white thyme
lumbar spine	Macracanthorhynchus	oregano oil
Lung	Fasciola	BQ drops
Lung	Paragonimus	mullein, BQ drops
Lung	*	mullein
muscle-tendon junctions (joints)	*Fasciolopsis buski*	6 fresh apricot seeds for 6 days, fennel seed (freshly ground), horseradish capsules, pomegranate juice, watercress or 6 watercress tablets daily
pancreas	Eurytrema	nopales (cactus)
rectum	*Fasciolopsis buski*	turmeric, oregano leaf
whole body	Paragonimus	nutmeg, coriander, Pau D'Arco

*where no parasite or pathogen is listb sed, the herimply benefits the entire organ. **We will discuss making drops later.

Fig. 20 Selected herbs and their tropisms

Not all herbs are readily available, but my point is that there are many good parasite killers. Research is needed to find many more. Essential oils that we know as spices, like thyme or cardamom, are particularly appealing because they are familiar, have a history of safe use, and are available. A recipe I recommend is called Spice Syrup, given in *Recipes*.

An HIV or AIDS patient is likely to have most or all of these parasites and pathogens. Make yourself the "General Spice Syrup" by adding additional spices to the basic recipe given. Add as many on the chart as you can locate. Look at the Spice Syrup recipe for advice on how much to add.

As long as you are making a recipe, consider adding a few more herbs for even more benefits.

Body part	Undesirable item	Herb to counteract
CD4 and CD8 lymphocytes	Azo dyes, Fast Garnet and Fast Green	bay leaf oil, hydrangea root powder, pomegranate, olive leaf, lemon oil, coenzyme Q10
whole body	Reverse transcriptase (HIV enzyme)	fennel powder (freshly ground)
whole body	Bacillus cereus, tyramine (antigen)	nutmeg

Killing Paragonimus and Eurytrema is next most important to Fasciolopsis. Although the Black Walnut combination kills them at the thymus, other herbs are more effective at other locations. That's why the "shotgun" approach of the

Spice Syrup is so important.

Procedure For Cure

Start by taking ornithine, 2 capsules at bedtime on the first night you get it. You don't need to wait for the rest of the program to start on ornithine. Take 4 ornithine on the second night. Take 6 ornithine at bedtime on the third night. After this take 4 or 6 ornithine capsules at bedtime every night till you are sleeping soundly. Then go off ornithine and see whether your sleep is as good without it. Use as needed. It is not habit forming.

Taking ornithine at bedtime may give you so much energy the next day that you don't need to take arginine in the morning. But if going off caffeine (recommended) has you dragging yourself through the morning, take one arginine upon rising and another one before lunch and supper. It can make you a bit irritable. Cut back if this happens.

Ornithine and arginine, each about 500 mg, are available in capsules, in separate bottles (see *Sources*).

There are no side effects as you can see from the case histories. There is no interference with any other medication. There is no need to stop any treatment that a clinical doctor or alternative therapist has started you on, provided it is free of immunity-destroying pollutants.

How could you know whether a medicine is free of the five immunity-destroying toxins: benzene, PCBs, asbestos, heavy metals and azo dyes? Only the Syncrometer® method can test for these in a few minutes. If you have friends with HIV disease, you could become their angel by learning to use this device. It is described, complete with lessons in the *Syncrometer® Science Laboratory Manual*, available from the same publisher.

Meanwhile, until you can do your own testing, take at least these precautions: wash color coating off any tablets you are required to take and set to dry. Dip all tablets in a cup of water to which one drop of hydrochloric acid (5%) has been added; then dunk in vitamin B_2 powder. This detoxifies traces of benzene. Or zappicate them.

HIV Curing Recipe

Herbal Parasite-Killing Program

1. **Black Walnut Hull Tincture Extra Strength** (see *Recipes*).

Day 1: (this is the day you begin; start the same day you receive it).

Take one drop. Put it in ½ cup of water. Sip it on an empty stomach such as before a meal.

Day 2: take two drops in ½ cup water same as above.

Day 3: take three drops in ½ cup water same as above.

Day 4: take four drops in ½ cup water same as above.

Day 5: take five drops in ½ cup water same as above.

Day 6: take 2 tsp. all together in ½ cup water or added to lemonade, or EZ Meal (see *Recipes*,Complete Meal Drinks). Sip it; don't gulp it. Get it down within 15 minutes. If you are over 150 pounds, take 2½ tsp. You may add honey, spices or syrup to flavor.

This dose kills most *Fasciolopsis buski* throughout the body. But it does not reach locations under the skin or far away in the genitals or brain. We will use apricot seeds and watercress tablets (see *Sources)* for these. The alcohol in the tincture can make you slightly woozy for several minutes. Simply stay seated until you are comfortable again. Then take niacinamide, 500 mg, to counteract the toxicity of the alcohol. You could also feel a slight nausea for a few minutes. Walk in the fresh air or rest until it passes.

<u>For a year</u> take 2 tsp. Black Walnut Hull Tincture Extra Strength every week or until your HIV or AIDS is but a dim memory. For advanced AIDS you will need this much daily. Do not substitute any powdered variety until you are much better.

You may be wondering why you should wait for five days before taking the 2 tsp. dose. It is for your convenience only. You may have a sensitive stomach or be worried about toxicity or side effects. By the sixth day you will have convinced yourself that there are no toxic side effects.

Family members and friends should take 2 tsp. every other week to avoid reinfecting <u>you</u>. They may be harboring a few parasite stages in their intestinal tract without having symptoms. But when these stages are transmitted to an HIV or AIDS Positive person, they immediately seek out

the thymus again.

Going faster. In fact, if you are convinced after the first drop of the beneficial action of Black Walnut Hull Tincture, take the 2 tsp. dose on the very first day. You make take 2 tsp. daily after that if you wish.

Going slower. On the other hand, if you cringe at the thought of taking an herb or you are anxious about its safety, continue the drops, increasing at your own pace, until you are ready to brave the decisive 2 tsp. dose.

2. **Wormwood** capsules (should contain 200-300 mg of wormwood, see *Sources*):

Day 1: take 1 capsule before supper (with water).

Day 2: take 1 capsule before supper.

Day 3: take 2 capsules before supper.

Day 4: take 2 capsules before supper.

Continue increasing in this way to day 14, whereupon you are up to 7 capsules. You take the capsules all in a single dose (but one at a time until they are all gone). Then you do two more days of 7 capsules each. After this, you take 7 capsules once a week forever, as it states in the *Maintenance Parasite Program*. Try not to get interrupted before the 6th day, so you know the adult intestinal flukes are dead. After this, you may proceed more slowly if you wish. Many persons with sensitive stomachs prefer to stay longer on each dose instead of increasing according to this schedule. You may choose the pace after the sixth day.

3. **Cloves**: Fill size 00 capsules with fresh ground cloves; if this size is not available, use size 0 or 000. In a pinch, empty vitamin capsules. You may be able to purchase fresh ground cloves that are already encapsulated; they should be about 500 mg. Grocery store ground cloves do not work! Either grind them yourself or see *Sources*.

Day 1: Take 1 capsule, 3 times daily before meals.

Day 2: Take 2 capsules, 3 times daily.

Days 3, 4, 5, 6, 7, 8, 9, 10: Take 3 capsules, 3 times daily.

After day 10: Take 7 capsules all together once a week forever, as in the

Maintenance Parasite Program.

Alternatively, you may make yourself clove syrup:

- 1 tsp. oil of clove bud (see *Sources*).
- ½ cup syrup.

Add together. Shake well each time you are taking a dose. Dose is ¼ tsp. 2 times daily. It is easiest to take this at the back of the tongue, swallowing quickly. Follow with bread, not water until you are used to it.

Take **ornithine** at bedtime for insomnia. Even if you do not suffer from insomnia now, you may when you kill parasites.

Parasite Program Handy Chart

Strike out the doses as you take them.

	Black Walnut Hull Tincture Extra Strength Dose	**Wormwood Capsule Dose (200-300 mg)**	**Clove Capsule Dose (Size 0 or 00)**
Day	drops 1 time per day, like before a meal	capsules 1 time per day, on empty stomach (before meal)	capsules 3 times per day, like at mealtime
1	1	1	1, 1, 1
2	2	1	2, 2, 2
3	3	2	3, 3, 3
4	4	2	3, 3, 3
5	5	3	3, 3, 3
6	2 tsp.	3	3, 3, 3
7	0	4	3, 3, 3
8	0	4	3, 3, 3
9	0	5	3, 3, 3
10	0	5	3, 3, 3
11	0	6	7
12	0	6	0

13	2 tsp.	7	0
14	0	7	0
15	0	7	0
16	0	7	0
17	0	0	0
18	0	0	7
19	now once a week	now once a week	now once a week

At this point you do not need to keep a strict schedule, but instead may choose any day of the week to take all the parasite program ingredients.

Continue on the *Maintenance Parasite Program*, indefinitely, to prevent future reinfection.

Tips on taking pills

Whenever taking capsules or pills, have a bit of bread within reach. If a pill should stick, swallow some bread. Bread pushes the pill along its way, while water does not. Never take a handful of pills together. They may clump together and give you lots of discomfort. Take them one at a time.

Maintenance Parasite Program

YOU ARE ALWAYS PICKING UP PARASITES! PARASITE EGGS ARE EVERYWHERE AROUND YOU! YOU GET THEM FROM OTHER PEOPLE, YOUR FAMILY, YOURSELF, YOUR HOME, YOUR PETS, UNDERCOOKED MEAT, UNCOOKED DAIRY PRODUCTS AND HIDDEN DIRT ON FRUITS AND VEGETABLES.

I believe the main source of the intestinal fluke is undercooked dairy products and meats. After we are infected with it this way, we can give it to each other through blood, saliva, semen, and breast milk, which mean kissing on the mouth, sex, nursing, and childbearing.

Family members nearly always have the same parasites. If one person develops HIV or cancer, the others probably have the intestinal fluke also. These diseases are caused by the same parasite. They should give themselves the same

deparasitizing program.

Do this once a week. Space them as close together as you comfortably can so it becomes a single treatment.

- **Black Walnut Hull Tincture Extra Strength:** 2 tsp. on an empty stomach, like before a meal or bedtime.
- **Wormwood capsules:** 7 capsules (with 200-300 mg wormwood each) together on an empty stomach.
- **Cloves:** 7 capsules (about 500 mg. each, or fill size 00 capsules yourself) together on an empty stomach. Alternatively, take ¼ tsp. homemade clove syrup 2 times on this day.
- Take **ornithine** every night until you don't need it.

	Black Walnut Hull Tincture Extra Strength Dose	**Wormwood Capsule Dose (200-300 mg)**	**Clove Capsule Dose (Size 0 or 00)**
Day	1 time per day, on empty stomach	capsules 1 time per day, on empty stomach	capsules 1 time per day, on empty stomach

8	2 tsp.	7	7
9			
10			
11			
12			
13			

14			
15	2 tsp.	7	7
	and so on…		

The only after effects you may feel are due to dead parasites! They release their own bacteria and viruses at this time. If this maintenance treatment gives you any noticeable after effects on the same or next day, it means you did indeed kill something. You will know it is gone when there are no after effects from the maintenance dose.

Pet Parasite Program

Pets have many of the same parasites that we get, including Ascaris (common roundworm), hookworm, Trichinella, Toxoplasma, Strongyloides, heartworm and various tapeworms. Every pet living in your home should be deparasitized (cleared of parasites) and maintained on a parasite program. Monthly trips to your vet are not sufficient.

> You may not need to get rid of your pet to keep yourself free of parasites. But if you are ill it is best to board it with a friend until you are better.

Your pet is part of your family and should be kept as sweet and clean and healthy as yourself. This is not difficult to achieve. Here is the recipe:

1. **Parsley water:** cook a big bunch of fresh parsley in a quart of cold tap water for three minutes. Add four drops hydrochloric acid to detoxify traces of benzene from pesticide residue before cooking. Throw away the parsley. After cooling, you may freeze most of it in several one-cup containers. This is a month's supply. Put 1 tsp. parsley water on the pet's food. You don't have to watch it go down. Whatever amount is eaten is satisfactory.

> All dosages are based on a 10-pound (5 kilo) cat or dog. Double them for a 20-pound pet, and so forth.

Pets are so full of parasites, you must be quite careful not to deparasitize too quickly. The purpose of the parsley water is to keep the kidneys flowing well so dead parasite refuse is eliminated promptly. They get quite fond of their parsley water. Perhaps they can sense the benefit it brings them. Do this for a week before starting the Black Walnut Hull tincture.

2. **Black Walnut hull tincture** (regular strength): one drop on the food. Don't force them to eat it. Count carefully. Treat cats only twice a week. Treat dogs daily, for instance a 30-pound dog would get three drops per day (but work up to it, increasing one drop per day). Do not use Extra Strength.

If your pet vomits or has diarrhea, you may expect to see worms. This is just what was wanted. But it is extremely infectious and hazardous. Never let a child clean up a pet mess. Begin by pouring salt and iodine[10] on the mess and letting it stand for five minutes before cleaning it up. Clean up outdoor messes the same way. Finally, clean your hands with diluted grain alcohol (dilute 1 part alcohol with 4 parts water). Grain alcohol is actually *ethyl* alcohol that has been made by fermenting grain. In some countries sugar cane is used to make ethyl alcohol. A common brand in the US is Everclear™. But be careful. The smaller flask sizes are polluted with solvents from the pumping and filling processes, no doubt. Choose the 750 ml or 1 liter bottle, which is evidently bottled differently. Be careful to keep all alcohol out of sight of children; don't rely on discipline for this. Be careful not to buy isopropyl rubbing alcohol for this purpose.

Start the wormwood a week later.

3. **Wormwood capsules:** (200-300 mg wormwood per capsule) open a capsule and put the smallest pinch possible on their dry food. Do this for a week before starting the cloves.

4. **Cloves:** put the smallest pinch possible on their dry food. Keep all of this up as a routine so that you need not fear your pets. Also, notice how peppy and happy they become.

Go slowly so the pet can learn to eat all of it. To repeat:

- Week 1: parsley water.
- Week 2: parsley water and Black Walnut.
- Week 3: parsley water, Black Walnut, and wormwood.
- Week 4: parsley water, Black Walnut, wormwood, and cloves.

Here is a handy chart.

	Parsley Water	Black Walnut Hull Tincture Dose	Wormwood Capsule Dose	Clove Capsule Dose (Size 0 or 00)
Week	teaspoons on food	drops on food, cats twice per week, dogs daily	open capsule, put smallest pinch on food	open capsule, put smallest pinch on food
1	1 or more, based on size			
2	1 or more	1		
3	1 or more	1 or more, based on size	1	
4	1 or more	1 or more	1	1
5 and onward	1 or more	1 or more	1	1

Pets should not stroll on counters or table. They should eat out of their own dishes, not yours. They should not sleep on your bed. The bedroom should be off limits to pets. Don't kiss your pets. Wash your hands after playing with your pet. NEVER, NEVER share food with your pet. Don't keep a cat box in the house; install a cat door. Wear a dust mask when you change the cat box. If you have a sandbox for the children, buy new sand from a lumberyard and keep it covered. Don't eat in a restaurant where they sweep the carpet while you are eating (the dust has parasite eggs tracked in from outside). Never let a child crawl on the sidewalk or the floor of a public building. Wash children's hands before eating. Eat "finger" foods with a fork. If feasible, leave shoes at the door.

Six of the bagged varieties had PCB, benzene, asbestos, thulium, numerous heavy metals and azo dyes. Two bagged varieties were unpolluted.

Fig. 21 Polluted and safe pet foods

Safe pet food is hard to find. Traces of solvents in their food are just as bad for your pet as it is for you. Don't buy flavored or colored pet foods. They are polluted with solvents such as carbon tetrachloride, benzene, isopropyl alcohol, wood alcohol, etc. I encourage you to verify this with the Syncrometer® or by sending a sample to an analytical lab. (See labs listed at end.)

Pets add a great deal to human lives and should have the same loving care you give yourself.

Killing Co-Parasites

Because Paragonimus is the parasite that leads to benzene production right in your own body, it is the link to AIDS and more important than many others that you acquire during your low immunity state.

And because Eurytrema brings the SV 40 virus that is always present in HIV/AIDS disease, it too should have extra attention.

Yet the lung fluke and pancreatic fluke are very fragile parasites, considerably smaller than Fasciolopsis. Both parasites can be killed with the Spice Syrup given in *Recipes*. But you should add extra herbs to make the "General Spice Syrup" if you are very ill.

"Drug Cocktail" Effects

I have only investigated the actions of one drug combination commonly in use by HIV Positive persons. It is a combination of Viramune and Combivir.

I have not done experiments to see if this combination kills viruses directly. But persons on this combination show these results:

It has the effect of killing Paragonimus specifically, without killing Fasciolopsis, Fasciola, or Eurytrema. But without Paragonimus, there are few Pneumocystis fungal growths. No Potato Ring Rot forms so no zearalenone is produced and no benzene is formed. All these are now absent. Without benzene, the HIV virus is not triggered out of Fasciolopsis nor your own cells and so you achieve the "virus—**Negative**" state. Of course, exogenous benzene is still arriving and should be eliminated, too, to become truly **Negative**. But even a 50% reduction in benzene is very significant.

All this would be desirable if the means to achieve it were not so toxic. If you are "on cocktail," hurry to kill Fasciolopsis and Eurytrema as well, and to remove heavy metals, dyes, asbestos, PCBs and benzene from your body. How to do this will be discussed soon. Use your "drug cocktail" time to clean up your body, food and environment so your WBCs can eventually rise and T4 to T8 ratio can climb. Keep up a program of killing parasites with herbs and zapping every day. You might then be eligible for a real "drug holiday", one that does not collapse and require a different drug combination.

Herbs are only one way to kill parasites and eliminate HIV. The electrical way is called zapping. The third way is called homeography. The fourth is withholding their favorite food. We will discuss these soon.

Tapeworm Disease

We all have tapeworm stages in our bodies, probably going back to childhood when we ate dirt. It is not normal for these stages to hatch and develop further. Their purpose is to stay dormant. And perhaps they do little harm this way.

But I have found that all HIV/AIDS sufferers have "tapeworm disease". The stages are hatching. This spews the tiny larvae and cysts, plus unfertilized eggs and their bacteria all over the body, making you feel sick. Perhaps the large amounts of solvents accumulated in the body forces them to hatch; perhaps the lowered immunity allows them to hatch. The Syncrometer® usually detects scolices and eggs in the most vital organs: the thymus, spleen, bone marrow, brain and liver.

one scolex (head) inside cysticercus

multiple scolices inside cysticercus

multiple scolices inside multiple scolices inside cysticercus

Fig. 22 Various types of tapeworm larvae

Coenzyme Q10 is an effective treatment. But it takes a very large amount, 3000 mg., in a single dose.

We have since discovered that coenzyme Q10 also helps to detoxify the more difficult azo dyes, Fast Garnet and Fast Green. Here, too, a large dose is needed. It may be very costly but you are getting extra value from coenzyme Q10. Large doses are more cost effective than small doses. If you can afford it, take a large dose (about 1 tsp. powder) daily. If not, take the large dose once a week.

Fig. 23 Ascaris has pointed ends

If you do not get well after the herbal parasite program, coenzyme Q10, and the zapper treatment, you can assume you have either leftover tapeworm stages or survivor *Ascaris* eggs.

Ascaris Everywhere

Ascaris infests animals and humans from pole to pole of this planet. It is safe to say that all dogs and cats have it and all humans have it from time to time. Domestic animals and humans each have their own variety of Ascaris; yet can host the other varieties, too. Horses have *Ascaris megalocephala*. Pigs have

Ascaris suum. The human variety is *Ascaris lumbricoides*. Ascaris does not attach itself to you, it hardly even moves. It simply lies still in your organs absorbing your nutrients and eventually filling up with eggs. Often they are pink with your vitamin B12!

When you kill Ascaris worms by zapping or with the herbal recipe, they are mortally wounded. They are dying, **but the eggs inside them are not**. They were sheltered. Within a day these eggs begin to leave the dying worm. Soon hordes of eggs are dispersing in your body again!

And in another 24 hours they are beginning to hatch into larvae. You can detect this as it happens with a Syncrometer® and test-slides of eggs, larvae, and adults.

Of course, you will be zapping and taking the herbal parasite killers. But again, these do not penetrate the Ascaris body to kill what is inside. It could take weeks for the dead Ascaris to be totally disintegrated so no more eggs are being sheltered within.

Surely, a few Ascaris eggs still escaping into your body could not do much harm since the overall problem has been greatly reduced! This is not so. The eggs may even do more harm than the worms. Ascaris eggs bring three very important pathogens that spread throughout your body: *Rhizobium leguminosarum*, *Mycobacterium avium/intracellulare*, and the common cold virus, Adenovirus. A flood of these is responsible for your night sweats! As soon as the last Ascaris egg is gone, these pathogens are gone, too, and the following night becomes free of sweating. If your night sweats come back, you know Ascaris eggs are present again. And in 24 hours, unless you kill them, they will hatch into larvae and start the whole cycle over again. "Shingles" comes from *Ascaris lumbricoides*, as well as Mumps.

It takes about three weeks for large parasites like Ascaris and tapeworm larvae to disintegrate completely and be cleared from your tissues. If eggs or scolices are continually released during this time, the cycle of infection cannot be broken. Fortunately, the same two things that can penetrate tapeworm larvae can also penetrate Ascaris worms and mop up after them, whether dead or alive!

Strangle The Stragglers

Here is the Mop-up Program for both tapeworm larvae and sheltered Ascaris eggs:

- ozonated olive oil, 1 tbsp. taken morning and night
- L-cysteine, 500 mg, (2 capsules, 3 times daily).

You can easily make your own ozonated oil. Purchase an ozonator and a small bottle of olive oil. Treat the oil first to remove traces of PCB and benzene.

Pour a glass of **olive oil**. Attach an aerator to the end of your ozonator hose and drop it to the bottom of the glass. Turn the ozonator on before dropping the hose. Ozonate for 30 minutes. When done pour it in one tablespoon amounts into plastic relish cups with lids. Store in freezer. Oil melts quickly when needed. Or do your ozonating in a jar so you can spoon out the frozen oil later. If you merely refrigerate it, ozonate it again after five days to restore potency. Would other oils work? Possibly. I have not researched them, though, so it is wiser to stick with olive oil.

Ozonated oil gives you no noticeable side effects, but it should not be taken more than necessary. One could expect the ozone to jump across from oil molecules to your fat molecules, aging them too soon. Fortunately, the dose is small and may be directed at the intruders before it is directed at you.

The **cysteine** should be the L-variety; it may be cysteine hydrochloride or simply free cysteine.

Taking this supplement in large doses can give you side effects, perhaps due to its penetrating antiparasite property. If you have serious side effects, reduce the dosage. Even if you reduced the dosage, do not take it longer than three weeks. Most persons get no side effects. But the more parasitized you are, the more side effects you could have: fatigue, loss of appetite, nausea. Remember, animals that are being deparasitized have similar symptoms. I have not yet found a way to counteract these symptoms, so do what helps you most. It may be more rest, or taking vitamin C.

Take vitamin E, 400 IU, once daily. Vitamin E will counteract the over-oxidation produced temporarily by the ozonated oil. Take it five or more hours after the ozonated oil to make sure there is no loss of the oil's potency.

Cysteine has other important benefits for you. It counteracts the radiation we all get from living on this planet, called "background radiation". This might even explain why supplementing animals with cysteine had the effect of lengthening their lives substantially. Cysteine is a heavy metal detoxifier, perhaps through the formation of glutathione. It deserves a permanent place on your supplement list.

Nevertheless, supplementing with cysteine should not be overdone. After taking 6 capsules daily for two weeks go off it completely for one week.

If your symptoms return or never completely left, you can assume that some eggs escaped or you still have a particularly resistant tapeworm stage. You may safely double the dosage of ozonated oil. Take two tbsp. twice daily **for three days only**. No Ascaris or tapeworm stage can escape this high-dose treatment. Only reinfection can give them back to you. Although there are no side effects, do not take this dosage on a daily basis. But you may add it to your weekly maintenance program (including vitamin E)

	Ozonated olive oil	**L-cysteine, 500 mg each**	**vitamin E, 400 IU**
Two weeks	1 tbsp. AM, 1 tbsp. PM	2 capsules, 3 times daily	once daily, 5 hours or more after oil
One week off			
Two weeks (if necessary)	1 tbsp. AM, 1 tbsp. PM	2 capsules, 3 times daily	once daily, 5 hours or more after oil
One week off			
Continue this schedule until well!			

Zapping Parasites

Many variations in zapping technique have been discovered since the first one found around 1990.

The original technique showed that very small animals, like our parasites, can be killed with a very small voltage. But only IF the voltage is 100% positive offset, and only IF the voltage is varied up and down repeatedly.

If the varying voltage becomes NEGATIVE, even momentarily, it supports and maintains their lives! This must be avoided. You cannot take this for granted when you purchase a zapper. The maker must assure you that it has been checked on an oscilloscope and not even 1% negative voltage found. Preferably a picture of the zapper output on an oscilloscope should accompany the unit together with an arrow pointing to the zero line. If the circuit diagram is followed, there will be no error.

If the voltage is applied in pulses, to produce a "square" wave, it will affect many parasites at once so that the rate of raising and lowering it, called frequency, is not critical. Even though these tiny animals undoubtedly have a "mortal frequency", this rate does not need to be known or used when a square wave of electricity, **totally positive**, is used.

A positive electrical force that pulses up and down not only appears to kill tiny invaders, it also seems to energize your white blood cells to go on an all-out attack on your enemies: your parasites, your toxins, everything, in spite of their four blockers. In spite of benzene, PCBs, metals, and asbestos! For a time, your WBCs turn into Super-WBCs. That is why I recommend eight hours of zapping daily until you are well.

Remember that killing parasites, by itself, as we can do with herbs, removes the HIV virus source, but this does not return immune power. A zapper, on the other hand, not only eliminates parasites; it does so by returning immune power. Each method has its own virtues.

With this knowledge you may build or purchase a zapper. It is energized by a 9 volt battery. This is too small a voltage to harm you or even to feel although some people can feel a weak tingling sensation. Most of the current is flowing through the blood in your arteries and veins, but a fraction of it reaches every organ and tissue in your body. Except when this organ is saturated with a liquid *insulator*. Insulators do not let current pass.

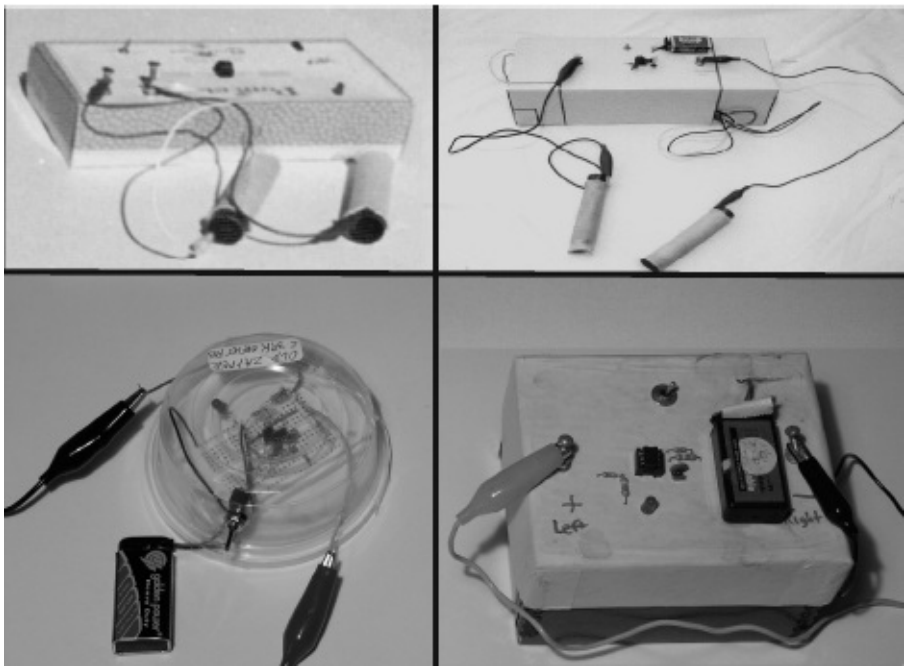

Fig. 24 Homemade zappers

HIV/AIDS victims are particularly full of insulators. How can that be?

PCBs

The "best" liquid insulators ever invented were a family of chemicals called polychlorinated biphenyls, popularly called PCBs and resembling thin machine oil. They were soon put to use in transformers, the large pots or kettle-like containers you see hanging from tall utility posts. Our industrialized nation, the United States, had not solved the problem of disposal though, before PCBs came widely into use. Finally, in the 1970s, after 40 years of use, production was stopped because the disposal problem still had not been solved and PCBs were beginning to seriously pollute the environment. They were now classified as a "toxic waste" to be disposed of only in government-regulated ways, mostly in metal barrels buried in toxic waste disposal sites. Now, 30 years later the barrels have leaked considerably through unavoidable rusting and breakage, and PCBs are trickling out and downward, with gravity, to the nearest waterway.

Meanwhile, PCBs began to pollute the oil supply for the world's soap trade. I noticed this by testing the soaps and lotions and salves that my clients were using. Even the liquid soap you could buy by the gallon in natural food stores was polluted with PCBs. I reported this in my books in 1995. When I reported this to the soap and lotion makers, I thought they too would be shocked and eager to eliminate it. I offered to help find their source of PCB pollution. Their response was even more shocking; it was to threaten me with lawsuits instead.

And so we all have been lathering our skin and scalp with PCBs. Being oils, they are immediately absorbed by the thin layer of fat that is beneath everybody's skin and held there. There is no detoxifying pathway for them in the body. That is why they are described as "not biodegradable". When the amount becomes quite large, the body pushes them into "blebs," also known as fatty cysts. PCBs from shampoos often develop into fatty cysts at the nape of the neck. PCBs from soaps and ointments may appear on the arms, legs, back or abdomen. If you have **fatty cysts** try to have these drained, if at all possible. They are not benign collections of "fat".

While the PCBs are collected in a bleb (pool) in your skin they are not harming you. But if you become ill for any reason your body mobilizes its skin-fat, and the PCBs will now drain into your body.

Much more information on PCBs is available in libraries and on the Internet.

Our public agencies publish reassurances that no health hazard exists. But the Syncrometer® tells a very different story. As a society we must mobilize our resources to destroy them and avoid them.

PCB Pathways

PCBs follow the lymph pathways, reaching the organ that is diseased or under attack.

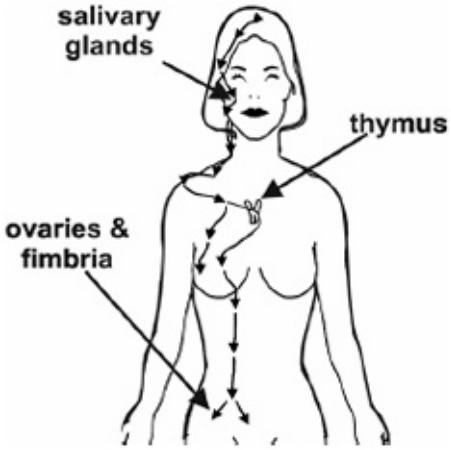

Fig. 25 PCB route in HIV disease in women

There are three main pathways for PCBs to travel although there are innumerable minor pathways, too.

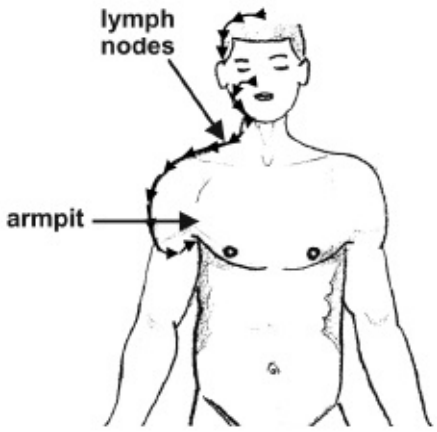

Fig. 26 PCB route in absence of disease

In women with cancer PCBs travel down to the center of the breast, coming out at the bottom, down to the waistline, headed for the fimbria of the fallopian tubes and then to the ovaries. Special pathways to the tumor location are formed

from this main route. In women with HIV disease, a major pathway to the thymus is seen; from there it skirts through an edge of the breast and downward.

In the absence of these diseases the major pathway for both men and women is toward the shoulder, down the arm and across to the sweat glands. .

In men with cancer PCBs have traveled to the lymph nodes that cluster at the neck, shoulders and collarbones. From here they internalize to show up at the cancer site.

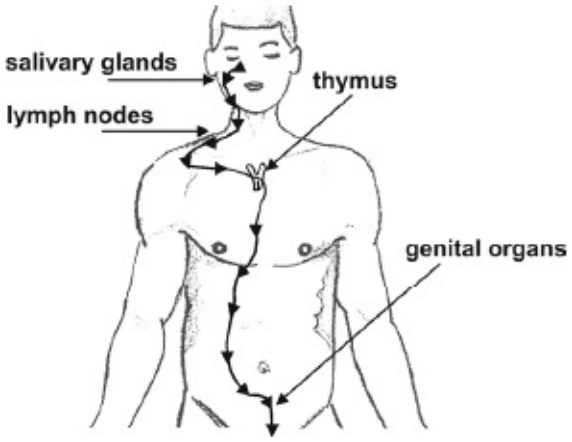

Fig. 27 PCB route in HIV disease in men

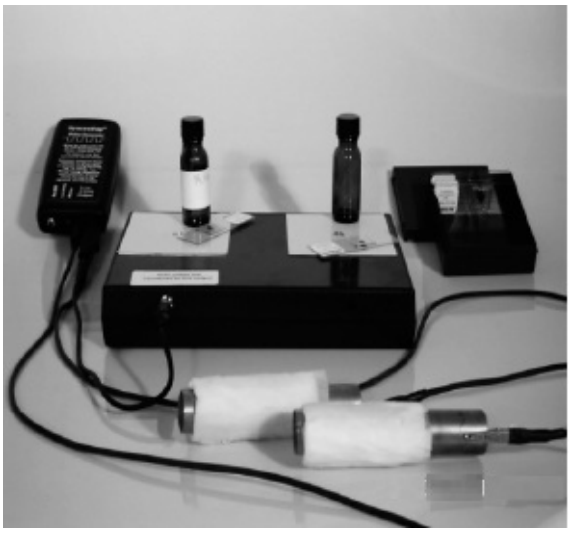
In men with HIV disease in the United States, the skin over the thymus is heavily loaded with PCBs coming from all the neck lymph nodes. They exit from the thymus through an edge of the breast down to the genital region.

Usually, one side is more affected than another.

Insulators, by definition, do not pass current. So the very regions that are most important to you now, the thymus and bone marrow, will not get a strong zapping using the regular technique described in earlier books. Another problem is hands; both hands and wrists of HIV/AIDS victims are typically saturated with PCBs, so the usual zapper contact points are much less effective, too. To zap these regions a new technique has been developed, called plate-zapping.

Plate-Zapping



The locations to be zapped are on the plates. Bottles or slides represent them. Escaping pathogens as well as targeted pathogens are placed here, too.

Fig. 28 Plate-zapper

The zapper current does not penetrate a body region that is saturated with PCBs because they are insulators. I think plate-zapping overcomes the obstacle of PCB saturation because there is resonance between the sample on the plate and your tissue causing higher voltage and current through that tissue. For instance by placing a sample of thymus on a 3½-inch capacitor plate in the pathway of the zapper current, the two similar organs (your thymus and the thymus sample on the plate) will be in resonance. I think this maximizes the current through your thymus. The thymus sample you put on the plate can be in the form of a microscope slide, meant for study by biology students. Microscope slides can be purchased from biological supply companies (see *Sources*) and are safe to handle.

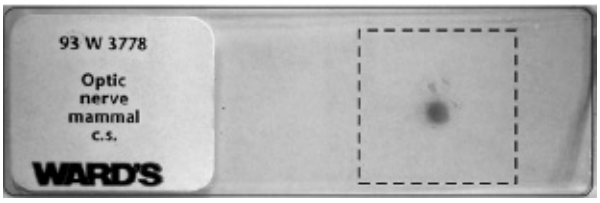


Fig. 29 Microscope slide with real tissue under glass square

Bottled Alternative

Instead of an actual sample of an organ, like on a microscope slide, it is possible to use a virtual copy. A virtual copy is a sample of water that has the

frequency pattern of an organ in it. This bottle of "patterned" water can act like the slide or real sample and has the advantage of convenience and availability. The zapper circuit uses the frequency pattern in the bottle-copy to find an identical one in your body. Whether you use a slide, bottle copy or a piece of real tissue, it provides the location where you want to maximize the zapper effect.

Bottle-copies are easily made from slides or real organs, even by a totally inexperienced person, using a regular zapper (30 kHz or more). Extra details are given in Experiment #96 of the *Syncrometer® Science Laboratory Manual* (see Parts Kit #96 in *Sources*).

White Blood Cells Respond . . .

With the sample of thymus placed on the plate in the pathway between you and your zapper, the current has an instant effect on the white blood cells of your thymus since these are part of the tissue sample. Instantly they are energized and begin to eat the PCBs, the benzene, the magnetic metals and the asbestos in your thymus.

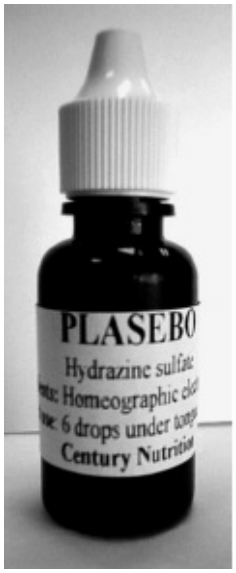

Fig. 30 Bottle-copy has frequency pattern of an object or chemical in water

Like a fairy godmother who has waved her wand, all four immune blockers are quickly taken out of the thymus tissue and imprisoned in the white blood cells. They have phagocytized. After this phagocytosis continues normally. Normal conductivity returns too, when all insulators have been removed. Large parasites and small parasites are killed next, perhaps with special WBC

weapons. Even tapeworm stages are killed and eaten. Hundreds of toxins, heavy metals, fungus, mycotoxins, all are eaten in one big frenzy.

However, it can all come to a screeching halt if the voltage of the battery has dropped below 9.0 volts. To do this superb job the battery must not run down below 9.0 before the job is done. And it takes 20 minutes, not just seven as it does for regular zapping. Only the specified locations are zapped by this method, not the whole body as for regular zapping.

. . . But Only If Fed

What will happen to the gorged white blood cells after they have "eaten" all this toxic waste? Will they carefully guard against any losses on their way to the kidneys and bladder? Will they unload their super toxic cargo in the proper place (bladder)? How do they unload their cargo? It all hinges on selenium and germanium of a very special kind. The wrong kind does no good at all. Only selenite and organic germanium work. These two enable the white blood cells to transfer their toxic load to the kidneys' WBCs, and then to the bladder and from there to appear in the urine. A Syncrometer urine test will now be **Positive** for PCBs, asbestos, lanthanide metals, mercury and all the others identified before, even Fast Garnet, Fast Green dye and holmium.

Vitamin C is needed, too, for your white blood cells to kill and unload their dangerous cargo. That is why it is included in the *2-Week Program*.

If there is not enough selenite, organic germanium or vitamin C, the white blood cells simply stop; they wait as at a dock, for days, and some of the toxic cargo escapes to the spleen, to the bone marrow and to nearby arteries and lymph vessels.

It takes 1000 mcg (1 mg) of selenite and 1 tsp. hydrangea powder in a single dose to keep unloading the thymus toxins for four hours. One cup of coconut "milk" has both. It takes two more doses after that, spaced four hours apart (altogether 12 hours) to clean up the thymus or other small organ.

Throughout the day, the thymus should be plate-zapped in various ways: combined with arteries, combined with veins, combined with white blood cells, each for 20 minutes. These zaps are interspersed with zaps to clear blood, lymph and the white blood cells themselves. And of course the kidneys are zapped to keep them from clogging with the heavy metals. Twenty-minute zaps can be kept up for eight hours or more.

A miracle has been done for you in one day. The battle for your thymus has been won. Be patient with the after effects due to dead parasites!

What happens to the dead carcasses of large flukes lying about like dead rats? They will soon be enveloped in mold and toxic decay. Watch what happens to a tiny dead fish at the bottom of an aquarium at a pet store. Within a day fine fuzz is seen all over the surface, like velvet. In a few days if it is not scooped out, a halo appears around the dead fish. Fungus has taken over the entire fish and is now going through its own stages of development, glistening under the aquarium light. The owner will scoop it out.

Who will scoop up the dead flukes in your thymus? If you had zapped flukes in the intestinal tract or liver or pancreas, they could have been pushed out through their ducts into the intestine and finally into the toilet. But the thymus and other organs have no such ducts, dead parasites will have to rot on the spot, turning into a bed of fungus, and all of it producing mycotoxins. A much better solution is to digest the fluke debris.

Fifteen capsules (about five or six grams) of mixed enzyme powders can digest the dead matter coming from four hours of zapping. Eight hours require two such doses.

When AIDS has already begun, nothing less than eight hours of zapping daily can catch up and exceed the rate of spread of disease. Zap eight hours daily until you are well.

Dodging The Flu

Is there a price to be paid for killing so much so quickly in the thymus? When an animal is "wormed" intensively, it may get quite ill. Yet, "sick-time" is a luxury that is not available for many AIDS patients. Every day must show advances made over parasitism. What can you expect? Although the fungal growth and decay-toxins can be avoided with digestive enzymes, one unexpected result cannot be entirely avoided. It is popularly called the "Herxheimer" reaction, or "healing crisis." It is an assortment of flu-like, cold-like, miscellaneous, and somewhat mysterious symptoms. It is the surest sign that your zapping is effective and you will heal. Fortunately, they don't last long.

Investigation of these symptoms with the Syncrometer® shows it is not mysterious at all. A new population of Salmonella bacteria and influenza virus has suddenly emerged. Many species of Salmonella are present. And both influenza A and B are present. Where did they come from? They appear in

exactly those locations where the two largest flukes were, Fasciolopsis and Fasciola. After many hundreds of spottings, it seems that they escape from the dying flukes like rats from a sinking ship. Sometimes Adenovirus, the common cold virus is present too. Adenovirus comes from killed Ascaris. They all contribute their symptoms to a common set we call flu and Salmonella Syndrome (FSS), or **detox-illness**.

Zapping one organ may give you such symptoms while another does not. The difference is clear. It depends on the lymphocytes there. If they are filled with mercury and thallium (from amalgam in teeth) they are not able to kill viruses or Salmonellas. And you could get detox-illness. If amalgam has already been removed there, flu and Salmonella pathogens are killed as fast as they emerge and no sickness is felt. That is why our *2-Week AIDS Program* starts with removing amalgam by extracting teeth and taking L-G and L-A. You are now less likely to get detox-illness from plate-zapping. Nevertheless, you are likely to experience some attacks. It is a very small price to pay since it is not a virulent flu or vicious Salmonella attack nor a dreadful cold. You have already been "carrying" these pathogens for many years as <u>your</u> strain. In fact, you have already been attacked and have felt them many times without recognizing it. And as often as you have had the flu you have also battled and won "prion disease". The Syncrometer® sees **prion protein** bits escaping from the flu virus.

There are ways of combating detox-illness that do not involve antibiotics. Arm yourself with Lugol's iodine to kill the Salmonellas. That is half the battle. Lugol's is an old remedy for thyroid disease and is exceptionally safe! Only Salmonella bacteria are so sensitive to iodine that six drops in ½ cup of water kills nearly all that are in your body anywhere. Four such doses taken in a day could eliminate them even in your brain.

Prions are very sensitive to several herbs. They are given in the "Prion Punch" recipe.

I recommend taking Lugol's and Prion Punch four times daily, preventively, on days that you are plate-zapping. **But do not take Lugol's if your doctor has told you, sometime in the past, that you are allergic to it. This could happen after a clinical scanning procedure that uses a large dose of iodine.**

The flu and Salmonella syndrome is a partnership. Together, they can cause mild fatigue, slight nausea, slightly elevated temperature, dizziness, disorientation and lack of appetite. But mood is usually spared or even elevated! By preventing at least one of the FSS duo (Salmonella) from developing, by

taking Lugol's, the symptoms are greatly lessened. You may, in fact, notice nothing. But it is better to be forearmed against flu, too. Have on hand homeopathic flu medicine, Oscillococcinum.

Our best solution for avoiding detox-illness is homeography. Together with antidote tactics (Lugol's, Oscillococcinum and Prion Punch) and zapping tactics, side effects can be totally avoided. We will discuss homeography later.

It is important to know that if you develop any after effect from zapping, however small or large, we have always found it to be due to flu, Salmonella and prions, namely the result of killing large flukes. For some persons Adenovirus, the common cold, or *Clostridium botulinum*, which causes weeping, plays a role, too. Go after these the same way—by including them at the zap location and with homeography.

Plate-Zapping Is Part Of The Team

Will plate-zapping the thymus bring your T-count back up and reduce your illness? You may already have many diseases in progress, caused by: Pneumocystis, Toxoplasma, CMV, or Treponema (syphilis). Will they go back into their capsules and hiding places or be killed to bring you relief?

The answer is yes, if at the same time you are removing amalgam and dyes from your teeth and your food so you can make competent T4 and T8 cells again, and don't kill them with benzene after they are made. Remember they are made in the bone marrow so your next plate-zap should be at the bone marrow. Your T-cells are being killed and disabled in all your lymph nodes, the spleen, bone marrow, genital organs and thymus by five immunity-destroyers, and so far you have only removed these from the thymus. So perhaps you will feel dramatically better, perhaps not. Be patient. As long as you are plate-zapping eight hours a day without being sidelined due to detox-illness you are progressing as swiftly as possible.

Of course you are avoiding eating any of these immunity-destroyers, including Fast Garnet or Fast Green; we will discuss diet and dental sources of these later.

After plate-zapping the thymus and bone marrow, zap all your genital organs, one at a time. Follow the detailed instructions given in the *2-Week Program* Zapping Schedule.

So far we have discussed two ways to kill parasites on a grand scale: the

herbal way and the plate-zapping way. But there is another, much simpler way!

Feast or Famine

The fastest way to get rid of any pest, like ants or mice, is to have no food for them. Does Fasciolopsis have a special food that it depends on? Insects with a complex life cycle, that includes a caterpillar, sometimes depend on a single plant to provide essential food factors. The Monarch butterfly is an example. It must have the milkweed plant to grow its larva; the Koala bear needs a single food, Eucalyptus leaves.

When the tiniest bit of onion is eaten, it arrives quickly at all the various Fasciolopsis lairs. What is the attractive force? New parasite stages immediately develop and their population booms. Withholding onion is just as powerful. The famine we create for them cuts their population in half in about 5 days. But many sources of onion are so unexpected, it is almost impossible to avoid. Most kitchen spices I tested and even a sample of organic butter had onion chemicals in them! The only way to rout the last remnant of onion is with a diet completely devoid of canned food, spiced food, and processed food for two weeks. This is the third way to kill Fasciolopsis on a large scale. And the search is on to find the essential foods of Paragonimus and other parasites.

When we stop eating plants with onion-chemicals Fasciolopsis disappears (were they killed?). I have not identified which chemical or chemicals in raw onion provide the essential nourishment for Fasciolopsis.

The Lily family includes only a few foods: onions, garlic, leeks, chives, and asparagus. I tested all of these and they had raw onion chemicals along with non-Lily plants cilantro, beet greens, and Swiss chard. The solution for these vegetables is simply to cook them thoroughly! Unfortunately, onion is added to so many spices that nearly all canned and processed food have them, even when no spices are listed, and evidently escaped being cooked enough! Our tactic will be to eat only unprocessed food, prepared in simple ways. In one week the Fasciolopsis population is decimated. But we should kill them with direct methods, too.

An Enema A Day Keeps The Viral Load At Bay

A simple way to kill very many HIV viruses is with enemas. The bowel, too, becomes a seething source of HIV viruses and other disease pathogens as AIDS progresses. They are easy to kill here, with a simple enema. Use Lugol's or

Black Walnut hull tincture added to the water. Alternating them is best. Even plain salt water can flush out half of them each day. Take an enema daily. See instructions.

Viral Load Dropping

With the thymus, bone marrow and genital organs cleared, and the bowel-virus greatly reduced, the viral count will be on its way down. Way down! But it is too soon to get a new viral load test. It is best to wait for three weeks. And even if the drop is as far down as "UNDETECTED," you must not rest. Undetected does not mean zero, or that you are cured. To be cured, all the Fasciolopsis adults and larval stages in your body must be eradicated, a worthwhile goal in any case.

There are more Fasciolopsises in other organs, in the brain, in your lymph nodes, in your salivary glands and under the skin in the lymph vessel valves. Are they setting free their HIV viruses? Only if benzene is present. But the hazard is too great to let any survive.

You are no longer using benzene-polluted foods and products. And other herbs are assisting Black Walnut in killing Paragonimus and Eurytrema to stop benzene from forming and the SV 40 virus from appearing.

You are no longer feeding Fasciolopsis its essential nutrient from the Lily (onion) family. The benzene already in your body will be destroyed with vitamin B_2. Vitamin B_2 will also detoxify Fast Garnet and Fast Green dyes though more slowly than coenzyme Q10. Stay on at least 10 capsules of B_2 daily. Together with coenzyme Q10 and dye-remover herbs (see *Recipes*) you will soon get these dyes out of your WBCs, where the harm is being done.

Benzene turns into phenol. Magnesium and glucuronic acid destroy phenol. Magnesium should be taken in large doses (but only the powdered variety to avoid its laxative effect). Glucuronate is found in Kombucha tea, a traditional Asian recipe[11], and in supplements.

Phenol is broken apart into wood alcohol. This is detoxified to formaldehyde. Detoxification of formaldehyde is often stalled by lack of taurine. Finally, it is all turned into formic acid—the most vicious of the series! This, too, must be gone before healing begins, but there is a simple way to do so which we will discuss soon.

Zapper Mysteries

It is interesting that simply turning on an electrical (or magnetic?) field of the correct variety gets phagocytosis started. Regardless of which immune blocker is present, the white blood cells can be stimulated electrically to begin phagocytosis. From this I concluded that something much more fundamental was happening during zapping, something completely new and not understood.

All the blockers can, of course, come back. If any of these is not excreted, at least by the next day, or if more arrive from teeth, food, or neighboring sources, phagocytosis stops again.

For this reason the most important locations, the thymus and bone marrow should be plate-zapped daily, as well as the blood, cerebrospinal fluid, lymph, arteries, veins and white blood cells for at least two weeks. Other locations get added to this **basic set**.

There is another way, besides herbs, zapping, enemas and nutrient withholding to eliminate parasites from your body: restoring immunity. The body normally uses benzoquinone (BQ) and rhodizonic acid (RZ), which it makes itself, to kill flukes and two very common Ascaris varieties. It uses the body's own electricity to make these.

In AIDS, as well as cancer and other diseases, large parts of the body are no longer making BQ or RZ nor the other immune weapons I mentioned earlier. We will find a way to help the body make them again through **homeography**.

Homeography

Homeography is a new science. It uses electronically prepared drops of water taken by mouth. It rests on the ability of water to incorporate a frequency pattern of some object or chemical or living thing and to hold it in a stable way for a very long time (years). More than one frequency or frequency pattern can be stored together.

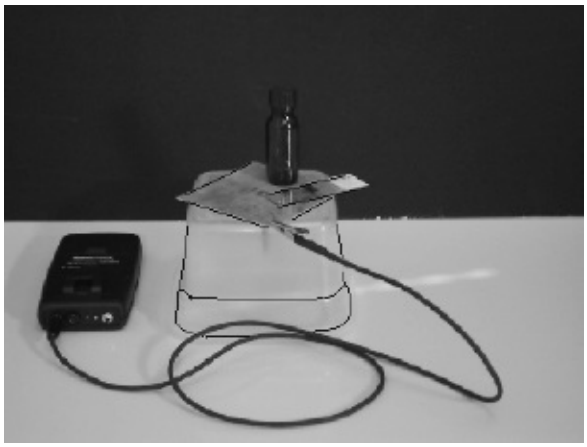

Fig. 31 Making a bottle copy of a slide using a zapper

In fact, water seems to have a large capacity to hold frequencies without getting them mixed up or blurred. These discoveries are too new to be able to answer even simple questions. What kind of energy is being held in the frequency pattern? How is it held? Only further research can shed light on these problems. But the phenomena are surprisingly simple to see and repeat by anyone.

How To Make Homeographic Drops

You will need a source of Positive offset square waves, at least 30 kHz, close to 50% duty cycle and at least 9 volts peak-to-peak. This is what a zapper produces, so you may already have the most important item. You will also need a 3½ inch square of aluminum sheet, about 1/32" to 1/16" thick, called the plate. You may find the aluminum at a hardware store; just cut to size. The plate is fastened to a plastic stand; a disposable food container works well. A wire comes from the Positive output of the zapper and connects to the plate. The Negative output is not used.

To use the apparatus, place a bottle of plain water from the cold-water tap on the plate. The bottle may be brown glass or polyethylene plastic. It should contain about 10 ml (2 tsp.) water. Place the item you want to copy right beside it. Surround all bottles used with a metal shield (aluminum or aluminum-steel pipe) to make the effect stronger, although it is not strictly necessary. The two items or tubes must touch. Now zap for 20 seconds. The plain water now is a **bottle-copy**.

Place tubes over bottles to shield them (see Sources).

Fig. 32 Shielded bottles make stronger copies

After incorporating a bone or other substance into a water sample, its presence should be, ideally, verified using a Syncrometer® or more rigorously, using a digital frequency synthesizer in conjunction with a Syncrometer®. These optional details of copy making are in the *Syncrometer® Science Laboratory Manual*. Realistically, you must be able to trust the copier.

Numerous purposes can be achieved with electronically made bottle-copies. You can use them when testing with the Syncrometer® or when plate-zapping. Secondly, the water copy itself can be taken by mouth in the form of **drops** under the tongue. How could this be useful? Depending on the variety of drops made, different goals can be achieved.

Homeographic Drops Can Strengthen

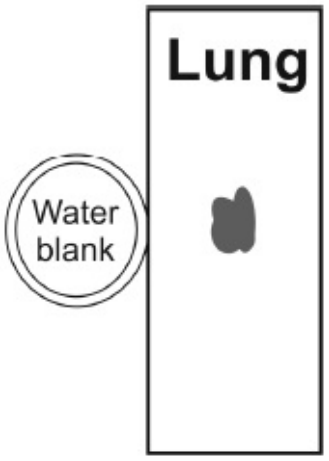

Fig. 33 Strengthen your organs with their own frequencies supplied as drops of water.

1. The most important goal is to clean your organs of all the toxins, pathogens and parasites accumulated there. Simply making a copy of each organ and taking this as drops many times a day accomplishes this. For a few hours the Syncrometer® sees the new frequency pattern superimposed on your own organ's pattern. For a short time you are not missing any frequencies from your own "sick" organ. Sick organs regularly miss many of their frequencies. Does this strengthen metabolism? Does it give you your previous youthful vigor? The WBCs get activated as if you had zapped this organ. Sometimes you can feel the effect immediately.

Never take drops of a parasite or a virus. It would surely strengthen them! Use only the goals and formats given here. This is not the same as homeopathy.

The dose is six drops taken 6 times daily for two days. Drop them under your tongue just behind the lower teeth. Leave them there to slowly absorb before swallowing them. After two days reduce the dosage to 3 times daily. No food should have been in your mouth for five minutes, nor eaten afterward for five minutes.

You can use multiple samples to focus the action more precisely. In this example we make drops of the CD4 cells in the thymus. Taking these drops would strengthen them specifically. I have not found good uses for combining more than two anatomy samples, so as tempting as it may be to make an "all-in-one" bottle, do not experiment! It could be detrimental.

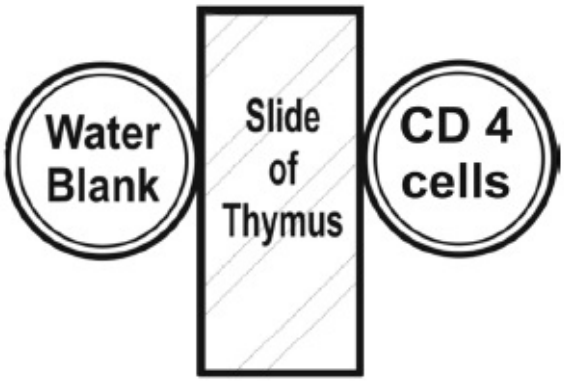

Fig. 34 This combination makes the thymus CD4 cell pattern

Many of your organs have a left and right partner. For example, you have two lungs and two kidneys. In the case of the thymus and thyroid there are left and right lobes. Your brain has a left and right side that is quite symmetrical, but your liver and pancreas have left and right portions that are not symmetrical. The more we can focus on a particular part, the more effective our drops will be. Capacitors and inductors are electronic components with a precise amount of capacitance or inductance. By putting them on your plate, along with an organ sample, you change its electrical properties slightly. I have found by adding a 1 pF (picofarad) capacitor you can move the location more to the right or further up. If instead you add a 1 μH (microhenry) inductor you can move the location more to the left or further down.

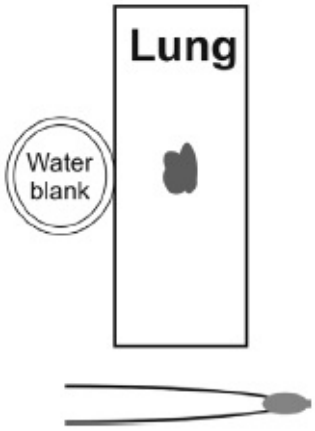

Fig. 35 To make a right lung, place a 1 pF capacitor on plate

For example, suppose you know your right lung is worse than your left, and you want to concentrate on the right lung. You might make a bottle copy of a lung slide, and a 1 pF capacitor laid near it. The resulting drops would strengthen

the right lung only.

You may make drops of all the organ samples you can buy. You may have 30 or 50 bottles to take, **giving one minute to each**. You can do this while you are zapping. There are no side effects although you may feel new body currents in locations of disease. If you take these drops more than 6 times daily, the effect may be much stronger. If you give yourself detox-illness you have evidence that you even killed large parasites. How did your body do that?

Homeographic Drops Can Supply

Homeographic drops can add missing things to a particular organ. The things we want most are the immune weapons BQ, RZ, G, and GA. These mega-parasite killers are by far the most dramatic and versatile chemicals in our bodies, as impressive as the power of our neurotransmitters. They have the most responsible job—to kill large parasites. The AIDS patient's body is full of parasites—because there are no mega killers at most locations.

You can instruct your body to make BQ by using a homeographic combination. A different combination makes RZ.

To make BQ, which kills one of our Ascaris varieties (*Ascaris lumbricoides*), we combine the organ where you wish to install it, with saliva and blood all together in one blank bottle of water. Bottles have shields placed around them; slides do not. After taking these drops several times you will find BQ present in this organ.

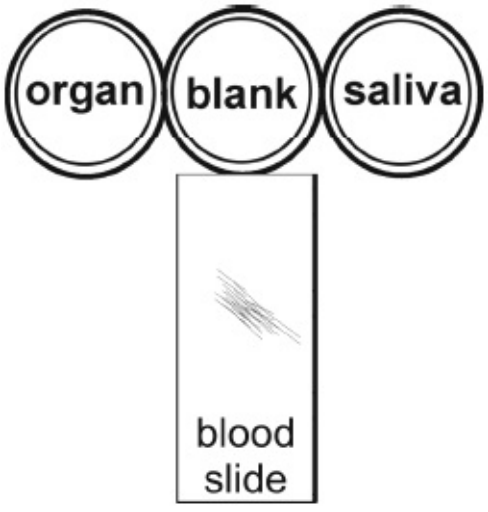

Fig. 36 This combination makes BQ in the organ

One could, of course copy some real benzoquinone into a bottle of water and take those drops. We call this "cloned BQ." These drops are quite powerful but only for a short time. Inducing your body to make BQ using the combination of saliva and blood and organ is superior!

To make RZ, the organ to be replenished is combined with saliva and lymph. The saliva should be from a fairly healthy person. Bottle copies of all these supplies can be purchased (see *Sources*). Notice that the three ingredients must not touch each other, but all must touch the blank bottle.

Why are BQ and RZ missing in the first place? It depends on the presence of Ascaris-chemicals, such as 1,10-phenanthroline, guanidine, methyl guanidine and others. Ascaris produces a host of such abnormal chemicals. Evidently they quench BQ and RZ.

If BQ can be made abundantly, until no Ascaris or their chemicals are left, the body can continue to make its own BQ. If not enough is made, Ascaris chemicals are left over, stopping the production of BQ. BQ continues to be missing and now parasites can grow large, mature, and shed eggs. Parasitism continues.

As soon as you take six drops of the saliva-blood-organ bottle-copy your body starts making BQ at that organ. This destroys the Ascaris-chemicals as well as Ascaris itself at that one location. Within the day, this tissue is freed from Ascaris parasitism. You may suddenly feel like a brand new person. Ascaris was bringing you night sweats.

As soon as you feel better you may reduce the dosage to 3 times a day. Because of the possibility of reinfection from the environment and also from other parts of the body, it would be wise to continue taking these drops 2 or 3 times per day for months.

Making G, GA and other weapons requires combining other body fluids, including bile and urine. Each combination kills a specific large parasite. Until research on these is complete take the cloned weapons themselves.

You now have a very easy way to remove both toxins and parasites from your most important organs with a minimum of discomfort, and to restore immune weapons. It is not unusual for an AIDS patient to be taking 30 or more homeographic bottles continuously while zapping for eight hours a day.

Zapper Alchemy

Another technique is plain copying. After a few days of taking drops you may be running low in this variety! You can make more the same way you did the first time, but it's easier to make a copy! Copying a single bottle to another (blank one) we call "cloning". But if you want to use this technique you must do so while your bottle of drops is still half full. Clone any new bottles as soon as you make them.

Fig. 37 To clone your master substance it should touch the blank

Being able to copy almost anything into a bottle of water gives you access to perishable, unpalatable, hard to find, or very expensive substances. For example, I highly recommend benzoquinone (BQ) and rhodizonic acid (RZ), but they are not readily available. Similarly, nopales and jalapeno seeds are somewhat perishable—so just stuff them into a half-ounce glass bottle, and copy them for posterity! Such copies give you some of the effectiveness of the real thing; in general, about one half. Clone your new copies before they are half consumed in order to continue getting strong copies. Copies of copies retain their strength. **Keep all bottle-copies out of direct sunlight and at least six inches (15 cm) away from any magnet.**

The beginning list of drops to make for yourself is given in the *2-Week Program,* Homeography Schedule.

If your caregiver is also HIV Positive, make two bottles instead of one each time. This lets both of you recover together.

Review

It is important to kill all your parasites because some are making you sick directly while others are contributing to your illness indirectly.

1. The herbal way is system-wide but misses hard to reach places like the

brain and lymph valves under the skin. Also, herbally killed parasites release their eggs into the blood unless promptly zapped. Although cloves kill eggs, it is difficult to consume enough at the right time. Regular zapping is easier.

2. The zapping way should be done by plate-zapping since PCBs saturate the most important organs, even hands, preventing them from conducting the zapper current. For plate-zapping, sit with your feet on the zapper's copper tubes for a total of eight hours a day. Follow a schedule of organs to be plate-zapped. This lets you restore immunity to one organ after another. Expect minor side effects, which you minimize by taking "protective" drops for the key brain organs, hypothalamus, pituitary, pineal and cerebrospinal fluid.

3. The homeographic way keeps your mouth busy for about ½ hour, 6 times a day. What could be easier! You can strengthen each organ while clearing it of its toxic burden. You can restore your immune system's weapons and take cloned drops of those weapons you cannot restore.

4. The starvation method is easy but only eliminates Fasciolopsis, the most important one.

5. Enemas are quick but not permanent, and limited to your colon. However the colon does have the largest viral and bacterial load.

Which method is best? Use all five. They complement each other. Take the herbal recipe <u>while</u> zapping. This kills eggs as they are released. You may take drops while zapping, too. You can even do four of them while getting IV feeding. If you are not able to sit, attach copper pipe electrodes to your heels using socks that are tight fitting with holes cut in the right places. There must be considerable pressure applied. If you already have AIDS waste no time.

- Remember that your viral load will not come down unless you get rid of benzene and kill the parasite *Fasciolopsis buski* everywhere. You must also kill Paragonimus that leads to benzene formation in the body. And kill Eurytrema to get rid of SV 40 virus.
- Your CD4 cell count will not come up significantly unless Fast Garnet is removed from them. Your CD8s will not go down significantly unless Fast Green is removed from them.
- And <u>none</u> of these successes returns your phagocytizing power system-wide. To regain this and have immunity again from all the treacherous diseases everywhere in your body (not just in the locations where you have

zapped or "dropped") you must get rid of the immune blockers: benzene, PCBs, asbestos, and metals. We will get rid of these in the next chapter.

It will be a fascinating adventure. You will need a friend to care for you, help you make drops, help you zap for hours each day, help you get your supplements down, help you wash and treat your food, help you cook from scratch, and, finally, share your successes.

Such a friend is an angel from heaven. Reward him or her with your smiles and determination to do everything right. And when your AIDS lifts ever so slightly, try to help. If you have come up from incontinence, diapers, disorientation and sweats, give your caregiver the top copy of your new viral load results. Express your desire to live and your appreciation, because you need still more help. A **Negative** viral load is only part of the goal. Getting well is the whole.

And when you are well, write to AIDS activists, the gay groups, "Positively Aware", "Positive Health News"[12] and other HIV bulletins. Ask them if they would like to know how you did it. Let's hope they listen.

Getting Back Immune Power

Killing Fasciolopsis as you did in the last chapter will, of course, get rid of the HIV virus source and begin reducing your "viral load."

> The "viral load" test measures how many viruses are actually present in 1 milliliter (ml) of your blood. One ml is 1/5 of a teaspoon. The test we have been using is called HIV-1 RNA PCR QN. PCR stands for polymerized chain reaction. QN means quantitative, the determination of quantity. RNA stands for the ribonucleic acid of this virus.

But getting rid of the virus is not the same thing as regaining your immunity. It is true that killing the virus leads to the greater survival of your CD4 lymphocytes. But if your CD4s were not filled with mercury and thallium they would be able to dispatch these viruses themselves instead of succumbing to them. And this is only a fraction of the immune power you have lost, making you sick.

Your phagocytes which make up the bulk of your immune cells need to be able to phagocytize again. Your lymphocytes need to be able to kill the viruses they contain, not just trap them. Your CD4 cells must no longer be programmed for early death by an azo dye. Nor should your CD8s be programmed for extra longevity by a dye. And your bone marrow should be able to produce the correct number of white blood cells as well as red blood corpuscles.

When these things are set right you will get well, feel well, and have all your old health back. But will you keep it? To keep it, you must stop getting the four immune blockers and the azo dyes into your body. Getting rid of these permanently is the subject of this chapter.

You can get half of this job done in one week. It can be the same week as you begin to kill parasites. And because you can do it all, kill parasites and get immunity back in two weeks, or at least see some visible results, I wrote a two-week program for you to follow. In the *2-Week Rapid Rescue Program* you do as many things as you can, as soon as you can. This salvages a loved one when nothing else can. But you may go slower if you have the time. Use judgment.

While on the program your viral load will be dropping at the same time as your immunity is returning. After two weeks you can be a whole new person. Gone are night sweats, fatigue and infections. Your appetite comes back; you can start gaining weight and do very moderate exercise.

You may have believed there are hundreds, if not thousands of things that lower your immune power, all the conveniences of civilized life, for example.

And you may have heard of dozens or more ways to "boost" or improve immune power. But removing the barriers to your own immune power is much more efficient and powerful than adding "boosters."

I have found only five things that affect phagocytosis (ability of cells to eat enemies): asbestos, certain metals (mercury, thallium, lanthanides), PCBs, benzene, and azo dyes.

Immune power should not be a fuzzy concept. Fuzzy concepts misguide us and lead to wrong conclusions. Our WBCs are our immune defense. In the same way as we were watching the thymus, we can watch our white blood cells (WBC), using the Syncrometer®. Just how to arrange for WBC-watching is given in the *Syncrometer® Science Laboratory Manual*. We can watch the white blood cells in action in the blood or lymph or even in arteries, veins and tissues of any organ. We can see if WBCs are eating bacteria and toxins (phagocytizing). We can see if they are making special chemicals—interleukins, for example. We can see if they have the equipment they need to carry out their work—beta glucans, for example. We can see if they are scheduled to multiply or to die by finding the ratio of **bcl-2** to **bax** gene products in them. We can discriminate between different white cells by their surface markers and search for the problems they may be facing. For example we can focus on CD4 (helper) cells, CD8 (suppressor) cells, or CD14 (macrophage) cells.

If you are planning to be a caregiver and perhaps even reach out to other AIDS victims in the future, start by learning to test with a Syncrometer®. You could build one or you could buy one. You can teach yourself or take a course. It is invitingly simple. Supplies are inexpensive. Even genes that cost over $200 in a minute sample can be purchased as homeographic copies, generally under $10 (see *Sources*). Perhaps your discoveries will help to bring a sense of reality to our pollution problem on planet Earth. But even salvaging one life can be a full time job and is the work of angels.

We will watch ten varieties of white blood cells throughout this book as we get rid of their blockers and destroyers.

Getting Rid Of Asbestos

We thought asbestos came to us from walls and ceilings of our buildings, hair blowers and clothes dryers. And certainly we can get sudden large doses of inhaled asbestos that way. It will stay stuck in our lungs. Perhaps a mesothelioma will develop. It does so at a surprisingly low frequency and slow rate.

The bulk of our exposure really comes from food and water, even the finest "organic" food and the "best" tasting bottled water. A steady diet of asbestos fibers from pureed vegetables in canned baby food, to fresh fruits and vegetables, to cooked and baked produce, even to rice, beans, coffee, sugar, and cereal grains finally reaches it's limit for your white cells. How does it get into all these foods? A clue comes from taking swabs of conveyor belts. In supermarkets these belts carried vast quantities of asbestos fibers. The Syncrometer® detects them easily. I believe that the practice of throwing newly picked lettuces, cabbages, and the whole gamut of produce on conveyor belts to be spray-washed, simply picks up all the loose bits of asbestos that are lying on the aged and fraying belts. And new belts pick it up from the dust off old belts nearby. Does it not wash off easily in your kitchen sink? Not only is it stuck in the produce with its sharp spear-like ends, but it is then sealed tightly into the food as the spray dries and hardens under blow dryers.

Fig. 38 Asbestos is needleshaped

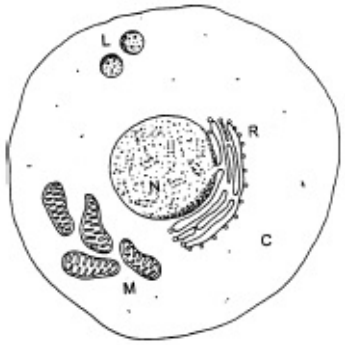
But you can clean it off. Two hot water washes removes most of it while electrical treatments destroy it. Sonication is one of the new electrical ways of treating food, described in this book. Read the details in the *Clean Up Your Diet* section. All your food and water must be cleared of asbestos in a failsafe way.

After this, removing it from your body makes sense.

How does asbestos destroy your immunity, your white blood cells' ability to phagocytize? The Syncrometer® made it possible to see some of the details.

A substance, **ferritin**, is involved. Ferritin is a gummy ball of protein with pinholes in its walls. It attracts iron to itself, or simply sticks itself against your iron, as in your old worn out red blood corpuscles. The iron molecules are inside the red blood corpuscles, where they are part of your hemoglobin. To salvage the iron molecules they are stuffed through the pinholes to the inside of the hollow ferritin ball. It is like poking pennies into a piggy bank. A cluster of such iron molecules is accumulating inside. How clever it is to recycle our iron so that we should never be anemic. Yet one of the largest causes of death from either AIDS or cancer that I see is due to anemia! There is a point of weakness in the story of iron usage; the iron captured inside the ferritin ball cannot be used again until it is in reduced form. Not many reducing agents can do this. Vitamin C and L-cysteine are two, red beets are an herb that can also do this. If you are anemic you may have plenty of iron but have it locked up in your ferritin.

Ferritin is expected to be present only in a special location inside cells: the lysosomes (see picture).



A healthy cell is a very busy place, with mitochondria (M) that use oxygen to turn out energy, the cytoplasm (C) where glycolysis takes place, the lysosomes (L) that tackle invading bacteria, the nucleus (N) where your genes make the RNA that will produce your proteins, the ribosomes (R) that stud the membranes attached to the nucleus, where proteins are actually made.

Fig. 39 A cell with lysosomes, etc.

Suppose you have eaten oatmeal with raisins and nuts, all of which bring asbestos fibers. Your white blood cells take notice. When the white blood cells begin to eat the asbestos fibers that are arriving with your food, there will soon be loose iron molecules inside the phagocytes. One common kind of asbestos

has iron molecules as a part of its structure. The white blood cell can pry off this iron. But loose iron triggers genes in the WBC to make much more ferritin (to store it all). So much ferritin is made that it seeps out of the cell and coats the outer surface. Eventually the whole white blood cell is smothered in ferritin. The little receptor-sites on the outside surface of the white blood cell, whose job it is to "sniff out" toxins or bacteria, are smothered in ferritin like an oil slick over a duck. The cell is helpless, it certainly can't phagocytize. After ferritin coating appears, the white blood cells remain quite empty although there are bacteria and toxins all around.

How can the ferritin be removed? The quickest way is with the drug, levamisole, two tablets, 50 mg each, taken 3 times daily before meals. Most of the ferritin coating will be gone from the thymus' white blood cells in three days. But levamisole has other values too, so it is recommended in your recovery recipe for at least 14 days.

Another ferritin remover is the plant enzyme, papain. Unfortunately, it smells like pure decay. If you could wear a mask or a clothespin, while you get it into a liquid that's spiced, like the Spice Syrup, it is not so disagreeable. The dose is 1 tsp. papain 3 times daily, before meals, to avoid using it up on food digestion. You could of course put it into capsules, but by then you have suffered from the smell just as much.

Papain has additional advantages, such as digesting (destroying) Clostridium toxins.

Bromelain is another plant enzyme that can digest ferritin off the white blood cells. It is less potent than papain. You will need twice as much or more.

Both enzymes require about two weeks to accomplish what levamisole does in three days. The herb, watercress (*Nasturtium officinale*), called "berro" in Spanish, can also remove ferritin.

Simply not eating produce unless it has had a hot water wash and been electrically treated, will keep asbestos out of you. The electrical treatments to be described later evidently break up the fibers enough to destroy them. Now that you have freed your white blood cells from their sticky ferritin tombs you have overcome the first of the four immunity blockers.

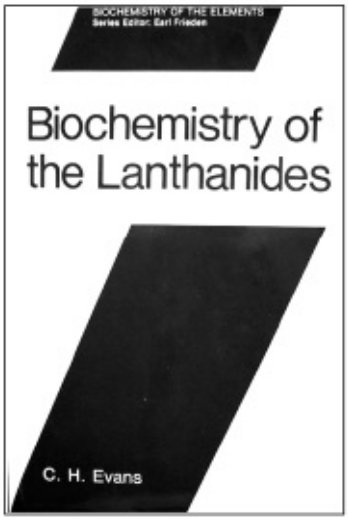
Getting Rid Of Lanthanide Metals

The lanthanides are a set of 15 magnetic metals. The lanthanides were studied

intensively after WWII to try to find uses for them and to bring them into commerce despite their toxicity. This may sound noble enough to the business mind. But it is like trying to find uses for X-rays in shoe stores, radioactivity in watch dials, and radioactivity in porcelain teeth (to make them sparkle). With reckless disregard for society's safety such commerce constitutes white-collar crime of the lowest kind. It has done as much harm to human health as bringing mercury into the dental profession. After studying the lanthanides for about 10 years in connection with cancer and AIDS I am led to believe they have interfered profoundly with the force of the natural magnetic field surrounding us. Much more research needs to be done to investigate this possibility.

All 15 lanthanides are so similar that simply separating them for commercial purposes is a formidable job. For this reason they are usually not separated, not even for injecting into people's veins during body scanning! Such injections may be labeled "gadolinium", a lanthanide, but should have been called "lanthanide soup" since all are present. Wherever they are used, the Syncrometer® detects at least 13 out of the 15. One, called thulium, is especially toxic (this is not the same element as thallium).

Only rarely have I seen a lanthanide occur by itself. In vitamin C, manufactured synthetically, I find thulium, by itself, as a manufacturing pollutant. And in the membranes of reverse osmosis systems of water "purification", yttrium or thulium occur, by themselves.



ISBN 0-306-43176-9

Fig. 40 Lanthanides disrupt fundamental biological processes

Thulium is used in science to induce mutations of the most vicious, "efficient", site-directed kind! This may be good for research or the military, but not for you.

Thulium is destructive to calcium metabolism. Do not use vitamin C unless you know the results (and can see them) of tests for thulium. Analytical labs that can do this are listed at the end of this book. It is quite inexpensive.

Do not use reverse osmosis water. A lanthanide (from the water filter) added to your water is much more harmful than whatever the filter removes. A water-treatment company likes to trade on your (and their!) ignorance of water composition. It hires sales people who are sincere but ignorant also. They may show you a demonstration of how hard your water is by adding a chemical to a sample of your water. The chemical precipitates minerals and impresses you with how "excessive" those minerals are. But water should be hard. Your body counts on getting minerals from water. None of these minerals are harmful. Any truly harmful items cannot be precipitated and revealed that way!

Water purity is a very challenging subject. There is no perfect answer, since:

- Membrane filters bring lanthanides.
- Carbon filters bring benzopyrenes, serious carcinogens.
- Other kinds of filters add heavy metals or chemicals.
- Distilled water brings metal from the pipes (usually copper) in large amounts, or lead from glass tubes if they are used.
- Rainwater brings smog particles and PCBs in cities.
- Cistern water brings the materials of the cistern wall plus molds and may be stagnant.
- Well water brings traces of tin and arsenic if it is near fertilized fields or animal run off. It may bring PCBs if the pump is submersible. Otherwise, it is a good choice, perhaps the best.
- Regular water from the faucet has benzene in Africa; the source is not yet known. I have frequently detected it in American water, but only if it is wrongly chlorinated (using laundry bleach instead of EPA registered bleach). At least 90% of USA AIDS cases I have seen were drinking such water!

- Softened water brings the actual chemicals of the softener (large amounts of aluminum) plus contaminants into the water, often strontium, uranium and PCBs. Even though the softened water is brought only to the hot water faucet, it cannot be kept out of your food and drink when a single lever faucet is used. The aluminum accumulates in the brain and adrenal glands causing dementia, particularly Alzheimer's, and adrenal insufficiency. Learn more about this from the internet[13].
- Bottled water always has contamination from disinfectants, pump oil, and various solvents. This is very dangerous water although it may taste better due to a bit of ozonation or other "treatment".

This leaves tap water as the best choice in most cases. But it should be run till the pipes have been emptied (about 1 gallon) before the first use in the morning.

Since lanthanides have been brought into industry they have polluted the environment and most of our food. Thirteen are found together on the same produce. In fact, produce commonly has benzene, dyes, and even PCBs. This suggests that a common procedure does all the harm and could be undone by simple legislation. But unless people bring lawsuits against our "protective" agencies or food suppliers nothing can be done. These agencies perceive their duty to be "protecting" industry even while it is sworn to "protect" society. Such conflict of interest should be absolutely resolved.

Lawsuits are too costly for the average person, but simply going after the truth by analyzing your water, food, supplements and air for suspected serious toxins is a practical route for anyone or any group to take. At least you can protect yourself and your group from "rare" diseases and the now less rare AIDS and cancer.

Holmium is another lanthanide that is as powerful as it is dangerous. It occurs in combination with PCBs. Perhaps it was used as the catalyst to manufacture PCBs. It is suddenly abundant when PCBs are being removed by a too-low zapping voltage or by the body itself. When too low a voltage is used for plate-zapping it must all be repeated, to remove the holmium that was left behind. Wherever there is holmium there is no interleukin 12. **White blood cells cannot phagocytize in the presence of holmium or any other lanthanide.**

Tooth filling material, whether metal or plastic, all contains lanthanides. They seep constantly into your body. They do not stay in your intestinal tract to be eliminated nor go to the bladder to be excreted. They go to your thymus and

bone marrow if you have HIV or AIDS disease, to your tumors if you have cancer, and to some other organ if you have another disease. Toxins always migrate to your problem-spot; I have called this phenomenon morbitropism, meaning disease-attraction. Diseased organs attract those things causing the disease.

The teeth that are "filled" with metal or plastic have become saturated with lanthanides. There is no way they can be cleaned up. These teeth must be replaced with partial dentures. They should never have been filled with a soft material that could not be hardened enough to prevent seeping.

But denture material itself is very easy to harden. You can do it yourself, simply in a saucepan. If you have a removable denture, follow the recipe given on.

> Perhaps further dental research will bring improved hardening technology. Until then, filled teeth must be replaced and no new teeth filled with any plastic material. It cannot be hardened sufficiently.

Once the lanthanides are out of your mouth, a major source has been eliminated. Simply not eating them with food is the last task. Lanthanides do not sonicate apart as asbestos and complex chemicals can. You must carefully wash them off your food with hot water. The practice of preparing fruits and vegetables, starting with two hot water washes in a row, removes lanthanides stuck in the sprayed-on chemical film along with asbestos. Read exact instructions.

Getting lanthanides out of your body is almost impossible. They do not behave like other metals. Supplements are not useful either. But plate-zapping an organ removes them. Homeographic drops can remove them, too, an organ at a time. Their magnetic property must be coming into play.

Getting Rid Of Amalgam Metals

The body's supply of mercury does not come from eating fish. It comes from a much more obvious source, right in your own mouth. A pellet of mercury about half the size of each amalgam filling was intentionally put there by some well-meaning dentist. But the American Dental Association (ADA) condoned this

practice in spite of being able to see the gross degree of corrosion it underwent later. In spite of ample amounts of research proving its harmful nature, the ADA persisted in proclaiming its harmlessness. And so, from a single profession, the entire United States has had its immunity damaged and is paying the price in cancer cases, HIV and AIDS cases, and countless other diseases. It is important for sociologists to study this phenomenon. Unless it is studied and acknowledged, we are bound to repeat it. What safeguards could be put in place to avoid a global catastrophe?

How long will it take to get rid of the amalgam accumulated in your body even after you remove it from your teeth? More than a lifetime! There is no way of getting it out of your brain, spinal cord, and other organs in one person's lifetime. But we can remove bits and pieces here and there.

We will choose the critical organs, your thymus and bone marrow to clear amalgam first. We will assist your body by providing more of its own natural heavy metal fighter, L-G.

L-G stands for lysine-glutamate.

It tackles your amalgam deposits, even the mercury, thallium and uranium they contain.

Every white blood cell that has mercury or thallium inside itself is unable to kill. Yet killing is its job. The body relies on lymphocytes and special killer cells to kill viruses, bacteria, parasites, and foreign tissue bits like yeast and fungus. We even have a "second brigade" variety of lymphocytes whose job it is to kill those cells that couldn't kill. And we have complement C_3 to assist with killing. We were meant to be very protected.

All 10 white blood cell types that were being watched by Syncrometer® make L-G. They also make L-A (lysine and aspartate). Maybe L-G and L-A were intended as heavy metal protection since there are processes in the body that can make toxic forms of heavy metals quite naturally. Every fungus and bacterium that dies and gets oxidized changes its organic minerals into toxic metal forms. Even nickel is released in the body from dead fungal enzymes and bacterial enzymes (urease). But there is enough L-A and L-G to keep up with this, unless you add mountains of metal. No amount of body-made L-G can keep up with the

amalgam flood coming from teeth.

But once the tooth source is gone, taking large doses of L-G for quite a long time keeps amalgam metals pouring out with the urine until your body is cleared, about six months. Make both L-G and L-A from scratch with the recipe or obtain ready made from *Sources*.

Take 1 tbsp. of the liquid 4 times daily, using a non-metal spoon. After a week you may take 2 tbsp. twice a day. You will need to keep this up for about six months.

Don't start this though, until your tooth fillings made of amalgam have been removed.

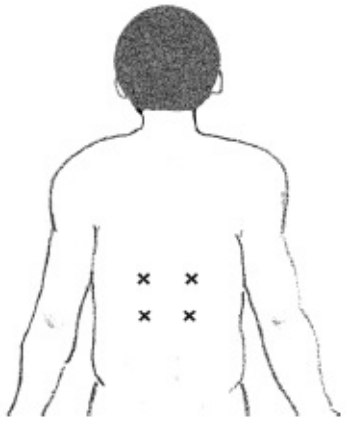
Fortunately you can get a head start on amalgam removal by extracting amalgam filled teeth. Teeth that once had amalgam fillings can be treated with a new device, a **toothbrush zappicator**. Evidently, this changes the leftover heavy metals chemically, allowing them to be dissolved and excreted (perhaps hydrolyzed or oxidized). By zappicating every tooth that once held amalgam and every space along the bony tooth-ridge where teeth once were, the buried bits of amalgam can be removed, too. Taking L-G at the same time removes it all faster. After three complete rounds of zappication directly on top of teeth and along sides where soreness or redness is present, the buried amalgam will be gone from these bone locations in a few days.

The salivary glands and soft tissues of the mouth must be cleared of amalgam too. Zappicating the cheeks and face, both inside and outside, as well as the throat and tongue as far as you can reach clears up amalgam deposits to a depth of ½ inch. It cannot remove tattoos or visible mercury.

You can clear the amalgam from your mouth in one week by removing the responsible teeth first, then zappicating your mouth and taking L-G. Work on the thymus at the same time, using plate-zapping and homeography. As soon as the mercury and thallium are out of the thymus white blood cells, they will be able to kill HIV viruses again. They will be able to kill flu, Salmonellas and prions, too; this way you can avoid the side effects of plate-zapping. Clear the bone marrow of amalgam next, using homeography along with plate-zapping, again while taking L-G.

Be sure to take all your supplements; these contain the sulfur compounds that can react with metals and allow them all to be excreted. The kidneys will be called upon next.

At the same time as you are zappicating your teeth, you should be wearing "kidney magnets" to assist them, as well as drinking a lot of water. Kidney magnets are tiny 10-gauss magnets you can tape over your kidney locations, one or two per kidney. Most important is being sure that the NORTH Pole is touching your skin. Such magnets are the equivalent of zapping. See *Sources* for the magnopatch.



Magnets assist adrenals, kidneys, ureters and bladder.

Fig. 41 Tiny North Pole magnets

Teeth that once had amalgam fillings and now have plastic caps or fillings can be zappicated to change their chemistry, too. But if the amalgam was not removed very completely, there may be too much left to mobilize this way. It would be best to extract them, of course. Zappicate them at least 3 times. If your health does not return, extract these.

Getting rid of lanthanide metals, mercury and thallium is part of the "dental cleanup". We will describe it very carefully later, since on this depends a large part of your immune system recovery.

Getting Rid Of PCBs

Roomfuls of scientific literature on PCBs exist. Agencies and environmentalists are truly concerned. But nobody has come up with a way to detoxify PCBs that have entered the water supply or food chain; nor to test for them, cheaply and quickly. We are sitting as helpless babes-in-the-woods waiting for PCBs from toxic waste sites to reach the waterways, not even knowing when it has happened or what to do.

Arm yourself with information off the internet. Then get the water supply that

comes to your kitchen tested with the latest technology. But don't just send the water. Run water through a carbon filter for a month or more. Then send in the entire filter. This lets you know if you ever ran PCB-water through it. Learn about the latest technologies. Costs are coming down. Labs are eager to serve you!

For yourself or your HIV/AIDS patient, buy a simple pitcher-filter. Add a capsule of vitamin C to the first few pitchers of water and run them through the filter as the instructions state. This will detoxify the benzopyrenes in the charcoal permanently. After you have used it for a month, start out again with a new filter. Save your old filter for PCB-testing. Save several and send them all together for a single PCB test. Then act. If the test shows any PCBs (regardless of the legal limit) your water is much worse than most other places. Make plans to move. The chance is good that the next place you move to will have good water. Test it again, the same way.

Make sure you are not consuming, or even using softened water. Such water often has PCBs. Soften your water with borax when laundering or shampooing. The PCBs present in water softener salts are harmful even in parts per trillion (ppt) as is benzene (given in parts per billion, ppb). Have a laboratory check for these and dioxins and other chemicals while they check for PCBs. If you suffer from cancer, HIV, AIDS, or a "rare" disease, your first suspicion should be your water.

Water filters can of course take out small amounts of PCBs. But these are not thrown away! All later water, even if perfectly pure, must now pass through this PCB-polluted filter. It must take a trace with it into your glass! Getting a toxin chronically is much more harmful than getting it sporadically in larger amounts.

If your water tests free of PCBs, benzene and heavy metals, stop using any filter. It adds more toxins than it subtracts.

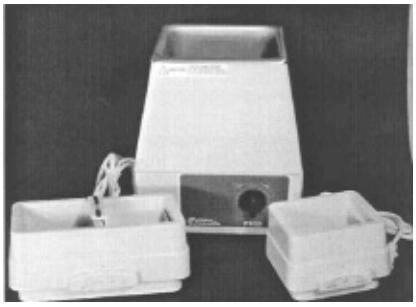


Fig. 42 Jewelry cleaners like these can remove PCBs

Test cooking oils; test soaps; test your favorite most expensive shampoos. If you can't test, stop using them. Make your own.

Fig. 43 Clean PCBs off plastic toys and baby things

Traces of PCBs can be sonicated off baby toys, baby bottles and teethers as if you were "cleaning jewelry". It also comes off dentures, fresh from the dentist, or even if very old. It comes off toothbrushes and off eyeglasses fresh from the optometrist. Don't contaminate your sonicator. Always place the article in a plastic bag with water added and zip tightly before lowering it into the sonicator water. Sonicate baby things three times. Empty the water into the toilet, not the sink. Rinse the items afterwards.

There was a time, even recently, when professional people announced they saw no harm in PCBs. They saw no harm because there was no way for them to see the harm. PCBs quickly disperse all over your body's fat. It is like dropping a bag of trash containing cockroaches on your kitchen floor in a new house. In moments there is nothing to see. They are "gone". The harm is invisible but will come later with absolute certainty.

PCBs, which act like any machine oil, will coat all your accessible cells with a thin layer much like an oil slick over an animal. And the white blood cells, whose job it is to remove it, will get covered, too.

Macrophages, your WBC "piranha-brigade", must have molecules of *betaglucan* on their surface in order to work. PCB oil swamps or removes their betaglucan. Without it, they cannot phagocytize, namely eat, your body's enemies, including PCBs! Like soldiers without ammunition, they must stand idly by. Fortunately, most PCBs stay in your fat. But it is only a temporary solution. When you develop a trauma or disease condition in one of your organs, they are attracted there. Now immunity will fail at this organ, making the disease much worse quite quickly.

Meanwhile, the liver will try to detoxify PCBs but it has no reactions that can do this. That is why PCBs are called nonbiodegradable.

We have developed two tactics to remove PCBs from your body: one is to give ozonated oil in fairly large amounts, such as tablespoons, daily.

The second is to take coriander (essential oil), 1 drop, 3 times daily in a tsp. of syrup. Alternatively, it can be made part of a "Spice Syrup" that contains 1 tsp. coriander oil to ½ cup syrup. The dose will now be ¼ tsp. Spice Syrup 3 times daily. It can be mixed with other oils (see Spice Syrup recipe).

Evidently ozonated oil travels to your PCB accumulations, mobilizing them from your organs towards the kidney and bladder and out with the urine. Plain oil does not have this effect. Nor does ozonated water. The ozone probably jumps from the oil molecule to the chlorine atoms of the PCB molecules. Once ozonated the liver may be able to oxidize them further. This is only speculation but it does appear in the urine now, proof that it is leaving your body.

Ozonated oil has another benefit; it can destroy viruses that are already inside your cells' chromosomes. These are called latent viruses. *Herpes* is an example.

The essential oil, Frankincense, can kill, or remove, latent viruses too. But essential oils are so heavily polluted with benzene in the market place, it is not worth risking without first testing.

If you have AIDS and are living in the United States you can assume you are loaded with PCBs and need to remove it as fast as your liver and kidneys can handle it, in order to get your phagocytizing power back.

Ozonated oil is not without its hazards, we can be sure. Do not consider taking it as freely as vitamins. Ozone is an oxidizer and should be balanced with reducers. Taking vitamin E should help; use 400 units daily, five hours away from ozonated oil.

No PCBs, benzene, antimony or apiol in these oils. Only olive oil can be safely heated. Use the others cold, like in salad.

Fig. 44 Safe oils

Cook and bake with homemade butter or olive oil. Yet, hardly any cooking oils on the market, including olive oil, are safe from benzene and PCBs (many also have antimony pollution, a significant toxin).

If you import olive oil directly from Italy, in large containers, it may not be polluted. I tested only one such five gallon container. It was not polluted. This is not the same as buying oil that states "imported from Italy". The PCB pollution comes with bottling and mixing after it arrives in the United States. Read labels carefully.

Butter made in Mexico or homemade was pure. Boiling USA butter helps but is not enough for an HIV/AIDS victim. Dyes, metals and apiol do not boil out. Make your own or use only oils (see *Recipes*). At this time PCBs have not yet entered other dairy foods. But you will need to avoid dyes here. Be sure to add a pinch of vitamin B_2 to any dairy food and to boil it as well as treat it electronically. Other details will be given in the *Diet* and *Recipes* chapters.

PCBs have polluted the soap, shampoo and lotion industry for 10 years already. I mentioned this as early as 1994. The problem has not abated. It has intensified. Don't use any commercially made body product. Make your own or simply use borax for all purposes. The recipes are given in the *Recipes* chapter. No salves, no ointments, not even health food varieties are safe.

There are many more details you can learn about PCBs from the Internet. Most important is protecting your loved ones by testing, treating, and avoiding.

Getting Rid Of Benzene

Benzene deserves special attention not only because it is the AIDS-related solvent, but also because it is presumed to be absent from our consumer environment. Yet I have found traces in everything from bottled water to toothpaste! It is so toxic its concentration is even regulated and tested in gasoline and dry cleaning fluid to reduce our exposure to it in the air. Can you imagine eating it or putting it on our bodies, even in minute quantities?

It is commonly believed that all petroleum products, including benzene, are carefully kept away from the food industry. And under no circumstances would solvents like benzene be allowed near food. This is wrong. The Code of Federal Regulations (CFR) in the United States specifically allows petroleum products to be added to food. Mineral oil is an example; it is made from petroleum. This is

an excerpt:

21 CFR 172.878 (4-1-94 Edition) White mineral oil.

White mineral oil may be safely used in food in accordance with the following conditions: [Paragraphs (a) and (b) describe purity levels] (c) White mineral oil is used or intended for use as follows:

Use	**Limitation (inclusive of all petroleum hydrocarbons that may be used in combination with white mineral oil)**
1. As a release agent, binder, and lubricant in or on capsules and tablets containing concentrates of flavoring, spices, condiments, and nutrients intended for addition to food, excluding confectionery.	Not to exceed 0.6% of the capsule or tablet.
2. As a release agent, binder, and lubricant in or on capsules and tablets containing food for special dietary use.	Not to exceed 0.6% of the capsule or tablet.
3. As a float on fermentation fluids in the manufacture of vinegar and wine to prevent or retard access of air, evaporation, and wild yeast contamination during fermentation.	In an amount not to exceed good manufacturing practice.
4. As a defoamer in food	In accordance with §173.340 of this chapter.
5. In bakery products, as a release agent and lubricant	Not to exceed 0.15% of bakery products.
6. In dehydrated fruits and vegetables, as a release agent	Not to exceed 0.02% of dehydrated fruits and vegetables.
7. In egg white solids, as a release agent	Not to exceed 0.1% of egg white solids.
8. On raw fruits and vegetables, as a protective coating	In an amount not to exceed good manufacturing practice.
9. In frozen meat, as a component of hot-melt coating	Not to exceed 0.095% of meat.
10. As a protective float on brine used in the curing of pickles	In an amount not to exceed good manufacturing practice.
11. In molding starch used in the manufacture of confectionery	Not to exceed 0.3% in the molding starch.
12. As a release agent, binder, and lubricant in the manufacture of yeast	Not to exceed 0.15% of yeast.
13. As an antidusting agent in sorbic acid for food use	Not to exceed 0.25% in the sorbic acid.
14. As release agent and as sealing and polishing agent in the manufacture of confectionery	Not to exceed 0.2% of confectionery.
15. As a dust control agent for wheat, corn, soybean, barley, rice, rye, oats, and sorghum.	Applied at level of no more than 0.02% by weight of grain.

Fig. 45 Lawful uses of white mineral oil in food.

All of the following petroleum products are also "safely used in food" subject to similar conditions of purity and use: petrolatum (21 CFR 172.880), synthetic isoparaffinic petroleum hydrocarbons (21 CFR 172.882), odorless light petroleum hydrocarbons (21 CFR 172.884), petroleum wax (21 CFR 172.886), petroleum naphtha (21 CFR 172.250).

There is even one food that benzene can be used with directly—BEER! Read this excerpt:

21 CFR 172.560 (4-1-94 Edition) Modified hop extract.
The food additive modified hop extract may be safely used in beer in accordance with the following prescribed conditions:
(a) The food additive is used or intended for use as a flavoring agent in the brewing of beer.
(b) The food additive is manufactured by one of the following processes:
(1) [describes a hexane extract]
(2) The additive is manufactured from hops by a sequence of extractions and fractionations, using benzene, light petroleum spirits, and methyl alcohol as solvents, followed by isomerization by potassium carbonate treatment. Residues of solvents in the modified hop extract shall not exceed 1.0 part per million of benzene, 1.0 part per million of light petroleum spirits, and 250 parts per million of methyl alcohol. The light petroleum spirits and benzene solvents shall comply with the specification in §172.250 except that the boiling point range for light petroleum spirits is 150°F-300°F.
[(3) through (8) go on to describe other allowable manufacturing processes using methylene chloride, hexane, methyl alcohol, sodium hydroxide, butyl alcohol, ethyl acetate, potassium carbonate, ethylene dichloride, isopropyl alcohol, trichloroethylene, palladium, hydrochloric acid, sulfuric acid, peracetic acid, sodium borohydride and other chemicals.]

Fig. 46 Lawful ways of making hop extract for use in beer .

Ironically, the law regulates the purity of the benzene used (§172.250). It's hard to imagine what worse chemicals the government agency is concerned about! And if you think one part per million doesn't sound like a lot, keep in mind that the government maximum allowed level in drinking water is five parts per billion, over 200 times less! Of course it's assumed that by the time the hop extract is added to the rest of the beer ingredients, the concentration will be much less. But, what counts is the total amount consumed, not the concentration. One glance in the supermarket shows you that the amount consumed is mind-boggling.

Allowing the use of petroleum products in food when lab analysis was still unable to test benzene levels below ppb has undoubtedly led to the worldwide lowering of immunity that is so apparent. Scientists have studied the immune lowering effect of benzene for many years. We just didn't know that we were eating it because we could not test.

I find benzene is present in foods and products that have been colored, flavored, stabilized, conditioned, defoamed, coated, or preserved. Although our regulatory agencies have been vigilant in checking gasoline, dry cleaning fluid, and outdoor air for benzene, the most toxic route, food, beverage and cigarettes, has escaped detection. The present extent of benzene pollution is unthinkable and overwhelming.

These are the products and foods that I have found to be polluted with benzene. STOP USING THEM IMMEDIATELY. DO NOT FINISH UP ANY ONE OF THEM. THROW THEM OUT NOW! Throw them into the garbage and take the garbage out of your house.

Benzene Polluted Products

THROW THESE OUT

Your health is worth more than the fortune you spent on them!

Flavored food, yogurt, jello, candies, throat lozenges, store-bought cookies, and cakes
Vaseline products (Noxzema, Vick's, Lip Therapy), chap stick, hand cleaners
Cooking oil and shortening (except safe varieties)

Rice cakes, even the plain ones
Bird food made into cakes
Essential oils, add 1 drop HCl and pinch of vitamin B_2 to the bottle

Bottled water, whether distilled, spring, mineral, or dispensed at a health food store. Bottled fruit

Personal lubricant, including lubricated condoms (treat electronically as if food)
Pills and capsules, at least a third of all I test are polluted. This

juice.
Cold cereal, including granola and health brands
Toothpaste, including health brands
Chewing gum

includes herbal extracts and prescription drugs. Wash color coating off; then rinse in HCl water and dunk in vitamin B_2 before swallowing. Hardly any Mexican brands are polluted.

Ice cream and frozen yogurt
Vitamins and other **health supplements** (buy nothing colored or flavored; rinse in HCl water)
Baking soda and cornstarch (see *Sources*)
Flavored pet food, both for cats and dogs

Cigarettes (if you smoke, have yours analyzed by a lab) Treat each package electronically as for food.
Soaps, hand creams, skin creams,moisturizers
Marijuana
Amyl nitrate, butyl nitrite, and similar products, commonly called "**Rush**"

Copy the benzene list, put it on your refrigerator, and make another copy to stick on your medicine cabinet. There is not a single item on this list that you can take a chance on.

Zappicate 10 minutes.

Fig. 47 Lubricated condoms have benzene

Stop using benzene-polluted products as soon as you read this. **This includes health brands!** Don't wait until you have low immunity. If you can't believe this extensive pollution with benzene and wish to have this verified first, set the items aside. Use other products while you are waiting! Send them all to an analytical lab for testing.

Or you could check your benzene consumption by doing a urinary phenol test (request one from your clinical doctor). Choose the test that is meant to identify chronic benzene exposure, not acute. The normal range will be included with your test results. If yours is high, let this galvanize you into action.

3 varieties, colored and flavored, but without benzene shows it can be done.

Fig. 48 Mexican-made candy

It is impossible for me to have tested every batch of every food and product, but so many test Positive you simply cannot risk any of the foods and products on the list.

Make your own replacements from our recipes!

In HIV disease the body rids itself of benzene in three to five days after stopping the use of polluted products. But in AIDS, the skin and all fat locations hold onto it for several weeks. We will detoxify it with vitamin B_2.

All persons with HIV or AIDS associated illness have benzene accumulated in them. But what about the rest of us? We, too, have been using benzene-polluted items. Why does it not accumulate in everybody? The answer, of course, lies in how much benzene you get. But is that all? Is there some special toxin that only some of us get, and that specifically causes benzene buildup? Indeed there is.

People with a benzene buildup have more Paragonimus parasites and have been eating more of a special mold toxin. It is found in popcorn, potato chips, baked potatoes, French fries and brown rice! The mycotoxin is zearalenone. Stop eating these foods. Eat white rice and cooked potatoes. The toxicity of molds is much more important than the nutritional difference.

Our household products, body products and even foods have benzene pollution in them.

Fig. 49 Some benzene-polluted products—BEWARE!

Fortunately, popcorn and brown rice can be electronically treated to clear them and potatoes can be peeled to see the mold (discard these; zearalenone spreads throughout the potato).

All persons with a benzene buildup, regardless of their HIV status, have zearalenone toxicity. Many persons have also been eating a lot of grilled food, toast, wieners, and open-flame heated food. Such foods have benzopyrenes in them. Benzopyrenes use up the liver's detoxifying ability for benzene and leave benzene to accumulate. Stop eating these foods.

Two More Tips For Reducing Benzene Buildup

1. Make sure you are taking at least 600 mg of **vitamin B_2** (riboflavin) with each meal.

2. Don't visit tanning booths! Ultraviolet light destroys the B_2 already in your body.

Your body detoxifies benzene into phenol. That is the logic behind the urinary-phenol test. Phenol is also very toxic. The phenol gets broken down to wood alcohol, according to the Syncrometer®. The wood alcohol is "detoxified"

to formaldehyde. This is even more damaging. It is next changed to formic acid —the most harsh of all! All these damage your thymus specifically by causing it to shred, letting little bits of itself swim away into your body. **Magnesium** and **glucuronic acid** help with detoxifying these. **Cysteine**, **thioctic acid** and **taurine** help. **Glutathione** and **inositol** help. Even **baking soda** helps excrete formic acid (see *Sources*). Soon your thymus will be free of the whole troop.

How Benzene Works

Benzene destroys a special organic complex, called *carboxy ethyl germanium sesquioxide*, normally found in our phagocytes. Benzene removes the carboxy ethyl portion, leaving only the germanium sesquioxide. Without the whole complex, our cells cannot make two special antiviral substances called **peptides**.

His-Cys-Lys-Phe-Trp-Trp-OH (abbreviatedly pronounced "hiss-siss") is a very important natural peptide that we all have. It locks the door to your genes when viruses approach and wish to enter (integrate). In technical language, this peptide inhibits the **integrase**, which permits viral integration as well as disintegration when the virus decides to leave your genes to multiply. What could be more important to the HIV virus than the ability to integrate? The second peptide, Ac-muramyl-Ala-D-isoglutamine-OH ("ack-mur"), is another natural viral replication inhibitor. Evidently carboxy ethyl germanium sesquioxide holds the master key to both these peptides. Benzene destroys this essential germanium! As soon as benzene is gone, carboxy ethyl germanium sesquioxide and both peptides reappear.

Our bodies can use germanium sesquioxide to build carboxy ethyl germanium sesquioxide. But for some reason germanium sesquioxide taken as a supplement is not readily utilizable. A truly organic source like hydrangea root, nuts or coconut is far superior. Ordinary shredded coconut has it. Don't forget that the extra germanium won't do you much good if you don't also protect your body from benzene.

Magnesium helps to detoxify phenol, forming magnesium phenyl phosphate. Take it in powdered form (like in capsules) to avoid its laxative effect (perhaps tablets are harder to dissolve and absorb). Always take vitamin B_2 and magnesium together. And in the long run, such as months, take B_6 also.

Benzene comes to us from both outside and inside sources. Outside sources are petroleum products. Petroleum pollution is on our food as pesticide but not yet in our water supply. It has already engulfed the water supply across the

continent of Africa. We must avoid this tragedy in the United States and the rest of the world. I have not found benzene in the public water supply except when illegal bleach was used to chlorinate it. Presently 5 ppb (parts per billion) benzene is legally allowed. It is allowed due to the limitation of technology. Labs could not test smaller amounts until recently. But now labs can easily test ppt (parts per trillion). And this should be done for all public water supplies and of course bottled waters, before the pollution problem swoops down on us as it has in Africa.

In the meantime, in the absence of testing, water should be treated with hydrochloric acid (HCl). A minute amount of HCl can detoxify traces of benzene in water.

If you are an HIV/AIDS patient, USP-quality HCl should be added to all the water you use for drinking or cooking. One drop of 5% HCl treats two cups of polluted water. Start now (see *Sources*). Do not use more.

HCl is not dangerous. It is our own stomach acid. But our stomachs cannot be relied on to do this job because sick and older persons have very little HCl in their stomachs. Do not put HCl straight in your mouth. It will dissolve your teeth. Follow instructions given in the *Clean Up Your Diet* section or *Recipes* chapter.

You have now accomplished two goals

1. You have killed Fasciolopsis, Paragonimus and Eurytrema with all their stages everywhere in your body. YOU NO LONGER HAVE THE SOURCES OF THE HIV VIRUS OR SV 40 VIRUS.

2. You have eliminated the four immunity blockers: asbestos, metals, PCBs and benzene. Your biggest white blood cells, the macrophages, are now busily eating all bacteria, dead parasites and toxins that had accumulated. Your phagocytizing ability is back; you have your own army around you. <u>But not yet virus-protection</u>. For this you need your lymphocytes.

Rescue Your Lymphocytes

Get Rid Of Fast Garnet And Fast Green

Fast Garnet dye kills CD4 cells while Fast Green multiplies CD8s. Other azo dyes do different damage. Research is badly needed.

First of all, stop eating fish and chicken! If you have become a fish and fowl eater in order to avoid red meats you will need to turn back. (Turkey is the only fowl that I know is safe, so far. Rock Cornish hen and chicken are not.)

All the fish in the market place, fresh, frozen or canned that I tested (hundreds of samples) had Fast Garnet dye in it except an occasional can of tuna. They also had hypochlorite (bleach) and the other azo dyes in them. There are hundreds of dyes; my test set has 18. Some fish also had all the heavy metals that come with clorox disinfectant, even including mercury and thallium.

It comes no doubt from the simple practice of sloshing or spraying clorox bleach liberally over the fish kill to sanitize it. Or from dipping chicken parts as well as whole chicken carcasses in clorox water to sanitize them. And from washing cutlery, cutting boards or kitchen counters with this non-food grade bleach. The dyes do not get destroyed by it like other chemicals would. Azo dyes penetrate animal cells very quickly (that is why they are dyes) and later, when we eat this flesh-food, the dye enters our cells. Dyes are designed not to rinse off. Both fish and fowl are safe from bacteria, and that is good, but not at the cost of destroying the human immune system.

Why is Fast Garnet or any other azo dye even present in household chlorine bleach? The answer to this would certainly be worth a king's ransom.

I don't readily believe in conspiracies or diabolical deeds or alien plots. This tragedy of AIDS must be a simple accident that happened on planet earth in the 1900s because everybody was doing things the same way—using clorox bleach from the supermarket, meant for laundry and toilets, instead of food-grade registered bleach to disinfect food.

It is terribly risky for the entire human population to be doing things in exactly the same ways. There is safety in diversity. This is the single most important lesson taught to us by the whole science of genetics. The entire phenomenon of sexuality is all about bringing diversity to the species. When we, then, arbitrarily make life's customs more uniform, more compliant, more standardized, we are undoing the very purpose of our parental genes. We must undo the uniformity in the food handling and manufacturing process even though it confers reliability, a different virtue.

Stay away from all artificially dyed food, especially if it states it has been allowed by the FDA and given a number.

Food should not be painted,

as any mother or father of small children knows by instinct. Food should be clean and pure, not dyed.

Fast Garnet causes CD4 cells to be programmed to die.

Fast Green causes accelerated cell divisions in the bone marrow and spleen, causing leukemias and polycythemia. It has the same effect on CD8 cells.

DAB, another dye, causes alkaline phosphatase, in blood test results, to rise abnormally.

Sudan Black B causes elevated lactic dehydrogenase (LDH) in blood test results.

Fast Red Violet causes lymph blockage and effusions so that lungs or the abdomen must be drained.

Fast Red blocks the formation of urea, so BUN levels in the blood are low and toxic ammonia can accumulate.

Sudan IV blocks the formation of creatinine so it is low on the blood test.

Those scientists who evaluated the dyes before they were legally allowed in food certainly did not study these effects of azo dyes. The experiments that were done by them would have been on bacteria and on mice or rats looking for mutations or tumors. And these animals may not even have CD4 cells that behave like ours. Maybe they are not even susceptible to AIDS or benzene!

Depending on such experts is total folly. We need plain common sense, not experts. We can't expect to anticipate all problems for all products but the common sense of parents involved in decision making for food regulation would have saved us from AIDS. They have always known that we should not paint our food.

Eating colored food is the most obvious way of getting Fast Garnet and Fast Green dyes into your body and immune system. Makers of candy, cakes, butter and yogurt may all be disclosing the one legal dye they are using. But what is

not disclosed are the 99 (figuratively speaking) other illegal dyes that pollute the product in the end. No FDA employee may know the problem. They do not investigate such possibilities. No manufacturer may know the problem. It is truly not their job! No environmental protection group may know the problem. But somebody and some group does. And it should be investigated.

Tooth Troubles

The other huge source of azo dyes is our plastic teeth. They are colored with azo dyes even when they look white! The fillings are not hardened enough to prevent seeping. All plastic fillings must come out and no new fillings can be put in for this reason. Not only do they all seep azo dyes, they all seep lanthanides, other heavy metals, phthalates (carcinogens), and acrylic acid (plastic), too. They cannot be hardened enough in the tooth to prevent seeping. And the teeth themselves get saturated with all these toxins, plus the metals that came before the plastic was used. The best advice is to extract them. A partial denture is easy to harden outside the body to prevent seeping, even if it contains dye! See the tooth hardening recipe.

The next best is to zappicate them. A recent breakthrough in technology allows you to harden plastic teeth already in your mouth. It uses a "toothbrush zappicator", as will also be used to remove amalgam metals left over in your mouth. This will be discussed further in the *Clean Up Your Dentalware* section.

After plastic filled teeth are removed from your mouth or zappicated to hardness, how do you get dyes and plasticizer (urethane, acrylic acid, phthalates) out of the rest of the body? You have about 1000 deposits estimated with the Syncrometer®. We will focus on getting them out of the T-cells of the thymus and bone marrow.

Vitamin B_2 will help but it is not as easy as for other dyes. Even a 40-capsule dose does not get it all out. Coenzyme Q10 will help, too. Take at least 10 capsules of Q10 daily in a single dose. Take Q10 in the morning on an empty stomach. Repeat for five days in a row. Then take them once a week. You may open the capsules and stir it all into honey and water.

An herbal recipe also helps to take these dyes out of your CD4s and CD8s. It includes bay oil, pomegranate, lemon peel, hydrangea, and olive leaf (see Dye Remover Syrup). Make the homeographic counterparts of these herbs and take these drops as well as the real herb. If you are missing one, make up the recipe anyway.

Homeography is the swiftest way to clear dyes from CD4s and CD8s. Follow the detailed instructions. Also use the dye-remover recipe and supplements.

Taking organic germanium and selenite helps the phagocytes unload these dyes. Vitamin C is also necessary. Be sure to take all that is recommended in the *2-Week Rapid Rescue Program*.

Now you have all the instructions you need to complete a two-week program that will rescue you or your friend from even advanced AIDS.

Advanced Aids

What is Advanced Aids? The criteria I use are any one of these:

- Clinically ill with repeated infections.
- A CD4 count below 50.
- A WBC count below 3000.
- A RBC count below 3.5. (A RBC count at 3.0 or below requires a transfusion.)

Although I don't use it, another common definition is a total T-count (CD4 and CD8) under 200.

It is just not possible to recover from such severe deterioration with nothing but a virus killing "cocktail" of drugs as regular medicine suggests. It takes all of our techniques to permanently rescue such a patient. But it can be done, reliably, without failures and here is the program.

2-Week Rapid Rescue Program For HIV/AIDS

Try to get started on every item by the third day, so that you have a full two weeks of treatment behind you before scheduling a retest. Each item is discussed further at the end of the program, to help you with details.

1. Remove all amalgam or other metal in your mouth. Extraction is best. After a few days use tooth zappicator on each remaining tooth and tooth space to remove residual metal and to harden plastic. Do not zappicate metal containing teeth or root canals. Do this 3 times. Zappicate dentures 40 minutes on each side to "set" the plastic and destroy PCBs. Repeat after any adjustment has been made by your dentist. Extracting plastic filled teeth is best, too. If you choose to zappicate instead but your CD4 to CD8 ratio does not come up, return for extractions. Use only dye-free impression compound.

2. Request these blood tests:

- CBC
- urinalysis
- blood chemistry (called SMAC) of about 24 items. Omit cholesterol panel and thyroid panel.
- PCR-HIV-1-RNA QN for your HIV viral count
- immune analysis: CD4 and CD8 counts, and their ratio

All other tests are unnecessary and create needless cost.

The test results will give you a starting point to compare with new tests to be done after the *2-Week Program*.

3. Go completely natural—in food, in body products, in housekeeping supplies. You must avoid benzene, PCBs, asbestos, lanthanide and other heavy metals and azo dyes. Use the C*lean Up Your Diet* chapter to help you prepare food. Use the *Recipes* chapter to make body products and housekeeping supplies.

4. Get away from your accustomed drinking water, both bottled water and

your household water. Find a district that uses chlorine gas to chlorinate the water and has not "boosted" it with liquid household bleach. Rent an apartment or motel room in this district or drive a rented RV to this district. Then test your own drinking water (optional) for PCB, benzene and heavy metals by sending in your filter, not water to a lab (see *Sources*). Do not engage a lab that tests only in ppb for PCBs.

5. Choose your new diet. Eat no chicken or fish in any form: fresh, frozen or canned. It likely contains quantities of Fast Garnet dye. Now that you can easily destroy parasite stages electrically, you can eat beef, lamb and pork again if it is very well cooked; turkey is another choice.

Eat no dairy products for two weeks. After this you may have goat milk that has been treated electrically and comes from a dairy that does not use clorox bleach in their "sanitation" procedure. They may use Lugol's iodine. Add hydrochloric acid (USP, 5%), three drops per cup.

Stay off foods that contain these allergenic substances: **phloridzin**, **chlorogenic acid**, **apiol** and **gallic acid**. They disturb your major glands as well as the thymus and set the stage for Kaposi's and other cancers (see *Food Table*).

Foods with phloridzin are:

Fig. 50 Pick apples carefully

- Apples, except Red Delicious and Golden Delicious
- (all others must be cooked or baked to destroy this chemical).

- Pork, ham and derivatives (must be cooked or fried by you, not merely commercially, to destroy this chemical).
- Soy products including oil.
- Unripe fruits of any kind (they must be cooked if they are not totally ripe).
- Bananas (but putting them in the refrigerator or freezer for four hours destroys the chemical and makes them safe).
- Potatoes (only cooking or baking, not frying, destroys this chemical); no chips or fries are safe.

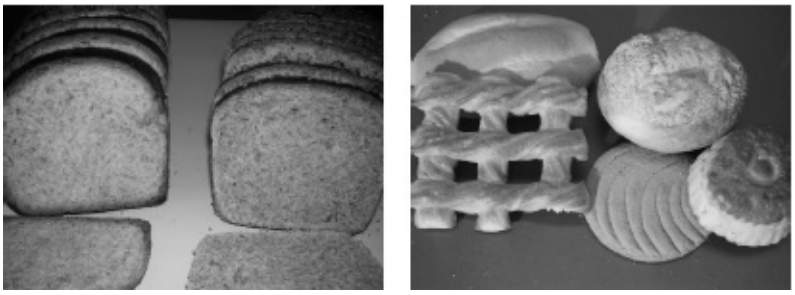
Fig. 51 Midget banana varieties: Machos, Burros, purple, and plantains are safe

Foods with chlorogenic acid are:

- Potatoes (but cooking or baking destroys this chemical, not frying; no chips or fries are safe).
- Cow's milk and all dairy products including butter (boiling for 1 minute destroys this chemical).
- Peppers of all kinds, unless cooked very well done.
- Unripe fruits, unless cooked.
- Watermelon.

Foods with apiol are:

- All common cooking oils.
- Soy products including oil and soy sauce; **cooking does not destroy this chemical.**



Even sweet breads had no gallate, apiol or RAS.

Fig. 52 Safe bread baked in Mexico

Foods with gallic acid are:

- Commercially baked goods and bread. Bake your own.
- Cereal grains (cooking the cereal destroys this chemical). Avoid cold cereal.

Also, stay off foods belonging to the **Lily** family, including **onions, leeks, garlic, chives, asparagus,** and **aloe vera**, also cilantro, Swiss chard, canned and processed foods containing spices. Spices nearly always have some onion ingredient. Removing all onion from your diet will block Fasciolopsis' life cycle. Fortunately there are exceptions to every rule. Thorough boiling destroys this chemical, too, so you will get this back at a later time.

Even though boiling or freezing salvages some of these foods, **do not choose them now**. Wait until your viral load has plummeted**.** After this sign of success, you may boil or freeze some of these foods and when you are well you may zappicate them extra long (20 minutes)! **Until then, avoid them all**.

Remove spray on produce, including organic, with two one-minute hot water washes.

Treat all your food electrically before or after preparation; this includes condiments, supplements and medicines. You may put your whole plate on the zappicator to be sure you have not missed a single item.

6. Add 15 drops of hydrochloric acid (HCl, 5%, USP) to your plate of food when served. Put one drop in your water. Distribute the rest, stirring it in with a plastic fork. Eat with plastic cutlery. Do not put HCl straight in your mouth; it will dissolve your teeth.

7. Five minutes before each meal (3 times daily) take one iron capsule, 10 mg; two vitamin B_2, 300 mg; and two magnesium oxide capsules, 300 mg each. Later, take 4 more capsules of vitamin B_2 in a single dose, making 10 daily, to detoxify azo dyes and benzene.

8. Take 10 coenzyme Q10, 400 mg, on an empty stomach daily, to detoxify dyes in your T-cells and kill tapeworm stages.

9. Don't use or eat anything on the benzene list.

Don't use any recreational or otherwise unnecessary drug. Don't, friend or foe. Don't sell it. Put it in the toilet. Put your cigarettes there, your beer, Rush, marijuana and other chemicals. If you needed them to make life worth living, you may have been chronically depressed. You can clear this up, too, in a non-psychiatric way by taking the set of "protective" drops for the brain.

You will get the high of a lifetime when you see your next blood test results. Be patient.

10. Start zapping, preferably plate-zapping for eight hours a day, using the Zapping Schedule.

11. Take Black Walnut Hull tincture Extra Strength, 2 tsp. daily, plus ¼ tsp. Spice Syrup 2 times daily. You may mix them. Also take 7 wormwood and 7 clove capsules (unless taking cloves in Spice Syrup). There are also recipes for Buski Tea and Six Fresh Seeds as well as plain watercress tablets if you do not tolerate Black Walnut Hull or want to progress faster.

12. Drink one cup of Pau D'Arco tea, strong brewed, once a day to kill more Paragonimus. Or make electronic tea and drink one ounce 3 times daily till well. You may do both.

13. Start taking homeographic drops, according to the Homeography Schedule.

14. Take selenium, but only in the form of sodium selenite, because many other forms are toxic. If you can find 200 microgram capsules of selenite, take 5 capsules, 3 times daily. If you find some other strength, take an equivalent amount. One cup of coconut "milk" can substitute for one of the three daily doses.

15. Take organic germanium in the form of powdered hydrangea root, 1 tsp. 3 times daily, mixed in any beverage. One cup of coconut "milk" can substitute for one of these doses, too. In other words, drinking one cup of coconut "milk"

means you only need to take two doses of both selenite and hydrangea per day. Even if you like coconut "milk," only take one glass per day.

16. Take vitamin C, 1000 mg, 2 capsules, 3 times daily.

17. Take L-G, one tbsp. liquid, 4 times daily. This removes residual mercury, thallium, and other amalgam residues. Also take L-A, one tsp. 4 times daily.

18. Take six drops of Lugol's iodine solution in ½ cup water at the end of each meal and bedtime to control Salmonella. Do not mix it with any food. Do not take iodine if your doctor has told you that you are allergic to it. You could only get this allergy from past clinical procedures. You may take two extra doses a day if you feel "fluey" (feel like you are getting the flu).

19. Take levamisole, 50 mg, two tablets 3 times daily. A popular brand is Decaris. This removes ferritin from your asbestos-damaged white blood cells so they can phagocytize. Not available in United States. If not available, take 1 tsp. papain 3 times daily, or twice as much bromelain or 6 Watercress tablets 2 times daily.

20. Take 15 capsules (400-600 mg each) of digestive enzymes between meals twice a day to clear away dead parasite refuse and avoid illness from deparasitizing.

21. Purchase about two dozen small magnets, only 10 gauss in strength. Apply two magnets over each kidney area. This will keep them clear and unclogged while they pass so much toxic material in these two weeks. The north side should be touching the skin. Tape them in place with wide masking tape, not the medical variety (it has mercury and PCBs). Wear them continuously by day; remove at bedtime. Use the other 20 or so magnets to make a magnet belt (as shown) to be used later. Test the polarity of each magnet with a compass. If you can't do this, omit this item.

Fig. 53 Wrap around body to get PCBs out of skin

22. Take ozonated olive oil, 1 tbsp. twice daily, frozen or liquid. It may be mixed with food. This helps PCBs leave your body and enter the urine. Zappicate oil first, then ozonate for 30 minutes. Store frozen.

23. Take glutathione, 500 mg, 2 capsules, 3 times daily, to supply reducing power and help lungs.

24. Take betaine hydrochloride, about 300 mg. Take three, 3 times daily with meals for 3 days, to kill clostridium bacteria in bowel.

25. Take vitamin A, 10,000 units daily.

26. Take zinc, 30 mg, one a day with meals.

27. Purchase Oscillococcinum, homeopathic flu medicine. Wait till you have flu symptoms before taking it, though. Follow package instructions.

28. Take nopales (cactus) herb, six tablets once a day, to kill Eurytrema and prevent Kaposi's and other cancers.

29. Take L-cysteine, 500 mg, 2 capsules, 3 times daily to kill tapeworm stages and sheltered *Ascaris* eggs.

30. Do an enema daily, alternating Lugol's solution and Black Walnut tincture to kill parasites and viruses in colon.

31. Drink ½ cup Prion Punch three times daily, more if detox-illness strikes with flu-like symptoms (see *Recipes*).

32. Take glucuronic acid, 250 mg, 1 capsule, 2 times daily. It is a phenol-detoxifier and helps make acetylcholine, to lift fatigue.

33. Take thioctic acid, 250 mg, 3 times daily and taurine, 500 mg, 3 times

daily to support the liver while so many toxins are arriving there.

Help With Each Item

1. Get ready for your dental visit by preparing dental bleach. It is a very, very dilute solution of USP bleach (see *Recipes*). Take ½ cup with you. Rinse your mouth just as you are being seated in the dental chair. This kills the large amounts of bacteria that are in everyone's mouth. They would enter your blood stream as soon as there is any bleeding. Remember to do this with all dental procedures in the future even if it is just denture fitting. Do not swallow it. Do not use the dentist's antiseptic or mouthwash; it is the usual sweetened chemical concoction with a "new improved" formula, heavily dyed. You may use colloidal silver that you can swallow. Or use Lugol's iodine (six drops in water) that you also may swallow. These are not as good as dental bleach.

At the end of the visit, rinse with dental bleach again as you get up from the dental chair. This timing is important. It prevents infections.

As soon as you get home start doing the Dental Aftercare program. Have your book marked at the page with instructions. Do not drive yourself home from the dentist; ask a friend to go with you. You will also get better service as a twosome. Ask for your extracted teeth, rinse them, and then cover with bleach water in a closed container. Do it all yourself. The stench may be too much for even your mother. And your body was asked to cope with it internally! Rejoice that it is all out. Your replacement teeth can be made of any material or color since you will harden the plastic yourself at home in a saucepan of water, following the recipe. You will also zappicate them. Your new teeth will be beautiful because you can choose them. You will be able to chew better than before and food will taste and digest better. Your tooth impressions can be taken at the same visit as for extractions but you must not put colored impression compound in your mouth or you will be putting azo dyes into your T-cells yourself. Some safe varieties are pictured below. Your gums must heal before you can try fitting the new dentures. Do not use impression compound for bite registration purposes. Use paper. It takes two to three weeks before you can wear your dentures with comfort. The *Dental Aftercare* program speeds this up.

Fig. 54 No Fast Garnet, Fast Green, silicone or aluminum in these dental impression compounds

Dentists and dental surgeons seldom are treated to seeing their patients after they have recovered from some devastating disease, whether it is MS, Parkinson's, cancer or AIDS. Without these professionals your recovery would be impossible. Let them know how important their role was by paying them a visit when you are quite recovered, not even needing antivirals. Or make a phone call or send a note of appreciation.

2. Learn to read and understand your blood test results. It is mostly plain arithmetic. Use the chapter on *Reading Your Blood Test Results*. Unless you or your caregiver learns to identify danger signs, they can be missed! I have seen persons with a red cell (RBC) count under 2 dismissed from the hospital, a white cell (WBC) count under 3 not tested for AIDS, an albumin level under 2.5 not given albumin, an iron level under 20 not given an iron supplement. You must assert yourself knowledgeably! Don't defer all decision-making to your doctor! Study those items thoroughly that are out of the normal range. Don't waste the doctor's time asking for explanations, nor burden your doctor with personal emotions. Understand the possible blood test interpretations. Your doctor may enjoy discoursing over it with you. You may develop a new respect for your doctor when you see how intelligent and concerned she/he really is. Blend your judgment with his/hers. In a standoff, always compromise.

The viral load test takes longer to complete. If you have gone off your antivirals expect to see the viral load come up before it goes down. The viruses are coming from Fasciolopsis parasites clustered in and around the thymus, in your bone marrow along your bones, in your genital organs, and in your lymph vessel valves under your skin. That is a lot of locations. As soon as benzene is gone these stop releasing HIV virus. Meanwhile you may have reached the upper limit of the test, more than 750,000 copies of the viral genome per ml of blood. I have seen AIDS patients with such high viral counts go for months without getting sick and actually getting better. It is not the virus that makes you ill; it is lack of immune power for other attackers.

But, of course, we will also get the viral count down to "nondetected" soon. As soon as the macrophages begin to phagocytize, they will eat the pathogens that are making you sick. But the lymphocytes must have the dyes Fast Garnet and Fast Green removed from them before the ratio of CD4s to CD8s can go up and the total T-count rise. All this can happen in these two weeks.

Your first observable goal is to increase the CD4 count and the ratio of CD4s to CD8s. When this happens it lets you know that the dyes are being removed and you will get virus-killing power back. Your final goal is a ratio of about 2:1 in favor of CD4s and a total for both of over 1000. Your total white blood cell (WBC) count should eventually reach at least 5000. You cannot realistically achieve this in less than six weeks but you can see the first signs of success in two weeks.

Reducing the viral load is not as important as getting functional CD4s and killer cells back as well as macrophages. Soon you will stay well although people around you are sick.

Top Priorities

Although your goal is to cure your HIV and AIDS, there is still a higher priority: **survival** right now! Obviously your top priority is to survive any current illness, be it lung disease, syphilis, *Herpes*, dementia, near-coma or a failing organ. This does not depend on the viral load of HIV. It depends on having capable lymphocytes and macrophages, namely, the ability to phagocytize and deliver dead pathogens to the bladder (for excretion). Only removing benzene, PCBs, lanthanides, ferritin coating (asbestos) and azo dyes can accomplish this. That is why removing artificial teeth and other sources of immunity-destroyers, such as food and water, come first in the program. Removing these at your failing organ, be it brain or lung or kidney, is the life-

saving event. Your body is very swift. Removing them here with plate-zapping and homeography, while stopping any further intake, will be noticeable in days, not weeks.

The CBC will be ready in an hour. Check the results at once. If the RBC is at 3.0 or below request a transfusion. If the WBC is below 3.0 minimize your contact with other people in order to reduce your chances of infection. When both counts are extremely low, request *hemopoietic factor*. Tend to any emergency with nutritional intravenous (IV) solutions. They should be zappicated to destroy PVC contamination, or at least filtered through a syringe filter to sterilize.

If you are wasting away from weight loss, no appetite or ability to eat, find a doctor who can give you nutritional IVs. You need intensive feeding, not just glucose and saline (salt water). You need fatty acids, amino acids and assorted vitamins and minerals. But if the doctor plans to use PVC bags of IV solutions instead of glass bottles it will be significantly counterproductive. They are heavily polluted with plasticizer, dyes, benzene, isopropyl alcohol, and even live *Ascaris* eggs and bacteria.

Glass IV bottles are available. And even these must be sterilized with ½ ml of ethyl alcohol and filtered through a 5 micron syringe filter. All this is easily accomplished and inexpensive. But you may need to go to a foreign country for these superior services.

Fig. 55 Good IV bottle and filter

It may take you a week to locate such a doctor. During this time you may feel strangely better, if you are on this Rapid Rescue program. You may be able to "cautiously delay" the IV a week at a time, but only if the scales agree that you are gaining weight.

If you need a transfusion, a week is much too long to wait. Don't delay. Perhaps you will not need another transfusion later if you are on this program.

Intravenous (IV) Supplements

If you are a caregiver, you might notice that in spite of all the good intentions your patient has to eat and take supplements, day after day passes and it simply does not happen. There are reasons beyond anyone's control for not eating. If your patient continues to lose weight, they are not eating enough. Provide the richest, highest calorie food you can. Prepare it in the most appealing way you can. But if they have not eaten food for two days, you must give IV feedings.

The IV feedings should include fat and protein, not merely sugar. It is common practice to give terminally ill patients dextrose-water (glucose/sugar) alone as nourishment. Perhaps it seems justified to clinical personnel since better nutrition would only delay the final event and increase suffering.

I recommend an intensive feeding program including a liquid amino acid mixture and a fat emulsion, since we will salvage the patient. If blood albumin levels are low (below three), a bottle of albumin should be given daily as well; on alternate days as condition improves. Along with these nutritional IVs, hefty doses of vitamins and minerals should be given.

The IV bags and the bottles of injectable supplements are often polluted with antiseptics, heavy metals, bacteria and even Ascaris eggs which bring with them Coxsackie viruses. The bags themselves seep plastic because the Syncrometer® finds polyvinyl chloride inside (a carcinogen!). For this reason we use only glass IV bottles. Since you cannot test easily for bacteria, you should give each 500 ml IV bottle one half ml of ethyl alcohol (either 76% or 95%) to kill Coxsackie viruses. To eliminate the bacteria and parasite eggs, run the IV tube through a five-micron syringe filter placed "in line." As for isopropyl alcohol or benzene, you are taking a chance—it is simply a gamble if you cannot zappicate. But it is better than doing nothing.

This is our "minimum nutrition" list for IVs.

- Fat emulsion (1,000 ml, Intralipid™ 10% see *Sources*) Use 1/2 or whole bottle a day.
- Magnesium (10 gm/20ml) use 2 gm in a day. Gives mild pain relief. Stops spasms.
- Potassium chloride (149 mg/ml) use 2 to 4 ml a day.
- Vitamin B-100 complex, use 5 ml a day.
- Amino acid solution (1,000 ml, with electrolytes). Give 1/2 or whole bottle in a day.
- Vitamin C (L-ascorbic acid, 500 mg/ml), 25 gm up to 100 gm in critical cases. Add calcium and magnesium injectables to the vitamin C IV to neutralize acidity.
- Calcium gluconate 10% (50 ml), use 25 ml when blood level is below the normal range. Add this to the vitamin C IV to help neutralize its acidity.

These dosages are somewhat flexible; use according to need.

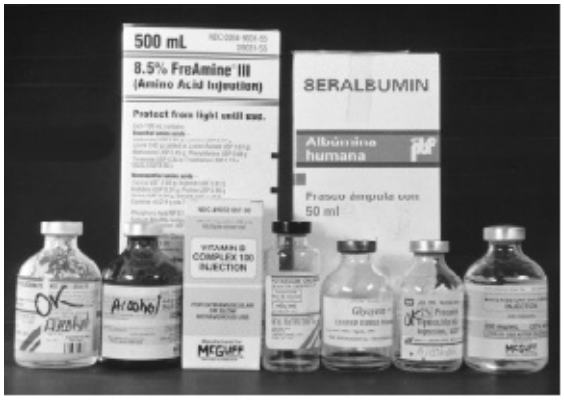


Fig. 56 Assorted supplements given by IV

Note: if you do not sterilize the vitamin C, amino acids, B-complex, and fat emulsion with ethyl alcohol, and filter them, you will be introducing the very pathogens you are trying to clear! It is not "normal" to get chills after an IV; it is caused by pathogens in the IV.

All these supplements are added to IV bottles of saline (salt) or dextrose (sugar) depending on which is lowest on the blood test. If both are low, glucose (50%) is added to a saline IV bottle to give both at once.

Note that no oxidizers are included in this regimen, nor sulfur compounds. It is quite inadequate, but may tide your patient over the first few days, when a small improvement makes the critical difference. As soon as your patient is willing to drink broth instead of water, you have gained ground.

Additional IV treatments may be used in other situations.

- Procaine, use 5 to 10 cc of 2% solution (the preferred pain killer).
- EDTA, single dose, 3 gm daily, to remove heavy metals
- Vitamin K, 5-10 mg a day to reduce bleeding
- Vitamin A (25,000 to 100,000 IU/day)
- Albumin (use a one dose bottle, 12.5 gm in a day)

Emergency Receding, Continue On

You can zap with an IV going. You can take supplements and drops with an

IV going. Don't let an emergency slow you down!

3. Going natural was never easier. Stop all body products unless homemade. Remove all chemicals from your home that could pollute your air. Use the next chapter on *The Four Clean Ups* for many tips.

4. If you live far away from the water treatment plant, your water is probably "boosted" with laundry bleach. Ask the water department whether you are getting such boosted water. If you are, move. You cannot win the battle against heavy metals and azo dyes in such water. If you had been using a water filter, send this to a lab for testing, not a water sample. Call the labs for exact instructions. Meanwhile, move to a district where only chlorine gas is used to chlorinate your water. You will not succeed with this program if you continue to drink benzene-water.

5. Evidently the fish are sanitized with laundry-grade chlorine bleach that is polluted with heavy metals and azo dyes right on the fishing boat to control bacteria. Or perhaps the cutting boards and tables are doused in it. This variety of bleach was meant for disinfecting toilets and barns. The correct bleach should have been a registered or USP variety.

Dairy products and eggs contain bits of animal tissues that come from the hypothalamus and pituitary glands. They enter your blood stream and consume your antibody immune power. HCl kills them.

Chlorogenic acid, phloridzin, apiol and gallic acid belong to a class of natural food chemicals called **phenolics**. The liver normally detoxifies them, but when parasites overrun the liver these phenolics along with many others are not detoxified. This starts the cascade of events that leads to over-consumption of immune power in cancer and AIDS. Although gallic acid, chlorogenic acid and phloridzin can be destroyed by heat (boiling temperature), do not use this "escape" for at least 2 weeks. Avoid all apiol permanently. Strictly avoid the Lily family until your viral load has dropped significantly.

Liver cleanses and parasite killing help most in controlling the development of new phenolic food allergies.

Choose as near unprocessed food as possible. Cook from scratch. The food zappicator will help you remove the traces of immune blockers left in the food you prepare. Finally, place your plate on top of the food zapper or zappicator for at least 10 minutes. Treat your pills, too. Each item only needs one 10-minute treatment. Most food items only need five minutes but eggs, dairy foods and

phenolic chemicals need at least 10 minutes. More is better. If your patient is very special, treat food for 20 minutes.

6. One drop of HCl in a cup of water can destroy the trace of benzene that could be there. HCl is compatible with Lugol's. You may add your portion of Lugol's to this water. HCl is sour but does not spoil flavor in these amounts. Don't get careless and squirt the HCl; you must count the drops. **Continue until well**. Don't drink beverages with your meals; they take up too much stomach-space. Drink only your Lugol's water.

7. The iron supplement should be ferrous or organic; larger doses give too much oxidizing action. Vitamin B_2 has several jobs to do. It must detoxify benzene, which it turns into phenol. It must detoxify azo dyes, even though they are almost unreachable inside your T-cells. That is why so much is needed. Expect the urine to be yellow. You may open these capsules and take it straight or stirred into water and honey. Magnesium oxide can detoxify phenol which itself is very toxic. It is needed in equally large amounts. But you can only make use of large amounts if it dissolves in the stomach. For this reason a powdered variety is chosen. Tablets do not dissolve completely and easily set up a diarrhea with their laxative effect taken this way. Powder does not. In AIDS the stomach does not make enough hydrochloric acid and pepsin due to the heavy infestation of Ascaris eggs and microscopic larvae here. By taking these three supplements five minutes before eating, the stomach is triggered to make them—an extra bonus. **Continue until well**.

8. If you cannot afford this, take 1 capsule daily and a 10 capsule dose once a week. It also protects the heart.

9. Antibiotics, antifungals, and antivirals are all toxic drugs, too. If they are hurting more than helping, you should consider going off these, but not without the consent of your doctor. Although your viral load will come up in the first week, that may not be so bad for you, because the side effects of these drugs are being instantly relieved. The rebound from going off drugs will at first be greater than the improvement from the *2-Week Program*, so it is very important that you are doing everything in the Program, especially the lifestyle cleanups. And don't go off heart medication, thyroid, diuretics, cortisone, and antiseizure medicine. Be sure to wash off dyes and zappicate your drugs to sanitize them.

If you have very little time left to live, you might assert yourself more vigorously to be allowed a "drug holiday" giving this *2-Week Program* a better chance. Sign the papers to relieve your doctor of responsibility. Assure your

doctor that you will follow the program responsibly, without a single transgression into recreational drug use.

10. Zapping with a plate attachment is much more effective for AIDS patients because they are always saturated with PCBs and benzene. The plate concentrates the current at the location (organ) placed on the plate, killing specifically the organisms placed there. Start by killing everything that is trying to spread through your blood, lymph, arteries and cerebrospinal fluid. This is called the **basic set**.

Each zap, if done with a 9.4 or greater starting battery voltage, returns phagocytosis to your white blood cells here, which immediately removes the immune blockers and live invaders from the current path simply by being eaten.

But it does not return BQ or RZ nor reach anywhere outside of that one current path. The body has thousands of current paths. You must also use herbs and homeography. Besides plate-zapping equipment and slides of organs and pathogens, get a battery charger and rechargeable batteries, plus a voltmeter to make zapping inexpensive and enjoyable. The batteries should be chargeable to over 9.4v. Eat, read, write and take supplements and homeographic drops while zapping eight to 10 hours a day. You will get a flu-like syndrome with disorientation and a zombie-like behavior unless you prevent it all with anti-flu, anti-Salmonella and anti-prion treatments constantly. It is not dangerous but wastes your time. If you begin to feel "fluey", zap the hypothalamus repeatedly and take more of the "protective" drops made for the brain. Also take the antidotes, Lugol's iodine, Oscillococcinum and Prion Punch. Wait till you are better before starting to zap <u>new</u> organs. Zapping with a regular zapper or with nothing on the plates also relieves detox-illness. It also kills parasite eggs in the blood that are released by herb-killed parasites. Zapping with copper pipes under your feet is most effective since the skin is more conductive here. It is less saturated with PCBs. Pressure from the feet keeps the current going to your internal organs, not merely through the skin. Placing feet on flat surfaces is less effective.

11. If you take the herbs while zapping, the eggs released will be immediately killed. Zap for at least ½ hour after taking herbs, preferably longer. The Spice Syrup kills other parasites like Clonorchis, Eurytrema and Strongyloides. Each plays a role in HIV disease. If these doses are not tolerated, make the Buski Tea and drink 2 cups a day. Add the Six Seed recipe, taking it for 6 days; then go off 6 days and repeat. Watercress is the easiest to tolerate. You may chew Watercress tablets, dissolve them or blend them with another beverage. A strong

dose is 6 tablets twice a day. Suit your needs. Watercress is *Nasturtium officinale*. It can be grown at home (see *Sources*), and eaten daily in salads.

12. "Drug Cocktails" also kill Paragonimus, which in turn cuts your benzene burden in half. With much less benzene the virus level falls. Pau D'Arco is pleasant with no side effects.

13. You can easily learn to make your own homeographic drops.

14. Selenite is also available from Brazil nuts (50 micrograms per nut), and coconut. You could never eat as much as you need. Yet a food source is more potent and should be part of the diet. One cup of coconut "milk" provides one complete dose of both germanium and selenite. Store-bought shredded coconut is a potent source, too.

15. Organic germanium is found in many foods including nuts and coconut "milk". Shredded and flaked coconut from the supermarket has it too, and it has always tested free of pollution. Eat a lot in all the delicious ways. The effective germanium supplement in the marketplace is Ge-132 but is too often polluted with solvents to risk. The amount of germanium in the dose given, together with the selenite, is necessary for the functioning of your macrophages. You may have successfully removed the four phagocytosis inhibitors so that the WBCs are now filled to capacity with virus, bacteria, PCBs and refuse. But they will not be able to unload this cargo at the bladder (into the urine) unless they have enough selenite and germanium. One does not substitute for the other. Other forms of both selenium and germanium can be quite toxic. Food is always safest in the long term. But in the Rapid Rescue program you need a lot and you need it fast so selenite is chosen.

16. Vitamin C is also necessary for your WBC actions. Use only the L-ascorbic acid form. Later, when you can have safe goat milk, vitamin C can be stirred into it. If you dump enough in, it turns into yogurt. Flavor it and it's even more delicious. Be sure to stick to plain ascorbic acid to avoid thulium pollution and oxidized forms of vitamin C that could do harm. Remember to zappicate all first. Meanwhile, take by capsule or in other beverages.

17. Copper, cobalt, vanadium, toxic germanium, toxic selenium, chromium, and nickel are heavy metals that come from amalgam, but also come from natural (bacteria and fungi) sources. L-A removes these. Make your own solutions with the recipe. Do not combine L-G and L-A with each other nor put them in beverages.

18. All commercially available ready-made Lugol's solutions that I tested were polluted with wood alcohol and isopropyl alcohol (unless listed in *Sources*). But when a pharmacist made it from scratch it was pure. Ask a pharmacist to make (not buy) it for you. It is excellent for sterilizing produce before putting it in the refrigerator. It is excellent as a quick mouthwash when you accidentally bite your tongue or cheek. By rinsing your mouth within seconds, no pain develops and you can finish your meal. Iodine fumes from around the bottle cap can stain any surface. If this happens, use vitamin C at once to reduce it to colorless. A drop of straight Lugol's smeared on your tongue at bedtime helps control thrush. Lugol's is also useful in enemas.

19. Levamisole is used in the veterinary profession as a parasite killer and immune stimulant. It is available in other countries for people. In a country as heavily parasitized as United States, levamisole should be an over-the-counter drug for people, but it is not. The amount used here for ferritin removal is much less than is used as a vermifuge, so no symptoms occur. Nevertheless go off it after two weeks. Resume again a week later if you are not yet well. Watercress (6 tablets twice daily) also removes ferritin.

20. Killed parasites need to be digested as soon as possible. Any refuse in the body that isn't cleared away in four or five hours develops fungus growth. Pneumocystis infection is such a takeover in the lungs after numerous Paragonimus are killed. It must not be allowed to spread. Simply digest it. Purchase multiple digestive enzymes and also a pancreatin-lipase mixture. If available, alternate them. You may take them out of their capsules, though you may be inclined to put them right back in.

You may stir them into a beverage and add spice. Zappicate everything first (or last). If you are concerned about prions in the animal-sources take the Prion Punch at the same time.

21. Do not use larger magnets because they slow the organ's pace of operation wherever they are placed. We want the kidneys to keep pace with toxin-pickup, not to be slowed down. Ten gauss is not strong enough to pick up three regular paper clips end to end without linking them. Catalog estimates can be way off. Test yours. To make a magnet belt purchase 3" wide elastic bandage. Lay flat. Using household plastic cement put a dot on the south side of each magnet.

Also put dots of glue on the belt in a zigzag design, 1½ inches (4 cm) apart. Stick on the magnets. Let stand 24 hours to dry hard enough to handle roughly. To store the belt, roll it up so that all the north sides face out. This keeps them

from touching each other and sucking their magnetic fields out of them. Don't be tempted to purchase magnetic equipment in the market place. The polarity is not carefully enough maintained for you. South Pole forces can do as much harm to you as North Pole can do good. If in doubt, stay away from magnets—zap the kidneys and bladder daily instead. Only North Poles should touch skin.

It is easy to use an ordinary compass to prove you have the correct polarity. Place a compass on the table. Make sure no other magnets are nearby on the table. (Some things in your home that may contain magnets are electronic equipment, speakers, refrigerator magnets, and, of course, the magnets you are working with.) Notice that the compass needle swings and points in one direction.

Fig. 57 Two kinds of compasses

On some compasses the needle is labeled "N," and on some the needle is colored red on one end. We will ignore both! All you need to know is which direction north really is. (If you don't know you could ask a neighbor.) Make a note of the north-pointing end of the compass needle.

(Don't rely on the word "north" printed on the compass enclosure. As you can see in the picture, the compass enclosure may be turned any way you happen to set it down, but the needle will steadfastly point in only one direction.)

Now bring the magnet you wish to test close to the compass. As you slowly approach the compass with one side of the magnet, the needle moves. The north-pointing end of the compass needle will either be attracted to (follow) your magnet, or swing away. **If attracted, that side of your magnet is north and**

goes on your skin. If it swings away, that side of your magnet is south and is worn away from your skin. Label your magnet! All magnets you purchase should be checked this way before you use them.

Wait until you are much better before using the belt. It will chase the PCBs out of your skin and into you for excretion. Check polarity again just before using. Treat all skin areas for 20 minutes. Repeat twice more. Apply snugly, holding it in place with pins.

22. No method is known other than zapping or homeographic drops that can pull the PCBs out of a person in a reasonable time period. These techniques operate through the immune system at only one specified location. It is valuable to have a more general method, like ozonated oil or coriander oil to assist the immune system throughout the body. Do not take ozonated oil as freely as if it were a supplement. The ozonation could become excessive. But as long as you are very ill you still have pileups of PCBs somewhere. At times the loose fleshy blebs of them stick out monstrously. If drainage is an option, take it. You can safely take ¼ cup ozonated oil and speed up your recovery but do not repeat this daily; twice a week should be the limit. It does add calories to your diet. There is never a weight loss during this time. Be sure to zappicate the oil before ozonating it.

Coriander oil is an essential oil that can oxidize PCBs and benzene in a slow and steady way. Add it to your Spice Syrup (1 tsp. oil to ½ cup syrup) and stay on it for nine months. The dose is ¼ tsp. 2 times daily.

23. Glutathione is especially valuable for the lungs, which need to keep their sulfur compounds in reduced form. It protects the liver from aflatoxin and is an all around energizer.

24. Betaine eliminates Clostridium bacteria in the intestinal tract. This is very valuable help when antibiotics are counterproductive and yet bacteria need to be eliminated. Three days after dental work is done you may reduce it to 3 capsules once daily.

25. Because azo dyes interfere with vitamin A metabolism, it seems wise to supplement with vitamin A. It also has a reputation for cancer prevention, another risk in AIDS. Market varieties are, of course, polluted with processing solvents and frequently are polluted with lead, so it is important to purchase from *Sources* only.

26. For men, zinc is also useful in preserving virility, being high in

concentration in semen.

27. Oscillococcinum works best at bedtime. You may go to bed achy and fluey and wake up good as new. But if you use it during the day, when you are not really sick, it loses effectiveness. Be conservative.

28. This is the large desert cactus used by native peoples to cure diabetes. It kills the common pancreatic fluke, which is one of our tumor initiators, brings us diabetes and brings the SV 40 virus.

29. Cysteine can give you side effects so stay seated. Sometimes it gives euphoria; it is well deserved.

30. The colon that descends on your left side is invariably parasitized at a location about halfway up. One pint of enema fluid reaches it but only iodine or Black Walnut tincture in the enema fluid kills parasites on contact. If you feel twinges here, be sure to search for them in the toilet bowl later.

31. Detox-illness can strike at a brain location that is not protected. For this reason a "Prion Punch" recipe is made to act more systemically. Use as many ingredients as you can locate.

32. Glucuronate can detoxify a variety of phenolic allergens. It also helps indirectly to make acetylcholine, the neurotransmitter that moves your muscles. It helps the liver detoxify ("conjugate") bilirubin to avoid jaundice.

33. The liver needs cysteine, glutathione, taurine and thioctic acid to detoxify benzene through its four major steps: first to phenol, then to wood alcohol, then to formaldehyde, then formic acid and finally beyond this to safety. These four supplements can prevent coma due to liver failure. You may open capsules and combine them all in the Whole Lemonade beverage (see *Recipes*).

34. A body full of benzene is also full of its detoxification products: phenol, wood alcohol, formaldehyde and formic acid. These may even do more harm, besides over-acidifying the body. Alkalinizing with bicarbonate is the mild way to eliminate these poisons and get proper pH back. A 2:1 mixture of sodium to potassium bicarbonate is superior. Purchase urinary pH test paper at pharmacy.

The Plate-Zapping Method

It is easy and beneficial to put a metal plate between you and the zapper. Whatever organ specimen you put on this plate directs most of the current to that organ in your body. Whatever bacteria or virus you put on this plate gets more

current, too. Such an arrangement overcomes the insulating effect of PCBs in the body.

First of all:

1. Be sure your zapper is 100% Positive offset, without the tiniest spike of **Negative** electricity. Have it checked on an oscilloscope. You must avoid even a few microseconds of **Negative** voltage.

2. Identify the "hot" (+) lead from your zapper. If you accidentally choose the (-) lead you will get no benefit, although it does no harm. If your zapper is not clearly marked with a (+) sign take it to any electronics shop. The technician will gladly check it for you.

3. Do not use a wall outlet as power source. Do not use a frequency generator without supervision by an electronics expert.

4. Purchase a voltmeter and test your batteries before beginning and after every two zaps afterward. Make sure the voltage is not below 8.9 volts at the end of each zap or it will have to be repeated. Start at 9.4 volts to be sure of this.

5. Purchase a battery charger for metal hydride batteries that will charge to 10 volts and two to four metal hydride rechargeable batteries.

You will need:

1. Zapper with continuous running capability instead of seven-minute sessions; this is for convenience.

2. Plate box that can be attached to the "(+)" lead of the zapper with proper leads.

3. Two copper pipe electrodes and two banana-to-alligator clip leads (wires).

4. A kitchen timer.

5. Four packages of 1 pF capacitors and 1 μH inductors.

6. Microscope slides of body organs (anatomy set), bacteria (pathogens), and digestive tract organs.

7. Bottle copies of any tissues that cannot be purchased as slides (see *Sources*). These are white blood cells (WBC), lymph (the fluid), and others.

8. Bottle copies of pathogens that cannot be purchased as slides, like SV 40 virus, p24 (part of the HIV virus), prion protein and others.

Digestive System Slide Kit

Appendix	Liver
Bile duct	Pancreas
Colon	Parotid gland
Duodenum	Rectum
Esophagus lower	Stomach, cardiac region
Esophagus upper	Stomach, fundic region
Esophagus-stomach junction	Stomach, pyloric region
Gall bladder	Sublingual gland
Ileum	Submandibular gland
Jejunum	Submaxillary gland

Anatomy Kit

Brain, composite (cerebrum, cerebellum, medulla)	
Bone marrow, red	Lung
Bladder	Lymph node, human
Blood, smear, human	Mammary gland (breast)
Hypothalamus	Pineal
Kidney	Pituitary gland
Thymus	

Anatomy Male Slide Kit

Ductus deferens	Seminal vesicle
Epididymus	Sperm
Penis	Testis

Anatomy Female Slide Kit

Cervix	Ovary
Fallopian tube/Oviduct	Uterus
Fimbria	Vagina

Pathogen Kit

None of these pathogens are alive. They are safe to handle. Bottle copies contain only water.

Adenovirus (bottle copy), the common cold

Aspergillus mycelium, lung fungus

Bakers' yeast, homemade or Saccharomyces cerevisiae slide, bread yeast

Cabbage Black Rot, common fungus

Clostridium botulinum, decay bacteria, causes depression

Clostridium perfringens, decay bacteria

Clostridium tetani, decay bacteria, causes fatigue

Escherichia coli (E. coli), bowel bacteria

Hepatitis B (bottle copy), liver virus

Influenza A and B (bottle copy), common flu

Mycoplasma (bottle copy), lung bacteria without walls

Penicillium mycelium, lung fungus

Pneumocystis carinii, lung fungus

Potato Ring Rot, food fungus, invades body

Protein 24 (HIV, bottle copy), bit of HIV virus

Salmonella enteridites, bowel bacteria, invades body

Salmonella paratyphi, bowel bacteria, invades body

Salmonella typhimurium, bowel bacteria, invades body

Shigella dysenteriae, bowel bacteria, invades nerves

Sorghum mold (bottle copy) from infected Sorghum leaf, invades body

Treponema, syphilis spirochete

Miscellaneous Specimen Kit

("B.C." means Bottle Copy.)

3 Yeasts (Baker's yeast, Saccharomyces cerevisiae, mycelium and spores) B.C.

Lymph (fluid) B.C.

Saliva B.C. (also see instructions)

Artery combination, "A", arteries, veins, nerves B.C.

Lymph vessel combination, "L", lymph vessels, veins B.C.

Cerebrospinal fluid B.C.

Heavy metals, assortment of 50 taken from amalgam B.C.

Prion protein B.C.

3 Clostridiums (C. botulinum, C. perfringens, C. tetani) B.C., cancer bacteria

Staphylococcus (aureus) and 4 Streptococci (alpha Strep, beta Strep, Strep G, Strep pneumoniae) B.C.

2 Shigellas (S. dysenteriae, S. sonnei) B.C., bowel bacteria

Copper (atomic absorption standard)

Mercury (atomic absorption standard)

Thallium (atomic absorption standard)

Flu and 3 Salmonella (combination) B.C.

Coxsackie B1 and B4 viruses B.C., brain viruses

3 Baker's Yeast plus RAS B.C., invades body

3 Salmonellas (S. enteriditis, S. paratyphi, S. typhimurium) B.C., invades body

White blood cells, B.C.

Aspergillus and Penicillium, combined B.C.

Fast Garnet dye

Fast Green dye

Take-Out Drops

Thulium out-of-hypothalamus

Aflatoxin out-of-liver

Adenovirus out-of-nasal epithelium

Herpes I out-of-skin

Herpes II out-of-skin

Cobalt out-of-heart

Methylmalonate out-of-kidney

Basic Vascular Set

Blood	WBC
Lymph	cerebrospinal fluid
"A"	"L"
Four 1 pF capacitors	Four 1 µH inductors

Basic Pathogen Set

Yeast + RAS	Sorghum mold
Flu + 3 Salmonella	P24 antigen
Prion protein	Pneumocystis

You do not need to purchase all the items listed. Use the schedule to guide you. You are now ready to start zapping every organ for which you have a specimen, slide or bottle.

Setting Up:

Wrap a single layer of paper towel around one of the copper pipes. Wet it under the cold faucet and place it under your foot, near your heel. Protect the carpet with a paper plate pushed into a plastic bag.

Connect the **Positive** side of your zapper to each plate (in "parallel") on your plate box. Then connect each plate, in parallel, to your left foot, meaning the copper pipe under your left foot. (Although the Positive current is coming to your left foot via the plate box, it doesn't really matter which foot gets the Positive current. You may alternate feet every day if you wish.)

Connect the **Negative** side of your zapper directly to your other (right) foot.

Now the current will be guided to whatever organs (location) you put on the plates. Everything at those locations will get zapped but individual parasites or bacteria you put on the plates will get preference. If a large parasite is placed on the plate, other varieties will be neglected. For this reason we do not put large parasites on the plates at all. They will be reached automatically. We put only very tiny pathogens there that consume almost no current. We will start with these:

1. Influenza A plus B combined, called flu
2. 3 Salmonella varieties, combined
3. Sorghum mold, our most common fungus
4. Baker's yeast plus RAS, next most common fungus
5. P24 antigen
6. Prion protein
7. Pneumocystis

When flu and the Salmonellas are combined in one bottle, copied from the real items, we have more room left on each plate. Use this space wisely. If you have brain symptoms, choose Treponema and Coxsackie virus to take up the leftover space. If you are susceptible to colds, put Adenovirus on the plate. If you are getting waves of depression or weepiness put *Clostridium botulinum* on the plate.

Remember that the pathogens placed on any plate must not touch each other. They are separate pathogens in your body that the current will seek out.

On each plate you must choose only one location. If you choose more than one the current must divide itself between them and neither one gets enough to do a good job. However, if you put on two locations that touch each other, such as liver and arteries, the current goes to your liver-arteries, not foot arteries or any other arteries.

The Left Plate

Your blood and lymph system is the most important place (location) to zap, because this is the river-system that all pathogens use to spread themselves. Whenever adult parasites are killed, in any way, they release their eggs, which

immediately enter the blood and lymph system. Fortunately this body fluid conducts electricity best, even when PCBs and benzene are everywhere. It is called the *vascular system*. By keeping one of the body fluids on a plate at all times, all released eggs are promptly zapped. We will use the left plate to zap the vascular system, but this is only a convention.

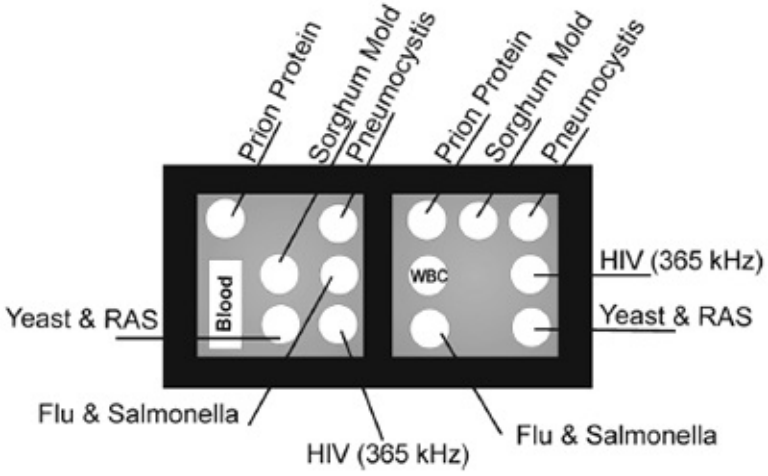

Fig. 58 Arrangement of your first plate-zap

With regular zapping instead of plate-zapping, the current already goes mostly along the vascular system and is therefore very useful, especially after taking parasite-killing herbs. With plate-zapping you must specifically choose the vascular system to accomplish this. Simply leaving one plate empty also accomplishes this since the whole body is reached through it.

Plate-Zapping Arrangement

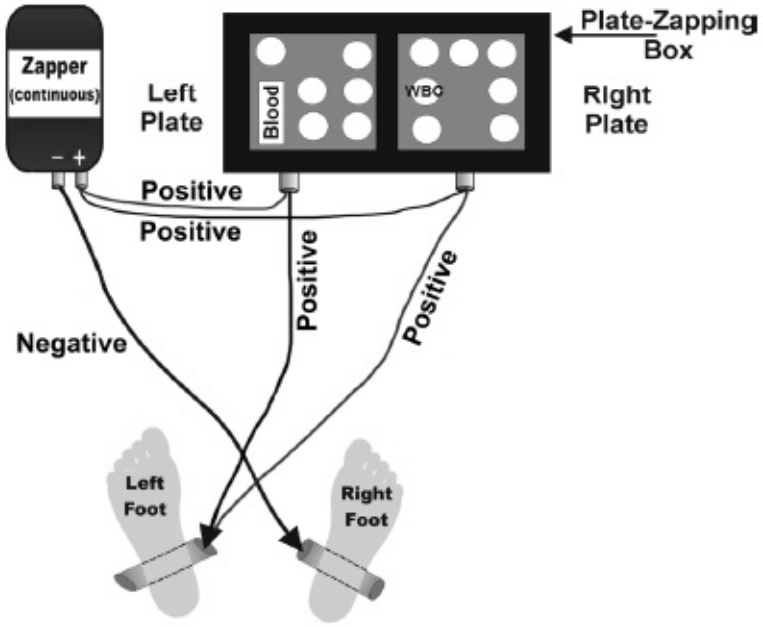

Fig. 59 Plate-Zapping arrangement

Plate-Zapping Schedule

Each zap will be 20 minutes long. Before you begin, attach your kidney magnets, north side touching skin, using one inch of wide tape. Set your supplements, voltmeter and charger on the table nearby. Find a comfortable chair, warm blanket, and begin.

#1: Put the blood slide on the left plate, put the set of pathogen samples beside it. None of them touch each other; in fact, spread them apart as much as space allows.

Put the WBC (white blood cell) sample (bottle) on the other plate. Place a second set of the same pathogens on this plate. Turn on the zapper and put your feet on the copper pipes for 20 minutes.

#2: Exchange the blood for the lymph sample (bottle), leaving the pathogens as they were. Exchange the WBC for the "A" sample (arteries, veins, nerves). Also place a 1 pF **capacitor** on the plate, but not touching A nor hanging over the edge of the plate. This capacitor somehow creates a preference for the **right side** of your body. In this case, it is the arteries, veins, and nerves on the right side of your body. Zap for 20 minutes.

Keep notes on locations you have zapped (blood, WBC) and check the battery.

#3: Keep "A" on the plate, remove the capacitor, and replace it with a 1 μH **inductor**. The inductor creates a preference for the **left side** of things. In this case, it is the arteries, veins, and nerves on the left side of your body.

Remove lymph from the left plate and place the bottle called "L" on it, and a 1 pF capacitor beside it (without touching each other). Keep all the pathogens as is. Now you are focusing on zapping the lymph vessels and more veins on right side of your body. (The lymph vessels are different from the lymph fluid sample used earlier.) Zap for 20 minutes. After 20 minutes you will have completed your first hour of plate-zapping. It is unlikely that you will feel anything yet. Remember you can take a break between 20-minute zapping sessions.

#4: Keep "L" on the left plate and replace the capacitor with your 1 μH inductor. During the next 20 minutes your left side lymph vessels and veins will get zapped.

Remove "A" and the inductor from the right plate and place the bottle called "CSF" on instead. This stands for cerebrospinal fluid. It is equivalent to lymph, but bathes the brain instead of your other organs. In fact, it is the same as lymph plus 3 pF. Zap for 20 minutes.

These four zapping sessions form the **basic set**. Do these every day. They consume a little more than 1¼ hours, leaving seven hours for you to advance into your other organs and tissues. Even if all you do on the first day is the basic set, you are off to a good start. You do not need to wait for a complete set of slides or supplies. Use whatever you have as soon as you have it. You may make your own organ samples, too, using animal parts from the meat market. Even a drop of blood squeezed from a slice of beef liver onto a plastic sheet works well.

If you are starting this next set on the next day, go back and do the basic set, first. You will do the basic set, first, every day.

We will continue zapping a part of the basic set at the same time as other organs throughout the day.

#5: For the next zap, keep the same pathogens on each plate. On the left plate place the blood slide again. On the right plate place a thymus sample (slide), your A bottle, and a 1 pF capacitor. The thymus sample touches A.

Neither touches the capacitor. This arrangement focuses on the arteries of the right side of the thymus.

#6: Replace blood with WBC on the left. Exchange the capacitor for the 1 μH inductor on the right plate and zap the arteries in the left side of the thymus for 20 minutes.

#7: Replace WBC with lymph on the left. On the right plate zap the lymph vessels in the right side of the thymus. This means place the thymus sample touching your "L" bottle plus your capacitor on the right plate. We will write this as thymus/L +1 pF. The slash between "thymus" and "L" means "touching." The "+1 pF" means put a 1 pF capacitor on the plate, too (but not touching because no slash). From now on you should assume each zap is 20 minutes.

#8: Replace lymph with A on the left plate. Put thymus/L + 1 μH (thymus touches L, and a 1 μH inductor) on the right plate. Both plates still have the usual pathogens. Zap 20 minutes.

#9: Replace A with L. Put thymus/A/WBC +1 pF (thymus touches the A bottle which touches the WBC bottle) on the right plate. Your capacitor is on the right plate, too. Zapping is directed to the right thymus's arteries' white blood cells.)

#10: Replace L with CSF. Put thymus/A/WBC +1 μH on right plate.

#11: Replace CSF with blood. Put thymus/L/WBC +1 pF on right plate. Zapping is directed to the right thymus's lymph vessels' white blood cells.

#12: Replace blood with WBC. Put thymus/L/WBC +1 μH on right side.

By now you should also have taken a dose of selenite, hydrangea and vitamin C. Also a dose of digestive enzymes and the parasite herbs including Black Walnut, wormwood, nopales, the Spice Syrup and Pau D'Arco. There are other supplements you should be taking, of course, but these are important to take while zapping because they are parasite killers. You have been killing escaped eggs in the vascular system by zapping the basic set all the time. You have also taken the set of "protective" drops and some Prion Punch for the brain plus Lugol's drops to prevent detoxification illness. You will have checked your battery at least 4 times. You have zapped 4 hours.

If you got this far by your second day, stop here and congratulate yourself. Start tomorrow at zap #1 again and try to finish through #20. That is almost seven hours of plate-zapping. Don't go forward until you have gone back and

repeated #1 through #12.

Notice that you are zapping the vascular system on the left plate while going forward to other organs on the right plate. The order of the basic set does not matter. Even skipping some does not matter. Even having the left side blank does not matter. You are still getting the benefit of each plate-zap.

#13: Put lymph on the left. On the right plate put bone marrow/A +1 pF. (Zapping is directed to the right bone marrow's arteries.) Pathogens are on both plates.

By now you can assume that pathogens will always be put on each plate, never touching each other.

#14: A on left; bone marrow/A +1 μH on right plate.

#15: L on left; bone marrow/L +1 pF on right plate.

#16: CSF on left; bone marrow/L +1 μH on right plate.

#17: Blood on left; bone marrow/A/WBC +1 pF on right plate.

#18: WBC on left; bone marrow/A/WBC +1 μH on right plate.

#19: Lymph on left; bone marrow/L/WBC +1 pF on right plate.

#20: A on left; bone marrow/L/WBC + 1 μH on right plate.

This concludes your third day of plate-zapping. Remember to keep checking battery voltage. Wear kidney magnets by daytime only; store them in sandwich fashion with north touching south (or red touching white) because this is their natural attraction, keeping them strong. **Keep magnets at least 6 inches (15 cm) away from bottles. A magnetic field destroys them.**

Don't neglect any detail. Try to make 3 quarts (or liters) of urine in a day to help your kidneys excrete metals, dyes, asbestos, PCBs and phenol (from benzene). Not to mention the wood alcohol, formaldehyde and formic acid from the phenol.

If you have been suffering from an illness like lung disease, consider the lungs your "problem organ" and continue zapping next day at #21. This gets added to the 7 hours you have already done on the third day, bringing it to 28 zaps (9 hours, 20 minutes).

Repeat these 9¼-hour days until the problem organ is much better; it could take a week.

#21 L on left; problem organ/A +1 pF (the problem organ might be your lungs, brain, skin or other place) on right plate.

#22: CSF on left; problem organ/A + 1 μH on right plate.

#23: Blood on left; problem organ/L +1 pF on right plate.

#24: WBC on left; problem organ/L + 1 μH on right plate.

#25: Lymph on left; problem organ/A/WBC +1 pF on right plate.

#26: A on left; problem organ/A/WBC + 1 μH on right plate.

#27: L on left; problem organ/L/WBC +1 pF on right plate.

#28: CSF on left; problem organ/L/WBC +1 μH on right plate.

Week Two Plate-Zapping

After the problem organ is better, we need to make time for zapping other organs. Continue to do the **basic** set on one of the plates at every zap. For the other plate do the even number zaps from 6 to 20 on even numbered days. On odd numbered days, do the odd number zaps from 5 to 19. This will take about 4 hours, leaving time to start on new organs.

First clean up the genital organs. For men you will need slides of testis, ductus deferens, penis, seminal vesicle, epididymus and sperm. For women obtain ovary, fimbria, fallopian tube, uterus, cervix, and vagina. There are eight plate-zaps for each organ. They are combinations of left, right, with arteries, with lymphatics, and with white blood cells. It's the same pattern as you used for your problem organ.

#29: Blood on left; testes/A +1 pF on right plate.

#30: WBC on left; testes/A +1 μH on right plate.

#31: Lymph on left; testes/L +1 pF on right plate.

#32: A on left; testes/L +1 μH on right plate.

#33: L on left; testes/A/WBC +1 pF on right plate.

#34: CSF on left; testes/A/WBC +1 μH on right plate.

#35: Blood on left; testes/L/WBC +1 pF on right plate.

#36: WBC on left; testes/L/WBC +1 μH on right plate.

After zapping the basic set plus some thymus and bone marrow daily and a genital organ you are zapping about 7 hours a day. Do a different genital organ each day. You only have to do each organ once (one day). Men will be done in 5 days and women will be done in 4½ days.

Make sure you are taking the supplements, organic germanium (hydrangea) and selenite, vitamin C and digestive enzymes.

Next clean up all the locations of your digestive tract. You should have a set of about 20 digestive slides. Most of these organs do not need to have left and right sides zapped. For those, you can do two organs in one day. So the first day of digestive plate-zapping might go like this:

#1: Blood on left, WBC on right

#2: Lymph on left, A + 1 pF on right

#3: A + 1 μH on left, L + 1 pF on right

#4: L + 1 μH on left, cerebrospinal fluid on right

(Next you will do the odd numbers on odd-numbered days, and the even zaps on even-numbered days.) The basic set (only blood, WBC, lymph, A, L, CSF) is being rotated on the left plate. On the right plate we put the odd or even numbered choice from this list:

#5: thymus/A + 1 pF

#6: thymus/A + 1 μH

#7: thymus/L + 1 pF

#8: thymus/L +1 μH

#9: thymus/A/WBC +1 pF

#10: thymus/A/WBC +1 μH

#11: thymus/L/WBC +1 pF

#12: thymus/L/WBC +1 μH

#13: bone marrow/A +1 pF

#14: bone marrow/A +1 μH

#15: bone marrow/L +1 pF

#16: bone marrow/L +1 μH

#17: bone marrow/A/WBC +1 pF

#18: bone marrow/A/WBC +1 μH

#19: bone marrow/L/WBC +1 pF

#20: bone marrow/L/WBC + 1 μH

(Now come the digestive organs. The genital organs were already completed.)

appendix/A

appendix/L

appendix/A/WBC

appendix/L/WBC

bile duct/A

bile duct/L

bile duct/A/WBC

bile duct/L/WBC

The second day of digestive organ zaps might target the colon and duodenum, and so forth.

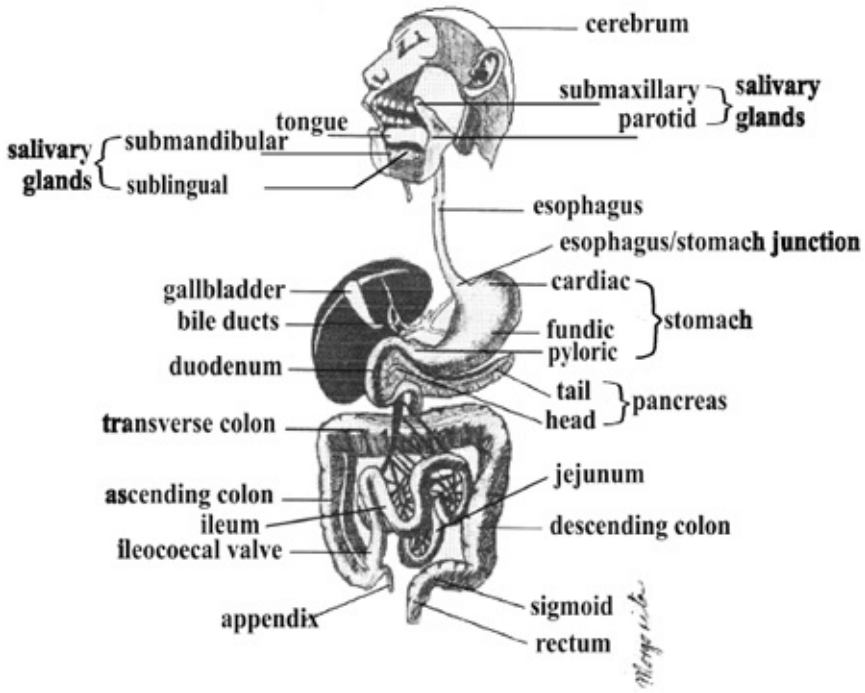

Fig. 60 The location of your digestive organs

Salivary glands come in pairs, one on the left side and one on the right side. Each must be zapped: parotid gland, sublingual gland, submandibular gland, and submaxillary gland. These should be plate-zapped as follows:

parotid/A + 1 pF

parotid/A + 1 μH

parotid/L + 1 pF

parotid/L +1 μH

parotid/A/WBC +1 pF

parotid/A/WBC +1 μH

parotid/L/WBC +1 pF

parotid/L/WBC +1 μH

Obviously you can only do one salivary gland set per day. If you did the entire digestive system as provided in the slide kit, which is 16 single organs and four organ pairs, it will take you 12 days. On the thirteenth day **do the colon again**. This time add <u>two</u> 1 pF capacitors. This targets a spot halfway down the descending colon, which I have found to be especially favored by flukes. (Day 13 is not significant; you can actually do the organs in any order.)

If you are suddenly attacked by detox-illness, write down immediately which new organs you zapped that day. They obviously had a significant number of large flukes. As soon as you are ready to continue, repeat these several times to be sure there are no parasites left there. This time be more prepared.

Expect to see parasites in the toilet bowl while zapping the digestive organs. This doesn't happen when you zap other organs, but when parasites in the digestive system die, they can leave with your bowel movement. Try to identify yours.

Fasciolas and Fasciolopsises are often an inch long but can also be much smaller. They can be distinguished by color. Their edges are ragged, like torn pieces of bread. This is due to having burst in the toilet water after falling into it. The difference in osmotic strength between their body fluids and the water outside is probably responsible for bursting. A few do not burst and resemble canned grapes. As their body tears, strings of eggs slip out, hanging loosely. Their appearance is rather translucent under a binocular microscope but when

Lugol's iodine is dripped onto them, many tissues take on clearer outlines.

Paragonimus is much smaller and rounder, about 1/8 inch in diameter. There are actually 3 red dots, but one is much less visible. Two of them appear to be round suckers. It too is in burst condition, letting egg strings hang out. Macracanthorhynchus is easily identified by its round "bubble" at one end. It does not burst. Echinostoma has a hooked tail and does not burst. E. recurvatum is tough and leathery in spite of its thinness. It resembles pieces of straw or hair. Under the binoculars one end looks rounded like a match head. Eurytrema is too small to identify from real life.

To keep them from disintegrating you should wash them in 1% salt solution (1 tsp. table salt to one pint water). This will keep the one or two intact specimens from bursting, but only if you transfer them to salt water immediately. To preserve them permanently purchase 40% formaldehyde. If your specimens are in water add an equal amount of the formaldehyde solution. If this is not available add several drops of Lugol's iodine to each one to sterilize it for safety in handling.

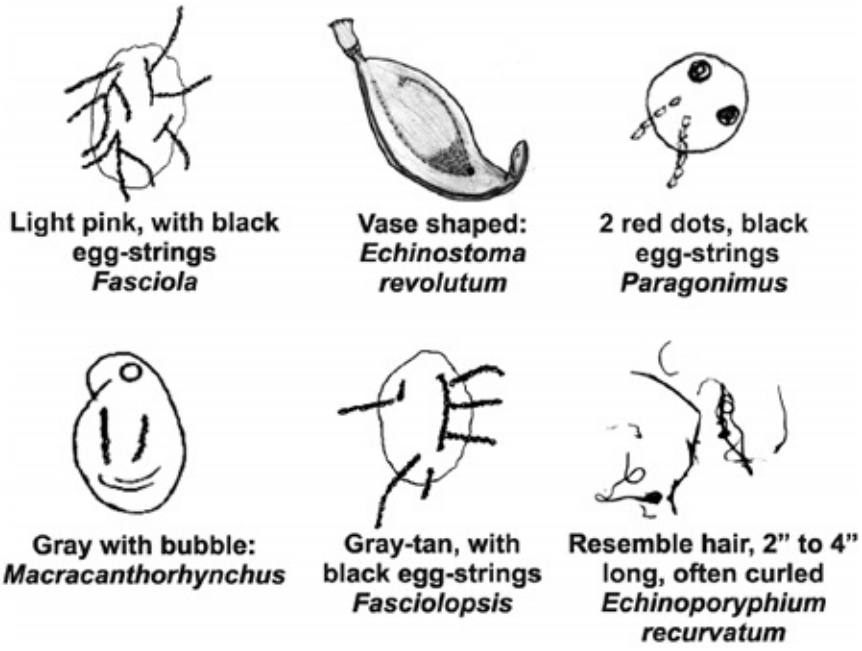

Fig. 61 Common parasites, drawn from life

Week Four Plate-Zapping

Depending on how many slides you have, and how long you spent on problem areas, you have been plate-zapping about three weeks. Now we are going to

finish with various other locations of your body. An anatomy set is available as a slide kit (a larger kit is also available, see *Sources*). Zap all locations that are relevant.

Bladder, hypothalamus, and pineal are all "single" organs, while brain, kidney, lung, lymph node, breast, and pituitary are all "left and right". These will take approximately eight more days.

If you have an organ or body location that is giving you trouble, and the slides you have do not include it, **order it!** (See *Sources*.)

The complete plate-zapping program will last longer than the *2-Week Rapid Rescue Program*. Continue steadily. Going too fast invites detox-illness. Hopefully you have seen at least a few parasites of your own, and have positive evidence of getting better.

Homeographic Drops Schedule

Regular zapping gives a tremendous advantage to your whole body's immune system. Plate-zapping is focused on the immune system of individual organs. Homeography can be both systemic in scope or focused on specific organs, too. Taking six drops of electronically "patterned" water mobilizes the white blood cells at any location chosen.

These drops must be made with a Positive offset voltage, without even 1% Negative voltage. Water made with any Negative voltage frequencies does not have this effect.

I do not understand the physics or chemistry of water sufficiently to explain these phenomena. Questions must wait. But you can harness the forces involved to "boot-up" your immune power even when all the blockers are present. The organ chosen begins to clean itself up. Mobilizing the WBCs is not all that is involved. You can often "taste" the action. Sometimes you can feel the organ respond. You can even get a mild detox-illness. Perhaps the electronic language is native to life. Only research can tell us.

You must be very careful not to set your drops near a magnet. The magnetic field destroys them. Keep them at least 6 inches apart. The first drops to make should be the "protective set" for the brain. This is where you feel things like "being sick", nausea, fatigue, high temperature, anxiety, bleak moods, depression, even downright weeping. The hypothalamus, cerebrospinal fluid, pituitary and pineal need this protection. You take these continually, for weeks,

until you are done plate-zapping.

Protection From Detox-Illness

Feeling sick after plate-zapping is due to only a few pathogens. These have been escaping from and are specific to each parasite! They are flu virus, Salmonella bacteria, prion protein bits, *Clostridium botulinum* and Adenovirus. Even Coxsackie viruses and Treponema spirochetes are escapees! It is these that you need protection from throughout your plate-zapping sessions to keep the brain clear. The simplest way is to take "Protective Drops".

To make your protective set, copy your slides or bottles of brain locations. Copy your slide first. Then copy it again with a shift to the left side of your brain. Then copy it again with a shift to the right side. This makes a set of 3 bottles for each of the pineal, hypothalamus and pituitary slides. The cerebrospinal fluid bottle has no "sides". You now have 10 bottles. Save these, marking them "M" for Master bottle. If you should get detox-illness, one or two of these could give you dramatic relief in 10 minutes.

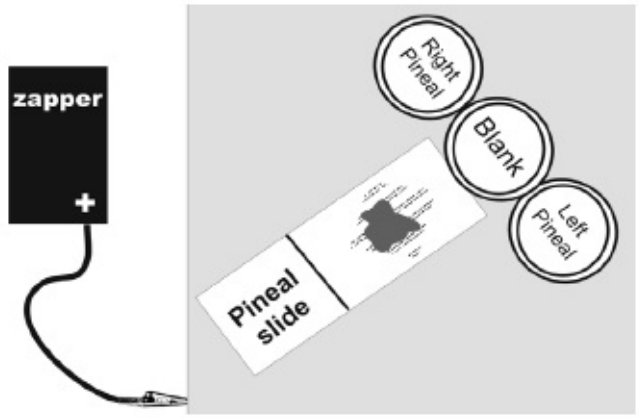

Fig. 62 This combination makes an ALL Pineal bottle

You may combine the right, left and center locations of each organ to make a "grand" or "ALL" pineal, ALL hypothalamus and ALL pituitary.

To make the ALL version, connect the (+) side of your zapper to the copy plate. Place a new blank bottle of water (1/2 oz. brown glass or polyethylene containing 10 ml. or 2 tsp. water from the cold faucet) near the center of the copy plate.

Place the left organ on one side touching the blank.

Place the right organ on the other side touching the blank.

Place the original slide so it also touches the blank.

Remember to put metal shielding tubes over the bottles (the slide touches the shield). Zap 20 seconds.

Label your new blank "ALL PINEAL, right, left, middle".

Every organ that you take drops for will get stronger and cleaner. The more often you take them, the faster the process. Take them at least 6 times daily, one minute between bottles (when you are plate-zapping). This is your brain protective set:

1. Pineal + 1 pF (this makes the right side of the pineal gland)
2. Pineal + 1 μH (this makes the left side of the pineal gland)
3. Pineal slide without additions (the "middle")
4. Hypothalamus + 1 pF
5. Hypothalamus + 1 μH
6. Hypothalamus slide without additions
7. Pituitary + 1 pF
8. Pituitary + 1 μH
9. Pituitary slide without additions
10. Cerebrospinal fluid

If you made ALL versions of these you will have 4 bottles to take 6 times daily on zapping days.

If you did not, you have 10 bottles to take 6 times daily. Perhaps the separate bottles will protect you better and get you out of detox-illness faster than the ALL variety. That is why you were told to keep your separate Master bottles.

Circulation drops next. This is a single bottle with a copy of blood. Copy your slide of peripheral blood. These drops activate the WBCs everywhere in your body.

Next, make a set of lymph drops, called the LYMPH SET.

1. Lymph (copy the first bottle you order)

2. Lymph + 1 pF (place a blank water bottle beside the lymph bottle. Place a metal tube over each. The tubes should touch. Place a capacitor on the plate too, not touching anything. Zap 20 seconds)

3. Lymph + 2 pF (the 2 capacitors should not touch each other or anything else, nor hang over the edge)

4. Lymph + 3 pF (this is the same as cerebrospinal fluid, also reaching down the spine)

5. Lymph + 1 μH (place the inductor on the plate instead of capacitor)

6. Lymph + 2 μH

7. Lymph + 3 μH

The lymph set reaches very many organs because it travels through them. It activates the WBCs there to remove harmful things. Plain lymph drops reach your midsection, the abdomen. Lymph + 1 pF reaches a band that includes the liver. Lymph + 2 pF reaches to the top of the eyes. Lymph + 3 pF reaches the brain and scalp. Lymph + 1 μH reaches the genital region. Lymph + 2 μH reaches from the groin to the knees. Lymph + 3 μH reaches the feet.

Lymph drops can be very powerful for you, even abolishing pains. Take the whole set 3 times daily; more if you are in pain.

Do not combine them. Clone them as soon as you have made them so you will never run out.

DO'S and **DON'T'S**. Do not switch bottle caps or nozzles. You may reuse a bottle if you rinse it 3 times under the cold faucet and also rinse the nozzle and cap. Even one drop of a different frequency destroys a new bottle of drops. Since you have no way of testing whether a bottle is potent or blank, be extra careful not to confuse bottle parts. This is also the reason for taking drops one minute apart. New drops must not touch old drops in your mouth.

Do keep bottles out of direct sunlight. Do not carry them in your pocket. Do not rubber band them together while they are being copied. Do not touch them during copying. Do turn off the zapper before touching them to remove them.

Organ Drops Next. Each organ you choose will show activation of its WBCs specifically, no other organs are activated. The most important organ to activate is kidneys. Make right and left kidney bottles, taking them separately, or make an ALL kidney version where right and left kidneys have been combined with your original slide. **Always take kidney drops first when beginning your**

drop-taking session. Then make these:

1. Thymus (copy the slide alone)
2. Thymus + 1 pF (this treats the right lobe)
3. Thymus + 1 μH (this treats the left lobe)
4. Bone marrow
5. Bone marrow + 1 pF
6. Bone marrow + 1 μH

You may be wondering where these locations really are. Certainly, no two people will have the identical slide. We cannot know where your thymus section was taken. Extending your coverage to the right and left of it probably reaches the edges, but it is not certain. To be much more certain, add 2 pF and 2 μH to get better coverage and even reach beyond the thymus. In HIV/AIDS patients PCBs and parasites are not limited to the thymus. They are spread all around the upper chest. If you are very ill or would like to be very well, or are very tall, make more drops than just the 1 pF and 1 μH extensions.

Similarly for the bone marrow sets, if you are anemic or very low in WBCs, make 1 pF, 2 pF, 3 pF and 4 pF extensions. Also make the 1, 2, 3, 4 μH extensions.

If you have an "organ in trouble" like lungs, kidneys, liver and so on, make more than 3 bottles for each, extending farther to both left and right.

How often should you take the drops? Whenever you start a new organ, take drops very often the first day, even every hour if possible. This increases the chance of treating it quickly because there is a cumulative action; 6 times a day is the minimum for a new organ.

After two days of intensive treatment, most of the action is done. You may go down to 3 times daily.

Keep a daily log of zaps done and drops taken, along with a note about symptoms felt at each organ.

Next, make drops for every organ that is involved in your illness.

Treatment Example

Here is a sample list of drops for a patient with anemia, T4 count of 5, chronic diarrhea, is feverish, bedridden, very sleepy and has no appetite, has muscle wasting, sweats, lung disease and apathy. A nutritional IV is running.

First, put kidney magnets on and then take these drops.

All kidneys All hypothalamus
All pituitary All pineal
CSF
This completes the protective set.

lymph
lymph + 1 pF
lymph + 2 pF
lymph + 1 µH
lymph + 2 µH
Skip lymph + 3 pF (same as CSF) and lymph + 3 µH (feet) circulation (blood)
This activates lymph and blood WBCs

thymus + 1 pF
thymus + 1 µH
middle thymus, slide only
thymus + 2 pF
thymus + 2 µH
bone marrow + 1 pF
bone marrow + 2 pF
bone marrow + 3 pF
bone marrow + 4 pF
bone marrow + 1 µH
bone marrow + 2 µH
bone marrow + 3 µH
bone marrow + 4 µH
plain bone marrow, slide

All this took 25 minutes, running alongside the time for one plate-zap. If your patient is willing to have drops put in his/her mouth while zapping or getting an IV, you can progress much faster.

left cerebrum
right cerebrum
left cerebellum
right cerebellum
left medulla
right medulla
medulla, plain slide or bottle

If all these were part of a brain composite slide, you would make one set of three bottles from it.

It is time to take Lugol's to avoid detox-illness (6 drops in ½ cup water)

5 minutes later: 1 dose Oscillococcinum for fever and sweats

15 minutes later: ¼ cup of Prion Punch for sleepiness and apathy.

5 minutes later: 5 selenite (200 mcg) capsules
1 tsp. hydrangea powder
10 tsp. BWT Extra Strength
7 wormwood capsules
15 digestive enzymes

Some of this could have gone into the Prion Punch or be put in a Coconut Whipping Cream beverage.

Taste it yourself to judge if your patient would spoon it down. Add whatever is needed, with preference for ½ tsp. nutmeg.

Continue with these drops as the next zap is done from the zapping schedule.

All kidney (kidney drops begin each series of drops taken)
left adrenal
right adrenal
adrenal, slide alone
This removes aluminum and restores cortisone production.

left lung right lung
left alveoli (lung sacs) right alveoli
trachea

Another 10 minutes have passed, the lungs are being treated. Encourage

coughing up whatever is possible, never swallowing anything. You should wear a face mask to protect you both when there is lung disease with coughing, at least when at close range such as giving drops. If the cough-up is green, the lungs need much more attention. Also make drops of:

left bronchi
right bronchi
left bronchioles
right bronchioles

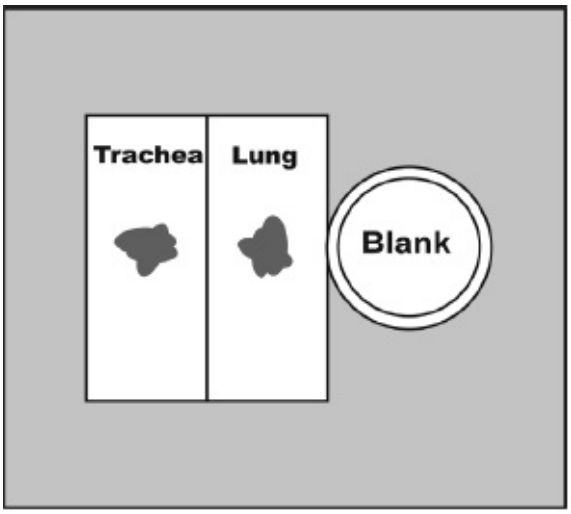

Fig. 63 Combining trachea and lung makes the bronchus

The bronchi can be "made" by combining trachea and lung slides so they are touching. Place the blank bottle touching one side of this duo, not in the middle. Make right and left bronchi. Then make bronchioles. Use the bronchi you just made and add 2 µH. Make left and right bronchioles.

You have also finished another zap while taking about 20 bottles of drops. Your patient could visit the bathroom. Check to see that hands were sterilized with straight alcohol before settling back in bed for a nap. Or put 1 drop Lugol's in a cup of water and dip hands.

To zap the lymphocytes in the left and right thymus, make a bottle as shown for both CD4s and CD8s (see figure). Clone these bottles so you have one for drop-taking, too. Label one "for zapping", the other "drops".

Do not walk away from your patient during the nap if an IV is also in progress. Your vigilance is worth more than the nursing service.

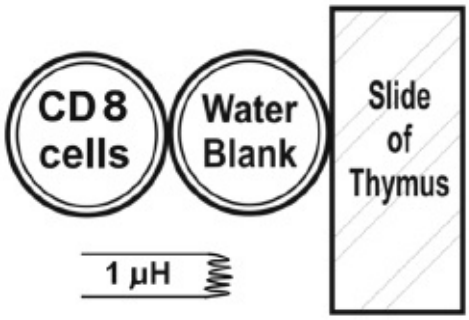

Fig. 64 This makes "CD8 lymphocytes of left lobe of thymus"

Awaken him or her in an hour if it is daytime. Upon awakening your patient, give food without asking whether it is wanted. You must be somewhat authoritative because a sick body is not always strongly motivated to live. Arrange wastebasket (for vomiting). Give iron, vitamin B_2, magnesium and Decaris. Five minutes later serve an appealing plateful of food with 15 HCl drops, all zappicated 20 minutes. Serve no water or beverage (to reduce vomiting). Get plate-zapper ready to use while eating. At end of meal give 6 drops Lugol's in ¼ cup water and five minutes later ¼ tsp. Spice Syrup placed at back of tongue. Judge the timing of the supplements to suit your patient's need for comfort.

If your patient is too sleepy to do all this, emphasize prion-killing. Give Prion Punch repeatedly. Prions are associated with aluminum. Give the 3 recipes that draw aluminum into the urine, called Whole Lemonade, Green Dinosaur and Wheat Germ Tea. Give each once a day till sleepiness recedes. Then reduce to one or two of these beverages a day.

Ten minutes later start the same round of drops to take during the next 2 zaps, beginning again with ALL kidneys. I am assuming the protective set, lymph set, circulation, thymus and bone marrow had already been done once earlier. It is time to repeat those that are being taken 6 times daily.

Give Oscillococcinum 6 hours after the earlier dose.

If no food is being eaten, give hydrazine sulfate drops 6 times daily till appetite returns. Give hypothalamus drops afterwards. Keep this up till your patient says, "I'm hungry". It could take 2 or 3 days (till the metal, thulium, is out of the appetite center in the hypothalamus).

If sleepiness does not recede and coma seems to be approaching, emphasize liver support (cysteine, glutathione, thioctic acid, taurine, and glucuronic acid).

You may give one of these every hour (in a tbsp. of coconut whipping cream or straight honey).

As long as your patient seems too sleepy or "out of it", stick with the basic zaps, the brain-related zaps, the Protective Drops and any other brain-related Organ Drops, along with aluminum removal beverages. It could take a week of such care to pull him or her out of this critical state.

Then move on to making drops for all the genital organs.

> If you peek ahead you will see we could have a hundred bottles to make and take. Resist the temptation to stop and make them all now. You will have eight hours while you plate-zap, and this is something you can do during that time.
>
> All of the drops you have made so far are taken 6 times a day for the first 2 days, then 3 times a day or less. Give priority to new drops. Stay on the 3-times-a-day routine for the *2-Week Program* and then go down to once a day until you are well. A new acute condition is treated every hour. An acute condition could be a cold, a *Herpes* outbreak, or a rash. Make organ drops for these, such as skin, lip, lungs.

Progress is not smooth; there are ups and downs. At some point your patient may regress to somnolence again. Treat it vigorously as before. Prions go or stay where aluminum goes or stays. Keep it flowing out with the urine steadily.

Do not allow smoking friends, pets, or relatives with colds to come closer than the doorway to chat with your patient. If you yourself smoke, do so outdoors and chew on mint leaves or take 1 drop peppermint oil afterwards to quench your breath. Use a face mask if you are coughing or feeling ill yourself.

After a week assess progress by using a list of symptoms to compare, not counting detox-illness.

As soon as the crisis allows, make immune weapons.

After making drops for the genital organs, make drops for all the remaining organs in your kit, giving preference to those that need it most.

The More The Merrier

It is so easy to make and take drops that there is no reason not to do a lot more! In fact, even if you have the real herbs make drops from them and take these too! Here are the ones I recommend the most:

Wormwood	Lugol's iodine
benzoquinone (BQ)	rhodizonate (RZ)
glyoxal (G)	glyoxylic acid (GA)

Real BQ, RZ, G or GA could only be taken in homeopathic amounts prescribed by a homeopath. But the copied forms of these immune weapons help greatly, too. The drop schedule is the same as for other drops. Copy them yourself as soon as you get them so you need not reorder (see Parts Kit #96 in *Sources*). Consume the drops you make yourself, not the "masters" you purchase.

You could, of course, instruct your body to make these weapons. Taking them directly adds to the benefit.

Also take drops (copies) of the essential oils and herbs that kill parasites. You are likely to have all of the common parasites, as do most American persons I have tested. Only the amounts, stages and locations vary. **Reminder: Never make drops of the parasites or bacteria themselves.** Kill them all, gradually, by taking homeographic drops of:

oregano oil

wintergreen oil

fresh apricot seeds, cracked yourself (old ones do not work)

peppermint oil

clove oil

thyme (white) oil

coriander powder

nutmeg powder

fennel powder

This is in addition to taking the real spices in the form of a syrup (see Spice Syrup). Taking drops is a gentler way of taking a harsh substance and still getting some benefit. You may add your own selections but only if pure and

zappicated.

Save-A-Friend

Caregiver's Instructions

I have seen friends rescue one another from certain death. Then I am proud to belong to the human race. If you have a friend who is failing on the usual drug-cocktails and he/she accepts your offer of help, you have been chosen for sainthood. After you succeed you might contemplate starting a unique new gallery of "saints" to raise public consciousness of the obstacles in your path.

Of course you don't have time for such "trivia" now. You have "promises to keep and many miles to go before you sleep". But remember this objective after each patient you save. Meanwhile…

Find a residential zone where the water treatment plant uses chlorine gas (not liquid bleach). Call the water department—then let other HIV patients know this. This is the single most important change you could make for your immune system. If they answer that they do use chlorine gas but your zone has a booster station, find the zone that gets only the chlorine gas (before the booster station).

1. Check yourself and your friend into a motel with a kitchenette; choose a sunlit room. There should be no new paint or new carpet or old cigarette smoke. Check laundry facility. Make sure no water softeners are used; they contain PCBs. Also check into public laundry facilities nearby with the same question. Or rent an RV and move it to an RV park in this zone.

2. Bring nothing but a comb, electric or disposable shaver, borax powder, some pots, pans, and dishes.

3. Bring no unnecessary drugs and no supplements except the list for the *2-Week Program*.

4. Bring a new toothbrush and oregano oil tooth powder or make your own (see *Recipes*).

5. Cut a dozen plastic strips from a shopping bag for floss.

6. Use the borax powder for all-purpose soap. Pour borax powder into a cup at both kitchen sink and bathroom sink. This will be your soap. But don't rub it onto your skin or hair. Put a tablespoon into a plastic carton or tall plastic cup. Run the hot faucet as hot as it can get; then fill the carton or cup. Stir till all

powder is dissolved. Pour it into your hands for soap action, or for shampooing. One such batch is enough for one day.

To wash hands, rub them under the hot water faucet first; pour borax water over them and rub again. Then rinse.

7. Bring citric acid powder to make hair rinse. Put 1 tsp. in a plastic cup when getting ready to shampoo hair.

8. To shampoo hair, wet hair thoroughly first. Then pour borax solution over hair and massage scalp. There should be no undissolved crystals at the bottom. Your hair is almost instantly clean, to the point of being squeaky. No need for lathering. Rinse thoroughly. Add water to citric acid powder while under the shower. Pour it over your hair in several small batches that you work into your hair. Leave this in your hair to "condition" it for a full minute while you rinse your body lightly with borax water or use a skin-brush. Be sure to dab borax water into armpits, groin and genital area and rub into buttocks and feet. Finally rinse hair lightly. If all this is unacceptable, use 2 egg whites as the shampoo (see *Recipes*).

9. Place new items like toothbrush, comb, and razor on zappicator for two minutes to destroy PCBs. Then rinse very thoroughly. Do not spray the razor with lubricant oil.

10. Launder the motel linens and towels in pure borax according to directions on box. Throw away the motel soaps, shampoos, conditioners, and scents. Don't use the hair blowers or icemaker or coffee maker either.

11. For drinking water, run the cold faucet for 1 gallon, first, in the morning. Then fill a glass quart jar and refrigerate.

12. Then go shopping for your "Get Well Motel Vacation". Buy unglazed paper plates (not Styrofoam or plastic), plastic cutlery and cups. Buy glass saucepans, enamel or Teflon coated frying pan, and a dozen canning jars to store beverages in refrigerator. You may also store food in plastic cartons. Buy pure salt and spice pack for cooking (see *Sources*).

13. Buy hydrochloric acid (5%, USP) and Lugol's iodine to sanitize food. Make Lugol's from scratch or ask your pharmacist to make it for you. Also see *Sources*.

14. Bring your bread maker, sonicator or food zapper or zappicator.

Buying Groceries

The safest foods are pastas, beef liver, other cuts of beef and lamb, turkey, cabbage, avocados, corn on the cob, Canadian honey, agave syrup, lemons, coconut (shredded or raw), cantaloupe, pinto beans, natural peanut butter, salad oils, homemade bread and spreads. For staples choose Mexican brand beans, rice, oats, sugar and sweets. Zappicate everything upright while still in the package.

Buy mostly fresh fruit, vegetables, and meats. Buy no ground meats; they are dyed. Obey sanitizing rules when preparing food (see *Clean Up Your Diet*).

Buy freshly baked bread, brown or white, in a paper bag, at a supermarket if you did not bring a bread maker. Cut away ¼ inch of the bottom crust. Place the whole loaf on your zappicator. It will take 20 minutes to destroy the gallic acid at the far end. Do not buy bread baked with oil because the popular oils I have tested have both apiol and PCBs. Check the ingredients. Buy old fashioned peanut butter. Neither dark nor white flour in the supermarket shelves ever tested **Positive** for PCBs, apiol, or gallic acid (although the bread does).

Buy herbs in bulk to make teas (see *Sources*), not in tea bags or foil packs. Place the entire package on zappicator. Store in glass jar. Chamomile and other single-herb teas are fine. Avoid caffeine-containing and decaffeinated varieties.

Never buy food that has a dye listed in the ingredients. I find even natural colorants are polluted with commercial ones. If you have a choice, shop at a natural food store. Their products are less polluted. If not, find a small neighborhood grocery that does not spray on the shelf nor package the produce.

Help Your Helper

If you have found a caregiver, do your best to help. Read all these instructions! Keep very warmly dressed although windows should be partly open. Buy a thermometer and overdress till your temperature stays at 98.6˚F. Do not allow any visitor to smoke in your room, nor to bring a pet. You may resort to putting up a sign that says, "Please, no smoking, very allergic".

Bring hobbies and inspirational reading material or music. It will keep you stronger.

When family and friends come to visit, do not offer them coffee, cookies, beer, soda pop, cigarettes or anything that is off your diet. If they bring their own junk food, throw all the leftovers in the trash bin as soon as they leave. Do not eat unsafe food just to please them when they offer it. But be kind; they do not

know any better.

If you have a health therapist arrange to be visited once a week. If you have had a viral load test recently, within six weeks, you do not need a new one before starting the program. This monitors the HIV virus. Also pay attention to the ratio of CD4 cells to CD8 cells as well as their total. This monitors your AIDS. Make notes on your other blood test results. Use the chapter, *Reading Blood Test Results*, to interpret them.

Then, just before you start this program remind yourself that **you do not have cancer, or heart disease or mental illness**. **You are still young and strong. Life is ahead of you**. You have only two moderately severe problems—a virus and an immune system problem, both of which can be cured—even at the same time. The cures are partly personal (throwing away old habits) and partly a protocol (following a procedure). And you are in charge. There is no guesswork involved. Just kill the parasites that bring the virus. And get rid of five things that destroy your immune system: benzene, PCBs, asbestos, metals, and the azo dyes—especially Fast Garnet and Fast Green. In two or three weeks you can do the blood test that checks your viral load and CD4 to CD8 ratio again. Or you could wait till your regular blood test time arrives. In this case, do not interrupt the program till you have been tested, even if it takes longer than 2 weeks. Other items on the blood test should be done, too, if they were abnormal earlier.

It will take dedication without cheating. There is no "luck-factor" in this cure, only cause and effect. And if friends or family make jokes out of your newfound health enthusiasm, try making a bet with them: if you succeed in two weeks (to lower your viral load or raise your ratio of CD4 to CD8), they pay $2,000 to cover your total costs. If you don't succeed, extend the bet to the next two-week period for an additional $1,000.

When you win, trade a copy of your blood test results for the prize and offer to continue.

Reading Blood Test Results

There are many blood tests, called "panels" that can be used to assess a person's health. Each lab owns a catalog of these, and each test may vary between catalogs. What is important for you to know is:

1. How good the "cell numbers" are in your blood.
2. How many HIV viruses are thriving in your blood.
3. How good your body chemistry is.

Your cell numbers will be given in the CBC and Immune Analysis.

Your viruses will be counted in the viral load test.

Your body chemistry is checked by a SMAC (there are also other terms for this) and urinalysis.

First, the CBC. CBC stands for "complete blood count." A small amount of blood is dispensed into the automatic counter to find how many of each kind of blood cell you have.

There are three kinds: **white blood cells**, **red blood corpuscles**, and **platelets**, but they are all made from the same original "baby cells" in the bone marrow. Baby cells are called stem cells. Stem cells are constantly multiplying to provide us with fresh young cells of all these kinds.

Nearly half of your blood is made up of all these cells put together. They can all be centrifuged down into a clump, leaving the liquid on top, called the serum.

A typical CBC (panel) might look like this:

CBC W/DIFF and PLT

✔WBC	✔total neutrophils, %
✔RBC	✔total lymphocytes, %
Hemoglobin	✔ monocytes, %
Hematocrit	✔ eosinophils, %
MCV	✔basophils, %
MCH	neutrophils, absolute
MCHC	lymphocytes, absolute
RDW	monocytes, absolute

✔ Platelet count	eosinophils, absolute
MPV	basophils, absolute

The list might look like a foreign language. Don't let this overwhelm you. CBC "W/DIFF and PLT" means with different kinds of white blood cells and platelets also counted." Select only those tests checked above for you to study.

The white blood cells (WBC) are your immune system. The red blood corpuscles (RBC) deliver oxygen to your cells. The platelets make your blood clot when needed. The neutrophils have several other names, too. They are your phagocytes (eaters). The monocytes are (become) your macrophages (big phagocytes). The lymphocytes are your T-cells and B-cells together. Eosinophils go up if you have Ascaris parasites or allergies, although this is not reliable. And basophils often go up if you have cancer, also not reliable. The neutrophils, lymphocytes, "monos", "eos" and "basos" are your different kinds of WBCs, so are given in percentage amounts.

Red Blood Corpuscles (RBC)

The healthy level of red blood cells is 4.4 to 4.6 million per mm^3 for both men and women. We have been taught that five million is the perfect result, especially for men. This is not correct. All levels higher than 4.6 are the result of cobalt and/or vanadium toxicity! These toxicities are very common. The Syncrometer® detects the element vanadium in the bone marrow, liver and other vital organs when fossil fuel is breathed chronically, as with gas or oil heat. Of course, the cleaner the furnace burns, the cleaner the air remains. A dust sample taken off the kitchen table in the morning can be tested for vanadium with the Syncrometer®. Vanadium could come from the gas stove or leaking refrigerant. Humans should not be inhaling vanadium mist constantly.

Just as bad as fossil fuel pollution, is sucking on objects day and night that release vanadium, namely tooth fillings, caps, root canals and crowns. Such inorganic vanadium, from a dental source, permits a special fungus, *Chaetomium globosum*, to grow in us because vanadium is required for its growth. When it is killed, the vanadium is released in a toxic inorganic form, only to be picked up again soon by more of this fungus.

Cobalt causes the same deceptive elevation in the RBC level. A too high level of RBCs often makes the skin reddish colored, like a mild sunburn. Both cobalt and vanadium seep constantly from metal and plastic teeth.

The RBC and hemoglobin level are related, so some doctors prefer to use the

hemoglobin "numbers".

When the RBC level drops too low, you are called "anemic". Your bone marrow is not making enough RBCs. A toxin in the bone marrow is the usual cause but no doctor ever searches for it. Instead it is given a name, like "anemia of chronic disease". The Syncrometer® finds heavy metals from clorox polluted drinking water, dental amalgam, lead, copper (from your water pipes), benzene, Ascaris, other parasite eggs, and azo dyes to be present in your bone marrow. These are the more likely causes.

This is not a popular subject for clinical medicine. Your questions will not and cannot be answered. Clinical medicine does not to try to find the causes of your anemia by examining your diet or environment. You must protect your own health independently. Learning to use a Syncrometer® would let you do this.

If the RBC falls below 3.0 a transfusion must be obtained promptly (the same day). Some hematologists focus on the hemoglobin level rather than the RBC to assess the need for transfusion. This might result in waiting too long. I recommend giving transfusions a bit too early rather than a bit too late.

When the RBC or hemoglobin drops too low, not enough oxygen is delivered to your organs. If not enough oxygen reaches the heart it can be permanently damaged. Heart failure is not far away. It is best to get two units of blood together and raise the RBC to a comfortable level for your body, rather than to skimp along on one unit. To heal, your body needs lots of oxygen, not a survival amount. Use your transfusion time wisely; it is "borrowed." Hurry to clear parasites, bacteria, artificial teeth, and environmental toxins out of your body. You may request *erythropoietin* from your clinical physician to help build blood temporarily.

Take vitamin E (400 units), (see *Sources*) and calcium (500 mg.) daily if you are getting blood transfusions. It seems a wise policy to toughen the RBC walls and to support clotting during these times.

The fastest way to get your RBC up is to remove metals and dyes from your bone marrow, much faster than taking blood builders or special supplements. This is the purpose for zapping the bone marrow and taking homeographic drops after doing the dental work.

Platelet Count (PLT)

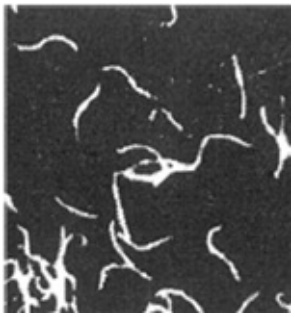
You should have 200,000 to 300,000 platelets in a mm^3 (uL) of blood. A count

below this again implies a toxin in the bone marrow where they are made. When platelets are sparse, not enough clotting action is present in blood. Surprisingly, our blood vessels spring leaks all the time, and must be patched by platelets. Many small bleeds do not get patched, and are allowed to get bigger when the platelet count drops below 100,000. If dental work is necessary and platelets are below 100,000, a dose of platelets should be given between two and three hours before the appointment.

Platelets should be given before the mouth and gums are bleeding spontaneously from low levels. Removing copper, cobalt, vanadium and azo dyes restores the bone marrow's ability to make platelets again.

As the platelet count drops below 10,000, emergency care is needed. A capsule daily of calcium helps with clotting, as does vitamin K.

Of course, dental extractions to remove the copper, cobalt, vanadium, and dyes will trigger the very bleeding that is necessitating platelet transfusions. But time is of the essence—every minute counts now. Without the dental clean up, death is certain. With the dental work, survival is at least possible. Dental surgery should be done in a hospital where blood and platelets can be immediately given and bleeding stopped by clinical means.



The infective stage is micro-scopically small and invades the migraine center of the brain.

Fig. 65 Strongyloids are native to horses

High platelet levels such as over 400,000 results in too much clotting activity; the blood will run sluggishly because it is too thick now and can not deliver enough oxygen and food to the cells. A small amount of niacin (100 mg) and an equally small dose of aspirin (½ baby aspirin) should be given 3 times a day to thin the blood in this case. Platelet counts of 500,000 to 800,000 tell us there is bleeding somewhere in your body (the body is trying to stop it by clotting it). If the platelet count goes too high from a variety of cancer it may be called

thrombocytosis. But thrombocytosis is due to the dye Fast Green and excessive stem cell factor released by rogue bits of hypothalamus arriving in the bone marrow. Stop your hypothalamus erosion by killing Strongyloides and avoiding food with chlorogenic acid. Take Fast Green out of the spleen and bone marrow with homeographic drops of each organ.

White Blood Cells (WBC)

These cells are our defense team, called our immune system. They swim along with our blood and lymph. Lymph is the fluid that is not in our arteries and veins; it bathes our organs and is collected from these to be put back into our circulation by means of "lymphatic vessels". The vessels have valves to help them move the lymph along, as our veins do.

One type of WBC has the ability to crawl by means of pseudopodia (feet!), squeeze through tiny spaces, respond to bacteria or something dead or toxic far away by moving toward it, and to simply eat it all as a way to destroy it. These are called **neutrophils** (and also called "segs" or "polymorphs" or "granulocytes") and should constitute about seventy percent of your total WBC. About twenty percent are smaller, rounder, and capable of eating and killing viruses; those are the lymphocytes. The **lymphocytes** are further divided into T and B lymphocytes, named after the thymus or the bone marrow. The last 10% of your WBCs are other varieties, like monocytes (which turn into macrophages), eosinophils and basophils.

Your total WBC count should not be below 5,000/mm^3 (same as 5,000/uL). Any amount below this implies a toxin in the bone marrow again! Toxins abound. Heavy metals and azo dyes are especially attracted to your bone marrow probably because of its high fat content. (Metals and dyes are fat-soluble.) Lead, mercury, thallium, nickel, copper, cobalt and vanadium are commonplace here. Benzene, PCBs and apiol, too, have a preference for fatty tissues. The first two destroy phagocytosis and apiol starts inflammation. *Ascaris* eggs are quick to invade the bone marrow, upsetting the normal chemistry there in many ways.

Azo dyes have a special affinity for the stem cell line in the bone marrow that makes white blood cells, probably because they are constantly in mitosis (cell division). Scarlet Red dye (Sudan IV), Sudan Black B, DAB, Fast Green and Fast Garnet as well as Fast Red varieties are commonly found here by the Syncrometer®.

Avoiding benzene is essential to get back your normal WBC count.

When the WBC is extremely low (below four) immunity is much too low. You are susceptible to any invader. Levels below three are life threatening. But even levels as low as 1.5 have been quickly doubled (in six weeks) by avoiding benzene, asbestos, PCBs, dyes, doing dental work and killing parasites.

In AIDS the total WBC gets lower and lower due to the damaged bone marrow. But the lymphocytes have an extra problem; the T4s are dying out, while the T8s are increasing. An immune analysis test shows this to you.

Typical Immune Analysis Test In Early HIV/AIDS

	Test Result	**Normal Range**
WBC	5.3x103/u	(3.7-10.5)
Lymphocytes	27%	(14-46)
Lymphocytes ABS	1.4x103/u	(.7-4.5)
% CD3	79%	(58-86)
% CD4	33%	(31-59)
% CD8	45%	HI (12-36)
CD3 ABS	1130	
CD4 ABS	472	
CD8 ABS	644	
CD4/CD8 ratio	0.73	Low Ratio (0.92-3.72)

1. Notice that the WBC is still quite adequate, over 5,000.

2. The lymphocytes are more than 20% of the total white count. This is typical of a person with any viral disease. Your body tries to increase its virus-killing capability.

3. 27% of $5.3x10^3$ is 1,431 in absolute numbers (given as $1.4x10^3$).

4. Of the lymphocytes, about 80% should be T-cells (CD3s), the remainder B cells. This result is good. It is 79% of the lymphocytes (.79x1,431), which is 1,130/mm^3 in absolute (ABS) numbers. Notice that it is all quite elementary arithmetic.

5. The CD4s are your "helper" cells and are 33% of all your lymphocytes. Calculate (.33x1,431) which is 472, your absolute number.

6. The CD8s are your killer-plus-suppressor cells and are 45% of all

your lymphocytes. Calculate (.45x1,431) which is 644, your absolute number.

Notice that the number of CD4s is well below the number of CD8s, just the opposite of what it should be. This is a typical part of the AIDS picture.

The remaining part is subtler. It is the inability of your phagocytes, all your neutrophils and macrophages (monos) to phagocytize, that is, to eat any of your enemies. There is no blood test designed to show you this, but the Syncrometer® detects it easily. You may have the normal numbers, in this case $5.3x10^3$/u, but if 70% of them (the neutrophils) can't phagocytize for you, it is as if you didn't have them. This is a part of your AIDS picture that is not demonstrated to you on this test.

The ratio of CD4 to CD8 cells lets you see the picture at a glance. A ratio of 0.92 is the low end of the "acceptable" range. Of course, this is entirely unacceptable to us. The ratio should be about 2:1 in favor of CD4s!

Your CD4s need Fast Garnet dye removed from them so they can multiply and increase, while your CD8s need Fast Green dye removed from them so they are not over stimulated and can decrease. The ratio can begin to normalize in a week doing the *2-Week Program*.

There are many variations of this immune analysis test; some are more obscure than this one. Don't let that deter you from understanding every detail on it. It would serve you and society much better if there were notes printed with the test results that would help you understand rather than suppress your initiative.

Always ask for a copy of your test results so you can study it at your leisure. Pick out the essential data, which is only WBC, % CD3 and % CD4. Everything else you can calculate.

A Typical Viral Load Test Result

HIV-1 RNA PCR QN (W/LOG) 16,430 ABN

This tells you that a Polymerase Chain Reaction (PCR) test was done on your blood to search out the ribonucleic acid (RNA) that belongs to the HIV-1 virus. QN means "quantitative", namely counting and calculating how many viral chromosomes are found in 1 ml of plasma. In this case, it was 16,430.

Often an explanation or disclaimer is added as a note.

W/LOG means your number has been given a logarithmic form. This is of no use to you. ABN means abnormal. Less clear is the number <400, printed on many forms. This means "less than 400". Many tests cannot detect fewer than these; so it is the cutoff point between "normal" and "abnormal", an arbitrary definition. If your test result is <400, it means no viruses could be detected, a very happy result. But it does not mean you are cured, of course, if you have to keep killing viruses to achieve this.

The program in this book tells you how to really cure yourself, not just keep the virus number down. When your viral load is **Negative** (not detected), and stays **Negative**, without the help of a drug, you can have confidence that you are really cured.

Your Body's Chemistry

How well your body can do its chemistry can be seen in a panel often called the SMAC ("smack"). Compare your results with "perfect" ones (our standards).

The Perfect Blood Test

Test	Healthy range by our clinic standard	Units	Our lab range (for comparison)
glucose (fasting)	85-95	mg/dL	65-115
BUN	15-16	mg/dL	5.0-26.0
creatinine	0.9-1.0	mg/dL	0.6-1.4
AST or SGOT	12	U/L	0-55
ALT or SGPT	12	U/L	0-55
GGT	12	U/L	0-57
Total bilirubin	£1.0	mg/dL	0.1-1.8
uric acid	3.0-4.0	mg/dL	2.2-7.7
cholesterol	200 plus your age	mg/dL	130-200*
triglycerides	100-200	mg/dL	30-180
sodium	138-142	m Eq/L	133-145
potassium	4.5-4.7	m Eq/L	3.3-5.6
chloride	98-104	m Eq/L	95-111
calcium	9.1-9.6	mg/dL	8.5-10.4
phosphorus	3.0-4.0	mg/dL	2.2-5.6
Total protein (T.p.)	7.0-7.4	gm/dL	6.3-8.3
albumin	4-4.6	gm/dL	3.9-5.1
globulin	2.5-2.8	gm/dL	2.0-5.0

LDH	125-160	U/L	91-250
alkaline phosphatase	75-85	U/L	39-117
Total iron (serum)	75-105	ug/dL	30-170
carbon dioxide		m Eq/L	12.0-33.0

**Cholesterol range is arbitrarily set by lab, see text.*

Common abbreviations

alk phos	alkaline phosphatase	HGB	Hemoglobin
ALT	alanine amino transferase	K	Potassium
AST	aspartate aminotransferase	LD or LDH	Lactic dehydrogenase
BUN	blood urea nitrogen	Na	Sodium
Ca	Calcium	P	Phosphorus
Chol	Cholesterol	plt	Platelet
Cl	Chloride	RBC	red blood corpuscles
CO2	carbon dioxide	T.b.	total bilirubin
creat	Creatinine	T.p.	total protein
FBS	fasting blood sugar or glucose	trig	Triglycerides
GGT	gamma glutamyl transpeptidase	WBC	white blood cells

When AIDS is not yet fully developed, the blood "chemistry" results do not show abnormalities. The body that is under 50 years of age is still "young", strong, and able to compensate for many problems.

Even an AIDS-ravaged body usually has surprisingly good test results. In many cases death comes before organ failure can be detected in the test results and before it can be expected. The true cause of death may not yet be known. There may not even be a blood test devised to detect it. I believe it is still largely mysterious, even though it is assigned to a disease.

In view of this "mystery factor", we should pay attention to every blood test result that has gone out of its range. The range is given to tell you what the test results are for 95% of the population, that is, most people. These results are considered normal and healthy, even though we know quite well that 95% of the population is not healthy, nor normal. Still, this approximation is good enough for rather young and healthy people like early AIDS victims.

Blood Sugar (Glucose)

Glucose should never be lower than 80 mg/DL whether you have fasted before the test or not. The liver should always be able to make blood sugar for you, even if you have not eaten recently. The liver stores a reserve of blood

sugar for this purpose. If yours is below eighty, the liver is not able to keep your level up, either because its stores are empty, or for other reasons.

As you recover, the liver will regain its functions. But if your blood sugar is already below seventy, you must eat throughout the day to re-nourish your body. Your body must be nourished to heal. You should eat the richest, most nourishing (but safe) foods you can find. If your blood sugar is over 90, you are still in good condition. You must work hard to eat enough high calorie, nutritious food to keep this figure from dropping.

There are only three categories of foods: carbohydrate, fat, and protein. All your carbohydrate foods, breads, rice, grains, pasta, vegetables, and fruit, are turned into blood sugar by the body's chief factory, the liver.

Why couldn't we simply eat glucose (also called dextrose), to supply it all? It is because there are many food-factors packed into ordinary foods that you would miss by eating plain sugar. Nevertheless, if no food can be digested, a beverage of honey water or dextrose (confectioner's sugar) in water will sustain you for several days, until you are able to eat. If vitamins, minerals, amino acids, fats, and a few extra nutrient factors are added, you can be sustained for six weeks, plenty of time for your appetite to return. If you are a caregiver and your patient has missed a meal make a "replacer" in beverage form (see *Recipes*).

BUN And Creatinine

These are evaluated together because they both reflect on kidney function. BUN stands for **blood urea nitrogen—**namely, how much urea is in the blood.

I have found that high urea levels imply a bacterial infection somewhere and low levels mean there is a block in its formation. When your body cannot form urea, there is serious trouble ahead; yet it has often been interpreted as "extra-good" kidney function or not explained at all.

The bacteria that raise the BUN most are the exceptionally bad ones, Clostridium varieties. Bacteria make copious amounts of ammonia, which is extremely toxic to us. (It has the odor of a diaper pail.) So our bodies try to catch the ammonia and make harmless urea out of it. Urea can be removed from the blood by the kidneys and bladder quickly.

When your BUN is quite near or actually over the top of the range, you must quickly kill bacteria. The main sources, of course, are decaying teeth and your bowel contents. Use the techniques discussed; tooth extraction,

betaine supplement, hydrochloric acid, multiple enemas, Lugol's, turmeric, and fennel, besides regular zapping, to quickly reduce your bacterial burden. Double the kidney herb recipe until you can produce 1 gallon of urine in 24 hours. Even ordinary IVs can help to "wash out" BUN. The BUN can drop significantly in five days.

A BUN that continues to rise becomes life threatening. At higher levels such as over 50, urea begins to damage the tissues, including the kidney itself. If the kidney becomes damaged, BUN will rise still further and dialysis must be used as a stopgap measure until kidney health recovers.

A BUN level over 55 often brings dizziness and delirium, yet some persons can endure a level of 80 (even higher for children)! There are many ways of clearing up this condition, even at this late stage. Take numerous (four) enemas in a day. Help the kidneys by stopping all malonate consumption (seeping dentalware)—methyl malonate is the kidney toxin. Detoxify it with as much vitamin C as you can tolerate. Cysteine is a specific kidney helper (take four 500 mg capsules, 3 times daily for a week). Meanwhile, kill parasites by plate-zapping the kidneys throughout the day. Start taking the increased amounts of the Kidney Cleanse recipe. All the clinical techniques for lowering BUN (hydration, etc.) should be used, too.

BUN levels can be too low for many years without you being aware of it. A test result that is near the bottom of the range or below is too low. There is a block in the **urea synthesis cycle** somewhere, probably in the liver. I have preliminary evidence that an azo dye blocks urea formation. Azo dyes pollute our foods, both natural and processed. Our new system of hot washes and zappication cleans them up. Take dyes out of the kidneys with homeographic drops.

Creatinine is more truly a test of kidney function than BUN. Creatinine formation can be blocked too, and be extra low. Again, this does not imply extra good kidneys!

And, again, I have evidence that an azo dye is the culprit. Clean dyes out of your food and dentalware.

Creatinine levels rise too high when the kidneys fail to clear it from the blood. A level of 1.4 should not be exceeded. If it goes above this, vigorous help for the kidneys should be obtained at once. The Kidney Cleanse, starting with the usual dose but doubling it after a few days helps most. Lots of water (at least 2½ quarts/liters a day) helps. Cysteine (6 grams a day) and lysine (5 grams a day), in

divided doses, are especially useful supplements. Alkalinizing your body with 1 tsp. baking soda or sodium/potassium bicarbonate mix (two parts baking soda, to one part potassium bicarbonate) at bedtime helps the kidneys, too. Sometimes a drug is responsible for kidney failure. To test this, all drugs should be eliminated or substituted with an equivalent variety for at least a few days to see if the creatinine will fall. If the kidneys respond and creatinine levels drop, do not go back to earlier drugs. Even a creatinine level over 5.0 can be reduced to safe levels again in these simple ways.

But clinical help should be requested before it rises above 3.0. Accept dialysis at the earliest time allowed. This will buy you a small window of time; use it wisely—to extract rotten teeth or get plastic out of teeth, kill bacteria and parasites, change diet, and find drug replacements.

The most important supplements to help failing kidneys are vitamin C, folic acid, vitamin B_6, vitamin B_2, pantothenic acid, and magnesium. Maximize these.

Liver Enzymes

The liver is the body's main manufacturing plant. If the liver is injured chemically, many cells will die. And when they die, they release their enzymes into the blood stream. So high liver enzymes mean that liver cells are dying. Three common enzymes are:

1. **AST** (aspartate amino transferase), also known as SGOT.
2. **ALT** (alanine amino transferase), also known as SGPT.
3. **GGT** (gamma glutamyl transpeptidase).

If your transferases, also called transaminases, are going up, a liver toxin is present and you must search, even amongst your "natural" supplements for a toxin. The Syncrometer® usually detects lead in the vitamins in such cases. For this reason, only tested supplements should be used. If your transaminases are over 70, and rising, don't wait; try going off all supplements for five days to see if the transaminases will come down. If not, replace all your drugs, too, with substitutes for five days. Repeat your blood tests five days later using just a "liver panel."

Sometimes an essential drug such as a heart drug or anti-seizure drug is responsible for the elevated transaminases. Even if the transaminases merely climb over 70 U/L, replacement prescriptions should be requested from your

doctor. Transaminases over 350 can still be brought down to safety, if you act quickly. But if they soar higher, liver failure is in progress. Seek out IV therapy.

The GGT reflects a different liver function. It can represent liver "blockage". In this case the alkaline phosphatase is usually too high also. The best thing to try is simply a liver-cleanse. Repeat it every two weeks. Don't give up, even if your GGT is over 1000.

Total Bilirubin (T.b.)

A rising bilirubin is a much more serious liver problem than rising enzymes.

If the liver is not capable of detoxifying your used hemoglobin or if the bile ducts are truly blocked (usually by tumors), bilirubin builds up in the blood. You can detect a yellowish tint first in the whites of the eyes. This condition is called *jaundice*. You can help your liver to detoxify hemoglobin (called conjugation) by taking glucuronic acid, 250 mg, three times daily.

There is no time to lose. If your T.b. is over 1.0, there is already a serious problem. The problem is aflatoxin or drug toxicity. Aflatoxin can be cleared with the glutathione supplements in your program. But drug toxicity means you need to change your drugs and quickly! Hurry to your doctor to make the necessary change.

When the T.b. reaches thirty and you are as yellow as a lemon, it can still be filtered out of your blood in a clinical procedure. It is important not to let it get higher, since it may damage your other organs. It also helps to give albumin by IV, one bottle (12.5 gm) daily to absorb some of the bilirubin even if the albumin level is normal. What helps most is homeography. This means taking drops of water that are electronically "instructed" to take aflatoxin and bilirubin out of all parts of the liver (this means the liver sample you have on a slide followed by liver + 1 pF, liver + 2 pF, liver + 3 pF, liver + 4 pF, liver + 1 pF + 1 μH, liver + 2 pF + 1 μH, liver + 3 pF + 1 μH, liver + 4 pF + 1 μH, liver + adipose). Do not give up even if T.b. has reached fifty! You may be improving your situation, namely, liver disease, and yet not losing your jaundice. The yellow pigment seems tightly stuck in your tissues for some time. Be patient.

Another cause of jaundice is simple blockage of the bile ducts by a tumor. It is a mechanical effect. Your doctor can help you find the cause of blockage; then act with all possible speed. A stent can be put in your duct to keep it open but this only buys you a little time. Use it to do all the cleanups recommended.

If you have hepatitis C, you need to remove amalgam metals and dental plastic from the liver, using the homeographic technique. This will enable the CD4s and CD8s to kill again, this time the hepatitis C virus. But the improvement will only be permanent if you remove these from your teeth, the source. Then do liver cleanses, on a 2-week schedule. Clean up your body, diet and environment. Test your water for PCBs and benzene or find a different home. Add HCl drops to your water (one per cup). Take one drop of coriander oil, 3 times daily or as part of a Spice Syrup. Take L-G and L-A and wear kidney magnets by day.

Uric Acid

Every time the uric acid level is too low, the Syncrometer® finds clostridium bacteria present in some organ. As soon as they are killed, the uric acid level rises to a more normal value!

Uric acid levels can be manipulated, too. Supplementing with glutamine raises it. It takes three to 10 grams a day of glutamine to raise the uric acid level significantly in five days. Unless bacteria are killed, though, it will fall back down again.

Taking folic acid lowers uric acid levels. Uric acid levels are an example of a "masked" result, where two deficiencies leave uric acid levels looking normal. But it doesn't mean you are healthy. By the time you have AIDS it would be wise to take both glutamine and folic acid.

Most important is clearing Clostridium out of your colon and your teeth. Betaine clears it from your intestine. The dental work described later clears it from your teeth.

Triglycerides And Cholesterol

Triglycerides are your blood fats. They are usually much too low in AIDS patients. Scientists do not yet understand the reason. But it is easy to see that AIDS patients are very malnourished, without feeling hungry.

If your triglycerides are below one hundred, you must eat, eat, and eat to catch up on lost calories and nutrition. Even if your triglycerides are above one hundred, you must struggle hard to keep this level up. Your food must be as rich in fat as your digestion allows. Five or six meals a day are the norm. You must force yourself to eat, even without appetite.

Cholesterol levels tend to go with triglyceride levels, and are often much too

low, as well. Since cholesterol is largely made in the liver, low cholesterol reflects a sick liver. Cholesterol is needed for every cell—it forms the outer coat or membrane. Old cholesterol must constantly be disposed of, and new cholesterol made. A healthy cholesterol level of "two hundred-plus-your-age" was established decades ago for Americans. It is not less true now, despite the current emphasis on cholesterol lowering. Cholesterol levels that are too high (over 300) will come down automatically as liver health is improved, as the thyroid level comes up, and as liver blockages are removed with cleanses.

Do not eat cholesterol-reduced foods nor take cholesterol-lowering drugs when recovering from AIDS. Low cholesterol will come up automatically, too, as liver health improves.

The sugar, fat and cholesterol content of your blood tell you the state of your nutrition. Are you a well-fed specimen or barely getting by? Now, more than ever, you need to supply calories of the highest quality to accomplish the extra task of healing that your body has taken on.

The most nutritious foods are liver (done lightly), goat milk and raw eggs. Make these safe with extra long (10 to 20 minutes) zappication plus HCl drops, and eat them daily, when the program allows it.

Electrolytes

Sodium, potassium, and chloride are called your electrolytes. When sodium and chloride levels are too low, the kidneys and adrenal glands are letting too much escape into the urine. You must assist these organs in particular.

The five supplements that help most are vitamin B_6 (500 mg a day), folic acid (50 mg a day), pantothenic acid (3 tsp. a day), vitamin C (10 gm or 2 tsp. a day) and vitamin B2, 300 mg, 10 capsules daily. Only large amounts help when adrenals or kidneys are failing.

Other supplements useful for the kidneys at this time are magnesium oxide (600 mg with each meal), lysine (5 gm a day), and cysteine (3 gm a day). Altogether, these can help you avoid the need for IV therapy with steroids, albumin, and saline. But if the problem persists or is even worsening, clinical assistance must be found.

Low levels of sodium and chloride contribute to fatigue. It will lift when you rescue your adrenals.

Potassium chloride is tissue or cell salt. When it is too low, you may feel

fatigue, as with low sodium. But in this case, simply eating a lot of it helps. If your potassium level is very low (under 3.5), you will need 3 tsp. daily of potassium gluconate as a supplement. Use 1 tsp. with each meal, stirring it into food, or as "salt." (1 tsp. potassium gluconate supplies 480 mg potassium.) If your level is 3.6 to 3.9, you will need ½ tsp., 3 times daily. If your level is 4.0 to 4.4, you will need ¼ tsp. 3 times daily. Your tissues will gradually load up on this precious nutrient. Foods known to be high in potassium are not enough; only a supplement helps.

Whenever you are on a potassium supplement for more than a few weeks you must get a follow-up blood test. When a level of 4.7 is reached, you must stop the supplement, and rely on wholesome foods for further supplies. If you cannot schedule a blood test in this time frame you must stop taking potassium just in case it is high enough.

Persons with a potassium level that is too high, such as 4.8 or higher, have a thyroid problem (not caused by taking potassium). Naturally, we would not supplement potassium when it is already high. Without enough thyroid hormones the tissues cannot lap it up as they normally do, this lets it accumulate in the blood while the tissues are starving for it. Thyroid problems are mainly caused by dental toxins. High potassium levels (over five) can cause symptoms such as slow heart rate.

As you do the dental clean up, the thyroid recovers quickly and now the tissues eagerly lap up more potassium from the blood stream. This can cause a sudden drop from too high to too low levels. Another blood test is necessary to see if you now need to supplement potassium. You cannot rely on your doctor to be aware of these subtle relationships. You must notice them yourself on follow-up blood tests.

Your blood salt (sodium, chloride) content determines your blood pressure to some extent. Salt holds water; it was meant to hold water in your arteries and veins. If your salt level drops too low, you cannot hold the water in your blood vessels. Water will escape into your tissues because the blood vessel walls are porous. As the fluid escapes into your tissues they become water logged (edematous) and your blood pressure must drop, causing fatigue. Most of this escaped fluid can be drawn back into the blood vessels if it is treated vigorously right from the start. Extra potassium and diuretics are the first things to try. The Kidney Herb recipe gives diuretic action. Double the amount by the third day. Coconut milk, one glass daily, is strongly diuretic and could be added.

Spironolactone, our natural diuretic (100 mg, two daily), or a drug variety can be added to all this but you may need a stronger variety, too.

When electrolyte levels are too high, this is nearly always evidence of dehydration. You need to drink more water. To help the kidneys excrete salt and other wastes, they need plain water to dilute all the wastes they must process. One liter/quart a day, plain cold tap water, besides other beverages, is a good rule to follow for rehydration. If rehydration is needed immediately, drinking water is not enough, it must be given by IV. Prolonged diarrhea or vomiting can result in such an emergency, and requires clinical help.

Calcium And Phosphate

These are considered together because they make up our bones and are regulated together by the parathyroid and thyroid glands.

A calcium level over 9.7 is too high even though it is well within the accepted "normal" range. And a phosphorus level over 3.9 is too high also; it reflects bone dissolution. (Growing children are an exception; their phosphate levels should be higher.)

Calcium levels higher than 15.0 may begin to cause mental confusion.

We have brought down a level as high as 19.0 safely, due to lightning-speed attention. Tooth extractions of all artificially-filled teeth, in a single sweep, on the day of arrival can bring the calcium level down several points the same day, to begin the recovery. Levels below 7.0 must have the same emergency procedure: tooth extraction will gain a few points in 24 hours, to bring you back into the extremely low, but surviving category.

Phosphorus levels that are below three indicate a need for vitamin D. The correct level is 3.0 to 3.9 mg/dl. As your kidney health improves, this will improve also. A supplement is advised, meanwhile.

Total Protein (T.p.)

The liver makes our two main blood proteins, **albumin** and **globulin**. One of their functions is to give your blood osmotic force so water will stay in the blood vessels rather than seep into the tissues (similar to the action of salt). Albumin is more effective in this. But your globulins are also your antibodies. The total of albumin plus all your globulin is called total protein (T.p.). It should reach a value of about seven; 7.5 is better. This assures good osmotic strength.

Cobalt and vanadium are the chief culprits in disturbing the albumin and globulin levels, and again, emergency dental work to extract toxic teeth is the life saving measure. Take L-G and L-A for their chelating action. Also make homeographic drops that take all amalgam metals, including cobalt and vanadium, out of your liver.

If the albumin level is too low, (at the bottom of your blood test range), clinical help is advised. IVs of albumin and calcium are needed. You may need to be assertive about this. There is apathy and reluctance to provide this, usually due to lack of experience. Find an alternative physician.

Albumin in injectable form (8.0 or 12.5 gram bottles) should be given without delay. Two bottles are needed if albumin levels are below three. Each albumin bottle should be sterilized to kill bacteria and *Ascaris* eggs by adding ½ cc of ethyl (grain) alcohol through the stopper, and then shaken for 10 seconds to prevent precipitation. Filtering alone does not remove the Coxsackie viruses that accompany *Ascaris* eggs. Many IV bottles also contain traces of benzene, isopropyl alcohol, copper, cobalt, and vanadium and azo dyes (from antiseptic contamination, no doubt) not to mention PVC plastic. If you cannot locate glass IV bottles, you must zappicate the IV plastic bags to destroy some of it. We customarily discard about twenty-five percent of all bottles of injectables for their pollution. You must weigh the need for IVs against the risk of these toxins being present.

Getting a few days of injected calcium and albumin can save your life and give you just enough time to do your dental extractions, parasite-killing, new diet, new lifestyle and supplement routine. Encourage your caregiver to use this time wisely for you.

Injections of calcium by IV should also be accompanied by magnesium to keep them in balance. Additionally about 25 grams (one entire bottle) of vitamin C should be given to balance pH and keep everything in solution. (These, too, must be sterilized with ½ ml ethyl alcohol and filtered). Whether the basic IV is chosen to be dextrose or salt (saline) depends on your blood test results. If your sodium and chloride level are also low, choose saline. If not, choose dextrose. If both are low, choose saline and add concentrated glucose. The IV bottle will be automatically sterilized when the injectable is added containing the alcohol. But if none has been added, then ½ ml alcohol should be added to the IV bottle itself.

Twenty-four hours after teeth are extracted, the relief is felt by the thyroid and parathyroid gland, as well as the liver, allowing albumin, globulin and calcium

to correct themselves.

When albumin is too high (greater than 5), the same toxins are responsible: cobalt, vanadium and dyes. Even when T.p. reaches twelve or higher, you can still recover by doing immediate dental extractions. But time now matters to the minute. And there is nothing to lose—but life.

To sum up, cobalt and vanadium are what cause albumin and globulin to be too high or too low. These come from both plastic and metal tooth fillings.

Lactic Dehydrogenase (LDH)

Hard exercise causes your muscles to make **lactic acid**, which is what makes you feel "stiff" the next day. Because LDH levels closely parallel lactic acid levels, labs always test for LDH instead of lactic acid. The test for LDH is universally used to mean lactic acid levels.

But lactic acid levels do not go up due to exercising in AIDS patients. AIDS patients are too fatigued to exercise. It has been largely a mystery.

The Syncrometer® has found several reasons why the LDH goes up. It occurs when the azo dye Sudan Black B is present. All patients with elevated LDH show this dye in abundance. It has been bioaccumulated because the body did not have enough vitamin B_2 or coenzyme Q10 to detoxify it nor could the immune system (WBCs) carry it away.

Hurry to remove the source of dyes, namely, dental plastic, clorox-treated drinking water, and food. Help the phagocytes by taking organic germanium and selenite, as in the *2-Week Program*. Use homeography to take Sudan Black B out of your liver and all its parts.

The second cause of a high LDH is indirect. When cells have lanthanide elements within them, a family of nucleoside analogs appears, called dideoxy nucleosides. How this happens is not clear, but that nucleoside analogs cause lactic acid elevation is well known.[112] It is the side effect of drugs used for AIDS patients. Raising lactic acid would inevitably raise LDH.

By removing lanthanides with lightning speed (dental work), as well as azo dyes and substituting any AIDS drug that causes this directly, the LDH can be expected to drop 100 points in just five days, sometimes faster.

When the LDH is very high, over five hundred, all the dye removal treatments should be maximized. Normally, we remove dyes with coenzyme Q10, vitamin

B_2 and homeographic drops. But if the LDH is over one thousand and all your treatments are not bringing it down in the first five days, you could be given a shot of *benzoquinone* oxidizer ("BQ", see *Recipes*) a clinical procedure originated by Dr. W. Koch. Even values as high as three thousand can be brought down with a shot of this oxidizer. There are no side effects. If this is not an option, make homeographic drops that stimulate BQ formation by the body itself. Also take drops that make RZ. Results come in two days. There is no toxicity from either method.

BQ shots can be given several times, on alternate days. More will not help. It buys a week of precious time to accomplish dental work, deparasitizing, etc.

Thyroid supplementation can be increased to maximum tolerated (up to four grains) to accelerate the LDH drop.

We use a cut-off point of 160 U/L for LDH if the laboratory uses a range up to 240. (But remember, not all laboratories use identical procedures, so if the range on your blood test goes up to 480, you would double 160 to get 320 for your acceptable limit.) This limit of 160 is arbitrarily chosen. A value well below 160, such as 120 to 130 is acceptable, too.

Occasionally, LDH values are much too low, below 100. This causes intense fatigue. I believe this is due to cobalt toxicity affecting the glycolysis part of your metabolism. Large amounts of oxidized cobalt are produced by *Ascaris* eggs as they consume your vitamin B_{12}. Most "chronic fatigue" has this feature of low LDH. Kill *Ascaris* with homeography (making BQ and RZ), especially at the heart and muscles. Remove cobalt at the same locations. Also take L-G and L-A. In this way, cure your fatigue problem at the same time as your HIV and AIDS.

Alkaline Phosphatase (Alk Phos)

This is the enzyme that moves calcium in and out of bones. The only time it should be higher than the top of the range is for a growing child. When adults have such a high level, it shows bones are dissolving and calcium and phosphate are coming out of them even though you can't see the raised calcium and phosphate levels in your blood test. Your body is merely shipping out the calcium and phosphate with the urine.

A high alkaline phosphatase is always accompanied by an accumulation of the dye, dimethyl amino-azobenzene (DAB).[113,114]

Total Iron (Serum)

Iron is transported on a molecule called *transferrin* in the serum. Serum is the liquid part of the blood (not the blood cells).

The ideal blood level of iron is 100 ug/dL but even values as low as fifty will allow hemoglobin to be made so red blood cells can be born in the bone marrow. Below this, body systems begin to fail.

A hallmark of advanced disease is low iron levels so hemoglobin and RBCs cannot be made.

Although the serum iron level may be low, this does not mean there is a real shortage of iron. It is merely piled up in a useless mound of ferritin or of ferric phosphate. Some of it can be retrieved in ferrous form as soon as vitamin C appears on the scene. (Only the ferrous form is utilizable.) Vitamin C in its reduced form (as well as cysteine) can convert ferritin back to usable iron. But reduced vitamin C is absent in the presence of Ascaris eggs and larvae, which are omnipresent in sick people. What helps most is getting rid of Ascaris, so vitamin C can be in its reduced form. And, of course, taking extra vitamin C.

Part of the process of iron retrieval from ferritin is controlled by the enzyme *FMN*. The Syncrometer® detects FMN in **ginger**. Red beets also help. It seems advisable to eat both when iron is very low. (And both cysteine and vitamin C, of course.)

In general, however, you can expect your iron level to normalize by itself, as you clear up other problems. For this reason, my supplements are very small, only 10 mg. The hope is that the body will be able to use this before it gets stuck away inside ferritin. Killing Ascaris eggs and their microscopic larvae with BQ and RZ gives the best results; iron levels start moving up.

How Important Are Blood Tests?

Blood test values are never accepted as "absolute truth." The lab could make a mistake; something unusual could have happened; or a mysterious effect could be at work. Interpreting blood tests is still an art, hardly a science. For this reason blood tests are repeated before they are given great weight. And certain tests are given much more weight than others, for instance, the RBC, T.b, creatinine, albumin. Life depends on these and there is little room for variation.

Still, the time of day, whether you have eaten recently, or exercised, affect some results more than others. It is wise to wait for three or four blood tests

before being too alarmed about most other blood test results.

Since labs use different tests and ranges, it is obviously wise to stick to the same lab for easy comparisons.

The Four Clean Ups

1. Clean Up Your Dentalware

The purpose of this cleanup is:

- to get rid of a major source of heavy metals and azo dyes that are damaging your immune system
- to get rid of clostridium bacteria, our most treacherous enemies, hidden in crevices under tooth fillings

The Amalgam Era may become the darkest era in human history. Darker than cannibalism, headhunting, throwing Christians to the lions, burning non-Christians at the stake or having two world wars. The amalgam disaster was perpetrated on the very young and very old, on the sick and healthy, and on women as well as men, much less selective than primitive atrocities.

The toll taken by persuading all these people to accept pieces of amalgam to suck on day and night is unimaginable. It started the hundred-year slide downward of our immune power, our only defense against extinction.

Our only defense against all the parasites, bacteria, viruses and even prions that try to destroy us is our immune system. We may think that cleanliness, intelligence, warm clothing and medicines protect us. But they do not. Our white blood cells have infinitely more power. Their job is eating our enemies and killing and removing them in a variety of ways: sometimes physically, sometimes through chemicals they make, sometimes through electrical (or perhaps magnetic) effects.

Using the Syncrometer®, four immune cell blockers were found, and one immune cell destroyer in all victims of HIV and AIDS disease. Altogether, this is only five problems. It is surprisingly few. These stalk us in secret ways. Dental amalgam brings one group, the heavy metals. This includes the lanthanide family (the magnetic metals). And this is how we get a steady flow of

mercury and thallium into our bodies. But that is not all!

We may think amalgam is "pure", made of "pure" mercury, "pure" silver and a few other "pure" metals. This is a mistake. Metals are not sold as "pure" or impure. They are given grades as 99%, 99.9%, 99.95%, 99.999%, and 99.9999%. The remainder could be anything! What purity percentage is used in dentistry? Why are they never disclosed?

Every bottle, can or package of food or cosmetics must list its ingredients to some extent. Is dental material, that you actually keep in your mouth continuously, above all this? In reality, mercury has been judged for purity, not by measurement at all, though, but by simply looking at it. This is an excerpt from a technical dental textbook:

> The purity of dental mercury in the American Dental Association specification is defined by its surface appearance, its residue after pouring and its nonvolatile residues. The tests for surface appearance and pouring residue can determine the presence of 0.001 percent or more of base metal impurities. The addition of 0.001 percent of copper, zinc, tin, lead, bismuth, cadmium, arsenic or antimony caused an immediate change in the appearance of the surface of mercury. The mercury lost its mirror-like appearance and a film or "skin" formed on the surface. The contaminated mercury wetted the glass container and the container could not be completely emptied. The effect was very pronounced and could be readily detected in each case. However, the addition of 0.001 percent of silver or gold did not cause a change in the appearance of the mercury.[14]

Fig. 66 "Pure" mercury excerpt

The point is: if that undetected .001% base metal impurity happens to be cadmium or thallium, you'll develop high blood pressure or neurological disease besides diseases due to the mercury itself. Here is an excerpt from a technical text:

> ***TEJ500*** ***HR: 3***
> **THALLIUM COMPOUNDS**
> Thallium and its compounds are on the Community Right To Know List.
> THR: Extremely toxic. The lethal dose for a man by ingestion is 0.5-1.0 gram. Effects are cumulative and with continuous exposure toxicity occurs at much lower levels. Major effects are on the nervous system, skin and cardiovascular tract. The peripheral nervous system can be severely affected with dying-back of the longest sensory and motor fibers. Reproductive organs and the fetus are highly susceptible. Acute poisoning has followed the ingestion of toxic quantities of a thallium-bearing depilatory and accidental or suicidal ingestion of rat poison. Acute poisoning results in swelling of the feet and legs, arthralgia, vomiting, insomnia, hyperesthesia and paresthesia [numbness] of the hands and feet, mental confusion, polyneuritis with severe pains in the legs and loins, partial paralysis of the legs with reaction of degeneration, angina-like pains, nephritis, wasting and weakness, and lymphocytosis and eosinophilia. About the 18th day, complete loss of the hair on the body and head may occur. Fatal poisoning has been known to occur. Recovery requires months and may be incomplete. Industrial poisoning is reported to have caused discoloration of the hair (which later falls out), joint pain, loss of appetite, fatigue, severe pain in the calves of the legs, albuminuria,

eosinophilia, lymphocytosis and optic neuritis followed by atrophy. Cases of industrial poisoning are rare, however. Thallium is an experimental teratogen [used to induce birth defects for study]. When heated to decomposition they [sic] emit highly toxic fumes of Tl [thallium]. See also THALLIUM and specific compounds.[15]

Fig. 67 Thallium excerpt

So the entire amalgam-war against humanity was a secret one. We did not know what we were putting in our mouths. We thought amalgams were mostly silver, and very pure, when they were very impure. The Dental Association knew all along that there could be as much as .001% impure metal such as thallium or cadmium or anything else in it. "Experts" who were advising the ADA should have known enough biochemistry and physiology to warn against such a standard. And the effects of eating thallium are cumulative so toxicity comes earlier than ordinarily expected.

I have not seen any cases of high blood pressure where cadmium was not deposited in the kidneys, an organ where blood pressure is controlled. And no cases of neurological disease without mercury or thallium being present.

Mercury tends to be associated with thallium; they are difficult to separate when mercury is being prepared. It is probable that the .001% base metal is part thallium. The Syncrometer® nearly always finds them together. And what about the purity of the copper, nickel and other alloys used? These would not even have a visual "telltale". It is no wonder that the Syncrometer® detected 50 metals in a single sample of new amalgam that was ready to be placed in someone’s mouth.

Ag – Silver	La – Lanthanum	Se – Selenium
Al – Aluminum	Li – Lithium	Si – Silicon
Ba – Barium	Mn – Manganese	Sm – Samarium
Be – Beryllium	Mo – Molybdenum	Sn – Tin
Bi – Bismuth	Nb – Niobium	Sr – Strontium
Br – Bromine	Nd – Neodymium	TI – Thallium
Cd – Cadmium	Ni – Nickel	Ta – Tantalum
Ce – Cerium	Pb – Lead	Tb – Terbium
Cs – Cesium	Pr – Praseodymium	Ti – Titanium
Cu – Copper	Pt – Platinum	Yb – Ytterbium
Dy – Dysprosium	Rb – Rubidium	U – Uranium
Eu – Europium	Re – Rhenium	V – Vanadium
Gd – Gadolinium	Rh – Rhodium	W – Tungsten

Ge – Germanium	Rn – Radon	Y – Yttrium
Hg – Mercury	Ru – Ruthenium	Zn – Zinc
Ho – Holmium	Sb – Antimony	Zr – Zirconium
In—Indium	Sc – Scandium	

Fig. 68 Elements found in "pure" amalgam by Syncrometer®

The HIV victim must remove every bit of amalgam, however tiny, from the mouth. There is no way of curing AIDS without this fundamental act.

Earlier I recommended changing metal into plastic for teeth that had fillings. I no longer do that. Now that I know who the real killer of CD4 cells is: an azo dye named Fast Garnet, and that this pollutes plastic filling material (all of it) there is only one intelligent solution. Remove it all as quickly as you can and put none of it back in. It makes no sense to accept immunity-destroying dyes as part of your mouth.

It was quite shocking at first to realize the Dental Association does not do its homework. Were the ingredients of plastic tested for immune lowering properties? If the ingredients were tested in the standard way, it would have been done for mutagenicity, (and carcinogenicity), somewhat like this: The plastic ingredients would be added one by one to the culture broth of Salmonella bacteria to see if mutations result in the bacteria. This would be like testing for human toxins by pouring them in our swimming pools. It is a far cry from putting them in our mouths, to suck on endlessly the way we do with tooth fillings. Or the ingredients would be given as a shot into the belly of a mouse or rat, again very different from the chronic exposure of sucking on a pellet of seeping toxic plastic or seeping metal. Waiting for tumors to develop is another very different experiment from waiting for the CD4 to CD8 ratio to change. And what if the ingredients were toxic to developing sex organs—leaving feminization or masculinization as the end result? Would this be discovered?

An argument that may have been used is that the plastic ingredients "set", that is, harden in the tooth, thereby getting away from any chemical effects. What was not assumed was that they often, in fact, usually, do not set.

In short, no adequate testing was done to see if dental filling materials, the way we all acquired them (not hardened enough), could cause such immune disturbances.

Once put in, plastic can’t be easily removed! The plasticizer and dyes seep into the tooth structure itself, just as amalgam does. There is no way of just

removing the plastic from the tooth. The tooth must be extracted or the plastic must be made harder on site in your mouth. A device called toothbrush zappicator will be described later, that appears successful in doing this.

Hardening is important for dentures, too. When an artificial tooth is made and it is hardened in a laboratory (and later by yourself) no dye seeps from it. No plasticizer escapes. No polymer escapes. Only radiation from uranium could still escape. And we do not need to choose porcelain, which contains uranium. Any other choice will be a good one. Dentures, too, can now be hardened with a recipe.

Impression Powders

Get impressions made for partial dentures as early as the first dental visit. Use your own impression compound. A whole kit of it only costs about $35.00. Arrange for this beforehand. The dentist must know which variety to order for you. Those described have been tested and found free of Fast Garnet, Fast Green, Fast Red Violet, D&C Red Dye #30 Lake Aluminum, aluminum, copper, silicone.

Do not put any impression compound in your mouth after extractions; the dyes, aluminum and silicone enter the brain immediately, starting dementia and adrenal failure. In a year this "Alzheimer-like" deterioration is quite noticeable. A trauma in the mouth makes the tissue more absorptive for these components, no doubt. Wait at least 6 months.

You will be healed enough to try out your new partial dentures in about two weeks if you harden it. Do not put any putty-like material in your mouth for "fitting" or "bite registration". Use "articulation paper", silk or foil. Harden any piece of denture yourself at home before actually wearing it, even for one hour. The responsibility for this most important feature of plastics, hardness, cannot be left to the dentist or dental laboratory. It must be yours.

Looking Good

Good looks mean a lot to each of us. A beautiful smile means even more to our loved ones. When your mouth infections are gone, and you can chew well, you have no subliminal discomfort. A relaxed face exudes confidence, a sense of success in your relationships and business. You can have all this… and fake teeth! They may not be yours by birth but they can be beautiful, and so natural looking that you cannot tell they aren’t yours. You can add a touch of

imperfection, like a small groove or slant you had in your own to give them originality. And nobody cares a bit whether they are really yours or not. When you know they are good looking you just feel like showing them off with a smile.

"Hollywood" is made of fake teeth. The average movie star probably has a dozen of them (veneers, touch-ups, cosmetic improvements).

Here is one area where you don't have to go natural. Fake teeth can be made perfectly safe. You merely need to make them hard enough not to seep.

No seeping metal or plastic. Hot water or zappicating sets the plastic permanently.

Fig. 69 Front tooth re-placement

It is my experience that AIDS patients do not agonize over their decision-making. They stay levelheaded even when friends and family lose their perspective. If you are a caregiver, encourage the choice for extractions. Looks won't suffer. Chewing ability may even improve. And nobody will ever ask, or care, whether that front tooth is your own honest-to-goodness tooth or not. And nobody will ever say at your funeral: "But look, he still has his very own molars." Your mouth will be closed. Choose life without risk, for your child's sake, for your lover, for your loved ones!

The Visit To The Dentist

Find an oral surgeon or dentist willing to clean up your mouth for you. Willing to search for leftover bits of old amalgam, called tattoos. Willing to repeat X-rays and examine painful places later. It is more than "just pulling teeth." You may need to search hard for such a dentist. The alternative dentists have led the movement to ban amalgam from dental supplies. You may need to

travel many miles and even visit other countries to find the right alternative dentist.

First, obtain a good quality "panoramic X-ray" of your mouth. A panoramic views the entire mouth including jaws and sinuses allowing you to see much more than single teeth. If there are suspicious areas, repeat the X-ray at that location with newer digital X-ray equipment.

Make two appointments (if you have time), one for X-rays and one for dental work. That way you will be able to study the X-ray. But if your decision has already been made, no delay is necessary. The dentist can see all the unnatural teeth at a glance. Then request in writing that she/he extract them, or sign the appropriate form (to legally protect the dentist).

Arrange for a friend to accompany you to the dental office. All professional persons pay more attention to a party of two than a single person. Ask for permission to have your friend nearby, just outside the cubicle with the dental chair. Your friend can hand you your antiseptics. Your friend should sit quietly, not wasting the dentist's time with talk or questions. Your friend can drive you home.

Treat yourself to a good meal before going for dental work. You will be on liquids for a few days. Do not take extra vitamin C on your dental-day. It detoxifies, that is, destroys anesthetic, so the dentist would have to give you much more!

If you have "dentist phobia", take a strong dose of pain killer (not aspirin) ½ hour before your appointment time.

Your Antiseptic Is Best

Make and bring your own antiseptic. Even though the surgeon and dental assistant wear gloves, you can't help picking up bacteria. This is not the dentist's or surgeon's fault. They are coming from your own mouth. Sterility for the mouth is impossible. While tiny blood vessels are broken (bleeding), bacteria can enter your circulation.

By far the best antiseptic to use during dental work is USP chlorine bleach; this is the kind that does not have azo dye pollution.

> Bunyan [in The Use of Hypochlorite For The Control of Bleeding, Oral Surgery, v. 13, 1960, pp. 1026-1032] reported that rinsing with 0.2% hypochlorite solution stops postoperative bleeding within one minute after a tooth extraction or other oral operation. The hypochlorite solution functions also to contract and harden the blood clots and make them more resistant to infection. In addition to the

> effective hemostasis and the change in the character of the clot, the author reported a reduction of swelling of traumatized gingival tissues and diminution of the postoperative pain.[16]

I have found this quote to be completely accurate. There is essentially no bleeding, no pain, no swelling and no return of Clostridium.

DON'T USE HOUSEHOLD BLEACH because it is not safe for internal use! Obtain food grade (USP) bleach (see *Sources*). Purchase the same strength (about 5%, not stronger) as regular household bleach so you can handle it safely.

> Bleach (5%) whether USP or not USP is very caustic. You must not use it at full strength. You must dilute it. Follow the recipe exactly.

We will name the new diluted bleach you have just made "Dental Bleach." It is only 1% as strong as regular bleach. Take ½ cup of Dental Bleach with you in a convenient jar. Try it at home first, so you'll know what it will taste like. Rinse your mouth with it just before you sit down in the dental chair. Never swallow it! Hold the jar in your lap. Later, when the dentist signals you to rinse your mouth, use your solution again. Also rinse one last time before leaving the office. The dentist will appreciate this extra care because she/he is less likely to see post-dental infection in you.

Second best would be Lugol's iodine solution (six drops of actual Lugol's iodine in ½ cup of water). Use up the entire amount before leaving the dental office. Colloidal silver is third best. These are not nearly as good as dental bleach.

Make your own colloidal silver solution since the commercially available ones I tested had the familiar pollutants associated with antiseptics. The same instructions apply to colloidal silver; use ½ cup.

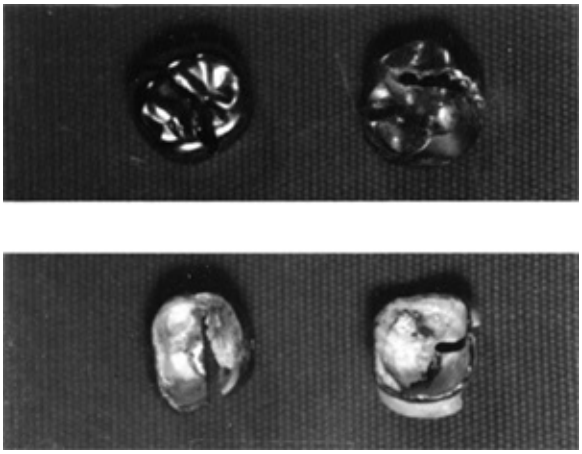
As soon as the extractions are completed, the sockets left behind must be cleaned by the dentist to remove leftover bits of adhering tissue. This will prevent leaving a residue for bacteria to thrive on later. Then they are squirted with a dropper of diluted Lugol's iodine solution, or straight white iodine (see *Recipes*). If you are allergic to iodine use colloidal silver instead. You must supply these.

Commercial antiseptic made for the dental profession is not satisfactory. It invariably contains isopropyl alcohol besides dyes and other chemicals. These

penetrate the brain instantly through the freshly traumatized tissues. Dyes do not leave easily. They were developed to stain permanently. With immunity in the brain destroyed by dyes, Alzheimer-like dementia follows.

Save The Pieces

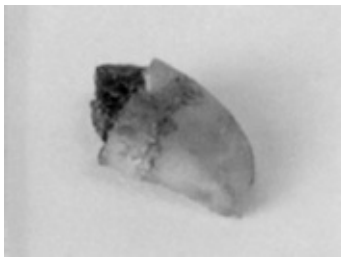
Tell the dentist before sitting down in the chair that you would like to keep the extracted teeth, root canals, and fillings, but they can all be tossed into a bag together. If the dentist tells you this is not allowed due to Public Health regulations, agree to fill out the proper application forms. The teeth may need to be sterilized first (in 50% bleach water—not by autoclaving because that would put mercury vapor into the air). It is amazing that your own teeth may be considered too dangerous—too bacteria-laden and full of mercury (a hazardous waste!)—to be handled, even by you, the owner! (Were they safer in your mouth?) But they do belong to you. You may be curious in the future about what they contain, and could have been leaching.



The top surfaces of tooth fillings are kept glossy by brushing (you swallow some of what is removed). Underneath is tarnish and foulness. Ask to see your crowns when they are removed.

Fig. 70 Tops and bottoms of some metal crowns

You can preserve them in a few days, when you are up to it. Cover them with Dental Bleach or Lugol's water to sterilize them again. If the odor from them is overwhelming and refuses to leave, you may understand how the internal infection of these teeth, not just the filling, was poisoning your body! Finally, you may wish to look for the Clostridium infection, which would be a darkened area or fine black lines under fillings or in crevices. After drying, store them in a paper bag (plastic traps moisture).



This tooth with crown removed re-veals a black surface underneath and fine gray lines of further invasion of the tooth. It is invariably Clostridium at work.

Fig. 71 Black tooth under crown

Save loose pieces of metal and plastic because you may wish to have them analyzed at a later date, too. Or you may simply wish to gloat over the retrieved "treasure" as you identify corrosion and gross infection. Take a picture of them to remind you later how bad they really were.

When extractions are done, congratulate yourself for the achievement. Start the Dental Aftercare program at once. Do not eat or drink (besides water) for the rest of the day after an extraction.

All root canals and dead teeth must be extracted, as well as teeth with fillings. Teeth with implants have not been studied sufficiently to know which metals they shed or if Clostridium infections start in their vicinity. For this reason, you must use your own judgment on implants.

After extracting rotten, filled or capped teeth, the dentist or surgeon needs to do two things before stitching up the wound: cavitation cleaning and amalgam cleanup.

Huggins Cavitation Cleaning

The tooth was held in the socket by soft tissues like tiny ligaments. Unless these are removed, too, they will decay and provide opportunity for bacteria to reside there. The sockets left behind should be carefully cleaned with special tools for this purpose.

This procedure has been taught in the past by Dr. Hal Huggins and many dentists are familiar with it. It is called cavitation cleaning. It prevents future infection and inability to heal at that site. In spite of such superior treatment of the socket, you may not get perfect healing immediately; you may occasionally expect a bone fragment to reveal itself later. It shows itself as a small white "bump". As it loosens and works its way out, infection and pain may accompany

it. Go back to the dentist. This could be a source of your pain elsewhere in your body if it is not removed.

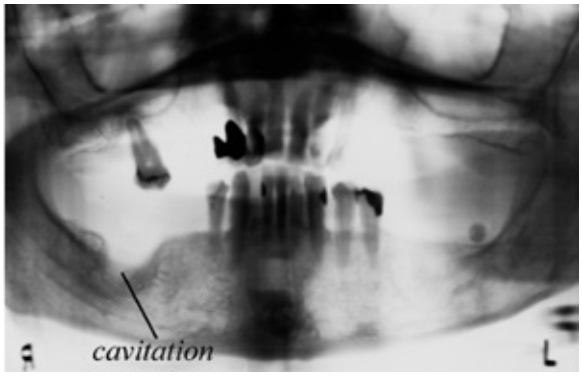


Fig. 72 Panoramic X-ray showing large cavitation at lower left

While the new sockets are being cleaned, any old infected sockets (cavitations) should be cleaned out as well. Some infection sites are less obvious; they must be searched for by a knowledgeable dentist. Soft mushy bone mixed with bacteria needs to be drained and the hollow "cavitation" disinfected. Each cavitation site gets squirted with diluted Lugol's solution or straight white iodine. Hidden cavitations (those that don't show up on the X-ray nor reveal themselves in other ways) can be cleared without surgery.

Arechiga Gum Cleaning

The second task after extracting your teeth, and cleaning cavitations is to remove imbedded amalgam from the gums. This procedure has been developed by Dr. Benjamin Arechiga of Mexico. Each quadrant of your mouth needs an amalgam cleanup. The top of the gum line will be gray from absorbed mercury. It is easiest for you to have this done while extractions are being done. The dentist begins by cutting a straight line on top of the bony ridge of the jaw where teeth once were.

Next, he/she snips away 1/8 inch (3 mm) of the gum on each side of the incision. The two ribbons, extending from the wisdom teeth to the closest front tooth are discarded. The remaining gum tissue stretches over the top easily and is sutured over. Surprisingly, the new gum tissue is more elastic and heals much faster than the old, mercury-saturated gums. You can count on your gums being healed in two to three days. The new gum tissue produces a strong even union, without small holes where food can get trapped. We call it the Arechiga technique, after the oral surgeon who invented it. While the dentist is cutting out

mercury-drenched gum tissue, the exposed bone can be cleaned of old amalgam bits that are easier to spot now.

Dental Aftercare

One of the purposes of doing this dental clean up is to kill all clostridium bacteria that have invaded the deeper regions of the jaw bone after being spawned in the decaying teeth and crevices under tooth fillings. From here they colonize the rest of your body. Evidence for this may already be in your blood test results: **a low uric acid level**. This was associated with Clostridium in all cases tested by the Syncrometer®.

Extractions do not automatically clear up infections. And antibiotics cannot be relied on either. Antibiotics are merely an adjunct to good Dental Aftercare. So a very vigorous program is needed to clear up infection even after the infected teeth are pulled because deep wounds such as the base of the socket where the bacteria used to be is precisely the preferred location for more clostridia. They refuse to leave. Other bacteria may leave but not Clostridium. Even cleaning the socket thoroughly may remove Staphylococcus but does not remove clostridium bacteria.

Copy the next few pages and carry them with you to the dental office. Review them while you wait.

This Dental Aftercare program is successful in killing Clostridium. You will need:

- a water pick
- hot water, towels
- pure salt (see *Sources*)
- Dental Bleach, USP (see *Sources*)
- one or two strainers for food preparation
- a blender to make blended food for a week

Acquire these before your dental appointment. Practice using the water pick beforehand, too.

> The first day of dental work is critical. If you miss this, a massive spread of infection can occur because the mouth is al-ways a "den of bacteria", and your own tooth infection is itself the source.

The immune power of your arterial blood is much greater than in your veins. How can you bring arterial blood into the jaw area to heal it faster after dental work? Simply by hot-packing it from the start!

Remember, even before leaving the dentist's office, just as soon as you are out of the chair, rinse with Dental Bleach. Then, again, as soon as you get home from the dentist. Next, swish your mouth gently with a cup of warm salt water. The heat brings in arterial blood. Keep the cotton plug in place for you to bite down on and reduce bleeding, even while swishing. Don't suction the water forcefully around your mouth; you could dislodge the blood clot that needs to form in the socket. Slowly move the warm salt water about your mouth.

At the same time apply a hot towel to the outside of your face where the dental work was done. Wring a washcloth out of the hottest water you can endure, trying it out at a place that is not anesthetized first. Otherwise you might accidentally burn yourself. Or fill a plastic bag halfway with hot water, zipping it shut securely and enclosing it in a second plastic bag. Do this for 30 minutes, 4 times daily, for a few days. Then 3 times a day for a week—even when there is no pain.

Don't suck liquids through a straw for 24 hours; the sucking force is too risky. Don't allow your tongue to suck the wound site, either; and don't put fingers in your mouth.

As the anesthetic wears off there will be very little pain if the bacteria in the tooth sites have been killed. But you could introduce the bacteria yourself, by eating, or by putting fingers into your mouth. Consider your mouth a surgery site. Anywhere else on your body, the surgery site would have been scrubbed first, then painted with iodine or other strong bacteria killers, and later sprayed again with antiseptic and bandaged to keep everything out—certainly food particles and fingers!

But the mouth cannot be bandaged and you must eat! To be successful, eat a big meal just before your dental appointment. Then drink nothing but water later on, the day of extractions. You may need a painkiller on the first night; choose a non-aspirin variety to minimize bleeding.

Bleeding should have reduced considerably by bedtime. The cotton plug put in your mouth by the dentist may be thrown away. If you need another one, make it yourself out of a tightly rolled paper towel in the shape of a finger. Rinse with Dental Bleach once more before bed.

Dental Day Two

The next day (the day after your surgery) you need to be well fed, yet eat no solids, or liquids with particles in them. The particles easily lodge in your wound. Your choices are:

- Beef broth, strained, with HCl drops added (see *Recipes*) or vegetable broth.
- Herb teas, sweetened, strained, with HCl drops added.
- Fruit or vegetable juice, strained, with HCl drops added.
- Puddings made of cornstarch or flour, thinned with fruit juice to be drinkable, with HCl drops added.
- EZ Meal of non-dairy variety.
- Cream shakes made with whipping cream, with HCl drops added. Adding a raw egg, with the white ropey part removed and three HCl drops added, provides protein. Goat milk can be substituted for cream. These foods must be zappicated. Note: If you are just beginning your *2-Week Program* you must be off dairy food. Use coconut cream instead (see *Recipes*).

Strain everything through the finest plastic strainer. Notice that all foods are sterilized somehow but dairy foods and eggs should be zappicated.

Drink through a large straw to bypass the healing area. Immediately after eating, rinse your mouth with a cup of hot water to which you have added ½ tsp. salt. Do not be afraid to start some bleeding; this could be expected and is even desirable if an infection has already started. Bleeding washes bacteria outward. Water swishing never dislodges the healing clot. Infection dislodges it. If pain increases instead of decreases on the second day, you are already infected.

Continue swishing and hot packing for one hour. Devote the whole day to fighting infection. If the pain subsides, the infection has been cleared. If not, you will need a more forceful stream of water. Begin using the water pick at its lowest speed setting. Water pick repeatedly until the pain clears. (It could take four hours!)

Hot pack the outside of your face just as on the first day. If pain is subsiding on the second day, you are being successful. But the gums are not healed; you cannot take chances yet on eating solid food. Nearly all infections come from eating solid food on the second day.

Floss the remaining teeth with homemade floss, being extra gentle. For floss, cut strips of plastic shopping bags, ¼ inch by four inches. Fish line floss and toothbrush are too harsh for the nearby sensitive tissues. After flossing, clean these teeth by hand-rubbing, using paper towel wound around your finger and dampened, then dipped into oregano oil tooth powder (see *Sources*) or ½ drop of straight oregano oil (less than ½ drop, if only a few teeth remain). Don't use more; this oil is fierce.

Also rinse your mouth with Dental Bleach several times during the day and bedtime.

Dental Day Three

On the third day, you may drink blended solid food; do not try to chew solids.

Use your water pick now after each meal. Fill the tank with hot water to which you have added a few drops of Lugol's iodine, or 1 tsp. colloidal silver, or salt. Set it at the gentlest level at first, squirting each site carefully. Floss the front teeth and brush them with Dental Bleach (other antiseptics are not strong enough).

No matter how carefully you eat, you will see food entering the gum spaces. Notice how difficult it is to squirt out any trapped food. Swishing is not sufficient! You need to water pick till all spaces are cleared. Continue hot packing the face. If pain returns and water picking has not succeeded in clearing it, you must hurry back to the dentist to search for the food particle. The wound will be opened and cleaned out for you.

Bleeding

A moderate amount of bleeding is normal, even days later. Bleeding caused

by water picking is not too serious. But if you sense an emergency, apply ice cubes wrapped in a paper towel or washcloth. Bite down on them till bleeding stops. Continue ice-packing for 4 hours. As soon as it is safe, return to hot-packing. If ice packing does not stop the bleeding, go back to the dentist or emergency room.

If you have a very low platelet count or are on a large amount of "blood thinners" which promote bleeding you need special attention. Yet, oral surgery is a very skilled profession. Dental work is safe in the surgeon's hands. Platelets can be given just beforehand; blood thinners can be temporarily stopped; and a transfusion can be given before or immediately afterward. These same patients often state that they feel better, immediately after the dental extraction, than they can remember in months! It was the dental problem that was poisoning their platelets and their blood! It may be the last transfusion that will be needed, in spite of some unavoidable blood loss with dental extractions.

Stitches should be removed earlier for immune compromised patients than others because they will get infected by the third day! Do not use self-digesting sutures; you need the extra dental visit to let the dentist observe your mouth.

Be Vigilant The Next Week

Continue water picking, hot packing, and rinsing your mouth with Dental Bleach after each meal until the gums are healed over. This may take five to seven days, longer for some sites. Floss and brush your front teeth once a day. If pain stays away you can take credit for killing your mouth-bacteria. You may reduce the treatments to 3 times daily, then twice.

Clostridium can return even after a week of steady recovery. Its true source is the rabbit fluke, a tiny parasite that we eat accidentally with filth on unsterilized food. If you detect an odor from your mouth, at any time, it is Clostridium making a comeback, even without pain. A crumb has lodged in the wound and is decaying. Try bleaching, swishing, and water picking for half a day; then hurry back to the dentist if the odor persists.

If you got through the whole ordeal without needing more than one nights' painkiller and without needing to return to the dentist for extra clean up, give yourself excellent grades. And if you got through, in any way, still give yourself very good grades!

It is common for dentists to recommend cold packing to reduce swelling after dental work. I recommend hot packing because I consider swelling less

important than infection or pain. It is also common for dentists to rely on antibiotics to clear up infection. I find this is not sufficient. The whole Dental Aftercare program is needed.

Pinpoint Fillings

Fig. 73 Safe Paste

Very small fillings of plastic can be spotted on a digital X-ray that could not be seen on the panoramic. They can be drilled out widely and the holes left open. They can be kept clean by two daily brushings, once with Dental Bleach and once with oregano oil tooth powder. Remember though, that you are taking a chance that the dentist did not see all the plastic, even with the help of a digital X-ray. It is simply not possible to see tiny bits of plastic, so risk is present and you (not your dentist!) must weigh it. After you are well you may wish to fill them with zinc oxide or zinc phosphate paste. These are older filling materials but can be purchased in unpolluted form directly from the manufacturer. All premixed tubes of paste were polluted, so mixing from scratch is essential. Perhaps an older dentist can demonstrate these old skills!

> Pinpoint plastic fillings, too, may be saved by the newly discovered technique for plastic hardening in the mouth using a tooth zappicator. Then brush daily with oregano oil tooth powder to clear Clostridium.

New Cavities

Purchase a long-handled inspection mirror (see *Sources*) so your helper can see the backsides of your teeth.

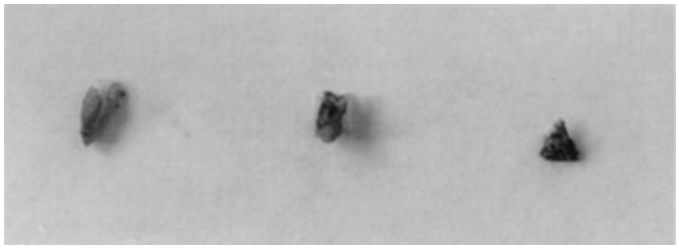
Search your mouth yourself, too, for a fresh cavity. It will be a small brown discoloration. Brush this spot twice daily, once with Dental Bleach and once with oregano oil toothpowder. There may be a time when dentistry has safe fillings to offer but it is not now. Not only must the filling material be safe, it must not seep after it is in your mouth and it must stick to your tooth so closely that no crevice remains for Clostridium or other bacteria to grow there.

> Only further research will reveal whether new plastic fillings can be sufficiently hardened by zappicating while keeping potential crevices uninfected.

Jerome Tattoo Removal

While the amalgam was being put into your teeth or taken out, tiny bits got away or flew away with great force into your cheek folds, into neighboring gums, into exposed bone nearby and down to the bottom of newly made sockets. Nobody will ever see these again, or so it was thought.

Larger bits of amalgam, called tattoos, can be seen on the panoramic or digital X-ray. Your dentist has already spotted them no doubt. But smaller particles do not show up. You must ask the dentist to search visually, with a magnifier and remove them all regardless how painstaking the job is. This and many more facts of dentistry are discussed by Frank Jerome, D.D.S. in his book, *Tooth Truth* (see *Sources*).



Find the black dot on each bone fragment. That is the tattoo, although the rest of the bone fragment is also discolored by amalgam.

Fig. 74 Tattoos

Each quadrant of your mouth needs a careful examination for mercury. Tiny pieces stuck in your cheek folds are pried out, plus any pieces buried in your

jawbone. In addition, the ¼ inch ribbon of mercury-soaked gum on top of the jaw ridge must be removed as previously discussed.

Fig. 75 Dental Syncrometer® probe

It is quite easy to find invisible tattoos using the newly developed "Dental Syncrometer® Probe" (see *Sources*) attached to the Syncrometer®. If your dentist is willing to remove these too, after you locate them with your Syncrometer®, you have a precious professional. If not, remove them yourself with the toothbrush zappicator.

Hidden Cavitations

These are not ordinary infected bone sites. They are primarily bioaccumulation sites. You can detect them easily by searching for mercury and other amalgam-related metals in the jawbone with the Dental Syncrometer® Probe. Here the Syncrometer® also finds plastic-related chemicals from fillings, and silicones as well as tin from toothpaste! Staphylococcus and Streptococcus may also be there. The real reason for this bioaccumulation site is the presence of lanthanide elements that are abundant in amalgam and have drifted there. Wherever the lanthanides land, the white blood cells become "choked" with iron and calcium deposits. After this they stop "eating" any more toxins, ruining your immunity at this location. Hidden cavitations can contain their mercury even 20 years after amalgam was changed to plastic! Healing was impossible here because immunity was lost and accumulation begun.

Even digital X-rays can scarcely picture these hidden bioaccumulation sites. But, again, detection with a probe attached to a Syncrometer® is much easier. Fortunately, they can be cleared with the tooth zappicator, without surgery.

Home Dentistry

Although dentists and dental surgeons alike have done their utmost to clean metal, plastic and infection from your mouth, there are still leftovers.

Syncrometer® testing reveals that half of the remaining teeth will still have traces of plastic! And the soft tissues of the mouth, the four pairs of salivary glands, the roof and sides and tonsil area have deposits of amalgam that have persisted through it all. On this hangs your fate if the CD4 count is much too low and CD8 count too high with unrelenting illness from AIDS. Mercury and thallium in your CD4s and CD8s prevent them from killing the HIV virus, or any virus. They prevent all your WBCs from killing Salmonella bacteria, making it necessary for you to be on antibiotics constantly. Syphilis cannot be combated. Azo dyes in these same cells have programmed the CD4s to early death (by their raised bax to bcl-2 ratio) and the CD8s to a delayed death (by their raised bcl-2 to bax ratio). Fortunately, you can do the final cleanup yourself at home.

Tooth Zappicators

A tooth zappicator is a small North Pole speaker fastened to the end of a toothbrush. The speaker is attached to your food zappicator circuit (the 1000 Hz zapper). The tooth zappicator is then held in place on top of the tooth ridge for three to five minutes. A surge of immune power is induced, which removes lanthanides, other metals, solvents, plastic remnants and bacteria all at once. You should have taken germanium, selenite and vitamin C beforehand.

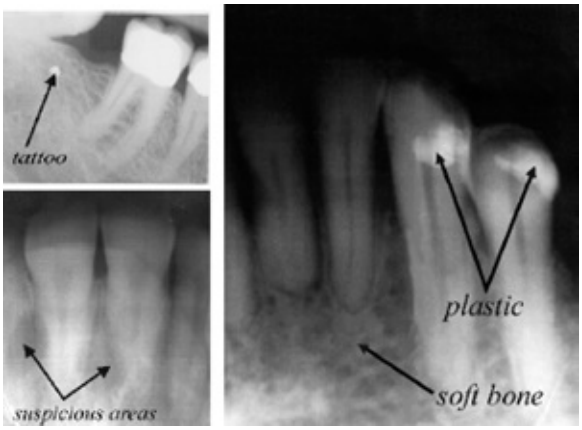


Fig. 76 Digital X-rays give superior view

If you have locations in the jawbones that appear infected or "soft" on your X-ray, treat them next. They will have bioaccumulations of old toothpaste, mouthwash, dental impression compound, etc.

Treat the whole tooth ridge, a segment at a time. Repeat on inner and outer surfaces of the gums, making three sets of treatments altogether. Don’t miss the remaining teeth themselves.

Even when you are not able to search for them first, most hidden cavitations can be systematically cleared by zappicating the whole upper and lower jawbone. Do it yourself to be sure it is thorough.

After three zappicating treatments the plastic teeth no longer seep dyes, and the stray amalgam that has saturated the tooth will be chemically changed so it can be removed by the immune system. Tattoos are not removed.

Only a North Pole force coming from the loudspeaker has this effect. Be sure to test the polarity of the loudspeaker with your compass before using it.

There are no side effects but remind yourself of what you are doing: chasing all the metal, plastic and bacteria into your white blood cells and to the kidneys for excretion. Help the process with germanium, selenite, vitamin C, kidney magnets and a lot of fluid to drink.

Zappicate Plastic Teeth

The tooth zappicator can also be used to harden plastic. For this purpose press it against plastic teeth or teeth with plastic fillings. Give five minutes to each location, then take a break for at least one-half hour. Repeat a second time on inner surfaces. Take another break, and repeat a third (and last) time on outer surfaces. The effect is permanent.

Build your own

Fig. 77 Tooth zappicator and compass

Ideally, each newly zappicated tooth is now tested with the dental Syncrometer® probe for unconsumed (not hardened) plastic, amalgam metals, or clostridium bacteria. Resonance with urethane, phthalate or bisphenol-A implicates unhardened plastic. Resonance with platinum, palladium, thallium, or mercury implicates amalgam. Note that even the tiniest brown spot tests **Positive** for Clostridium. Try to polish it away with baking soda or emery cloth. If you can't, go back to your dentist for assistance. Do not have these tiny infections filled afterward. But brush with oregano oil tooth powder and Dental Bleach alternately.

Zappicate The Mouth

Zappicating the teeth does not remove the amalgam remnants still all over your mouth soft tissues. The tooth zappicator can also remove them. Give five minutes to each small area, everywhere you can reach with the zappicator. Taking L-G helps during this procedure. Do not zappicate teeth and mouth on the same day. It could overburden your immune system or give you detox-illness.

In the past, I recommended EDTA, DMSO, and vitamin C as a mouthwash for the final cleanup of amalgam from your mouth. They are not nearly as satisfactory as your body's own L-G. L-G was evidently meant for removing heavy metals, because the body can do it by itself without leaving a molecule behind, and do it quickly provided L-G is present. It takes about five days for L-G to clear your mouth after first zappicating it, then six weeks to clear most of your body.

Take 1 tbsp. L-G, 4 times daily. See recipe.

This beginning Home Dentistry is a creative innovation of huge significance. Being able to do simple dentistry, using the Syncrometer® to guide you, may pave the way to caries prevention that has eluded us so long. You can find a tooth infection long before it becomes a cavity. And you may be able to clear it up with dental zappication and diet changes.

You are also able to clean up after amalgam removal yourself. You can stop seepage from plastic, and keep Clostridium away.

Your mouth is finally metal-free, plastic-free, dye-free, and Clostridium-free. It is a huge accomplishment.

Making Your Dentures and Partials

There are different opinions among dentists about when to make an impression of your mouth: before tooth extraction or later after your mouth has healed. Choose before or wait 6 months! Never let impression compound be put in your mouth earlier or unnecessarily, such as for "bite registration". Other means are available for this. The toxic chemicals put in your mouth to make the

impression and for fitting and adjusting are absorbed and travel to the brain. Mental deterioration from the huge doses of aluminum, dyes and silicone absorbed often begins the same year!

When impressions are made before extraction your replacement teeth can arrive much sooner. The fitting is done as soon as your mouth is healed enough to tolerate it. All the more motivation to do the Dental Aftercare correctly so no post-infection could delay fitting. Of course, the mouth will change slightly as it heals further. Adjustments will be necessary a month or so later and at future times. Adjustments should be made without impression compound. In a few cases, when entirely new dentures or partials are required, choose a safe variety of impression compound.

There are very many kinds of denture materials. **Methylmethacrylate** and **polyurethane** can be hardened by you at home and are therefore good choices. They will be safe from seeping, even if a pink color is chosen. Other materials hold promise but need more research. See *Hardening Dentures* in *Recipes*.

Congratulations!

You have completed the hardest task required to raise your CD4 cells and lower your CD8s while increasing their total number. You have removed an assortment of about 50 heavy metals that were blocking and destroying your lymphocytes, neutrophils and macrophages, namely most of your immune system. You have removed an assortment of azo dyes that were contributing to this. And you have evicted Clostridium from its fortress in your teeth.

A glance in the mirror shows you a beautiful set of teeth, sweet-smelling breath at all times, and chewing better than be-fore. You have enabled your body to survive.

On The Road To Recovery

Of course you have done a lot more than just clean up your teeth! You have removed heavy metals, dyes, and Clostridium from all of your mouth—your cavitations, your salivary glands, and your throat. The next step is to remove these same pollutants from your diet and environment, so all your specialized white blood cells can go to work for you again. This only takes days, not weeks.

You might be wondering how much it will cost for this very specialized dental clean up. Although the dental work may seem straightforward, extractions being very common procedures, the way you need them done is not at all common. Using homemade antiseptics, requesting cavitation cleaning and tattoo removal, and finding a dentist with digital X-ray equipment are all non-traditional. In Mexico, in 2003, the rate including the cleanups was about $85.00 per extracted tooth. Full dentures cost about $450.00-$500.00.

How To Make A Million Dollars In Your Spare Time At Home: Sue!

Pollution problems should be solved by people themselves, not industry or government, the responsibility is too great. Family health is at stake. Only people's groups would not be influenced by other priorities. What I am suggesting is that people form their own groups, find labs willing to do analysis of dental supplies, form collaborations with dentists willing to work creatively and follow-up on the job done with analysis of saliva by lab testing, later with analysis of biopsy materials.

I was joking about making a million dollars, but maybe suing the American Dental Association is the last resort solution it will take to bring the problem to the attention of the American People, and its suffering victims.

That is another reason for saving what was removed from your mouth (besides curiosity). Any extracted teeth with fillings could be analyzed. They could be set to soak in water overnight and the water analyzed for seeped ingredients. These ingredients were seeping into you. The real object is not to point out guilt but to find a developing problem before your entire family has been damaged, generation after generation. Before your family must spend half its generated income on health restoration.

Bad health underlies mental illness, addictions, and criminal behavior besides the customary diseases. Even reproductive disturbance is a state of bad health. It makes no sense to place a piece of estrogen-like chemical (as in bisphenol-A, used in dental plastic) in the mouths of children, in the form of sealant or filling, to be sucked on day and night. Both girls and boys are likely to be affected, especially before puberty. Again, a people's group would not let this happen, even if it were only suspected, not absolutely proved, whereas a professional or governmental group is bound by laws to have other priorities even when they are aware of the suspicion. You would not keep dark secrets as governmental groups do.

A list of labs doing analyses for metals, solvents, and other chemicals is given in *Sources*. Many others can be found in the yellow pages of telephone directories. Be sure you understand the sensitivity of the testing each lab can do. Obviously, the ability to test to parts per trillion is better (more sensitive) than parts per billion.

Despite what I feel is the uninformed state of the dental profession, the average dentist is devoted to human welfare, besides just his or her own. This is apparent in the movements, within the dental profession, to outlaw mercury, to outlaw all metal, and to advocate better nutrition. Not all agree. But that is my point. Progress is made from discussion, and trying to achieve higher standards. If you find a dentist knowledgeable about cavitations and Clostridium invasion and willing to support your strange, new agenda, then you have truly found a treasure.

2. Clean Up Your Diet

It is easier than ever before to make safe food for a person with lowered immunity. There are three things to be aware of:

1. Foods like lettuce and carrots are grown in dirt that contains parasite eggs. Regardless of where they are grown, most other foods are handled by humans who may have bacteria and parasite eggs on their hands. These foods must be disinfected as well as washed thoroughly.

2. Processed foods like cereal and bread, or anything that comes boxed, bagged, or sealed, can have unsafe additives or pollutants. Even something as natural as an apple can be coated with "food grade wax" to make it look more shiny. Foods with harmful ingredients on the outside can be washed in hot water; foods with harmful ingredients on the inside should not be eaten. A few can be salvaged with electronic treatment.

3. Some foods can give you an allergic reaction even though they are nutritious. HIV/AIDS victims become allergic to a number of common foods. These are foods that bring gallic acid, apiol, phloridzin or chlorogenic acid with them. I will discuss these soon. An allergic reaction brings inflammation and tissue destruction besides consuming immune power (complement C_3). Although you can treat these foods with a food zappicator, it is best not to eat them at all.

Of course, we thought our food was free of the obvious toxins, like metal, solvent and filth. But it isn’t. Nobody monitors it! Actually, our government agencies do monitor certain foods for insect parts, bacteria and mycotoxins, but

not for our immunity-destroyers. If there were only one advance to be made for civilization in the next millennium, cleaning up our food would be the wisest choice.

> Eat benzene-free, PCB-free, asbestos-free, dye-free and metal-free food. These are the immunity-destroyers. Kill all parasite stages and bacteria. Don’t eat food you are allergic to.

Avoiding allergies has always been considered a personal challenge because it is believed that no two allergies are alike. But HIV/AIDS sufferers share a common set of allergies! The reaction is in a very serious place, the thymus. It must be avoided for the thymus to heal.

In earlier books the malonic acid in food and drink was a very big problem. But that was conquered by the discovery that: a) milk directly from a cow did not contain it; b) oranges from a backyard tree left to grow wild did not have it and; c) organic carrots in their original plastic bags did not have it! Then came another discovery: by soaking supermarket oranges and carrots in two hot water washes, some of them became malonate free. Most produce could be cleaned up in two hot water washes, one minute long. That proved the point. Plants don’t naturally produce malonic acid—a metabolic poison. It must be the multiple sprays used to inhibit sprouting, protect from pests, add color and for other purposes that bring malonic acid with them. The problem turned into one of spray removal.

Today you can expect malonic acid to come out of raw fruits and vegetables along with the benzene, asbestos and lanthanides (metals) and even dyes with two very hot water washes, each one minute long. After that, or at any point during preparation, you should place the produce in a sonicator, on a food zapper or food zappicator to make it safe. I will discuss these three methods shortly.

Avoid Allergies

Unfortunately, fruits and vegetables are not "naturally" safe. We learn which plants can be eaten by trial and error, avoiding those that produce stomachaches, headaches, or worse. But we can’t instinctively avoid those foods that destroy immune function because we don’t "feel" this. It is the "plant phenolics" in foods

that can have such subtle actions. **Phloridzin** and **chlorogenic acid** are two of the worst. They attack the pituitary and hypothalamus glands, which are responsible for your hormone levels. When these master glands are inflamed they set free their cells which can now go coursing through your whole body. If they pass through another inflamed organ they can attach themselves to it. When the other inflamed organ is the thymus, we see fused pituitary and thymus cells, hypothalamus-thymus cells, as well as the "triplet", hypothalamus-pituitary-thymus cells. What role do these unions play? Only more research can tell. Most important is to know which food phenolics cause the thymus inflammation. And which phenolic might be assisting the HIV virus to invade it. Could they be apiol and gallic acid?

Apiol accumulates in the thymus in HIV patients. And, when **gallic** acid is eaten and not detoxified promptly by the liver, gallic acid is free to circulate. It is the trigger for SV 40 virus to appear.

Thymus Allergies

Phenol could be expected to damage the thymus because it is used commercially as a caustic and tissue destroyer. Phenol is produced from the benzene that is detoxified there. The thymus is kept chronically inflamed by phenol. Bits of the thymus gland can be seen floating away in the blood and lymph when phenol is present. Only the benzene on a food could bring phenol as an allergen, since foods don't have phenol (except bee pollen, avoid this). It is rare to have more than one allergen attacking an organ. But in HIV/AIDS more than one allergen is attacking the thymus gland. This is besides the two that are attacking the master gland. And besides the one that triggers SV 40 virus. Two thymus allergens are apiol and phenol. Removing phenol must wait until the benzene is gone. But apiol is under your control. It is very easy to avoid. It is present in all the popular cooking oils and soybean products. Use the safe oils. Gallic acid is easy to avoid, too, by baking your own bread. See the *Food Table* for a list of allergens in foods.

Spray Away

After I discovered the four immunity blockers and the azo dyes that destroy immunity, I gave them top priority in the clean up process. They are asbestos, heavy metals, PCBs, benzene and dyes. All of these are sprayed onto the fruits and vegetables we eat every day.

Sprays are oily, waxy solutions, contaminated with these immunity-

destroyers, together with other chemicals. They stick very tightly to the food because air blowers are used to dry the food after spraying. That is why the water must be very hot and why you need a timer for your washes. But then it is easy.

Washing alone, though, does not kill anything. It only removes things. Bacteria and parasite eggs are still everywhere. So, after washing, you must still eliminate the live things from your food with a sterilizer, a sonicator, food zapper or zappicator.

In the past, back to antiquity, bacteria and parasite eggs were killed by cooking, baking, pickling, drying, salting. But these are half measures. We must do a better job for an immunity-injured person.

What A Sonicator Can Do

Ultrasonic cleaners have been in use many decades. They are used to clean scientific instruments, even glassware, to a level not possible any other way. Sonicators can be bought in the form of jewelry cleaners. When jewelry is being cleaned, even the oily film of fingerprints comes off. We will use an ordinary jewelry cleaner, of a good size, but with water for the immersion fluid, not a solvent.

The food is placed in a plastic bag and lowered into the tank of water. The unit is turned on for five minutes.

Even PCB and benzene can be removed. In fact, these are chemically destroyed as well! The pounding action of water as a very fine tremor-activity evidently oxidizes the benzene, because the Syncrometer® detects its oxidation product, phenol, after five minutes. Another five minutes of sonication destroys even the phenol. Perhaps the same kind of action destroys PCBs because they "disappear", too. Asbestos also "disappears", presumably shattered. Food that is eaten after it is sonicated for benzene, phenol, PCB and asbestos does not show up in the immune system; this is my guide to toxicity. It is no longer toxic.

But lanthanide metals cannot be destroyed by sonication. They are elements; their form may be changed to an oxidized or hydrolyzed form, but this does not change the fact that a magnetic element is present. Other heavy metals are not destroyed either. Only hot water washes can remove these. Azo dyes as a group cannot be destroyed by sonication either. You must rely on hot water washing for these ultra-important immune system toxins.

You can rely on sonication to destroy parasites, their stages, and bacteria even if they are deeply imbedded in meats, bones, or inside cans or packages. Viruses and prions will disappear, too, evidently disrupted by the same shaking action.

Molds on food, together with mycotoxins, are also shaken off and destroyed.

Tiny bits of pituitary gland and hypothalamus that float in eggs and dairy foods are destroyed in 10 minutes, this will be discussed soon.

Large and small sonicators can be purchased from the Internet and from *Sources*; the 1½ gallon size is by far the most useful. A five-minute built-in timer is also a great time saver. Avoid the variety that strictly forbids touching the bottom of the tank.

Start with a general kitchen cleanup as soon as you get your sonicator. Clean up baby things first; babies are the most vulnerable. Shake all the PCBs off baby toys, baby bottles and nipples, even though they have already been used and washed. PCBs don’t "go away" by washing, they only spread. Sonicate baby medicine, swabs, band-aids, toys. Sonicate your kitchen sponges, your toothbrush and comb, your dentures, and everything else that goes in your mouth (yes, even cigarettes).

What A Food Zapper Can Do

This is a device that shakes the food at a very high frequency, too; but not in water. It is "dry sonication". Some advantages are obvious. It does all the things that a sonicator does but lets you place the food on top of the device instead of in a water bath.

Fig. 78 Food zapper gives special bene-fits

With a food zapper you do not need to transfer foods into plastic bags for immersion in the water bath. Fewer mistakes are made and you won’t have the chore of changing the water in the tank every day. It can treat food in plastic or paper containers as tall as a quart/liter bottle. See instructions for building your own. Your own zapper powers it and the voltage is not critical. But it must be

Positive offset; that is critical. For this purpose you can even use a wall outlet to power the zapper. Zap for five minutes to get killing action. Zap 10 minutes or longer for cleaning and detoxifying action.

All tests for the effectiveness of the food zapper were done with a Syncrometer®, a device that hardly anyone knows about, has never been tested officially but has a very great potential for improvement of life and health. The Syncrometer® circuit design and instructions for use are described in the *Syncrometer® Science Laboratory Manual*. Everyone, especially the non-technically inclined, is encouraged to learn to use it.

What A Food Zappicator Can Do

A food "zappicator" is the same thing as a food "zapper," but with a lower frequency. Build it the same way, but instead of using your zapper to power it, you need to purchase or build a modified zapper whose frequency is 1000 hertz.

The zappicator adds destructive power to the previous two devices. Not only can PCBs, asbestos and benzene be destroyed but a whole host of toxic molecules.

This kind of "zappication" chemistry is too new to answer many fundamental questions like how each phenomenon works. Most important is that it does not destroy most vitamins or change food in noticeable ways. It does oxidize some minerals.

Some things it destroys are:

- parasite eggs and stages
- bacteria and viruses
- prions found in dairy products and meats
- phloridzin, the pituitary-destroying chemical
- chlorogenic acid, the hypothalamus-destroying chemical
- phenol, the thymus-destroying chemical
- apiol, another thymus-destroying chemical
- D-phenylalanine, the malignant melanoma related chemical (amino acid)
- D-mannitol, the abnormal sugar molecule that clogs lungs and ducts

- gallic acid, the trigger for SV 40 virus

What harm do these allergens do? How could "simple al-lergies" be important when faced with so dire a disease as HIV/AIDS?

SV 40 Virus

Allergies seem almost universal and therefore of little consequence. Unless you are hosting Eurytrema, the pancreatic fluke!

Each of us gets a dose of Eurytrema parasite stages with any dairy product we eat. In the past it didn't matter because immunity was strong and they could be killed. But the lowered immunity of the 20th century changed all this. Parasites now flourish along with bacteria and viruses. Each parasite brings its own bacteria and viruses to flourish, too. **Eurytrema brings its SV 40 virus**. Yet the virus is not visible in all of us even when we are hosting Eurytrema. The virus must be triggered first. The common allergen, gallic acid, triggers it.

Simply by not eating gallic acid, you can avoid having this virus flourish. But if you do eat it, because it is in nearly every loaf of bread in the supermarket, you will trigger the SV 40 virus into multiplying.

SV 40 can enter any organ that is inflamed. Inflammation opens the tiny "port holes" that all cells have. Now viruses can enter. Organs that are reacting to some allergen get inflamed.

SV 40 is not a retrovirus. We would not expect it to make the enzyme, **reverse transcriptase**, the HIV enzyme. Yet, the Syncrometer® finds SV 40 wherever HIV virus is present. What is it doing there?

Aiding And Abetting HIV Virus

The Syncrometer® shows that SV 40 and HIV share the terrain. So where one virus exists, the other is quickly attracted. They become a **dynamic duo**. What are they contributing to each other?

The SV 40 virus brings two advantages to their relationship:

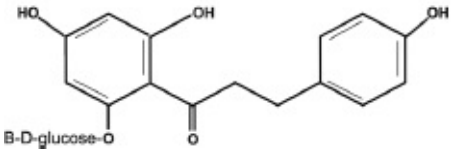
1. Cells with this virus live much longer. Their life-stopper gene that acts at the end of each chromosome (**telomerase inhibitor**) has vanished. Infected cells now have an "immortalized" property just like yeast and other very primitive life forms. We were definitely not meant to host this virus.

2. The self-destruction power, called **apoptosis** is lost. The Syncrometer® sees

that **caspase 3** is missing. Caspase 3 is a necessary link to apoptosis. Infected cells will not be able to self-destruct and terminate themselves, which is a very important property. Our bodies make use of apoptosis to stop the spread of infection. Does HIV virus take advantage of this? Would the HIV virus stop spreading without the help of SV 40? It is a tantalizing thought. The answer must wait for more research. But meanwhile, we should eliminate the SV 40 virus along with the HIV virus; they don't belong in us.

Phloridzin Attacks The Pituitary Gland

We were raised on the wise old saying, "An apple a day keeps the doctor away." But we were warned as children not to eat green apples. Rebellious children ate them anyway and seemed to suffer no harm. But they did!



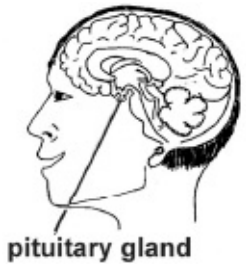
Can you spot the phenol.

Fig. 79 Phloridzin

It turns out that we must pick this single apple a day carefully, not just any apple will do. It should be a Red or Golden Delicious for eating raw. All others have a chemical called phloridzin. The greener they are the more they have. This chemical is prepared commercially from the wood of apple trees. Even rabbits know about phloridzin.

Baby rabbits are taught not to chew the bark on apple trees; it will make them sick. If they are naughty they will get instant diabetes and it cannot be reversed. The phloridzin caused it.

Phloridzin is a **food phenolic**; one part of its chemical structure is phenol, hence the name "phenolic". It was put forward in the 1980's by Robert Gardner Ph.D. that our common food allergies are due to these phenolics, not the proteins that everybody believed in for so long a time. Read more about food phenolics on the Internet. Read about phloridzin, gallic acid and others in a report by Dr. A. Ber.[17] Also read more about spraying grains with propyl gallate. [18]



The brain is easily accessed by dental and food toxins in the mouth

Fig. 80 The pituitary gland

Being rather difficult to detoxify, phloridzin and other plant phenolics are left over by the liver and allowed to circulate when certain parasites are present. When the human liver fluke, Clonorchis, is present phloridzin floods the liver and blood every time you eat some in your food. It is attracted to the pituitary gland and arrives there in less than a minute. The pituitary is the bottom end of a master gland that has the hypothalamus at the upper end. It is shaped a bit like a dog bone with the glands at the ends and a connecting path between them.

The hypothalamus end is near the middle of the brain, controlling your feelings, appetite, temperature and other vitally important parts of life.

How will phloridzin attack your pituitary gland?

Chlorogenic Acid Attacks The Hypothalamus

When tiny Strongyloid worms inhabit the liver, a different food phenolic, called chlorogenic acid is left undetoxified and now it floods the liver and blood. If any food with this chemical is eaten, it goes straight to your hypothalamus.

If we have not lost our immune power at these glands, the white blood cells will promptly eat up both the phloridzin and all the chlorogenic acid that arrives and take them to the bladder.

But when immunity fails, phloridzin or chlorogenic acid accumulates and piles up inside these glands.

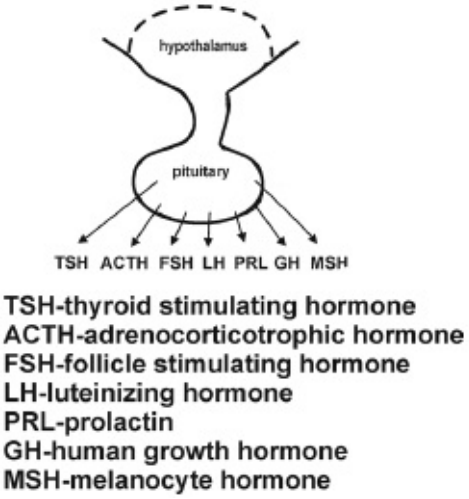


Fig. 81 Our "master" gland

As they accumulate a peculiar phenomenon is observed in the pituitary and hypothalamus glands. They literally "explode" on a micro scale. Bits of hypothalamus and pituitary tissue land everywhere. They sail away in the blood stream all around the body. Bits land here and there in all kinds of other organs. At first the white blood cells in the other organs pick them all up diligently. It is the job of the CD8s, also called cytotoxic T-cells or plain "killer cells"! But as immunity goes down everywhere in the body, these tissue bits begin to pile up at their new locations. They pile up at the prostate, breast, ovaries, lungs, thymus, bone marrow, kidneys, spleen, brain, liver, testis, uterus, colon, pancreas and others. Their survival marks the beginning of a subtle change. The little transplants begin to make their hormones right there in your other organs instead of only in the brain where they belong!

In the brain, the pituitary is **controlled** by the hypothalamus. The hypothalamus "tells" the pituitary when to "release" a particular hormone. The pituitary obeys. Imagine the havoc created when the bit of hypothalamus that has landed in the thymus tells the bit of pituitary that landed nearby to release thyroid hormone, which belongs in the thyroid or follicle-stimulating hormone, which belongs in the genital organs! All over the body wrong hormones are being produced in the wrong places.

The pituitary gland is responsible for making about a dozen of our most powerful hormones, controlling our sex glands, as well as the thyroid and the adrenals. The pituitary is a self-regulatory gland. This means it shuts itself off when there are enough hormones present. With hormones now being made in many places in the body the limit is soon reached, so the real pituitary gland in

the brain is turned off. The human growth hormone (HGH) normally made in the brain is gone. Instead there is HGH being made in the testis, thymus and other places. All this "abnormal" HGH will be eaten by the CD8s to be sure. But this leaves a huge deficit of HGH for the body as a whole. The Syncrometer® cannot find HGH in the pituitary gland, where it should be in HIV/AIDS victims.

At first the CD8s can keep up with this task. But later… immune blockers arrive! Eventually, there is total hormone chaos.

Which immune blockers are responsible for allowing the buildup of food phenolics in the pituitary, hypothalamus and thymus glands? They are the same five that disable immunity: metals, asbestos, benzene, PCBs, and azo dyes. The metals come from deposits of amalgam right there in the brain. Inside the brain these deposits release about 50 metals including a dozen lanthanides. All these came from your metal tooth fillings! Molecule by molecule they were moved from your teeth to these glands. The brain and thymus are full of such deposits that have emigrated from your tooth fillings.

Which immune toxins could be stopping the CD8s and other killer cells from killing and destroying the bits of gland tissue that are swimming freely and coming their way? This time it is mercury and thallium, not lanthanides. When mercury or thallium are in the CD8s, they can’t make their L-G nor interleukin 2. They also lose their killing power. Unable to kill them, fragments of hypothalamus, pituitary and thymus glands swim all around.

Free-floating gland tissues and food antigens consume more and more immune power, your CD8s and your complement C_3.

This lets more and more organs be attacked by the food phenolics. The thymus is attacked by apiol; the bone marrow and the genital organs will be targeted next.

Soon there is no detectable C_3 left. This arm of the immune system is gone. It is a catastrophe. Now parasites will have a population explosion; they were kept in check by the same immune cells. The numbers of antigenic food chemicals will increase. The patient becomes allergic to everything! There is nothing left to eat that won’t give some reaction. Organ after organ gets inflamed, letting in the viruses. The cells with viruses (SV 40 and HIV) have immortality. Nothing but killer action could get rid of them. And killer action is blocked by mercury and thallium.

No More Allergies

After going on an intensive parasite-killing program and avoiding food with phloridzin, chlorogenic acid, apiol and gallic acid things are set right again. These are the deciding factors that stop the chain of events leading to virus invasions. You can stop the whole chain in a week. Soon your body is winning the battle for survival.

One thing is quite clear. Foods containing phloridzin, chlorogenic acid, apiol or gallic acid should not be eaten. Later, when you are well again, you may destroy these chemicals on a food zappicator. But until then, stay OFF foods with these phenolics. Use the *Food Table* to guide you. The more careful your avoidance is, the faster your thymus recovers.

Fortunately, the list of undesirable foods is quite short and cooking or baking them salvages many. Imagine the damage you could do to your major glands, including the thymus, from a "health food" snack of potato chips fried in soy oil and dipped in a cheese dip, followed by an "organic" under ripe banana split?

Of course if you did not have Clonorchis and Strongyloides parasitism you would simply detoxify these food chemicals after you ate them. But nearly everybody has at least one of these varieties by the time they are adult. Nobody in modern times has bothered to do regular parasite-removal. Only some 80-year old healthy persons, whom I tested, did not have them. You will be healthy like they are in a few weeks. But your new diet will show results in 5 days! Your C3 level will be higher! More immune power will be left to kill parasites and viruses.

Food Worth Eating

With the three food problems solved: sanitation, freedom from common toxins, and freedom from allergens, you can enjoy it all. All that’s left! If you were living on the foods that are now banned, you can understand why you, in particular, were targeted for HIV/AIDS. After stopping, your body will get relief; relief from its second greatest burden—bad food. (The first burden may have been bad water). If you are feeling food-deprived, remember **the most basic principle in allergy-science: you get allergic to what you eat most often**! Do not overdo the new foods you will soon find delicious. Eat only one serving a day, the amount a child would choose! For example, one egg, not two; one small potato, not two large; ten peas; ½ apple; ½ orange; one plum; two strawberries and so on. The liver can detoxify small amounts of many food

phenolics. Allergies come from eating too much of one kind. Use the *Food Table* to trace paths that have only N's. Mark these and take these pages with you when you go shopping.

After your viral load is back down to **Negative** and your T-cell count is corrected you may zappicate all these foods in-stead of strictly avoiding them. But stick to goat's milk forever.

Shopping

Don't buy any produce that is obviously waxed! It was sprayed on generously —so the chemicals have penetrated the food deeply.

Fig. 82 Glossy produce

Shop for Kosher foods whenever possible. Search for these symbols: Ⓤ, K, ✡. This does not guarantee their safety, of course. Any processed food could have a solvent residue or azo dye. That is why you are advised to eat home-cooked food carefully cleaned. Yet, I find Kosher foods have much less of these toxins, a better starting point.

Asian and South American food is also much cleaner. But only if they are imported "as is". Imports suffer when they are repackaged for distribution in the United States. It is the American design of packaging equipment and method of disinfecting foods that is hurting the entire planet's creatures.

Even wild creatures and domestic animals are seated at this planet's table with us. We must care for them as we do for ourselves by keeping the food and water safe.

Organic produce has much less dye and pesticide pollution (benzene) than

regular produce. But asbestos tufts adhering to the outside of foods are just as severe a problem. And PCB pollution is rampant. I believe PCB enters with the soap sprays used on fields instead of pesticide. Most commercial soaps I tested had PCBs, which I reported in my earliest books. (But some sample soap bars and shampoo from both Italy and England did not have PCBs or benzene or other solvents!)

Even though organic and imported foods are better, no food is safe until it is cleaned up with hot washes and then electrically treated.

Fig. 83 Kosher and Asian foods are superior

Remember that all fruits and vegetables were grown in soil that was fertilized and had animal filth in it. It may look amazingly clean in the marketplace but if it does, it is toxic besides. With this knowledge, find small ethnic markets that buy "second" grades of produce, do not prepackage and do not spray on the shelves.

No heavy metals, azo dyes, PCBs or benzene pollution; an enviable achievement.

Fig. 85 African-made products

No pollutants in these for-eign made products.

Fig. 84 UK-made products

Travel Safely

Cleaning your food should be a quick and easy task. In earlier books I described double cooking, food sanitizing with hydrochloric acid, Lugol's iodine (especially while visiting foreign countries), and cysteine-salt. These are all still valid. Learn to use more than one system so you can travel anywhere, even by plane and go to restaurants in safety. Always carry Lugol's, HCl, and a zappicator with you.

Sterilize For Storage

Food will keep much better if given a sterilization treatment before putting it in the refrigerator.

Eggs should be washed before storing. One drop of Lugol's iodine in a quart of water can sanitize them (zappicate the Lugol's first). Throw away the carton; it is full of Salmonella. Zappicate eggs 10 minutes or longer before or after cooking.

Greens, vegetables and fruits can be soaked for one minute in HCl-water (one

drop per cup) or Lugol's-water (one drop per quart) before storing. Other details are given in the *Recipes* chapter.

Wake Up Your Appetite

Food should be delicious as well as safe. It is one of the great pleasures of living. But you need more than a knife and fork to eat with. You need your appetite. Nothing thrills a cook and your caregiver as much as seeing you have an appetite for his/her food. This is not under your conscious control, though. To have appetite your liver has to accept food. And your hypothalamus has to say, "It's good". If the liver rebels it could make you throw it all up! If the hypothalamus says, "Stop, this tastes moldy, rotten, or worse," your stomach could suddenly feel completely full. For this reason you should be taking homeographic drops that keep the hypothalamus "clean." The hypothalamus needs to be clear of amalgam, PCB, chlorogenic acid, as well as *Clostridium botulinum* bacteria, flu virus, Salmonella bacteria and Strongyloides. If you have thulium in your hypothalamus, it cannot make **hydrazine sulfate** for you. This is your natural appetite stimulant. If your appetite is quite low make yourself "organ drops" of hypothalamus to remove all of these. Taken daily they will keep your appetite up and nausea away. How to make them is given in the section on homeography. If you can't do this, simply taking cloned hydrazine sulfate drops will help. Soon the more fundamental process of killing parasites and removing bad water and amalgam-filled teeth will bring natural appetite back automatically.

Breakfast

If you can't have bacon, ham or sausage, nor hash brown potatoes or cottage cheese, cow's milk, yogurt, nor soy foods, or toast and jam or a tall glass of fruit juice from a bar, what's left?

There are still some excellent breakfasts left. Cooked cereals with sweetening and creamy goat's milk are a gourmet dish. Some varieties have the cream accumulated at the top. This is extra delicious and full of nourishing calories. But for the first two weeks use coconut "whipping cream" or homemade fruit juice on your cereal, since all milk is off your diet.

Cook your cereal from scratch. Don't eat cold cereal; it has too many solvents and added chemicals. Although all cereal has asbestos fibers stuck to it, any of the electronic treatments destroys it. Do not neglect this. The whole package can be treated at once, without opening it, making it less of a chore.

Put the entire package on a zappicator for 10 minutes to clean up traces of solvents.

Fig. 86 Good breakfast cereals

Make granola from a recipe, there is one in this book. Imported sweeteners are safest. Canadian honey, honey from South Mexico, sugar from Mexico or Paraguay, all tested free of toxins, but you still have to electronically treat them for phenolic allergens. Add raisins; you may add nuts; their aflatoxins are removed by any electronic treatment. Isn't this a delicious way to start your day! Use cinnamon to flavor, or fruit and honey. Such "small" items must be electronically treated, too.

> The biggest obstacle to eating natural food is time. Find a friend who has the time to cook for you, if you are not up to it.

If anything has not been electronically treated before cooking, the final product must be treated again.

Or start your day with dairy-free pancakes or waffles with coconut cream and honey. Later, when goat’s milk can be used in the batter it should have three HCl drops added. HCl also gives a better rising quality. Eggs get three HCl drops each.

Butter should not have color added. Even the annatto seed (a natural colorant) varieties tested **Positive** on the Syncrometer® to tartrazine, a yellow food dye! Do not eat dairy products that list any color as an ingredient.

Butter needs boiling, too. This destroys antigens and any "onion" spices. Maple syrup should be boiled to destroy gallic acid and another allergen, ASA, (acetyl salicylic acid). ASA is the antigen for the vagina. Do not use unboiled maple syrup if you wish to avoid genital disease.

Eat very ripe fruit; it tastes better anyway. Have it with all your breakfasts. Clean it up with hot washes followed by electronic treatment. Make your own

fruit juices with this wonderful, very ripe fruit. But avoid phloridzin, gallic and chlorogenic acid containing varieties. Just to be sure, zappicate it.

The simplest of all breakfasts is bread and milk. When it is mouth-watering homemade bread, baked right there before you, your appetite cannot resist it. With any homemade spread on it, there will be no yearning for old favorites, like toast and jam. Choose homemade preserves made with a recipe from an old cookbook or see *Recipes*.

Fig. 87 Popular varieties of goat milk

Goat milk is not homogenized and, therefore, gives you cream that has risen to the top. Save it for soups. Goat milk can supply you with your major nutritional needs. Every calorie and every nutritive factor is important for you. Although you are not ready to drink it for two weeks, find it in the market place and store several quarts in your freezer ahead of time. An ultra pasteurized variety can hardly be distinguished from cows' milk.

For meat lovers, now that you can make meat safe, try your favorite beef cut in place of bacon with breakfast. You might never go back to your old diet.

Lunch

Cook your food from scratch. Don't start with cans or packages or frozen items to make some recipe. In fact, don't bother with any fancy recipes. Just cook two or three vegetables for lunch and eat them with homemade butter [19] or mayonnaise and spice or herbs (try Fenu-Thyme, see *Sources*). Bread and milk rounds it out, plus fruit.

Soup is a work saver. Cook it with all the vegetables you can find that don't have phloridzin, chlorogenic or gallic acid. Add rice or barley for a change from

potatoes. Don't start with a packet or cube. Use genuine herbs to give it zest. You may start with beef bones or the meat itself, now that you can destroy all parasite stages in minutes with electronic treatment. Always acidify a soup with 10 drops of HCl to draw calcium out of the bones for you. This preserves the immune weapons L-G and L-A that are naturally present in meat. Vinegar should not be used; it is an antigen! The body cannot digest any amount you may wish to eat. It causes metastases to liver, prostate, colon, tongue and brain in cancer patients —definitely to be avoided. Adding the cream off goat milk gives you more calories. Save the meat for future cold beef sandwiches. Such a soup plus sandwich and goat milk gives you complete nutrition again.

Bake your own bread! I found aflatoxins in commercial bread after just four days in my refrigerator, but none in homemade bread even after two weeks! Aflatoxin is extremely toxic; it is made by mold. Zearalenone is another very toxic substance found on grains and produced by mold. In fact, zearalenone leads to benzene formation in your body! Bread goes moldy easily. Don't ever eat moldy food, whether it is fruit, breads or leftovers in the refrigerator. Throw them out. Buy a bread maker. It can do everything, including baking the bread. I never found aflatoxin, zearalenone or gallic acid in packaged flour, but just to be safe you can set the whole flour bag on the food zappicator. Add ½ tsp. vitamin C powder to the batter for each loaf to help retard mold further. (It also helps the bread rise!)

Never try to lower your cholesterol while re-gaining your health from HIV/AIDS.

This is a rule based on common sense. Synthetic eggs, margarine and cholesterol-reduced products are extremely "chemical" foods.

If you can’t bake your own, buy bakery bread; trim off the bottom ¼ inch and zappicate the whole loaf at once. The bottom ¼ inch has benzene contamination from the use of food-lube. Cups used for cupcakes also bring benzene. Zappication will kill the live yeast spores left from inadequate baking. They carry RAS, an oncogene that inhibits our interferon production. Zappicate bread extra long to reach the gallic acid even in parts that overhang your zappicator (20 minutes).

Do not toast your bread! This makes 4,5 benzopyrene, which inhibits benzene detoxification in your liver. Pan fry in homemade butter or stick-free pan to toast.

Trim ¼ inch off bottom crust to remove "food lube"

Fig. 88 Bakery bread

One big advantage of making your own bread, soup, and beverages is that you avoid the commercial machinery that stirs, pumps, kneads, holds, and scoops it all. All machinery requires regular lubrication, and "food-safe" lubricants have been defined for us by U.S. regulations! But they are not safe; they are petroleum products.

This is a sample regulation:

21 CFR 178.3570 (4-1-94 Edition) Lubricants with incidental food contact.

Lubricants with incidental food contact may be safely used on machinery used for producing, manufacturing, packing, processing, preparing, treating, packaging, transport, or holding food, subject to the provisions of this section:
(a) The lubricants are prepared from one or more of the following substances:
(1) Substances generally recognized as safe for use in food.
(2) Substances used in accordance with the provisions of a prior sanction or approval.
(3) Substances identified in this paragraph (a)(3).

Substance	Limitations
Here you find 39 chemicals like BHA, BHT, Polyethylene, 2-(8-Heptadecenyl)-4,5-dihydro-1*H*-imidazole-1-ethanol, and also including:	
Mineral oil	Addition to food not to exceed 10 parts per million.
Petrolatum	Complying with §178.3700. Addition to food not to exceed 10 parts per million.

(b) The lubricants are used on food-processing equipment as a protective antirust film, as a release agent on gaskets or seals of tank closures, and as a lubricant for machine parts and equipment in locations in which there is exposure of the lubricated part to food. The amount used is the minimum

required to accomplish the desired technical effect on the equipment, and the addition to food of any constituent identified in this section does not exceed the limitations prescribed.
(c) Any substance employed in the production of the lubricants described in this section that is the subject of a regulation in parts 174, 175, 176, 177, 178, and §179.45 of this chapter conforms with any specification in such regulation.

Fig. 89 Lubricants considered "safe" that contaminate food

Notice the mineral oil and petrolatum, which are petroleum oil products. How was it decided that they "may be safely used"? Safe for the machinery, but not for you.**Petroleum products should not be in our food, not even in minutest amounts.**

Fig. 90 USA bread has solvents and gallic acid

Would a very primitive woman, baking her family’s bread or corncakes, allow a tiny bit of dead dinosaur remains (the sophisticated term, *petroleum*, wouldn’t fool her!) to drip into her batter? Even if you said it would all be baked out by 80°C (well below boiling point)? Even if you said it was all perfectly clean, even made synthetically, now? Even if you said the pans would be easier to wash? I believe not and she might throw some batter in your face! This is because she has common sense; she knows that you shouldn’t put dead animal remains in food even if you can cook it and "make it safe". Dinosaur remains are even more unthinkable. Small amounts are not negligible even when the currently used test instruments can’t measure them.

"Food lube" for heavy-duty machinery like ice cream and dough mixers, and "food oil" for light-duty equipment like cheese and meat slicers are petroleum products that introduce benzene into our foods.

Fig. 91 Examples of commercial "food lube"

Our best test instruments are very crude compared to our body's ability to detect. The body detects a molecule at a time. Benzene is very difficult for a testing lab to detect and until recently cost hundreds of dollars for a single test. Manufacturers resisted such added expense. But the cost of benzene testing has dropped dramatically; sometimes it is under $100 per test. It still may seem expensive to a manufacturer. Yet, benzene has brought us AIDS, a huge expense! Wouldn't it be wonderful if our lawmakers required only chemicals that didn't show up in our immune systems to be in contact with foods? No expensive testing would be needed. Lubricants would then be things like olive oil, beeswax and cornstarch. And under "Limitations" would be "none."

Maybe the primitive housewife would even come to dinner!

Fig. 92 Food oil gets into food

Supper

Cook your supper from scratch. But what can you eat as a flesh food? Previously I emphasized fish and chicken because red meats were full of parasite stages that could not be easily killed. But now that parasites can all be killed in

minutes, electronically, meats can be back on the menu (with treatment). Fish and chicken are now removed because they are the hidden food sources of azo dyes that we had searched for so long and so hard. Unless you fish it yourself and do not use laundry bleach to clean up after preparing it, no fish is safe. Chicken, too, has bleach disinfectant in every sample I tested. You must avoid these two meats.

Do not grill, broil or barbecue (it makes benzopyrenes); instead, fry, bake, poach or boil. Don't buy breadcrumbs, use your own. Don't buy batter, make your own. Wash your hands after handling raw meat. Do not use household bleach on your cutting board or kitchen counter. Use 50% vinegar in a convenient spray bottle. Liver is now your most nutritious choice of meats, done rare or as you like it after electronic treatment. Other cuts are next best. Make your own salad, not prepackaged or from a salad bar. Make salad dressing out of any of the safe oils and lemon juice, with honey, salt and herbs to flavor.

If your digestion isn't strong enough for raw vegetables or fruit, make juice. Get a sturdy juicer and make your juice from anything that is phloridzin, gallic and chlorogenic acid free. But avoid those that have been sprayed in the grocery store to keep them fresh looking. The spray contains petroleum products. Add herbs purchased in bulk for seasoning or use a Fenu-Thyme capsule.

Beverages

Drink five kinds of beverages:

- **homemade fruit juices**
- **homemade vegetable juices**
- **water**
- **goat’s milk**
- **herb teas**

This means getting off caffeine. And if you are already fatigued, this means you might be even more fatigued for a short time. You might have headaches from withdrawal, too. But they will only last 10 days. Mark your calendar and count off the days. Headache medicine, like all medicine, is likely to have benzene pollution and azo dyes from the colorant used; avoid it. For energy, to replace caffeine, take one arginine (500 mg) upon rising in the morning and

before lunch. Soon you won't need it.

Use pomegranate, molasses, chlorophyll and coconut ingredients.

Fig. 93 Make your own healthful beverages

Cutting down on coffee, decaf, soda pop and powdered drinks won't do. You must be completely off. They contain very toxic solvents and T-cell destroying dyes due to the processing.

> Researchers have found even small amounts of alcohol, like three beers over a two-day period, cause a ten-fold increase in the rate of HIV multiplication.[20]

Although grain (drinking) alcohol is the recommended antiseptic for household use, that doesn't mean you may safely drink it. It is inadvisable to drink any form of alcohol at least until you are fully recovered (two years). This is why Black Walnut Hull tincture, which is 20-50% grain alcohol, may be taken in a lukewarm beverage (to evaporate some of the alcohol) and is followed by a dose of niacinamide.

Goat Milk: 2% or higher, consume three 8 oz. glasses a day. Start with ¼ cup and increase gradually, if you are not used to it. If you do not drink milk because it gives you more mucous, switch to a different brand. Boiling it can stop this milk reaction. If you have other reactions, like diarrhea, try milk digestant tablets (available at health food stores). Milk is too valuable to avoid: there are many unwanted chemicals in most brands of milk, but it is solvent-free and very

nutritious. The only exception should be for serious symptoms, like colitis, bloating, flu, or chronic diarrhea. Do not use powdered milk; it is heavily polluted with solvents.

Pasteurization is not sterilization.

Milk goes sour after the expiration date on the carton even when refrigerated and unopened. It is obvious that milk isn't sterile. You can improve upon this in several ways.

To be safe all milk should be sterilized and "denatured" with hydrochloric acid to destroy live animal tissues it contains.

Perfect sterilization of dairy products is not possible even in a bacteriology laboratory. You do not need to meet these standards. We will use easier ways that are still effective. Our goals are: no dyes, no heavy metals, no parasite eggs, no tissue bits, and no phenolics.

Read these options carefully so you can suit your needs.

1. You may boil milk one minute. Cool. Add HCl, 3 drops per cup just before drinking. This destroys many phenolics, parasite stages and bacteria. Cheese commonly has laundry bleach contamination, giving it heavy metals, too. These cannot be removed.

2. Sonicate 10 minutes and add HCl, 3 drops per cup. This destroys parasite stages, bacteria, traces of PCBs and benzene but does not remove phenolics: phloridzin, chlorogenic acid, gallic acid, and apiol. This is useful for goat milk.

3. Food-zap for 10 minutes. This destroys living things, PCBs and benzene. It only removes a few phenolics. Useful for goat milk.

4. Zappicate 10 minutes. This does everything.

Remember that none of these options are yours for two weeks, though, until you have made progress killing parasites and lowering benzene levels. After this, and only if you are feeling better, you may begin to consume a dairy product—goat milk only, and only if sterilized. Many people prefer the taste of "treated" milk. And many people can tolerate dairy products for the first time after making this change.

If you simply cannot tolerate even treated goat's milk, try making cottage cheese out of it. Get recipes for cheese making from recipe books. Goat cheeses are some of the most highly prized gourmet foods. Commercial goat cheeses are off your menu, but you can make your own, safely, in many flavors. Whey is a traditional, delicious beverage with all the calcium of milk in it. Save it all, while cheese making, for your own undernourished body.

There is no substitute for milk; calcium tablets are not satisfactory. Vegetable matter, although high in calcium, does not give you available calcium either. Soy milk has phloridzin, apiol, gallic acid and processing pollutants. Milk is baby food, designed by Nature to be full of factors for growth, health and immune power.

Goat's milk is better for you than cow's milk because it has extra factors that are not in cow's milk. But the biggest difference is that goat's milk does not have live bits of hypothalamus and pituitary tissue afloat in it. Nor does it have phloridzin or chlorogenic acid. Dairy products are too important to your recovery to abandon so you should find a way to make them safe and enjoyable for yourself.

Fig. 94 Water pitcher with filter

Water: Two pints. Drink one pint upon rising in the morning, the other pint in the afternoon sometime. The cold-water faucet may be bringing you cadmium, copper or lead, but it is still safer than any kind of purchased water, which must have antiseptics in it. Let your water run before using it, until the pipes for your house have emptied, about one gallon. Filters are rather useless because water pollution comes in surges. A single surge of PCB contaminates your filter. All the water you use after this surge is now polluted, so you will be getting it

chronically, whereas the unfiltered water cleans up again after the surge passes. Until you can test your own water for solvents, PCBs and metals, no expensive filter is worth the investment. Even reverse osmosis water is polluted with thulium and ytterbium, which must be coming from the filtration membrane. An inexpensive carbon filter that is replaced every month may improve your tap water. (Save all your used cartridges. You might wish to test for PCBs in the future). But a pinch of vitamin C should be added to the water first to destroy the benzopyrenes in the charcoal; they are potent carcinogens.

Plastic pitchers fitted with a carbon filter pack are available. Never buy filters that contain silver or other chemicals, even if they are "just added to the carbon." If you have copper or galvanized pipes, switch to PVC to be safe from cadmium, copper and lead (see the section *Clean Up Your Home*).

Herb tea: fresh or bulk packaged only. If only tea bags are available, cut them open and dump out the tea. Throw away the bag; it is full of antiseptic. Buy a non-metal (bamboo is common) tea strainer. Sweeten with organic imported sugar or honey. Zappicate both. Honey often has food phenolics due to the wide assortment of plants visited by the bees, no doubt. Honey obtained from the bulk tank in a health food store never had solvent pollution but it does have asbestos fibers like regular honey. Be careful not to buy foil packs of tea or tea blends. Tea blends are mixtures of herb teas; these have solvents in them from the extracts used to improve flavor!

Fruit juice: fresh squeezed only. Some stores or juice bars make it while you wait. You have to see it being made, but watch carefully: I recall visiting a juice bar where they made everything fresh, before your very eyes. And I saw them take the fruit right from the refrigerator and spray it with a special wash "to get rid of any pesticides" then put a special detergent on it to clean off the wash! So instead of getting traces of pesticide, I got traces of isopropyl alcohol and PCB! (Yes, I took a sample of the wash to test.) Be on your guard against rotten fruit, green fruit, and moldy fruit. Ask to see what they plan to use. Best of all, buy a juicer, peel the fruit and make your own juice. Try pineapple, pear, peach, nectarine, cantaloupe, and grapefruit, all very ripe. For stronger flavor add a bit of fresh lemon to each variety to give it more zip. Remember, everything gets double hot-washed and zappicated. Bottled fruit juices have traces of numerous solvents; as do the frozen concentrates, as do the refrigerated ones, don't buy them.

Vegetable juice: Buy a juice-maker. Start with head lettuce and other broad-leafed greens. Fine-leafed greens cannot be washed free of spray and regularly

test **Positive** for benzene and PCB! Previously I recommended ozonating greens to destroy benzene. But now PCB has become prevalent and ozonation is not satisfactory. After two hot washes, though, they will be wilted; place them in a blender. Afterwards, treat for residual spray with an electronic method. Drink ½ glass of vegetable juice a day. After you are accustomed to this, add other vegetables to double the amount. Use cabbage, cucumber, beet, pale zucchini, and squash, anything free of phloridzin, gallic and chlorogenic acid. But never use any fruit or vegetable that has been waxed! And peel everything that has a peel. Add herbs and a squirt of lemon for extra zest. Then drink one cup a day.

Horrors In Commercial Beverages

Commercial beverages are especially toxic due to traces of solvents left over from cleaning the manufacturing machinery, and extraction procedures. There are solvents found in decaffeinated beverages, herb tea blends, carbonated drinks, flavored coffee, diet and health mixes, and fruit juices, even when the label states "not from concentrate" or "fresh from the orchard," or "100% pure."

Jazz up your favorite homemade juice with seltzer water. It is not harmful to you (see *Sources*).

Fig. 95 Seltzer mak-er

Some of the solvents I have found are just too toxic to be believed! Yet you can build the test apparatus yourself (*Syncrometer® Science Laboratory Manual*), buy foods at your grocery store, and tabulate your own results. I hope you do, and I hope you find that the food in your area is cleaner than mine! Remember that the Syncrometer® can only determine the presence or absence of something, not the concentration. To know the concentration you should send a sample to one of the testing laboratories listed at the end of this book. There may only be a few parts per billion, but an AIDS patient trying to get well cannot afford any

solvent intake. For that matter, none of us should tolerate any of these pollutants:

- **Acetone**—in carbonated drinks
- **Benzene**—in store-bought drinking water, store-bought "fresh squeezed" fruit juice
- **Carbon tetrachloride**—in store-bought drinking water
- **Decane**—in health foods and beverages
- **Hexanes**—in decafs
- **Hexane dione**—in flavored foods
- **Isophorone**—in flavored foods
- **Methyl butyl ketone** and **Methyl ethyl ketone**—in flavored foods
- **Methylene** chloride—in fruit juice
- **Pentane**– in decafs
- **Isopropyl alcoho**l—bottled water, commercial fruit juices, commercial beverages.
- **Toluene and xylene**—in carbonated drinks
- **Trichloroethane (TCE), TCEthylene– in flavored foods**
- **Wood alcohol** (methanol)—in carbonated drinks, diet drinks, herb tea blends, store-bought water, infant formula.

Fig. 96 Unsafe beverages

If you allowed a tiny drop of kerosene or carpet cleaning fluid to get into your pet's food every day, wouldn't you expect your pet to get sick? Why wouldn't you expect to be sick with these solvents in your daily food? These solvents are just tiny amounts, but tiny amounts are nevertheless billions of molecules! Your body must detoxify each molecule.

Flavors and colors for food must be extracted somehow from the leaves or bark or roots from which they come and I suspect benzene-containing solvents are used for this. Until safe methods are invented, such food should be considered unsafe for human consumption (or pets or livestock!).

Sore Mouth Remedy

If your mouth is sore, or you get yeast infections, even unpolluted fruit juice is bad for you. Thrush (*Candida*) and *Herpes* in your mouth are especially hard to get rid of. Here is how to treat them:

For thrush:

a) While your mouth is bleeding, treat with one drop of Lugol's iodine solution (see *Recipes*) in one tbsp. water, enough to swish in your mouth, and swallow. Do this at bedtime.

b) If your mouth is not bleeding, put one drop of Lugol's iodine solution right on your tongue, directly, at bedtime. Quickly smear it about with your finger.

This will kill surface fungus. But Candida grows right into your living cells, which of course you can't, and don't want to, kill. The fungus will gradually die out as it rises to the surface due to stopping its growth. It takes a month! During this time follow these special dietary rules:

1. Drink no fruit juice; it feeds yeast. Even though the sugar is natural, yeast thrives on it, preventing you from clearing up thrush.
2. Don't eat ice cream or suck on candy for the same reason. If you have thrush stay off sweets until it is gone. Then test yourself on fresh sliced fruit (not juice) with cream to see if you notice a recurrence.
3. Use no alcohol. Even Black Walnut Hull tincture should be put in a lukewarm beverage for one minute to evaporate the alcohol.
4. Don't eat nuts, sunflower seeds, or toast if your mouth is bleeding. Also

avoid pineapple (too acidic) and popcorn. As a mouthwash use lysine powder in water, or a drop of Lugol's iodine in ¼ cup water.

5. Don't brush your teeth more often when your mouth is sore or bleeding. Floss once a day followed immediately by your once-a-day brushing with food grade hydrogen peroxide (see *Sources*) or oregano oil toothpowder (see *Recipes*). It is very important to kill amoebas and all bacteria in these ways because they invade under the gum line and cause terrible tooth and bone loss. In serious situations use several drops of white iodine (see *Recipes*) on a wet toothbrush. Iodine also sterilizes the toothbrush which otherwise would infect you each day.

For Herpes:

1. Drink and eat nothing very hot or ice cold. These trigger Herpes. Eat with plastic; it does not conduct heat or cold so well.
2. Don't eat nuts or vinegar, nor take arginine as a supplement.
3. During an attack take lysine, 500 mg, 5 to 10 capsules once or twice a day.
4. Take a cayenne capsule with each meal. Zappicate to destroy chlorogenic acid. Cayenne slows down the speed of virus travel along nerves.
5. Stay out of direct sunlight or cold winds on your face.
6. Don't tweeze hairs or bruise the skin around the mouth.
7. Take L-G, 1 tbsp. 4 times daily.
8. Take L-A, 1 tsp. 4 times daily (see *Recipes*).

The real reason for getting thrush or Herpes is the low im-munity of your mouth tissues. The cause of this is mercury, thallium, lanthanide metals, and dyes all seeping from your dentalware. Get it removed.

Kitchenware

When cooking from scratch you need the advantage of the most modern appliances. Purchase:

- blender
- pressure cooker plus glass bowls to fit inside

- seed grinder (coffee grinder)
- salad maker
- all plastic strainers and colanders

Wash them under the hot faucet or wipe clean with paper towels after use. Use plain borax to scour and homemade soap to help remove grease. In the dishwasher use plain borax or homemade soap, followed by 1½ tsp. citric acid in rinse cycle. This lets you clean up the kitchen in five minutes to get on with living.

Cook your food in glass, enamel, ceramic, or microwavable pots and pans. Throw away all metal ware, foil wrap, and metal-capped saltshakers since you will never use them again. If you don't plan to fry much (only once a week), you might keep the Teflon™ or Silverstone™ coated fry-pan, otherwise get an enamel coated metal pan. Stir and serve food with wood or plastic, not metal utensils. If you have recurring urinary tract infections, you should reduce your metal contact even further; eat with plastic cutlery. Sturdy decorative plastic ware can be found in hardware and camping stores. Don't drink out of styrofoam cups (styrene is toxic). Don't eat toast (many toasters spit tungsten all over your bread besides making benzopyrenes). Don't run your drinking water through the freezer, fountain, or refrigerator; it picks up cadmium. Don't heat your water in a coffee maker or metal teakettle; use a saucepan. Don't use a plastic thermos jug —the plastic liner has lanthanides, which seep. The inside should be glass.

Why are we still using stainless steel cookware when it contains 18% chromium and 8% nickel? These two metals have been rated as the two most carcinogenic metals! We should not even be handling them, let alone cooking in them.

Many bacteria and yeast(!) varieties have a requirement for nickel so that their enzyme **urease** will work for them. Urease attacks urea, present in all our body juices, and makes ammonia from it for these invaders. Ammonia is a utilizable nitrogen source (food) for bacteria and yeasts. If our bodies weren't polluted with nickel, these invaders couldn't grow! Why do we wear nickel jewelry and supply our bacteria and yeast? Nickel is in the soil, where bacteria and fungi belong, too. But if we insist on keeping plenty of nickel in our bodies and actually supply a huge stockpile in the form of retainers, caps and bridges, we must blame ourselves for our invasion.

It is hard to believe that metals we handle every day in our coinage, food and

beverage containers, body products, and home and garden products could be hazardous. Yet this has been well studied. The question is: why do we not apply our knowledge? It is like living near an alligator-inhabited river, but not keeping the children out. Merely being surprised every time a child disappears!

Never, never drink or cook with the water from your hot water faucet. If you have an electric hot water heater the heating element releases tungsten and other very toxic metals. Even if you have a gas hot water heater, the heated water leaches metals from your pipes. If your kitchen tap is the single lever type, make sure it is fully on cold. Teach children this rule.

> Although it is extra work to select food and prepare it in a way that almost sterilizes it, your stomach will soon notice that it feels flatter; you have less gas and bloating. This increases your energy. You might never go back to your old way of cooking.

If friends are cooking for you, give them a copy of these pages about the diet. The support of your family and friends is very valuable to you, but don't eat with their dishes (dish detergent is on them). You can always eat off paper plates, use plastic cutlery and a plastic cup you wash yourself under the tap. Keep a set of everything handy to take out with you. Carry your own pure salt, hydrochloric acid drops, Lugol's drops, and of course, your zappicator. Your friends are not made ill (yet) by all the pollutants—YOU ARE. They can excrete them efficiently—YOU CAN'T. The pollutants go to your thymus and bone marrow. You may feel singled out; take pride in it! When you succeed in curing yourself, your friends will want your advice. Give it kindly. But if you feel yourself tempted to compromise and are feeling depressed over your deprivations, get yourself invited to a H.E.A.L. meeting, M.C.S. or AA meeting. Give them support. You will get a better understanding of real deprivation and come away feeling like a "pretty fortunate person".

Don't Eat Leftovers

Do not eat leftovers unless they are re-sterilized as in the beginning. All food picks up bacteria while it is open to air and then stored in the refrigerator. After a few days these few have increased their numbers to a dangerous level for a low immunity person. Re-heating the food without actually sterilizing it only cultures

(increases) them; soon there are many more.

Don’t Eat Junk Food

Junk food is a combination of sugar, starch and fat, mixed by machines and with flavoring and dyes added. We are all very attracted to it because we are all very hungry. Our bodies and brain live on sugar and must have sugar to survive. They are not getting it. Why not? The liver is unable to make it. In fact the liver is making fat instead. It’s much easier for the liver to make fat than energy.

In some cases our organs are not able to absorb food. They are missing insulin, organic zinc or chromium. With competition by amalgam metals all around, it is no wonder. This implies a pancreas problem in addition to the liver problem.

In other cases the adrenal glands are full of aluminum. This reduces their cortisone production and the stimulation of the liver to make blood sugar. These organs are parasitized with Clonorchis, Strongyloides, Eurytrema flukes and Ascaris eggs (to name a few). Instead of digesting and detoxifying our foods properly, large quantities of food phenolics are left over to swamp and disable our tissues.

But for the HIV/AIDS or cancer victim the liver eventually can’t even make fat, so the spiral of life bends downward.

Junk food seems to come to the rescue with its sweet flavor that promises to raise our blood sugar effortlessly. But it is very polluted, as you can imagine, with its long list of ingredients, each having been processed and polluted in its own way even before the mixing began. Instead of buying junk food make your own sweets using old recipe books to guide you. Or invent them yourself. For example: raisins, nuts and shredded coconut stirred into Canadian honey for starters.

Don’t Eat Bunk Food

We have been indoctrinated that soybeans would be a near-perfect food, since they have most of the amino acids of meat. Yet they taste bad, as any child knows. Things taste bad for a reason—especially to a child. The liver knows and the hypothalamus knows when food should not be eaten. Now we know why soybeans should not be eaten: they are full of phloridzin and apiol. But commerce (and academic nutritionists) found ways to force us all, even cattle, to eat them. So soy products have penetrated the food market deeply. A way may

be found to breed soy plants without these phenolics, but meanwhile we should not be deterred from using our basic common sense. We should not eat food that tastes bad.

There are many bunk foods, because each of us has foods we dislike. And as genetically engineered food begins to take over the food market, be especially aware of your instinct not to eat bad tasting food or those that give us some food "reaction." Also be aware of heavily promoted "fake foods" (not recognizable as a fruit or vegetable). The risk of pollution and allergies will be much greater.

Still, before you write off a nutritious food, try getting better quality, try getting hungry first, and then try different cooking methods or combinations. And although you may discard a food at one time, try it again in the future. Meanwhile, improve your liver health by killing parasites and cleaning it regularly. These are the best ways to be truly well fed, so our bodies can make energy, not fat, and stay well.

Sterilize Hands Before Eating

Do not let human hands touch your food, unless they have been freshly sterilized. Even a few bacteria, that would not harm a healthy person, will seek out your thymus and bone marrow and prevent you from feeling well. You cannot trust restaurant food to be untouched. Don’t eat at a restaurant where the staff is not gloved. Simply touching the toast, a piece of pie or fruit to nudge it onto the plate contaminates it. Similarly, delivering a glass with a finger on the rim is unforgivable.

Your own hands are just as important. Nails should be very short to facilitate sterilizing them. They must be sterilized before eating and after bathroom use. If you are bedridden, use a spray bottle of grain alcohol. Even more reliable is dipping your hands in Lugol’s water. Put one drop Lugol’s in a cup of water (you should be able to see the color), dip your hands and wash. In a restaurant, use one glass of water to make this Lugol’s hand-cleanser; dip your napkin in it for wiping hands.

Supplement Your Diet

The concept of supplementing the diet with extra nutritional factors is, of course, a very good one. We do need protection! Our metabolism can get protection with supplements. Kidney metabolism, liver metabolism, brain metabolism, each can get some protection by supplementing. It is like the

concept of bandaging a wound—the wound needs protection.

Does this mean our organs are wounded? Not at birth, but sometime during childhood we begin to wound them. Toxic food and parasites wound them again and again while we trust in our "magical" healing ability.

But when the bandage on a wound is filthy, introducing the same bacteria as we are trying to keep out, we have a terrible dilemma.

We have a similar dilemma with our supplements. They contain the same immune-lowering toxins as we are trying to treat and eliminate! Supplements are polluted (all of them) with the four phagocytosis blockers (benzene, PCB, heavy metals and asbestos) and azo dyes Fast Garnet and Fast Green, which kill the CD4 and raise the CD8 lymphocytes.

We could say, "Oh well, this must be a very small amount, it’s probably not significant". This is like saying, "Oh well, the bandage has only a small amount of *E. coli* bacteria, probably not significant." We know instinctively this is false.

There is no simple solution. Plain intelligence tells us that a few *E. coli* penetrating deeply into our organs through a wound could be fatal. But if they are merely present over a scratch on the skin they might not even harm us.

Pills and potions, even of a life saving kind, if polluted in a special way that lowers immunity will hurt the very sick to the point of killing them while not much affecting the relatively well.

The dilemma is worsened by knowing that not every bandage is contaminated with *E. coli*; maybe some have only Staphylococcus or Streptococcus bacteria and a very few have nothing at all. You can’t tell the difference by looking at the bandages.

A very few, possibly 5%, of vitamin pills and drugs are not polluted with serious toxins. But which 5%?

If I were facing this dilemma myself, I would try to do without the bandage rather than risk infecting the wound. I would stay away from dirt. This is like stopping taking supplements. But if I were trapped in a coal mine with a gash in my leg and dirt everywhere I would use any rag I could find as a bandage. I would try to reduce bacteria by dipping the rag in my "coffee" and sprinkling it with my saltshaker no matter the pain. It is altogether an ugly picture.

Yet HIV/AIDS patients are trapped in this same picture. They desperately need help for their metabolism and none is clean enough. I am not talking about

minor toxins. I am talking about the very toxins that are responsible for AIDS in the first place: PCBs, benzene, asbestos, heavy metals and dyes. Facing such a dilemma myself, I would take no supplement or drug that had not been tested for these. If I could not test myself, nor find a tester, I would send it to an analytical lab to test whatever they could for me. And if this were not possible either, I would wash the tablet or take the powder out of the capsule. This removes some of the hazard. The remainder placed in a plastic spoon or zippered bag would be set on my zappicator. Without that, I would set it on my food zapper. And without that, I would put it in my sonicator. Without any of these, I would add or dip it into powdered vitamin B_2 and a drop of HCl in a tablespoon of water and gulp it, no matter the taste.

These are not happy decisions. There is no excuse for this degree of pollution in the supplement and drug businesses. They should have been analyzed for our safety, regularly.

It is possible to do detailed analysis of foods or products at a reasonable price. Look at the label on concentrated vinegar, available from manufacturers for the electronic and "cleanroom" industries. One gallon only costs $39.80; it could be diluted to make regular (5%) vinegar, giving you 80 quarts.

Look at all the information on the label. The cost per quart of this superior vinegar, tested for numerous heavy metals, is only about 50¢! Obviously, the chemical analysis is cost effective enough that it should be done regularly on our daily foods, at least our staples: water, bread and milk.

Acetic Acid, Glacial, Electronic/Cleanroom Grade

Packaged in a Cleanroom Environment	4 x 1 gal $39.80/gal
Assay (CH_3COOH) Min.	99.7%
Solubility in Water	To pass test

MAXIMUM LIMITS

Color (APHA)	10
Substances Reducing Dichromate	To pass test
Substances Reducing Permanganate	To pass test
Acetic Anhydride[$(CH_3CO)_2O$]	0.1%
Residue after Evaporation	10 ppm
Chloride (Cl)	1 ppm
Phosphate (PO_4)	1 ppm
Sulfate (SO_4)	500 ppb

Arsenic and Antimony (as As)	5 ppb
Aluminum (Al)	300 ppb
Boron (B)	200 ppb
Calcium (Ca)	300 ppb
Chromium (Cr)	200 ppb
Copper (Cu)	100 ppb
Gold (Au)	300 ppb
Iron (Fe)	200 ppb
Lead (Pb)	300 ppb
Magnesium (Mg)	300 ppb
Manganese (Mn)	300 ppb
Nickel (Ni)	100 ppb
Potassium (K)	300 ppb
Sodium (Na)	300 ppb
Tin (Sn)	300 ppb
Titanium (Ti)	300 ppb
Zinc (Zn)	300 ppb
Particulate Count (≥1.0 Micron)	25 particles/ml

Certainly, pills and supplements should be analyzed for heavy metals, non-legal azo dyes and solvents at least once a year. This ultra-important safety feature cannot be entrusted to the self-serving concept called "Good Manufacturing Process".

In fact, manufacturers should not be expected to do this themselves. We do not expect students to test themselves! We, the people, have that responsibility. Then we would have uniform testing, at a sensitive level, for products of our own choosing.

If you would like to be able to take extracts, tinctures, tablets or capsules of health-giving herbs or minerals, send them to an analytical lab listed at the end of this book. Prices are becoming affordable. Select a VOC (volatile organic compounds) panel that tests for benzene, decane, hexane, carbon tetrachloride, and if possible, PCB. Do not choose a test that only measures benzene in ppb (parts per billion). Get ppt (parts per trillion) even though the legally enforced level is 5 ppb for water. Once something has been tested at the ppt level, you may use it only if the result is "not detected." If you buy supplements through a co-op or natural food store, you could request that they do such testing. They are eager to serve you. Get a group together with similar needs; then request your store’s cooperation.

When you have your own test results, obtained from such a lab, you will have

something more persuasive than someone's Syncrometer® results even though Syncrometers® are much more accurate. Your results will be more binding, too, to present to your government representative. Arrange to discuss your results with him or her after you have enough to make your point.

HIV/AIDS victims should not be eating more of their own poisons, the immunity-destroyers, even if they also bring medicine or supplements.

And if you can't believe that these are your poisons, instead of solely the HIV virus, you might plan to finance some classical research. Some moneys are available from philanthropic foundations. But you must form a steering committee and guarantee honest and sincere effort. To bring wisdom to your research project the decision makers should be lay persons of many kinds: engineers, farmers, housewives, mechanics, massage therapists, cooks, actors, writers, activists. Of course, to get results of a reliable kind you will need professional scientists. But do the interpretation of the results yourselves, together with the professionals.

The need for common sense and wisdom in a research enterprise with a social purpose is similar to the need seen in the justice system. Twelve ordinary people in the jury are seen as a better bet than professionals. To imagine the challenges your committee might face when creating a new supplement, an example of creating clean vitamin D_3, cholecalciferol, is at www.huldaclark.net/vitd.

3. Clean Up Your Body

The reigns on style were loosened 40 years ago! We are not expected to wear makeup, or shave special places, or even smell like a bouquet of flowers. Why are we still trapped by the body-paint industry? We can be ourselves. Why are we still trapped by the "You-are-ugly" philosophy, and the "You-smell-awful" belief? After a dental clean up your mouth will be too sweet to ruin with breath lozenges, and your smile too sincere to ruin with paint.

In fact, the young non-smoker, non-drinker (not even coffee), non-drug user is very much "in" (in style). This is fortunate for you, because you will need to go off every cosmetic and body product that you are now using. Not a single one can be continued. They are full of titanium, zirconium, benzalkonium, bismuth, antimony, barium [21], strontium[22] , aluminum, tin, chromium, not to mention isopropyl alcohol and pollution solvents such as benzene and PCBs.

Do not use any commercial salves, ointments, lotions, colognes, perfumes, massage oils, deodorant, mouthwash, toothpaste, even when touted as "herbal"

and health-food-type. You can make your own safe ones. See *Recipes* for homemade varieties.

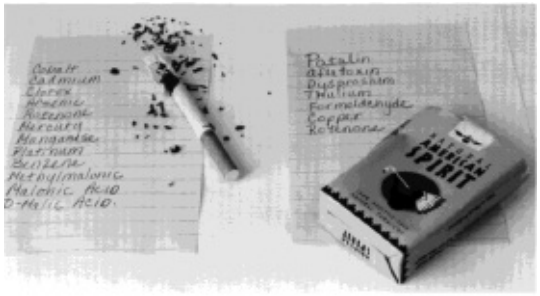
People all around us are trying, desperately, to use less toxic products. Most people are still healthy enough to have a "natural" instinct. They "know" all these products can't be good for them. That is why a health food or "natural" industry has taken root. People seek health. They reach for products that just list herbs and other natural ingredients. Unfortunately, judging by how many "natural" products I find are polluted, the buyers are being duped.

Why are so many natural products polluted? For the same reason that regular products are polluted. A major culprit is antiseptics. Because all products are required to have very low bacterial counts the Food and Drug Administration (FDA) requires all body products to have sufficient antiseptic in them. (Some of these antiseptics are substances you must avoid!) But you won't see them on the label because manufacturers prefer to use quantities below the levels they must disclose. And by using a variety of antiseptics in these small amounts they can still meet sterility requirements. The only ingredient you might see listed is "grapefruit seed" or similar healthy-sounding names. But lurking inside can be lots of substances that are harmful to your health.

This is sad for the intelligent citizens who wish to avoid harming themselves. Here are some examples of how a consumer can be duped when buying body products:

- Rocks sold as "Aluminum-Free Natural Deodorant". You rub the rock under your arms. It works because the rock is made of magnesium-aluminum silicate.
- Men's hair color with lead in it. Just because it is legal to use lead compounds in men's hair color doesn't mean the lead is safe to use. The hazards of lead are well known. Why the government outlaws lead in gasoline, paint, and plumbing, but allows you to smear it on your scalp is a mystery.
- Lipstick with barium, aluminum, titanium and azo dyes; eye pencil and shadow with antimony and chromium; toothpaste with tin, strontium, azo dyes, and silicone. Again, these chemicals are known to be hazardous, so don't be duped into thinking they are safe because they are allowed.
- Cigarettes contain lead, mercury, nickel, benzene[23] , Tobacco Mosaic Virus and Cabbage Clubroot fungus. Everyone knows cigarettes are bad for you,

there is even a warning, but looking at the glossy, clean, neat packaging, we dupe ourselves into feeling such a professional product couldn’t be so bad.



The list of pollutants in these "natural" cigarettes was obtained with a Syncrometer®. Use a magnifying glass to read them.

Fig. 97 Health food store cigarettes

- Chewing tobacco has all the same toxins as cigarettes, with additional ytterbium, but seems safer because it is smokeless.
- Hair spray and shampoo often do not list isopropyl alcohol on the label because the amount is below what is required for listing. Hair spray often tests Positive to PCBs, and this pollutant isn’t being cleaned up because the government doesn’t think it necessary to test for it.
- Laundry "balls" or discs that claim no chemicals are used and yet amazingly make your wash cleaner. Actually cobalt compounds leach out of them, to lower surface tension of water.

Some of the unnatural chemicals listed were detected with the Syncrometer® and are probably present because of residues from the manufacturing process, but others you will actually see listed on the label!

One of these dishwashing liquids is safe. The others had PCBs, benzene, asbestos, clorox bleach, azo dyes, and numerous heavy metals.

Fig. 98 Popular Detergents

See *Recipes* for easy-to-make, natural substitutes. But you might consider just stopping them all. Get started while you're on vacation.

Use nothing on yourself that you wouldn't use on a newborn baby. This is a permissive age. You will be the only one feeling "naked." Others won't even notice. Don't forget advertising is aimed at you, even if other people's eyes are not!

Don't even use soap unless it is homemade soap (see *Recipes*) or borax[24] straight from the box. Borax was the traditional pioneer's soap. It is antibacterial and can be made into a concentrate. It is also a water softener and is the main ingredient in non-chlorine bleaches. Boron, an element in borax, is natural to your body; it hardens bones. Residues of borax on dishes would not harm you. Make a borax solution and dispense it from liquid dispensers for hand washing and showering.

Fig. 99 Homemade soaps

Don't use toothpaste, not even health-food varieties. To clean teeth: floss first, then brush. Only do this once daily! The tiny scratches made with the brush on your gums cause invisible tiny bleeds! Of course you will be healed in a few hours but in the meantime, all your mouth bacteria can enter your blood stream. Floss very gently for the same reason. Don't buy floss. You may buy nylon fish line that you rinse in hot water first and place on the zappicator for two minutes. For homemade floss cut strips of plastic from a grocery bag. Cut them ¼ to ½ inch wide and four inches long. Rinse one in hot water before using it. This is finer than any floss and can get between the closest teeth because it stretches to fit. Don't floss briskly. Just one pass will be sufficient on each side of the tooth. Then brush with oregano oil tooth powder (see *Recipes*). The homemade powder is quite enjoyable. Just a bit of powder picked up on a dry toothbrush is enough.

If your mouth is sore with thrush, don't use a brush at all—the new scratches you make just spread the fungus. Finger-rub some oregano tooth powder over the tooth surfaces after flossing. The residue of oregano oil will kill bacteria and keep your mouth fresh for hours.

Don’t use mouthwash; use salt water (pure salt). If you have thrush, Lugol’s solution will be your best friend. It kills yeast. But it can also stain your teeth and tongue so use it at bedtime. By morning most of it will be gone. Use solid baking soda to get any leftover stain off your teeth. Apply Lugol’s to your tongue in one or two drops straight. Immediately smear it about. If your Lugol’s was not made by yourself zappicate it first to destroy pollutant solvents. For a mouthwash during dental work use Dental Bleach (not laundry bleach) for a month, not longer, it could give you too much chlorine.

Don’t use massage oils of any kind. Ninety percent (or more) of all the oil in the United States market place I tested is contaminated with something: benzene, PCBs, or antimony! And all contain live *Ascaris* eggs (simple filth). Use cornstarch lubricant (see *Recipes*) instead.

Don't use hair spray or make your own (see *Recipes*).

Don't use bath oil. Take showers, not baths, if you are strong enough to stand. Showers are cleaner.

Don't use perfumes or colognes. They pollute your lungs besides being themselves polluted. You may use an essential oil that has been zappicated to remove traces of solvents.

Our household, health, body products and drugs were found to be polluted with solvents, heavy metals, PCBs and lanthanides using the Syncrometer®.

Fig. 100 Some polluted body care products

Don't use lotions or personal lubricants except homemade.

CANCER is caused

in part by isopropyl alcohol. The other part is the same human intestinal fluke that you had, and the same SV 40 virus that you had! You are at much greater risk of developing cancer for this reason. You must be especially careful to avoid common rubbing alcohol.

Prohibit Isopropyl Alcohol

Isopropyl alcohol is the antiseptic commonly used in cosmetics. Check all your cosmetics for the word "propanol" or "isopropanol" on the label. It is usually put on the label, since it is not currently suspected of causing cancer. Don't give your discarded cosmetics to anybody. Don't save them. Don't have them in the house anywhere. **Throw them out.**

Check all labels for "propyl alcohol", "propanol" or "isopropanol". Throw those products away!

Fig. 101 Some isopropyl alcohol-containing products

Here is a list of common body products that have large amounts of isopropyl alcohol in them: cosmetics, shampoo, hair spray, mouthwash, mousse, body lotions, shaving supplies, and, of course, rubbing alcohol. **If in doubt, throw it out!**

Although body products give us our highest concentrations, isopropyl alcohol is in our food, too! We will discuss this soon.

Don’t shave special places. Reconsider the real need for it. Any shaved place is severely scratched if you look at it under a microscope. This lets in bacteria and chemicals, where they were never meant to be. For this reason you might notice that the skin stings for a while. If you have HIV or AIDS or any lowered immunity condition (as in cancer), stop shaving special places (You may clip

with scissors). If you are forced to, by your job, do the lightest shave job possible. Sanitize the area with grain alcohol before shaving to minimize the bacteria invading later.

Don’t dye your hair with the brand name varieties; their azo dyes are absorbed into your scalp and build up a large reservoir of dye here. Read labels carefully. A safe hair dye is described in *Recipes*.

Don’t polish your fingernails or toenails. The solvents penetrate the nails.

Don’t attach fake nails. The acrylic acid is a carcinogen.

Don’t get dye tattoos for eyebrows or any other place. The dyes seep constantly from these locations to your liver and other organs. You can follow them with a Syncrometer® and see how they are stored in your CD4s and CD8 killer cells.

Don’t use anti-perspirant; use only deodorants, like pure zinc oxide powder, ethyl alcohol (from the tall Everclear™ bottle only), or pure baking soda. You need to sweat out as much PCB and benzene as possible. If you are able to sweat, consider yourself lucky; wash your armpits out 3 times daily. You may also use the oregano oil tooth powder as a deodorant or a single drop of other essential oil, that you have zappicated.

Don’t pierce your skin anywhere to wear rings. It is an open wound and open invitation to the metals and surrounding bacteria to enter your sacred domain—your immune system.

Don’t "do any drugs" in any form, either soft or hard. It is Dr. Duesberg’s opinion that drug taking has destroyed the immune system of United States AIDS victims. He has a great deal of convincing evidence. He states in his book *Why We Will Never Win the War on AIDS*[25] that no agencies have investigated this explanation because it would be unpopular and adversely affect the drug market. Such a study requires resources beyond my reach. But this may indeed be a significant, if not the most significant source of azo dyes, benzene and PCBs for many AIDS patients. Perhaps nitrates ("poppers") have a special immune lowering action of their own. Such a possibility should be quickly tested by any country in distress, not shunned, nor argued in the courtrooms. Laypersons should be sitting on the committees that decide what theories to spend public moneys on to do research. Professionals, politicians or industry representatives will choose self-serving research.

Dump all your body chemicals and drugs in an outside dumpster. Never look

back. Life is ahead of you again, and you must hurry to catch up.

Whatever you do need to keep, or have made yourself, should be sonicated or zappicated as a final precaution against traces of PCB and benzene.

4. Clean Up Your Home

Your home is your personal environment. It is your little bit of cosmos, even heaven at times. Get it cleaned up while you are on your motel-vacation. This is an easy task because it mostly involves throwing things out. Hopefully your family and friends will jump to your assistance.

- The refrigerator gets checked or changed
- The basement gets cleaned
- The garage gets cleaned
- Every room in the house gets cleaned

Freon is a refrigerant that has been banned in most countries for its role in ozone depletion. It is also hazardous to you. Check your refrigerator. If it is older, it may still be one of the Freon-containing kinds. If so, wheel it outside the same day you read this. You may leave it on an extension cord and use it until you find a new non-Freon variety. You must be totally, not partially, Freon free.

What is so damaging about Freon in your body? After all, it is non-biodegradable. If it has no biological interactions, how could it hurt us? By being non-degradable, however, the liver has no chemical reactions with which to detoxify it so it can leave the body! It builds up, therefore. Healthy people accumulate it in their skin. Sick people accumulate it in their sick organs. AIDS patients all have especially high levels right in their thymuses. Freon can act like a trap for other fat-soluble items like PCBs and metals. Particularly, copper is seen at Freon sites. Water that has run through copper pipes carries copper and, of course, dental amalgam has copper. Your body absorbs the copper, which gets trapped by the Freon already there. Obviously, you must remove Freon from your thymus. But how?

Only one useful reaction with Freon comes to mind. Freon is thought to be responsible for the ozone "hole" at the South Pole. Would Freon react with ozone supplied to your body and thereby become biodegradable? Indeed, it does! But only if you drink it as ozonated water. Other ozone routes, as intravenous or

rectal, have not been observed to be as effective.

If you have AIDS buy a small ozonator (see *Sources*). Drop the hose into a glass of cold tap water. Five minutes are enough. Drinking three glasses a day is very effective. Even one glass a day keeps Freon and copper moving out.

If you are following your progress with the Syncrometer®, you will see that Freon now appears in the liver for the first time. Before this, it was marooned in the thymus and other organs. You may also detect a feeling like indigestion. You must come to the assistance of your liver. Even ozonated Freon is extremely burdensome to the liver.

A combination of herbs, (Liver Herb Drink in *Recipes*) rescues the liver from its plight, and prevents the indigestion. Begin with one cup daily, and then increase to two cups. Add juice, whipping cream, coconut cream or sweetening to make it enjoyable (see *Recipes*). After drinking liver herbs you will see that the Freon now appears in the kidneys. Yet it is marooned there unless you assist them. Take the kidney cleanse recipe, 1¼ cup daily, to assist the kidneys so they can finally excrete the Freon into the urine. Make an enjoyable beverage out of this, too.

It’s an elaborate detoxifying program of ozonated water, liver herbs, and kidney herbs taken together for six to eight weeks. This gets most of the Freon out. Afterward, continue the program at a reduced dosage for half a year. The complete Freon removal program is given in *Recipes*.

Clean Basement

To clean your basement, remove all paint, varnish, thinners, brush cleaners, and related supplies. Remove all cleaners such as carpet cleaner, leather cleaner, rust remover. Remove all chemicals that are in cans, bottles or buckets.

You may keep your laundry supplies: borax, white distilled vinegar, homemade soap, and chlorine bleach. This chlorine bleach will, of course, be polluted with azo dyes. It can be used to clean the toilet. It can even be used to whiten clothing; evidently the hot water activates it enough to oxidize its dyes. But never, never use it to wipe tables, counters or cutting boards. Its dyes and heavy metals are left as a residue on everything. Having tungsten, platinum, palladium and dozens more on your cutting board is not a good idea.

You may keep canned goods, tools, items that are not chemicals. You may move your chemicals into your garage. Also move any car tires and automotive

supplies like waxes, oil, transmission fluid, and the spare gas can (even if it is empty) into your garage or discard them.

Seal cracks in the basement and around pipes where they come through the wall with black plastic roofing cement. In a few days it will be hard enough to caulk with a prettier color. Spread a sheet of plastic over the sewer or sump pump.

Clean Garage

Do you have a garage that is a separate building from your home? This is the best arrangement. You can move all the basement chemicals into this garage. Things that will freeze, such as latex paint, you may as well discard. But if your garage is attached, you have a problem. Never, never use your door between the garage and house. Walk around the outside. Don't allow this door to be used. Tack a sheet of plastic over it to slow down the rate of fume entrance into the house. Your house acts like a chimney for the garage. Your house is taller and warmer than the garage so garage-air is pulled in and up as the warm air in the house rises. See the drawing.

In medieval times, the barn for the animals was attached to the house. We think such an arrangement with its penetrating odors is unsavory, in fact benighted. But what of the gasoline and motor fumes we are getting now due to parked vehicles? These are toxic besides! This is even more benighted.

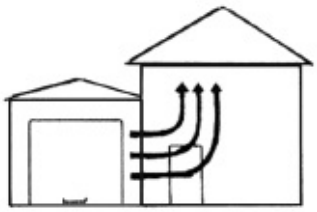


Fig. 102 Garage fumes

If your garage is under your house, you cannot keep the pollution from entering your home. In this case, leave the car on the driveway outside. Move the lawnmower, cans of gasoline, solvents, etc. into a separate shed.

Clean House

To clean the house, start with the bedroom. Remove everything that has any smell to it whatever: candles, potpourri, soaps, mending glue, cleaners, repair chemicals, felt markers, colognes, perfumes, and especially plug-in air

"fresheners." Store them in the garage, not the basement. Since most vapor rises, they would come back up if you put them in a downstairs garage or basement.

Next clean the kitchen. Take all cans and bottles of chemicals out from under the sink or in a closet. Remove them to the garage. Keep only the borax, white distilled vinegar and bottles of concentrated borax and 50% vinegar you have made. You may also keep homemade soap. Use these for all purposes. Remove all cans, bottles, roach and ant killer, mothballs, and chemicals that kill insects or mice. These should not be used anywhere in your house. They should be thrown out. Remember to check the crawl space, attic and closets for hidden poisons also. To wax the floor, get the wax from the garage and put it back there. An HIV/AIDS patient should not be in the house while house cleaning or floor waxing is being done.

To keep out mice, walk all around your house, stuffing holes and cracks with steel wool. Use old-fashioned mousetraps. Modern glue-traps seem needlessly cruel.

For cockroaches and other insects (except ants) sprinkle handfuls of boric acid [26] (not the same as borax) under your shelf paper, behind sink, stove, refrigerator, under carpets, etc. Some varieties of ants are repelled by borax (not boric acid).

Use vinegar on your kitchen wipe-up cloth to leave a residue that keeps out ants. Pour vinegar all around your house outside, using one gallon for every five feet, to deter ants. Do this several times a year. Keep foliage trimmed next to the house. You may also use an electronic deterrent.

Remove all cans and bottles of "stuff" from the bathroom to the garage. The chlorine bleach is stored in the garage. Someone else can bring it in to clean the toilet (only). Leave only the borax-soap, homemade soap, and grain alcohol antiseptic. Toilet paper and tissues should be unfragranced, uncolored. All colognes, after-shave, anything you can smell must be removed. Family members should buy unfragranced products. They should smoke outdoors, burn their candles and incense in their own rooms with doors closed and windows open, blow dry their hair outdoors or in the garage, use nail polish and polish remover outdoors or in the garage and not wear fragrance or fragrant shampoo or after shave if you have lung disease.

Do not sleep in a bedroom that is paneled or has wallpaper. They give off arsenic fumes and formaldehyde. Either remove them or move your bed to a different room. Leave the house while this is being done. If other rooms have paneling or wallpaper, close their doors and spend no time in them.

Take taurine and cysteine to help your lungs recover from formaldehyde damage (taurine 500 mg, three daily, cysteine 500 mg, three daily).

Do not keep new foam furniture in the house. If it is less than one year old, move it into the garage until you are well. It gives off formaldehyde. Wash new clothing for the same reason. Move unwashed clothing and suits to a distant closet. And do not sleep on foam pillows or a foam mattress.

Turn off radiators and cover them with big plastic garbage bags, or paint them, or remove them. They give off asbestos from the old paint. The plastic bags themselves should not smell bad—these fumes are **phthalates**—very toxic. Don't buy such bags. And, in any case, soak the bag in a bucket of hot bleach water for an hour first. Follow directions on the bleach bottle. Do not do this yourself.

For food use, avoid smelly plastic zippered bags, too. They are giving off phthalates! If your health food store uses such bags, let the store manager know.

Do not use the water from your hot water faucet for cooking or drinking. It has tungsten or other metals. Do not drink water that sits in glazed crock ware (the glaze seeps toxic elements like cadmium). Do not buy water from your health food store or any other dispensing place.

> All holding tanks, all stills, and all pumps must be periodi-cally cleaned, sterilized and greased.

Petroleum derived products are used for this. They contain a host of solvents of a very toxic kind. These pollute the water constantly. It is simply believed, on faith, that small amounts couldn't hurt you! Yet, you can identify them with a Syncrometer® and then find them in your thymus! It would be interesting to find out who is servicing your health food store's water supply and with what. You could make it a project. Send it (the cleaner or grease) to a lab for testing if you manage to get a sample. Test for benzene (and PCB if you can afford it).

Change all the galvanized or copper water pipes to PVC plastic [27]. But do not install plastic valves; these need greasing. Regular metal valves are fine; they do not contribute corrosion to the water. Most AIDS patients and all cancer patients have a buildup of copper. If you are already anemic, this is a high priority. Copper prevents iron from being used by the body to make hemoglobin. Copper

uses up your glutathione. Copper causes mutations. It would be wise to switch to plastic plumbing before anybody in your home develops illnesses. Although PVC in dissolved form is a toxic substance, amazingly, the water is free of PVC in three weeks! It gets hard enough not to seep.

If you have a water softener, by-pass it immediately and replace the metal pipe on the user side of the softener tank. It will be corroded. Softener salts are polluted with strontium, chromate and PCB! They are also full of aluminum. The salts corrode the pipes so the pipes begin to seep cadmium into the water. After changing your pipes to plastic, there will be so little iron and hardness left, you may not need a softener. If the water comes from a well, consider changing the well pipe to PVC to get rid of iron. While the well is open, have the pump checked for PCBs. Call the Health Department to arrange the testing.

Another option is to coat the inside of your copper pipes with epoxy (see *Sources*). The coating hardens in a day; the water did not appear in the white blood cells later, after drinking some. I tested this with the Syncrometer®.

Filters are not useful for metal removal from your drinking water. Corrosion of your pipes overburdens a filter. A new filter may work well but for only the first five days! Filters even add to the water pollution. Reverse osmosis water always contains ytterbium or thulium or yttrium! These are lanthanides, the very contaminants that block phagocytosis!

> Metal from corroded water pipes (lead, copper and cadmium) cannot be filtered out or distilled out. Filters were only meant to remove the amount of metal in city water, not corrosion-water. And distillers allow essentially all pollutants to be carried over in the steam.

The cleanest heat is electric. Go "total electric" if possible. If you must stay with gas, have a furnace repairperson check your furnace and look for gas leaks before the heating season starts. Don't call the gas company even though it is free. The gas company misses four out of five leaks! The Health Department does not miss any; call them!

It is possible to get most of this house cleaning done in one day. Do all you possibly can. The more difficult jobs may take a week. This is a week of lost time if you are scheduled for a blood test.

Don't stop because you are already feeling better. Illness can return with a vengeance. Get every clean up job completed so you can feel secure for your next doctor's checkup and for your future.

Finally, search the whole house for holes in the ceiling, walls or floor that lead to insulated areas. Any fiberglass that is exposed will fill your breathing space. Even tiny holes made by pesticide companies can be deathtraps for you; the microscopic bits of glass go to your lungs and thymus gland. Merely covering holes does not work; they must be airtight—fill and paint them. Use duct tape to seal attic entranceways. Check the water heater. Check furnace, air conditioner fans, and dishwashers; pull out any fiberglass stuffed around them. Vacuum afterwards and throw away the bag. Best of all, find a contractor willing to remove your fiberglass insulation, vacuum, and replace it with shredded paper or vermiculite insulation (see *Sources*).

Suppose you have nobody who is willing to clean up the house, basement, and garage for you, or take on your pets for a month while you find them a new home. Don't delay for a minute if you should be invited to stay with a friend or relative who is willing to clean up their place for you and take you to the dentist. If there are no invitations, go on vacation. Put yourself into a smoke-free motel room (bring your own soap, sheets, and pillowcases, and ask that they not "clean" your room or spray it). Bring your own bug-deterrent so you don’t create a problem for them. If you have a camper, remember to clean it up first. Foam and paneling must be out of it. Gas lines should be checked or closed off. Simply being outdoors is your safest place. A sunny beach, with shady places, where you can rest all day is ideal. Remember not to use any sunscreen or suntan lotions. In fact, bring nothing with you that you don’t need for the *2-Week AIDS Program*.

But if friends and family mobilized to help you clean up, reward them with status reports on yourself. They have a stake in your success. You are most fortunate.

Watch Your Health Improve

NOW YOU HAVE DONE IT ALL!

Look forward to your next blood test.

- Your parasites are gone. Without the intestinal fluke you cannot have HIV. Without Paragonimus you can't make benzene. Without Eurytrema you can't produce SV 40 viruses. Even those viruses that were stuck inside your own chromosomes are gone. You are on the *Maintenance Parasite Program*.
- You have cleaned out the benzene, PCBs, metals and asbestos from your body as well as Fast Garnet and Fast Green dyes. Without these you can't get AIDS.
- You have extracted the teeth with large metal or plastic fillings and have replaced them with partials that you hardened yourself. They do not leach out anything. Small fillings have been removed. You are keeping them squeaky clean with oregano oil tooth powder. You are no longer sucking on mercury, thallium, uranium, lanthanides, malonic and maleic acid, urethane, bisphenol-A, phthalates or dyes.
- You have switched to foods that are pesticide-free and not moldy or processed nor allergenic for you. This means foods that are fresh and have not been chopped, ground, extracted and mixed with other chopped, ground, extracted foods to create concoctions. You have stopped using supplements unless you know they are free of contamination with benzene, PCBs, metals, asbestos and dyes. You zappicate everything.
- You have stopped putting abnormal chemicals on your skin, in your mouth, on your hair, in your armpits, on your eyelids, on your teeth, on your scalp, on your nails, or in your nose, lungs or genital tract.
- You have cleaned the house of all the chemicals that your body considers toxic.
- You are zapping every day.

Congratulations, this is a big accomplishment!

I hope you did all this in the first week after you bought this book and started on the parasite-killing program. You stand an excellent chance of turning your future around! You could be one of the first true survivors that live to age 75!

Will your next blood test say HIV Positive or Negative? In the past I spoke of the P24 antigen test. Since then, the "viral load" test has become popular. Although this test has its drawbacks, too, it is quite satisfactory for your purpose. You are looking for a very large drop; we do not need to quibble over small amounts, their standards, or the tests' accuracy. You are aiming for zero. The test sensitivity, though, may only reach a number that is less than 400 virus chromosomes per ml of blood. This is a common standard accepted as **Negative**.

Ask your doctor to schedule this test for you. It is called PCR-HIV-1-RNA. If it comes back NEGATIVE now, be especially cautious! The virus may be gone but you could reinfect yourself in a single day. Celebrate in a safe, common sense way.

Of course you could be keeping yourself artificially **Negative** with a drug cocktail that quickly kills every virus that is spawned. That is not the same thing as being **Negative** as a result of eliminating the source of virus. If you are kept **Negative** by a drug cocktail, you cannot use this test to prove you have succeeded in eliminating the intestinal fluke. Your only useful test will be the **immune analysis**, which tests for the ratio of CD4s to CD8s and their total counts. Be sure you are monitoring these also. This is not as expensive as the PCR test.

Also ask your doctor to request a urinary phenol test (chronic, not acute exposure) for you if your first one was high, or got missed. This will tell you if you are still getting too much benzene somehow. Repeat these tests every three to six months after you are recovered to be sure you are holding on to your gains.

How long does it take to recover from AIDS after cleaning up the thymus and bone marrow? About three weeks. Your body is exceedingly swift. And it is age-related. The younger you are, the faster you recover.

How do you know you are recovering? After all, there was no blood test showing your phagocytosis ability or virus-killing ability.

1. Your fatigue lessens.
2. Your mind is clearer.
3. Your temperature goes toward normal.
4. Your skin lesions fade.
5. Your breathing is deeper.
6. Your night sweats stop.
7. Your bowel is functioning normally.
8. Your appetite is good.
9. You are gaining weight.
10. And, of course, your immune analysis shows the CD4 to CD8 ratio rising, as well as the total T-count and total WBC.

These improvements should encourage you to leave no stone unturned; that is, leave no pollutant in your thymus or bone marrow. Don't be satisfied with half measures. Your life is important to all of society; and your life affects all of humanity.

You may be very eager to find a job, shed your "disability" status and live on a higher income again. But don't rush into it.

You need not only to recover from AIDS, but also to be well, not fatigued. Only you have a profound understanding of the destructive course our so-called "civilization" is taking. Only you understand pollution as nobody else understands it. Only you may foresee the end of the planet's biosphere, or major branches thereof, as you were destined. You have an important mission to this planet's creatures. Your suffering must not be in vain. Heal yourself *completely* so that the rigors of politics, business, education and entertainment are not overwhelming to you.

Stay Clean

Here are a few more ways we could be getting the human intestinal fluke stages. Since the infective stage in nature is the metacercarial[28] stage, are we eating metacercaria from vegetation like lettuce? I have not seen evidence for this but it must be researched, thoroughly, as a possibility.

You will see in the case histories how some people test YES (**Positive**) for parasites in spite of having completed the parasite-killing program and being on the maintenance program. This is possible because a reinfection can occur in as little as one hour! Of course, your own bowel is the most likely source of reinfection. Keep hands sanitary by rinsing with grain alcohol solution. And never, never put fingers in your mouth. Observe the best sanitation rules. Zap daily and stay on the *Maintenance Parasite Program*. In cases of persistent reinfection the patient was not cleaning the fruits and vegetables correctly. This will now be easier with the electronic devices. Parasites can make good progress in two days (eating you up and reproducing in you) if given the chance.

You must <u>avoid</u> parasites in daily life! Unfortunately for fast food lovers, the solution is not to make a daily routine out of the maintenance program. Herbs powerful enough to kill parasites probably are not advisable on a daily basis for a long period of time.

Meat Could Be A Source

Are we getting metacercaria from eating animals that have the parasite?[29] Suppose we eat the raw blood of an animal that has this parasite. The animal's blood has eggs, miracidia, redia, cercaria and metacercaria in it. We swallow those live eggs, miracidia, redia, cercaria and metacercaria.

The metacercaria are meant to attach themselves to our intestine and grow larger, into adults that lay more eggs. But could the eggs, miracidia and redia that we eat also survive and develop in us? The miracidia and cercaria with their tails could simply swim away into our bodies. The eggs could hatch into more miracidia. Benzene will invite the stages into the thymus and the time clock for AIDS begins to tick.

They often bring dyes, too! Ask the store manager.

Fig. 103 Ground meats bring infective parasite stages.

When would we eat raw blood? In raw beef such as rare hamburger or steak! In raw turkey as in turkey burgers! And in raw chicken as in chicken burgers! Just handling these raw meats would put the infective stages on your hands! What a huge risk this gives us! Zappicate the meat package before even opening it—extra long—10 minutes. Cook everything thoroughly.

Some flukes are large enough to be seen with the naked eye, although their various stages usually need a low powered microscope. Therefore it should be possible to examine any meat sample from the grocery store to verify this source.
Look at the photos of ground meats. There are objects that look identical to the stages of flukes. Research needs to be done to culture them in order to classify them accurately.

This raises the possibility, in fact, the probability, that our meat animals are the "biological reservoir," namely source of infection, by the HIV causing parasite! The human intestinal fluke was first studied in certain snails in ponds in China. Are our farm ponds similarly infested? If so, our animals have an obvious source of metacercaria.

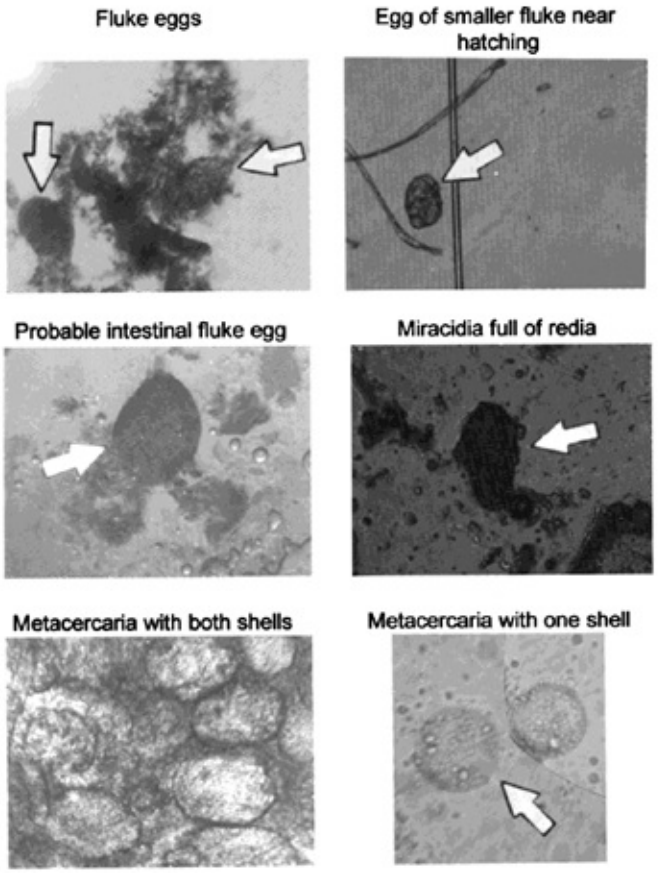

Fig. 104 Likely fluke stages in meat (100X)

My tests show that snails from artificial ponds, field ponds, aquariums, or taken from foliage that has been sprayed carry the HIV virus. These snails also tested **Positive** for benzene. The fish food, animal food, aquarium fish food and the foliage spray all had traces of benzene.

Fig. 105 The Syncrometer® detected HIV in snails

In the past I recommended becoming a seafood vegetarian. This has changed. The best advice now is to simply sterilize all meats. Begin by sonicating, zapping or zappicating it.

Then roast or cook in the usual way. **Don't eat any fish or chicken or Cornish hen** at all, since these have been dipped in or sprayed with common laundry bleach and are permanently contaminated with Fast Garnet and Fast Green dyes. It does not wash off. Delicatessen meat must also be electronically cleaned to be safe. Avoid ham and pork for its phloridzin content, although thorough cooking and zappication can destroy this. Are there other sources of this parasite? The common filth on fruits and vegetables are unavoidable sources of parasite eggs. They can be cleared electronically, after washing in hot water. Eggs and dairy foods require longer treatment. But the range of foods permitted has increased significantly in the past few years.

Animals could not always have been infested with these fluke parasites. Cows, chickens and turkeys are not the natural hosts of the human intestinal fluke, although pigs are. And parasite stages should never be found inside any of these animals in any case. But their feeds are now full of solvents, which promote abnormal parasitism in them, just as it does in us.

Three of these had the common pollutants: PCBs, benzene, asbestos, heavy metals, azo dyes and Clorox bleach. We can expect cancer.

Fig. 106 Animal feed supplements

Even bird food was found to have benzene and other solvents in it. Buy seed only if you love birds.

We can expect bird cancer and new diseases to develop.

Fig. 107 Processed bird food has benzene and gallate

Fig. 108 Solvent-free, gal-lic acid-free bird food

Sex Could Be A Source

Since the infective stages of the intestinal fluke are microscopically tiny and can travel throughout the body in the blood, it makes good sense that some get into the genital tract and genital fluids. It would be wise to practice protected sex. See the photos of parasite stages in urine. These will certainly be transmitted with sex.

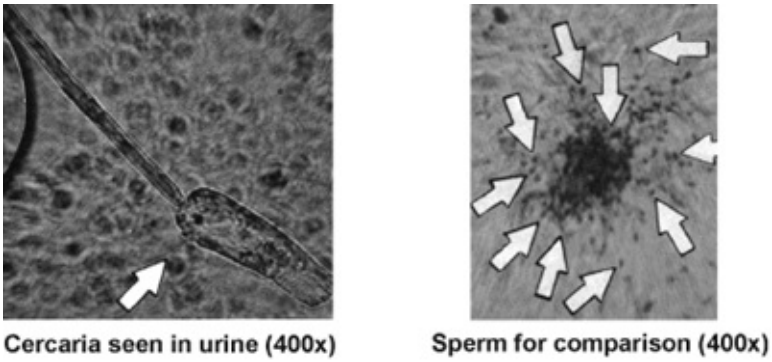

Fig. 109 Cercaria in urine vs. sperm

Cercaria resemble sperm, which you might expect to see, occasionally, in a urine specimen from a male. However the size difference makes them easy to distinguish.

Raw Milk Could Be A Source

Fig. 110 Miracidia in urine

When an animal or human is infested with the fluke stages, all the body fluids eventually have them. Milk is a body fluid. Cow’s milk and goat’s milk should all be sterilized before drinking it. Do not drink raw or merely pasteurized milk. But simply adding hydrochloric acid and sonicating, zapping or zappicating makes it safe.

Mother's Milk Could Be A Source

If the body is teeming with very tiny fluke stages because of the solvent in your tissues, could they be transmitted through mother's milk? See the photograph of mother's milk. It shows a fluke egg almost ready to hatch. The mother was full of benzene. The baby was full of benzene from drinking the mother's milk. The father was full of benzene, also. The family was using

cooking oil polluted with exceptionally high levels of benzene.

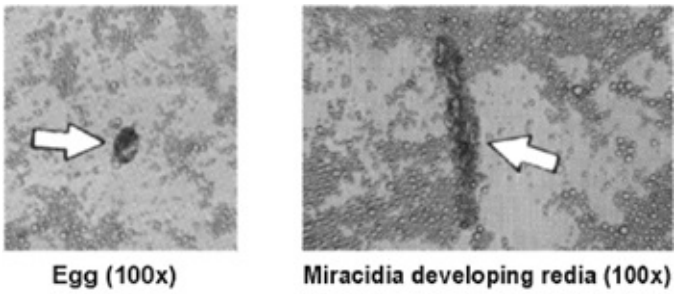

Fig. 111 Parasites in human milk

If you are nursing a baby and have HIV/AIDS illness, your milk could have infective stages in it. You can stop infecting your baby by:

1. Going on the parasite-killing program yourself. The ingredients will come through the milk and kill the baby's parasites at the same time.

Baby foods and supplies are processed in the same way as adult foods; this probably explains their extensive pollution with benzene and other solvents.

Fig. 112 Baby food and supplement

2. Stopping the use of baby food or baby products. This will clear your baby of it, as well as you, in about five days. Zappicate everything.

3. Dropping fish and chicken from your diet. Eat other meats and treat them with a sonicator, zapper or a zappicator. Strictly following the dietary guidelines in this book will prevent your baby from getting parasites, benzene and dye buildup again.

4. Taking vitamin B_2 and magnesium with each meal.

5. Stopping exchange of body fluids (through kissing on the mouth and sex) with persons who may be infected. You will be non-infective as soon as your

viral load is made **Negative** this natural way and stays that way. Practice protected sex anyway.

Fig. 113 Infant formulas with wood alcohol

Until your intestinal flukes are dead you may be giving the baby parasites in your milk, but don't stop breast-feeding, since this will become the baby's cure, too. Also, switching to canned formula would worsen the situation with solvent pollution. If your baby is very ill with AIDS, she/he is getting large amounts of Fast Garnet and Fast Green dyes, possibly from sugary drinks or bottled water or canned baby food. Change your water source to regular cold-tap water (not in Africa). Test your water source by sending the filter to a testing lab. Feed her/him no fish or fowl. Cook your baby's food yourself. And use no salves or ointments. Express your milk with a breast pump. Sonicate or zappicate it and then feed it to your baby. Store it in glass jars to refrigerate it. Soon your milk will be safe from the human intestinal fluke and the HIV virus it brings without extra electronic treatment. Be sure to sonicate or zappicate all baby bottles, nipples, teethers and mouth toys. Most of them have PCB contamination! They don't wash clean of PCBs.

Saliva Could Be A Source

Saliva is another body fluid that carries the tiny developmental stages of the fluke parasites. This means that kissing on the mouth could transmit the HIV/AIDS parasite. But would you eventually get HIV? Only if you had benzene in you!

Here are some photographs of human saliva as seen through a microscope.

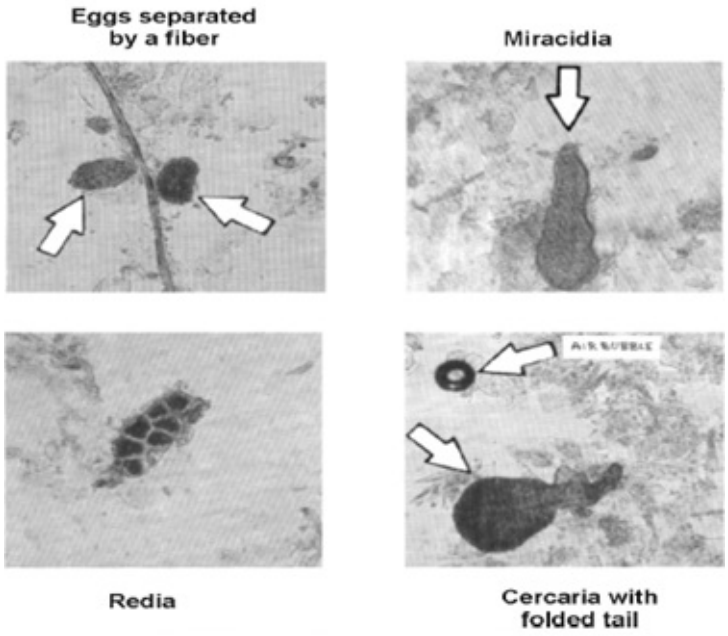

Fig. 114 Parasites in human saliva (100X)

Blood Could Be A Source

The blood carries the infective stages of the intestinal fluke. Until the public blood supply can be searched for them,[30] it is not safe. If you need surgery, use your own blood or get it from someone who has gone through the parasite-killing program. Of course, without solvents in your body, such an infection could not give you HIV/AIDS but it is still very undesirable. Could blood be electronically treated? This seems like an obvious treatment to try. Careful experiments need to be done.

Pets Could Be A Source

Because pet food is polluted with solvents, we should expect "fluke disease" to develop in our pets, too. This means the unnatural development of fluke stages in their bodies. Their saliva, urine and excrement become sources for transmission.

> Persons with AIDS should not have a pet. Pets pick up pa-rasites daily and are continually infectious. This is too much of a challenge for your weakened immune system.

We have learned to be careful with their urine and excrement. Now we must be careful with their saliva. Never let a pet lick you. Never kiss your pet. Of course, if you gave them clorox-free water and fed them homemade food, in their own dishes, and kept them on the *Pet Parasite Program*, there would be no danger for them or for you.

To Summarize:

1. We are eating the infective stages of the intestinal fluke in uncooked beef, chicken, turkey, and dairy products.
2. We then transmit it to each other by kissing on the mouth and sex.
3. Even if we pick it up in these two ways, we would not get HIV infection from it unless we have benzene build-up in our bodies.
4. We are getting Fast Garnet and Fast Green dyes from fish and chicken that are disinfected with laundry-grade (dye-polluted) household bleach. These foods cannot be salvaged.

World-Wide AIDS

There are six tasks that need immediate attention:

1. **Cleaning up the meat supply** so that it no longer is infested with flukes. A sample of animal saliva, fixed with equal parts of 20% formaldehyde and spun down in a high-speed centrifuge should provide a quick specimen for observation under the microscope. More modern methods could be devised, based on a reaction of saliva or blood with antibodies to fluke stages. Each animal should be tested. Animals need not be slaughtered but only deparasitized to a greater extent than they now are.

2. **Cleaning up the feed and food supply** of benzene namely, petroleum products. Even without the fluke parasites, benzene will give us AIDS. We do not need the parasites to get AIDS. As benzene spreads so will AIDS. When half the population has benzene build-up in their bodies, half of us will also get AIDS. Simply separating the petroleum industry from the food industry would

achieve this clean up.

3. **Destroying all conveyer belts** used in the food industry and exchanging for new ones made without asbestos would go a long way toward correcting AIDS. Establishing mandatory testing of all "belts" used in athletic equipment for asbestos would save costs and be fair.

4. **Stopping the use of amalgam tooth fillings**. The lanthanide metals block immunity, as do mercury and thallium. Each dental patient should be warned.

5. **Manufacturing household bleach in a USP grade** with ingredients thathave been tested for traces of azo dyes and heavy metals. Stopping the use of laundry-grade bleach for food contact purposes and in the water supply would stop a large part of AIDS.

6. **Testing the public water supply in Africa for traces of benzene, PCB, azo dyes and heavy metals** and comparing them with those found in the liquid bleach added to their water supply. This would reveal the cause of AIDS on that huge continent. The public water supply is contaminated with these AIDS-inducing contaminants. Using the Syncrometer®, I had tested nine water samples from unrelated sources in Africa before the year 2001. All were **Positive** for benzene! An additional 11 samples tested in 2001 showed nine **Positive**. A thorough study of how the water is handled and delivered would soon find the benzene source as well as PCB, heavy metal and azo dye sources and end the AIDS tragedy going on there.

Biological Questions

Since there is never a case of HIV infection without human intestinal fluke stages being present, do the stages bring in the HIV virus? Evidently the virus originates with them, not the adult. The stages normally pass through snails as an intermediate host. Does the virus really belong to the parasite stage or the snail?

Why do some people have benzene in their thymuses for a long time after an exposure, while others do not? Evidently, many people can detoxify it quickly so it doesn't build up. Is this a thymus problem or a liver problem?

Is there a special solvent that helps Paragonimus multiply, like wood alcohol for Eurytrema and benzene for Fasciolopsis? Why does Paragonimus flourish in some people and not in others? Why can Potato Ring Rot fungus flourish in us?

Why do I always see copper, cobalt and vanadium in the thymus of HIV patients? What role do they play? Are they involved in the T-cell ratio

disturbance, too?

Why does only *Fasciolopsis* bring HIV when many other flukes are also present and multiplying? Other flukes use snails, too.

Are other flukes bringing us yet new bacteria and viruses? **Is this how we get all our new bacteria and viruses?** Namely from newcomer parasites? This would make control of new diseases easier.

What symptoms does HIV virus cause? It is not clear in a single case history which symptom might be attributed to the virus, supporting the theory that HIV is a fluke or snail virus.

What symptoms does SV 40 virus cause? These and many more questions need to be researched. Fortunately, these questions don't have to be answered before you cure yourself of HIV/AIDS.

> I have recently detected the HIV virus within the human chromosomes, and it therefore has become a human virus. But in contrast to other viruses it disappears from this location, too, soon after both parasite stages and benzene are gone. The virus is still especially vulnerable. What is the body’s way to remove this latent virus?

Some Very Good News

- Fluke parasites are very easy to kill, much easier than many roundworms or tapeworms (tapeworms even sur-vive the parasite herbs).
- Pesticides used on foods haven't penetrated them so deeply that they can’t be washed off in two hot washes.
- PCB pollution can be sonicated off and even the molecules destroyed. The same is true for food zapping or zappicating.
- Municipal water is still the safest source, provided chlorination is done with chlorine gas, not liquid bleach. I found no cases of lead, asbestos, aluminum, or any solvent toxicity due to city water. If **we** begin to do water testing for PCB, using our filters, we will be able to head off wholesale

water pollution as this toxic waste approaches our reservoirs.

- Solvents, PCBs and aflatoxin leave the body in a few days after you stop getting them into your body if you don’t already have a buildup.
- Lead is not coming from paint; it is mainly coming from lead solder joints on copper water pipes. They can be changed.
- Asbestos coming from building materials is relatively minor, compared to your own clothes dryer belts, hair blowers, gym treadmill belts, and most of all, food and water! It can be washed off.
- Although milk has many food phenolic substances and live tissue bits from the cow, it is still unpolluted with metals, asbestos, solvents, aflatoxins or dyes (if you choose carefully).
- Some good tasting ultra pasteurized goat milk varieties are on the market. It is much less polluted than cow’s milk and does not have bits of live tissue from the pituitary and hypothalamus glands. It is much safer.
- Benzene and other solvents are not coming from widespread gasoline pollution. Instead, benzene is coming from our foods and products, due to the mistaken belief that we can use petroleum products to spray food and even directly in the manufacturing of food. This is an easier problem to correct.
- Analytical labs have made a giant leap forward in the past seven years. Cleaning up the environment and food will be possible with their help.

African AIDS

Message To The African People

Since I do not know how to reach your government agencies, and yet, I have great concern about the decimation of your population, I chose to write this chapter for you. Do what you can to bring this information to the proper authorities.

No blame is being laid. Water chlorination appears to be the problem. This is a western enterprise; similar mistakes are being made in the west. It is not intentional. But I do hope that you will build safeguards into any future western enterprise as widespread as water treatment, food processing, fuel consumption or air quality. It is a challenge for your best and brightest, together with your least and commonest of citizens. This must not happen again.

Africa, Oh Africa!

I hear your babies crying.
Your mommies are gone
And your daddies are dying.
This mother's heart aches for your children.
Reach out! Reach out!
Before all slip silently away.

The information in this chapter comes from three sets of tests. All were done in 2001. All were done by Syncrometer® in the same way as all the testing for this book. The three sets of tests were:

1. African water samples
2. African food samples
3. Samples of saliva obtained from African people.

The purpose of these tests was to search for the five immune-lowering

substances that I believe are the cause of AIDS in the United States and elsewhere on this planet. Benzene had already been found in African water samples tested seven years ago. Would the other four culprits be found, too? Or would there be entirely novel causes unique to Africa?

Remember that Syncrometer® tests do not quantify. My estimation is that parts per billion or less, parts per trillion, are involved. But significant is the fact that none, not even parts per quadrillion, were found in United States water (except in special cases) nor in water samples obtained from Israel, Germany, England, Spain, or Canada.

Eleven bottles of water arrived in a single package, all perfectly sealed, none leaking, quite a feat for the shipper. They had been given numbers from one to twelve (number three was missing), and no other information was enclosed.

African Water Samples Tested by Syncrometer®

Water Sample Code Number	PCBs	Benzene	Fast Garnet and Fast Green (dyes)	Hypo-chlorite bleach	50 heavy metals	Subset of 4 heavy metals (W, Hg, Pt, Pd)
1	*Positive	P	P, P	N	P	P
2	Negative	N	N, N	N	N	N
4	N	N	N, N	N	N	N
5	P	P	P, P	P	P	P
6	P	P	P, P	P	P	P
7	N	N	N, N	N	N	N
8	P	P	P, P	P	P	P
9	*P	*P	P, P	N	P	P
10	P	P	P, P	P	P	P
11	P	P	P, P	P	P	P
12	N	N	N, N	N	P	P

P = positive N = negative * Denotes especially high values.

NOTES:

1. These samples were collected by a person unknown to me and given code numbers. I did not know their source, method of collection or treatment.
2. PCBs are polychlorinated biphenyls, a toxic waste of constant concern to government regulatory agencies.
3. Benzene is a toxic solvent, causing cancer, found in gasoline and wherever petroleum distillate is found.
4. Fast Garnet and Fast Green are two of a large number of dyes, used in the food, textile and other industries.
5. Sodium hypochlorite is chlorine bleach disinfectant manufactured in different grades of purity.
6. The 50 heavy metals include nearly all that exist and are listed in the chemical table.
7. W = tungsten, Hg = mercury, Pt = platinum, Pd = palladium. These implicate an industrial origin, rather than food, air or normal water.

We are immediately struck by the fact that these water pollutants are not scattered randomly. They tend to occur together. Water samples #2, #4 and #7 seem entirely pure. Water sample #12 seems pure except for the heavy metals; these alone would make the water extremely toxic and undrinkable.

Our first suggestion would be that something has been added to the water that introduces all of these toxins together. We already know that chlorine bleach is added to make the water safe for drinking. We ask ourselves whether the bleach used could bring with it these contaminants.

Maybe there are other chemicals added to water, legally or accidentally, that could contribute some of these toxins.

My next step was to test a variety of bleach samples obtained in the United States, since it is possible that the bleach itself or the supplies for making bleach are imported into Africa.

I tested several USP grade samples of bleach purchased from a chemical company. There were none of these impurities.

I tested some chemical grade samples from the same company. There were no impurities.

Then I tested supermarket varieties of bleach.

I tested one sample from a variety with the NSF mark of certification. There were no impurities.

I tested three samples of dry (solid) bleach, which is calcium hypochlorite instead of sodium hypochlorite. It is available in small plastic bags in garden and pool supply markets. There were no impurities.

I tested one gallon of sodium hypochlorite, also intended for pool disinfection, called Sunny Sol 150, 12.5% NaOCl, with an EPA registration number. There were no impurities.

I tested only two brands of laundry bleach, commonly available in supermarkets, Ultra Clorox Bleach (EPA Reg. No. 5813-50) and Hilex Ultra Bleach, without an EPA number.

Both varieties had 18 azo dyes, including Fast Garnet and Fast Green. They also had all 50 metals, including W, Hg, Pt and Pd.

These varieties may or may not be the variety used in these African water samples. Any bleach manufacturer who is using the same ingredients or process of manufacturing could be adding these dyes and heavy metals.

These bleach varieties are undoubtedly not meant to be added to drinking water, they are only intended for laundry and toilets, etc.

But it is an easy mistake to make and, in fact, is often made in the United States as well as Africa.

It is easy to believe that one container of bleach is as good as another and, therefore, the cheapest can be chosen. Certainly, the convenience of buying it at a grocery store makes it more tempting, when the hazard is not known.

It might be believed that the bleach itself would destroy traces of dyes. This may indeed happen under special circumstances like when it is used in a hot water wash. But it did not happen in seven of these 11 samples. Although I tested several of these water samples for all 18 dyes that are in my test kit, I did not test all water samples this way. I believe Fast Garnet and Fast Green are the chief dye culprits in AIDS, so I finished the testing for these two instead of the entire set.

Note the absence of chlorine bleach in samples #1 and #9. There could be several explanations. Perhaps the sample was warmed or stood uncovered for several hours before shipping. Hypochlorite easily deteriorates, especially upon heating or standing. Perhaps less bleach was used. Perhaps a different variety was used.

American water samples seldom test **Positive** for bleach even though this is the same substance used to add to drinking waters. The African results suggest that far too much bleach is being used there.

Using too much bleach in the water could be a significant problem in itself. Chlorine is a powerful oxidizer. It could oxidize our sensitive proteins, our minerals, our vitamins, and our tissues themselves. The mechanisms have not been studied for chronic hypochlorite feeding.

But, certainly, the oxidation of iron in the hemoglobin of our red blood cells would asphyxiate the body. Over-use of bleach could easily be corrected by the technician in charge.

Although PCBs and benzene occurred in the laundry bleaches, they could also come into water in other ways.

The question remains, then, where are the PCBs and benzene coming from, if not with the added bleach? From buckets previously used for motor oil or gasoline, kerosene or similar toxic fluid? From the method of drawing the water, the pump-oil, submersed pump, or run-off into the water source (well, pond)? From something besides bleach that may be added to the water? From the way the well or water source was dug or prepared in the beginning? PCBs do not "wash clean" or "go away" in time. Are regulations on drilling and preparing the source not followed or not available or non-existent?

These are my beginning questions upon reviewing the results of my tests. Perhaps you have additional insights. Send them to me in care of the publisher (address given on the inside cover).

Remember that AIDS is not caused by benzene alone, although I believe it is most important. Four more toxins: PCBs, heavy metals, asbestos, and azo dyes can each contribute to the disabling of the white blood cells—but only these, no more. Any one of these first four can stop phagocytosis, while the azo dyes shorten or lengthen the life span of the lymphocytes. Phagocytosis, the eating of bacteria and viruses by phagocytes in your blood is the major part of immunity. Other aspects of immunity exist and are much more complex. I did not test for

asbestos in these water samples or bleach samples. Its presence or absence is, therefore, unknown.

After reporting my results to the sample provider, the water sources were disclosed by the provider, thus breaking the code.

Breaking The Code

The following were the sources of the water samples:

1	Bore Hole: Underground
2	Shallow Well
3	Sample not shipped
4	Shallow Well: (boiled, stored in clay pots)
5	Underground: Town Supply (usually bore hole)
6	Bottled Under Label: "Crystal Water"
7	Bottled Under Label: "AMAZZI"
8	Bottled Under Label: "Seven Falls"
9	Bottled Under Label: "RWENZORI"
10	Bore Hole: Underground
11	Tap Water: Surface Water (Lake Victoria) Capital—City Water Supply—Kampala
12	Boiled Tap Water: Surface Water (Lake Victoria) Capital—City Water Supply—Kampala

The results for the different sources were further explained in these ways:

Samples number #1, #5, and #10 were taken from three different districts of Uganda, all from underground (bore hole) sources. These "water sources are dug deep into ground for more than 30-90 metric meters. A hand pump is normally installed to lift this water to the surface. It often crosses from the topsoil to as deep as the granite soil layers.

"The rig used for sinking this deep well is always lubricated using grease, oils & it is believed that ‘prolonged use of this well water will clear up this contamination!!'

"However, the hand pump is also similarly lubricated and maintained that way!! (Its joints and the valves.) In addition, it is recommended that all hand pumps be disinfected using chlorinated compounds."

The "shallow well" source comes from "an underground level less than 30 metric meters. Often privately owned by individuals. The people use ropes attached to a bucket, which is lowered manually. Some/many sources having ropes lubricated with car engine used oils, or grease.

"The source for samples #2 & #4, however, had a small electric pump installed and plastic piping connected to a water reservoir (plastic). However, the T-pipe joints were still metallic."

Mineral bottled water is a "commercial source that has recently become common on the market. It is presented on the market under several brands, by different manufacturers.

"Interestingly, in contrast with the pictures and names of the labels glued onto the bottles, almost all manufacturers obtain ‘their waters' from an underground source".

The "surface water source is Lake Victoria, the third world's largest fresh water lake. The capital city's (Kampala) water supply is from this lake. The water is treated using chlorine compounds. It is pumped into the main supply network for the whole city. Apparently ‘no other stuff is added at the same time as the bleach' although this needs more verification. It seems the PCB and benzene contamination comes from the motorized water pumps (-old).

"Number 12 was the same sample as #11 but boiled using an electric kettle, and stored in a clay pot. Other people/homes store it in a refrigerator."

This is the end of the report by the sample provider.

I was surprised to learn that water sample #12 was actually the same as sample #11, only having been boiled. This was enough to drive off the PCBs, benzene, azo dyes, and bleach itself. Heating the bleach would have activated it first, presumably enough to destroy the dyes. But, unfortunately, metals will always be metals. They cannot be destroyed; they can only be removed. Filtering and distilling are two water treatments that might reduce the metal content but

perhaps not enough to make the water safe.

The rational solution is to: stop using impure bleach as an addition to the drinking water, and to eliminate the source for PCBs and benzene—once that is found.

As a temporary solution the water could be boiled and then filtered. Not the reverse. This would only solve the problems if it could be repeated many times and found to be reliable.

Phagocytosis is not the only part of our immune system that is impaired in AIDS. Besides this flaw in the neutrophils (white blood cells), there is a disproportion of the CD4 to CD8 lymphocytes. The CD4s, having eaten HIV and other viruses, as they should, are unable to kill them. They become infected themselves and are consequently killed by other lymphocytes, either the CD8 (killer) lymphocytes or another variety. This is a Syncrometer® finding. The CD4 problem is caused by an azo dye, Fast Garnet. The CD8 lymphocytes are over produced and contain the azo dye, Fast Green. The mechanism of this over production is not yet clear. But the ratio of bcl-2 to bax gene products is about 4:1, much too high.

The ratio of bcl-2 to bax could be affected by mutations induced by these dyes, as mentioned earlier. Research is needed to further clarify this.

With a huge over abundance of CD8s, the predatory pressure on CD4s may be greatly increased. The CD8s could be expected to kill those CD4s unable to kill their own viruses. All this is seen by Syncrometer®, not regular chemical tests as yet.

Both azo dyes are part of a large number of azo dyes found to contaminate common household chlorine bleach in the United States. The active ingredient in this bleach is sodium hypochlorite, but contrary to expectations, these dyes are not destroyed, at least not fully destroyed by contact with bleach. Why these dyes are present at all is not known. Nor is the supplier of these disinfectants known.

When water is chlorinated for purposes of disinfection, chlorine gas is used by the larger water departments in the United States. At substations or in small water supplies, solid or liquid chlorine is often used in the form of hypochlorites. In the United States it is the practice to measure levels of chlorination at certain checkpoints of the water distribution system. Solid or liquid hypochlorite is added if the level is not high enough. A technician is trained to perform this task

correctly. The quality of the hypochlorite is regulated by requiring registration of the product. But the registered variety I tested contained azo dye and heavy metal pollution too. This would introduce all these toxins into the drinking water that were never meant to be allowed.

It is my belief that this has happened on a large scale in Africa. My evidence comes from this data, which shows that water samples that tested **Positive** for all these toxins, also tested **Positive** for hypochlorite, chlorine bleach disinfectant. Water without toxins did not test **Positive** for hypochlorite.

L to R: Sodium hypochlorite liquid, trichloro-s-triazinetrione in tablet form, sodium hypochlorite liquid, calcium hypochlorite in granules, so-dium dichloro-s-triazinetrione in granules, trichloro-s-triazinetrione in granules. None of these chlorination supplies had PCBs, benzene, azo dyes or heavy metals.

Fig. 115 Safe chlorination supplies

It is certainly necessary to disinfect water chemically, or by boiling. **Chlorine has been found safe over many decades. All that is needed is a source of <u>pure</u> chlorine or hypochlorite, to prevent toxicity.** Using only chlorine gas would avoid all confusion.

BK Powder is practical for dairies. Steramine, in tablet form, is practical for camp-ing and kitchen use.

Fig. 116 More safe chlorinators

Also of some significance is my finding of extraordinarily high levels of hypochlorite. The hypochlorite is evidently much less in USA chlorinated waters, about 1 part per million (ppm). Perhaps larger than normal amounts of bleach are being used in Africa. This should not be necessary.

Laundry grade bleach should be banned from use with drinking water as well as any food contact such as the fishing or food canning industry! Fish and canned food already in the market place should be tested for azo dyes.

What is the effect of the heavy metals being consumed? Do they convey a direct toxicity to the water? Could they be filtered out? Are AIDS patients sick with metal toxicity? Would EDTA-chelation be a temporary treatment measure for individuals?

There are further issues, no less pressing than the origin of azo dyes and toxic heavy metals. The origins of PCB and benzene are not yet clear. You can see from the Syncrometer® test results that these two toxins are linked to the azo dyes and hypochlorite. The questions are, what additional procedures are used to treat the water? Are they mechanical or chemical? Or accidental?

Until these answers are found, the problem with AIDS must intensify, eventually reaching all who drink or otherwise consume this water.

As you can see from sample #12 simply boiling the water cleared some of the problems. Was this just a "chance" result, a fluke? Or could it be repeated and eventually relied upon? Would this reduce the AIDS occurrence or its severity? Would the remaining heavy metals be just as toxic? Or, in fact, the chronic high doses of chlorine?

If you have information, please send it to the publisher. Your participation may not go down in the history books. Mine may not either. But it is a godly deed, worthy of you!

African Food Samples

A different person shipped twenty food samples plus a water sample to me. They were his main foods. Some were raw; some were cooked. I do not know if any were canned, bottled, or purchased in the marketplace. Assuming that the water is the source of AIDS-pollutants, how would you explain these results?

African Foods Tested by Syncrometer®

	PCBs*	Benzene	Hypochlorite bleach	Asbestos	Subset of 5 heavy metals**	Subset of 5 azo dyes***	Thulium****
1. cooked beans	Pos	P	P	P	P	P	P

*PCBs are polychlorinated biphenyls.
**Subset of 5 heavy metals are mercury, thallium, tungsten, platinum, palladium.
***Subset of 5 azo dyes are Sudan Black B, DAB, Fast Red, Fast Garnet, Fast Green.
****Thulium is a lanthanide metal.

You can see that the water sample (#8), although coming from a different state than the water samples tested earlier, has exactly the same pollutants. In other words, it is handled in the same way. The same kind of bleach is added. The water is over bleached, as before. And the PCBs and benzene are again part of the problem. Are they part of the bleach? Or part of the water-handling methods?

My early conclusions would be: that raw foods and fried foods did not get touched by the water. That the cooked rice (#4) used water from a different source, as did the cow meat (#11). Is this true? Why didn't the cooking process always destroy the PCBs, benzene, dyes and bleach itself as it did for the one earlier African water sample? Is cooking unreliable? Or is the method of cooking also important?

These foods also had asbestos, suggesting they had traveled on conveyer belts. Or did the water have the asbestos? This is not clear. Were some foods treated with two kinds of water, once during processing for the marketplace, and once at home while cooking?

If you live in Africa, and are familiar with water or food handling practices, and would like to help, write down the name of each food. Try to explain how

each pollutant got into it. Add any explanation that you might have that is different from mine. Finally, make a copy of your notes, sending one to me. I will try to learn more about the possible ways this terrible tragedy is happening.

Hopefully your suggestions and the sender's explanations will clear up some of these questions.

Meanwhile, raw and fried foods appear to be safest.

How Do Human Saliva Samples Test?

Fifty samples of saliva were sent to me, sterilized in alcohol for shipment in glass bottles. Making a saliva sample does not need to be a distasteful affair. Chewing a small piece of paper towel is discreet and easy. Popping it into a zippered bag or glass container is next. After this it can be electronically copied, without opening the container. No hazard is created since only the electronic copies need to be shipped; nothing infectious is contained in them. (See copy making)

These are the test results for the first nine samples out of the 50 that were sent. The code is not yet broken. Names and places are unknown to me. Assuming that the AIDS problem stems from the water, how would you explain the differences between them?

African Saliva Samples Tested by Syncrometer®

(these are preliminary results, to be repeated twice more)

AFRICAN SALIVA #1	AT SALIVA	AT BLOOD	AT LYMPH
reverse transcriptase*	POSITIVE	P	P
P24 antigen	P	P	P
PCBs	P	P	P
Benzene	P	P	P
sodium hypochlorite (bleach)	P	P	P

Saliva samples #6, #7, #8 and #9 have only been partially tested. These are the preliminary results.

	Saliva Sample #6	Saliva Sample #7	Saliva Sample #8	Saliva Sample #9
PCBs	Positive	Negative	P	P
benzene	P	N	P	P
50 metals	P	N	P	P

hypochlorite bleach	P	N	P	P
P24 antigen	P	N	P	P
reverse transcriptase	P	N	P	P
mercury, thallium	P, P	N, N	P, P	P
Fast Garnet	P	N	P	P
Fast Green	P	N	P	P

Although only an electronic saliva sample is used, a special technique lets us find the results for blood and lymph given in samples #1 to #5 as well. Details of this technique are given in the *Syncrometer® Science Laboratory Manual*.

Notice that the lymph is the "dirtiest" of the three body fluids. Radon and lithium were found to be **Negative** more than once. Ferrous iron was missing in three cases; it was present in the uninfected person along with lithium. Does the over-oxidized body state found in the infected persons destroy both lithium and utilizable iron? Does anemia result?

Are all these persons sick or not? Young or old? What is their water source and how does it test? Even if their water should test pure, could their purchased food be so polluted that it could give them AIDS anyway? Are they also sick from the toxicity (poisoning) of the heavy metals in their body fluids?

If they were switched to clean water, and food cooked in clean water, could they recover their health? It seems possible and likely, to me. **Theirs is not an addiction or a behavior that needs to be overcome, only a mistake to be remedied.** Compliance would be perfect. An experiment arranged to test the theory that toxic water is the cause of AIDS in Africa would bring clear-cut results.

Fig. 117 Our future, unless we act.

The True Story Of…

These are the stories of persons seen in my office for HIV/AIDS disease. The first 53, seen in the period 1992-1993 are presented again. Some have been heard from over the years, but no accurate follow up study has been done. I would appreciate hearing from all. Some cases, those who chose not to follow my program, have been omitted in this printing, to make room for more current stories. This lets you see how my understanding of HIV/AIDS has evolved and how the curing-program has evolved with it.

Earlier cases were tested clinically with the P24 antigen test. Since then the PCR test has been used.

My early electronic (not clinical) test was for P24 antigen, as well. Since then I also include a reverse transcriptase test and a "rev" protein test. Reverse transcriptase is an enzyme made by HIV virus. Rev protein is exclusive to HIV. Each test takes less than a minute.

How to test electronically can be found in the *Syncrometer® Science Laboratory Manual.*

The success rate with this method is 100%. This does not include failures due to lack of compliance. Yet, compliance is extremely difficult for some persons. It is my fervent hope that society will sit up and take note of the dilemmas for these patients so that changes in manufacturing policies can be introduced that will benefit all future generations.

Some clients brought with them a clinical HIV Positive test result, others were not yet identified as HIV or AIDS cases by their clinical doctors because no test had been done or the test came back **Negative**. Because electronic testing is much more accurate, I considered them to have HIV if they tested YES (**Positive**) to my Protein 24 antigen sample. Likewise I considered the person cured of HIV when they tested NO (**Negative**).

Clearly, the Syncrometer® detects cases of infection long before a clinical test could. Notice the high frequency of combined HIV/AIDS disease and cancer. This is due no doubt to having a common parasite, *Fasciolopsis buski* and a common virus, SV 40.

*Cases marked with an asterisk are significant in that they also had clinical HIV tests repeated at the end of my program.

The names have been changed to ones of the same sex picked at random from a telephone directory. Ages have been changed by up to five years. Some personal characteristics have been changed in non-essential ways.

1 Donna Brooks HIV

Donna Brooks is 20 and came from two states south specifically for her Epstein Barre Virus diagnosis and Chronic Fatigue Syndrome. She has numerous other problems; many of them are weird, such as shaking with cold, gagging after eating, and pain in the kneecap. She has pain and tightness over the mid-chest. She has a hard time breathing with shortness of breath. She has pain in the breastbone and upper chest. All this suggests HIV illness. She has severe stomach problems and is losing weight. Her mother, who did not come with her, is extremely concerned. She aches all over. She has a rash on her legs and stomach. They have a cat and a water softener. She drinks mostly Mountain Dew™

☒ **Protein 24 (HIV) YES (present in her white blood cells) and also at thymus and vagina; NO elsewhere**

☐ **Ortho-phospho-tyrosine (Cancer) NO (not in her white blood cells, and assumed not elsewhere)**

☒ **hCG (Pre-Cancer) YES at liver, thymus, vagina and at numerous other tissues!**

Note: cancer marker ortho-phospho-tyrosine is NO but cancer marker hCG is YES all over her body! hCG always precedes cancer.

☒ **Fasciolopsis (Parasite) YES at liver, thymus, kidney, intestine, cervix**

☒ **Fasciolopsis cercaria (Parasite) YES at liver, thymus, vagina only**

She states that she is not sexually active and never has been; she has never had a blood transfusion. Note how heavily infested with flukes she is. The flukes in her liver are starting a cancer and the flukes in her thymus have brought her the HIV virus.

☒ **Sheep liver fluke (Parasite) YES at thymus and cervix**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☐ **Human liver fluke and all stages (Parasite) NO**

☒ **Benzene (Solvent) YES at thymus and vagina**

☐ **Isopropyl Alcohol (Solvent) NO**

Double and triple checked this. She will avoid all products with “PROP” on the label anyway. Note:

she did not have the cancer marker ortho-phospho-tyrosine, but she was flooded with the cancer marker hCG which is always made before ortho-phospho-tyrosine is made.

☒ **Acetone (Solvent) YES**

☒ **Toluene (Solvent) YES high**

☒ **Methyl butyl ketone (Solvent) YES high**

Remaining solvents: NO. She will stop all commercial beverages. She will be totally vegetarian for three months. She will go off the benzene list. She will start on the parasite-killing program. She brought her latest blood test.

BLOOD TEST	Result	Comment
1. T4	10.4	slightly elevated
2. Cholesterol	very low (168)	indicating a liver problem and cancer risk
3. Triglycerides	very low (37)	cancer risk.

Very low cholesterol and triglycerides have always indicated a high cancer risk. With the emphasis on reducing these currently, this fact seems to be overlooked. Most persons are eating margarine, not butter, and therefore losing their only source of butyric acid in the diet. Butyric acid has been studied and found to have antiparasite and antiviral actions. This is another example where chemical food may be the true villain of human illness. Donna is extremely anxious and broke into tears. She knows her mother will not suspect her of having secret sex affairs, but she can hardly believe the whole situation herself. We reassured her that she could clear it up completely.

Five days later

She feels better, especially mentally (more alert). She can breathe easier. Her sternal pain is gone. Her stomach is the main problem now.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Hexane dione (Solvent) YES**

Has had not one sip of a commercial beverage or tea but had potato chips and cookies. She has some with her.

☒ **Cookies (Food Sample) YES in her white blood cells**

She will stop eating store bought cookies, crackers, and flavored things.

☒ **Mineral oil (Toxic Element) YES**

Stop using lotions.

☐ **Isopropyl Alcohol (Solvent) NO**

She is using make-up that has no propanol in it, but will stop all of it anyway, and make her own.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☐ **Human liver fluke and all stages (Parasite) NO**

☒ ***Ascaris, Ascaris* megalo (Parasites) YES**

These common roundworms are the probable cause of her stomach problems. She will continue the parasite program and also treat the cat. After two weeks she will begin the kidney herb recipe to make more progress in her recovery.

Summary: Donna was understandably shocked that a 20 year old person like herself, who had never had a sexual or blood contact, could have the HIV virus. And, to make matters worse, she had the beginnings of cancer. She could not believe it but was willing to try anything since she already had a fat file from a clinical doctor. After just five days her mother could tell she was better, and she also noticed it herself, so she began to believe our story about the true nature of HIV illness. It is tempting to believe that isopropanol is part of the chemistry that goes toward the production of ortho-phospho-tyrosine and not merely a solvent that helps to hatch eggs or break down the tissues so they will accept fluke stages.

2 Sharon Brownie HIV and Liver and Lung Cancer

Sharon Brownie came to the office for pain behind her shoulder blades, behind her ears, in both legs, and on top of her head at the scalp. These are unusual symptoms to occur together.

☒ **Protein 24 (HIV) YES at thymus**

Quite a surprise.

☒ **Ortho-phospho-tyrosine (Cancer) YES at liver and lungs**

She also has liver and lung cancer, another surprise, since there is no smoker in the house.

☒ **Fasciolopsis (Parasite) YES at thymus and blood**

The meaning of this result is not clear. How could an adult fluke fit into a blood vessel? She has both cancer and HIV. Yet, the adult intestinal fluke is not in the liver, only in the thymus and, apparently, blood.

☒ **Fasciolopsis redia (Parasite) YES at blood, thymus, liver and lung**

She will start on parasite program. She will go off items on the benzene and propanol lists.

Four days later

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Protein 24 (HIV) NO**

Fifteen days later

She feels considerably better. She still gets weak spells in her arms and legs (but not pain, now).

☐ **Protein 24 (HIV) NO**

☒ **Gallium, Gold, Ruthenium (Toxic Elements) YES**

Tooth fillings. She has no tooth fillings but wears a metal partial denture. She will get a new metal-free plastic one.

Thirteen days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Oxalate (Kidney Stones) YES**

Start on kidney herb recipe.

☒ **Isopropyl Alcohol (Solvent) YES**

☒ **Pentane (Solvent) YES**

☒ **Kerosene (Solvent) YES**

Used in cook stove.

☒ **Denatured alcohol (Solvent) YES**

Used in lamps. She will be much more careful when pouring these fuels and will stop drinking soda pop.

☒ **Diphyllobothrium (Parasite) YES**

Dog/fish tapeworm. She will increase parasite dosage.

Eleven days later

She still has pain at left lower abdomen, upper back and lower back. This is probably still due to parasites, plus liver gallstones.

☐ **Kidney Stones (ALL) NO**

Continue kidney herbs at half dose.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Denatured alcohol (Solvent) NO**

☒ **Pentane (Solvent) YES**

Can't give up soda pop.

☒ **Isopropyl Alcohol (Solvent) YES**

Source unknown, since she uses no commercial body products.

☒ **Gastrothylax, Trichomonas (Parasites) YES**

Continue parasite program.

☐ **Parasites (Remainder) NO**

She will start taking peroxy and 07 in preparation for a liver gall-stone cleanse. She will do a 5-day high dose parasite treatment.

Another month later

Her left arm is numb, both feet are numb. There is shoulder and shoulder blade pain. She is still putting off the dental work.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Diphyllobothrium, Gastrothylax, Trichomonas (Parasites) NO**

☐ **Solvents (ALL) NO**

☒ **Diplococcus pneu, Histomonas, Salmonella typh, Haemoph inf (Pathogens) YES**

Two of these are teeth bacteria. She is getting a lot of headaches. Remainder of box 1 and 2: NO.

Five weeks later

She is still getting a lot of headaches, probably from tooth bacteria. She did a liver cleanse and got numerous tan-colored stones.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Clostridium sept. (Pathogen) YES**

Probable cause of pain behind both ears. Needs to do dental work.

☒ **Wood Alcohol (Solvent) YES**

Is drinking Pepsi™ again.

☒ **Kerosene (Solvent) YES**

They are using it again; must change.

Summary: Sharon eliminated the HIV virus and her liver cancer in record time: 4 days. What was more difficult was eliminating headaches; in fact, it was not accomplished. Her isopropanol disappeared after she switched off commercial shampoo. It remains to be seen whether her arms and feet will recover. She does plan to get the dental work done.

3 John Vissers HIV

This 35-year-old man experiences numbness in his legs and arm. He was exposed to glues. He also has fatigue and poor concentration. He experiences occasional sore throats and pain in his shoulders, wrists, lower back, and knees. His mood is very changeable with some depression. He only has a few good days in a month. He suffers from hay fever and chest tightness. This is a long list of ailments for a man of his youth. They have a water softener.

☒ **Protein 24 (HIV) YES**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at thymus; NO at liver**

Others not tested.

☒ **PCB (Toxic Element) YES high.**

Body current was extremely low considering that 5 volts was applied to his hands during testing—alerted me to possible PCB pollution.

☒ **Benzene (Solvent) YES**

Others not tested. He will start on parasite program and go off all items on the benzene list. His son is with him and is not well, either. We will attend to him next.

One month later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **TCE, TCE ethylene, Wood Alcohol (Solvents) YES**

One month later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **TCE, TCE ethylene, Wood Alcohol, Pentane (Solvents) YES**

He will stop using commercial beverages and make his own.

☐ **PCB (Toxic Element) NO**

Went off detergents.

Summary: John is unable to come more often for follow-ups. His numbness suggests mercury toxicity but we have not even tested for toxic elements at this point. He can be commended, though, for getting rid of benzene, HIV, PCBs, and parasites.

4 Pete Vissers HIV

This 8-year-old boy has pain in his chest and cysts in the back of his neck. He also has a frequently stuffy and runny nose, dry lips, swollen glands, upset stomach after eating, leg pains, and some trouble sleeping. The chest pain is similar to his father's.

☒ **Fasciolopsis (Parasite) YES at thymus; NO at liver**

☒ **Protein 24 (HIV) YES**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **PCB (Toxic Element) YES**

Others not tested. Start on parasite program. Go off detergent and benzene products.

Summary: The chest pain drew my attention immediately to the probability of HIV virus. The cysts were immediately suggestive of PCBs. These cysts are described in the Japanese book on the PCB event that took place many years ago there. So there was little difficulty in finding it in Pete. But I did not see him for follow up. It seems likely that the child was included in the lifestyle changes made by his parents.

5 Betty Naylor HIVand Cervical Cancer

Betty is 24 years old, arriving for Chronic Fatigue Syndrome. However, she had an impressive list of additional symptoms involving her lower back, stomach, throat, skin, ears and neck. She also had chest tightness and the need for long breaths of air and PMS. The chest problem suggested the possibility of HIV-illness. She sleeps all day and has burning over the sternum. They have a water softener. She has been sick all winter.

☒ **Protein 24 (HIV) YES at thymus, vagina; NO elsewhere**

☒ **Ortho-phospho-tyrosine (Cancer) YES at cervix only**

☒ **hCG (Pre-Cancer) YES at thymus, cervix; NO at vagina**

This was quite a surprise. Betty volunteered that she had never had sex in her life and had never been in the hospital except at birth. I reassured her that this could be quickly cleared up, provided she followed instructions meticulously. She was very eager to do so.

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at cervix and vagina**

☒ **Fasciolopsis cercaria (Parasite) YES high at cervix**

☒ **Fasciolopsis eggs (Parasite) YES at vagina**

☒ **Sheep liver fluke (Parasite) YES high at liver (one side) and intestine**

☒ **Sheep liver fluke eggs (Parasite) YES at liver (same side as above), cervix and vagina**

☒ **Human liver fluke adults (Parasite) YES at liver (same side as above)**

☒ **Human liver fluke eggs (Parasite) YES throughout liver**

These findings suggest both benzene and isopropanol have accumulated in Betty's body. There isn't enough time to test for all solvents today.

☒ **Benzene (Solvent) YES at thymus and vagina**

☒ **Isopropyl Alcohol (Solvent) YES at liver (same side as above) and thymus; NO at vagina**

To avoid benzene, she is to go off all toothpaste, Vaseline products, ice cream and frozen yogurt and cooking oils, except olive oil. To avoid propanol, she is to go off all body products that have “PROP” on the label. She is to go off all commercial beverages to avoid other solvents, not yet tested. We will follow-up very soon. She is very anxious. She will start on parasite-killing program. She will be strictly vegetarian for 3 months.

Five days later

She has a lot more energy and has gone off her antibiotics. She says she is very apprehensive.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Solvents (ALL) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

She is elated. She will continue the parasite-killing program and her other lifestyle changes.

☒ **PCB (Toxic Element) YES**

Off detergent; use borax and washing soda and homemade soap.

☒ **Gadolinium, Tantalum (Toxic Elements) YES**

Tooth fillings.

☒ **Holmium (Toxic Element) YES**

Probably with the PCBs.

☐ **Toxic Elements (Remainder) NO**.

She needs metal tooth fillings replaced. After 3 months of vegetarian diet she will eat only fish and seafood in restaurants and superwell done meats at home.

Summary: This young woman fairly bounced out of the office at the good news of her second visit. The entire story of how she could have gotten the HIV virus and developed cancer of the cervix was like a revelation to her—almost unbelievable. Yet her mother, she said, was witness to her health improvement in just 5 days, and she is forced to believe it all. At any rate, she is much too scared not to believe that she had HIV virus.

Notice a peculiarity: there is no adult intestinal fluke in the liver. Not even a stage of it is in the liver! Yet there is ortho-phospho-tyrosine being produced! It is being produced at the cervix where the miracidia and cercaria are and where the sheep liver fluke eggs are. Now, the sheep liver fluke adults are found in the liver. Could they orchestrate the production of ortho-phospho-tyrosine for the intestinal fluke? Or was there an adult intestinal fluke at some earlier time that got killed? One seldom sees both adult flukes together. Do they kill each other somehow? Notice, too, that the cancer marker, hCG, was present, along with the cancer marker, ortho-phospho-tyrosine at the cervix. But only hCG was being produced at the thymus. Is a particular stage responsible for producing hCG? I explained to Betty that she must take great care to protect her thymus for two years so that it will completely regain its health. It would be tempting to neglect the dental work but this would be a tragic mistake. Benzene leaves the thymus in a weakened condition so that other solvents and toxic substances continue to accumulate there. This would, surely, give her lowered immunity, perhaps even AIDS.

6 Kersten Mossay HIV

Kersten is a young woman with early teenage children. We have seen her from time to time, perhaps once a year, for 5 or 6 years now. She says she does not often go to clinical doctors. Today she has a 100° temperature, which she has had for a month. There is also blood in her urine. She has been to a clinical doctor who diagnosed it as *nephritis*. Her blood pressure goes from high (173/140) to extremely low. Her pulse goes to 120 in the evening. She has a sore throat and is experiencing double vision. She hurts all over, especially in her hands and feet. She has become extremely nervous, with bad memory and is very fatigued. A second clinical doctor did an antinuclear antibody test, which was Negative. He gave her a diagnosis of *fibromyalgia* and wanted to schedule her to see a psychiatrist, but she hasn't carried this out.

☒ **Protein 24 (HIV) YES**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

Being Positive for HIV astounded her. Neither she nor her husband have ANY risk factors. Coming from a strict religious background, there is no extra-marital sex or use of blood, nor recreational drug use. I assured her it had nothing to do with her or her husband's conduct.

☒ **Fasciolopsis (Parasite) YES at thymus and kidney; NO at liver, intestine, etc.**

☐ **Fasciolopsis remaining stages (Parasite) NO**

☒ **Gardnerella vag, Salmonella, Flu A and B, Shigella, Borellia, A strep, *Herpes* Simplex 1, Adenovirus, Proteus, CMV, Resp Sync Virus, Chlamydia, *Bacillus cereus*, Strep pneu (Pathogens) YES**

☐ **Propionobacterium, Trichomonas, Bacteroides frag, Campylobacter pyl, Haemophilus inf, Staph aureus, Strep pneu, Coxsackie virus B4, Histoplasma cap, Human Papilloma (Plantar), Coxsackie virus B1, Nocardia, EBV, Human Papilloma 4 (Pathogens) NO**

End of Box 1. She has 14 YES out of 28 tested, much too high for a regular illness; this is an immune deficiency state. Obviously, Kersten has numerous infections unleashed in her body and would soon be bedridden and terminally ill. Her generally healthy lifestyle, with avoidance of alcohol and nicotine, and ability to adapt to new personal habits, will come to her assistance now.

☒ **Benzene (Solvent) YES**

☐ **Solvents (Remainder) NO**

They will remove all solvents from their basement and house to an outdoor garage. They will lose

some paint cans to damage by freezing this way. She will start on the parasite-killing program and avoid eating meat altogether. She will stay off the benzene pollution list I gave her. She will bring in her husband for testing.

Three days later

Kersten's husband, Leroy, has arrived for a brief check. He is experiencing no health problems, although he works hard as a home builder.

Leroy

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and penis; NO at liver, kidneys, brain, prostate, etc.**

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus and penis; NO at liver, kidney, brain, prostate**

Leroy has brought a sample of the frozen beef they have been eating; it is from a special local source. It tested YES (**Positive**) to Fasciolopsis cercaria electronically. We will examine it under the microscope also.

☒ **Benzene (Solvent) YES**

☐ **Solvents (Remainder) NO**

He will start on parasite program. He loves beef and will cook it thoroughly but is not completely convinced it is dangerous. He probably, also, does not believe his HIV POSITIVE status. However, he is willing to help Kersten get well.

Four days later (1 week after first visit)

Kersten has arrived. She is very much better. She still has a sore throat.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke adult (Parasite) YES at intestine**

☐ **Sheep liver fluke other stages (Parasite) NO**

She will continue the parasite program, vegetarianism, and avoidance of benzene list. She is concerned about the children. I suggested being very careful to thoroughly cook the meat for them and avoidance of benzene polluted products and food.

Summary: It is 4 months later; evidently the family is staying well. I am especially fond of this family. Notice that they were not full of food solvents, in general, due to their habit of eating home-cooked food and beverages. Since the parasite stage could be sexually transmitted as well as eaten with meat, it was important for Kersten's husband to come in, which he did without a hostile attitude. Probably, he was not yet ill because the parasite cycle had not completed itself; he did not yet have the adult fluke. The virus can be present without an adult fluke but when all the stages are gone, it is gone, too. Note its preference for thymus and penis as a tissue site in Leroy.

7 Lenore Dale HIV and Intestinal Cancer

This is a young 34-year-old person who works for a doctor and has already tried a number of alternative health procedures. She has a long list of bizarre symptoms, such as swollen and itching lips, gagging when eating, suggesting AIDS, but the symptom of chest heaviness made it even more probable. She has a water softener.

☒ **Protein 24 (HIV) YES at thymus, vagina and ovaries**

☒ **Ortho-phospho-tyrosine (Cancer) YES at intestine**

☒ **hCG (Pre-Cancer) YES everywhere**

What a shocking realization this brought to her, both HIV and cancer in a single diagnosis. She could hardly bear the news in spite of my assurance that she could eliminate them both within 10 days. Perhaps she was also angry or disbelieving.

☒ **Fasciolopsis (Parasite) YES at liver and intestine**

Gave her cancer.

☒ **Fasciolopsis eggs (Parasite) YES at intestine, adrenals, saliva**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☐ **Human liver fluke and all stages (Parasite) NO**

☒ **Benzene (Solvent) YES at thymus**

Go off items on benzene list.

☒ **Isopropyl Alcohol (Solvent) YES at liver**

Eliminate propanol. Others not tested. She will start parasite program. Note: I failed to test for

Fasciolopsis stages in the thymus. My error!

Twelve days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

HIV and cancer are gone—everything was done correctly.

☒ **Aluminum Silicate (Toxic Element) YES**

Will disconnect water softener and switch salt.

☒ **Bismuth (Toxic Element) YES**

Get rid of fragranced items.

☒ **Radon (Toxic Element) YES**

Open the vents to the crawl space.

☒ **Thallium and Germanium (Toxic Element) YES**

This coincidence of thallium and germanium is only found when the tooth filling metal has these pollutants. She is very upset about this since she states that she has had weak hands (very weak) for many years already. This is a classic symptom of thallium poisoning. She had all her mercury fillings taken out by Dr. S. who is a Huggins Institute trained dentist. 5 gold crowns were put back in her mouth, and she spent $3,000 on this last fall.

☒ **Gold (Toxic Element) YES**

☒ **Mercury (Toxic Element) YES at tooth #29 and 15**

Tooth #29 has a gold crown. She says this tooth has been bothering her. I then searched for the location of the thallium and found it at teeth #29, 10, and 18. She will ask the dentist to do a fresh panoramic X-ray to search for tattoos. I shone a flashlight in her mouth and could see 2 tattoos. However, these metal pinpoint leftovers might be left from the braces she used to wear. She states she remembers seeing them after the braces were removed.

☒ **PCB (Toxic Element) YES**

Uses Dr. Bronner's peppermint soap—will go off.

Summary; Lenore's case is especially tragic but nevertheless an early warning sign for all humanity. She was given 16 mercury fillings starting in early childhood, some of which were polluted with thallium. This was the probable cause of having a child with microcephaly. In an effort to improve her health she turned to health food soap only to be poisoned with PCBs. Only her good intelligence and survival instinct kept her from self-destructive anger. She will probably set herself

and her family on the road to good health.

8, 9 Brenda Stauffer & Katy HIV

This is a very pleasant but concerned mother; she has her 10-month-old baby, Katy, with her. Brenda is 31 and complains of burning on her chest. (She places her hand right over her thymus, and I sincerely hope this isn't HIV disease.) She also has chronic back pains, which move about, and is always sleepy. Her baby has had one illness after another, including pneumonia and has been on antibiotics all winter. She is breast-feeding, and the baby appears well grown and content.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and vagina**

This is indeed shocking. She has no risk factors. I explained the benzene problem and its link to parasites in the thymus.

☒ **Fasciolopsis (Parasite) YES at thymus only; NO at liver and intestine**

Other parasites not tested.

☒ **Benzene (Solvent) YES**

Other solvents not tested. She is not using any items on my benzene list of polluted items. She is using peanut oil in cooking. She will stop and bring it in for testing. She will switch to olive oil.

Baby, Katy, age 10 months

She was tested by surrogate technique, using her mother in the circuit.

☒ **hCG (Pre-Cancer) YES throughout body**

☒ **Ortho-phospho-tyrosine (Cancer) YES throughout body**

☒ **Protein 24 (HIV) YES throughout body**

The shock of seeing this apparently healthy baby riddled with cancer and HIV disease was too tragic for me to communicate to the mother. I did not tell her.

☐ **Fasciolopsis adult (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES at liver, thymus, saliva**

We should be able to see these eggs in the baby's saliva and have taken a sample on a cotton bud for examination under the microscope.

☐ **Sheep liver fluke adults (Parasite) NO**

☒ **Sheep liver fluke eggs (Parasite) YES at saliva, thymus, liver**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒ **Human liver fluke adults (Parasite) YES throughout her body**

☒ **Benzene (Solvent) YES one of the highest levels seen**

It seems likely the baby is getting the parasite stages from the mother's milk; we will get a sample of the milk and search under the microscope. The benzene must be coming through the milk too.

Summary: Since the mother will go on the parasite-killing program immediately and be off benzene sources, I suspect the baby will be cleared of her problems within a week. I emphasized the importance of follow-up in one week, since the source of benzene was not proved. But the mother felt this would not be possible for various reasons. This lack of concern shocked me and irritated me. To be sure the mother returns I broke the news to her that her baby had cancer. She was overwhelmed with sadness, immediately. I hope she comes back on time.

Seven days later

Baby Katy

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **hCG (Pre-Cancer) YES at thymus**

Mother, Brenda

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **Wood Alcohol (Solvent) YES at pancreas and in breast milk**

☒ **Regular gasoline (Solvent) YES**

☐ **Solvents (Remainder) NO**

Father, George

☒ **Benzene (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

He has not observed any rules or restrictions. They will continue on parasite program and stay off benzene and propanol products.

Summary: The HIV is gone and cancer is almost gone for mother and baby. They will try to avoid commercial beverages and cold cereals for their family. The thymus is probably somewhat damaged and care must be taken to avoid toxic substances from getting into it.

Two weeks later

The baby has not been ill since last visit. She has been kept on a sulfa drug all this time, however. The mother seems afraid to take the baby off it.

Baby, Katy

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

Mother, Brenda

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis cercaria (Parasite) YES high at thymus**

This explains the burning over her chest, which she still experiences.

☒ **Benzene (Solvent) YES at thymus**

They are using some cooking oil for baking cakes; will switch to olive oil.

☐ **Isopropyl Alcohol (Solvent) NO**

Other solvents not tested. Brenda has been drinking unpasteurized milk; she will heat it to steaming now. The baby gets heated milk. The father was not tested at this time.

Summary: Both cancer and HIV are gone but are lurking in the wings. If the parents are not very vigilant over diet and body products they will recur. Fortunately, this story has a happy ending

Three weeks later

Baby was ill 1 week ago and got Sulfatrim from a clinical doctor. She is on the medication now.

Baby, Katy

☒ **Benzene (Solvent) YES high**

Don't use Baby Magic™ on baby.

☒ **Isopropyl Alcohol (Solvent) YES high**

Baby is eating Cream of Wheat™, oats, cornmeal and mashed potatoes with gravy.

Mother, Brenda

☒ **Benzene (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

She is eating nothing that might have benzene in it. We will test their well water. She will stop using baby shampoo.

Ten days later

They have brought a sample of their well water.

Mother, Brenda

☒ **Benzene (Solvent) YES**

☒ **Benzene (Solvent) YES in drinking water!**

Finally, the riddle of the benzene source is solved. The father, who is present, is very concerned. He will search for pollution in his well, pump and cistern.

Baby, Katy

☐ **Solvents (ALL) NO**

☒ **Haemophilus infl, CMV, Mycoplasma, Staphylococcus aureus, B strep, EBV (Pathogens) YES**

End box 1. 6 were YES (Positive) out of 34. This is quite poor; suggestive of developing AIDS.

Three weeks later

Brenda says she feels better. They have switched to a different well for their drinking water.

☒ **Thulium (Toxic Element) YES**

Orange drink, probably from the added vitamin C; will stop.

☒ **Beryllium (Toxic Element) YES**

Gasoline.

☒ **Fiberglass (Toxic Element) YES**

Will search for a hole in the ceiling or wall, exposing insulation.

☐ **Toxic Elements (Remainder) NO**

I tested her other children for benzene, and one was YES (**Positive**) for it (he is still using toothpaste; will stop).

Final Summary: Hopefully, this discovery of polluted well water will stop the nightmare these parents have experienced since the birth of their last child.

10* Mel Davison HIV

Mel is a healthy looking young man of 25. He came with a friend from a large city, five hours away. He brought with him a recent blood test, including his **HIV Positive** test results. He was referred by a cured cancer client.

BLOOD TEST	Result	Comment
1. Creatinine	slightly high (1.1)	kidney problem
2. Uric acid	very high (9.4)	kidney problem
3. Phosphate	high (4.3)	dissolving bone

4. Calcium	very low (8.5)	he is not drinking milk
5. Total protein	very high (9.0)	probable liver problem
6. Albumin	low (3.5)	probable liver problem
7. Globulin	high (5.5)	probable liver problem
8. GGT, SGOT, SGPT	high (55, 46, 58)	liver problem
9. LDH	high (208)	check for cancer
10. Cholesterol	very low (121)	check for cancer
11. WBC	very low (3.0)	bone marrow toxin?
12. RBC	low (4.35)	parasites
13.Platelet count	low (158)	bone marrow?
14. Poly/lymph	low (47/38)	chronic virus
15. Monocytes	slightly high (8.9)	virus
16. Eos	slightly high (3.6)	parasites
17. Baso	high (2.6)	check for cancer
18. Sed rate	high (56)	inflammation somewhere
19. HIV 1	POSITIVE	antibody test by ELISA Assay
20. HIV	POSITIVE	antibody test by Western Blot

These blood test results are definitely poor; his youthful healthy appearance belies these bad results. He will start to drink milk, 2%, 3 glasses a day and later cleanse his kidneys.

☒ **Protein 24 (HIV) YES at thymus and penis; NO elsewhere**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Fasciolopsis (Parasite) YES in half of thymus only and at intestine**

☒ **Sheep liver fluke (Parasite) YES at both sides of thymus and intestine**

☒ **Sheep liver fluke cercaria (Parasite) YES at penis only**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

Note: His thymus gland is hosting both intestinal and sheep liver flukes. They tend to exclude each other in the liver. Why are they compatible in the thymus? He must have many solvents in his thymus.

☒ **Benzene (Solvent) YES at thymus, intestine, penis**

He will start on parasite-killing program immediately. He will avoid benzene products.

Same day, 3½ hours later

He took a large dose of parasite killer, instead of beginning at day one.

☐ **Protein 24 (HIV) NO**

Perhaps he killed the redia stages that carried the virus?

☒ **Cobalt, PCB (Toxic Elements) YES at thymus**

Off detergents.

☒ **Mercury, Iridium (Toxic Element) YES at thymus**

Tooth fillings.

☒ **Vanadium (Toxic Element) YES**

Gas leak.

☐ **Toxic Elements (Remainder) NO**

He is requested to get all metal out of his mouth immediately and get replacements as he is able to afford them. His only gas appliance is a stove; he will get a maintenance person to check it for leaks. After this he will do an air sampling for us to test for vanadium next time.

☒ **Acetone (Solvent) YES**

☒ **Benzene (Solvent) YES higher than before**

He brought his own water for drinking with him; he will switch to faucet water.

☒ **Methyl Butyl Ketone, Wood alcohol, Carbon tetrachloride (Solvents) YES**

☐ **Solvents (Remainder) NO**

Note: Although the parasite was killed quickly, and the HIV virus disappeared, the benzene level had not reduced. He will go off all commercial beverages and drink only milk (to which he is allergic), water (from faucet), homemade fruit and vegetable juice, single herb teas, homemade coffee substitutes. He will go off all cold cereal. This is a lot of change to put into effect rather quickly. But his friend is supportive and may help him get it accomplished.

Eighteen days later

At his last blood test he was evaluated as having AIDS with a T count of 78.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Solvents (ALL) NO**

☒ **Vanadium(Toxic Element) YES**

Nothing has been done about the stove.

☒ **Cobalt (Toxic Element) YES**

Has not gone off detergents.

☒ **Mercury and Iridium (Toxic Element) YES**

Dental work not done.

☒ **PCB (Toxic Element) YES**

Still using detergent.

☒ **CMV, EBV, Streptococcus pneumonia (Pathogens) YES**

☒ **Herpes 1 (Pathogen) YES everywhere in body**

☒ **Candida (Pathogen) YES**

Obviously AIDS; others not tested at this time.

Nine days later

Mel has been well. He has bought a vegetable juicer and enjoys his new lifestyle.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and penis**

Has the virus again.

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus**

But NO at white blood cells, indicating a minimal infection.

☒ **Fasciolopsis redia (Parasite) YES**

☒ **Sheep liver fluke adults (Parasite) YES at liver, NO at thymus**

☒ **Sheep liver fluke miracidia (Parasite) YES**

Other flukes not tested.

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

Mel has probably reinfected himself by eating undercooked meat, by saliva or sexual contact very recently. Due to past injury of the thymus by benzene, the parasite stages go immediately to the thymus, interfering with T cell formation. He will increase his parasite maintenance program to daily doses instead of twice a week. This will prevent 3 days' growth opportunity for the parasites. Note that it is the cercaria or redia of the intestinal fluke that brings with it the HIV virus, not the adult. He will do a 5-day high dose parasite program, also. He will avoid eating beef, chicken, or turkey for 3 months. Also note that cercaria were not showing up in the white blood cells: if I had not also tested the thymus I would have missed them.

Ten days later

☐ **Protein 24 (HIV) NO**

Got rid of virus again.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **hCG (Pre-Cancer) YES throughout his body**

A precancerous situation exists; it is always caused by Isopropyl alcohol.

☒ **Isopropyl Alcohol (Solvent) YES at thymus, one part of the liver**

He has used regular commercial shampoo recently.

☒ **TCEthylene, TCE, MEKetone (Solvents) YES**

Flavored foods.

☒ **Styrene (Solvent) YES**

Off styrofoam cups.

☒ **Kerosene (Solvent) YES**

More careful with gasoline.

☒ **Butyl Nitrite (Solvent) YES high at thymus**

Commonly called “rush”. Will go off. Will bring in all other body products for testing.

☐ **t-Butyl Nitrite (Solvent) NO**

☒ **2 Methyl propanol (Solvent) YES()**

☒ **Grain Alcohol (Solvent) YES**

Possibly from Black Walnut tincture. Use no alcoholic beverage. Put tincture in warm beverage.

☐ **Solvents (Remainder) NO**

Note: Mel has picked up a number of solvents, including propanol which is giving him the precancerous condition indicated by hCG. However these solvents, while giving him AIDS, do not bring him the HIV virus. He will need to be much more disciplined to regain his immunity. He will take charcoal capsules (3 a day) and Silymarin caps (4 a day) until his next appointment. [I have since found Silymarin to be polluted and have switched to Milk Thistle, see *Sources*.]

Seven weeks later

I fear the worst after this long absence without reinforcement and support of office visits.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

He has done an excellent job of changing his lifestyle and is ready for a clinical test for HIV antigen. Hopefully he will do it today, before he can reinfect himself.

☒ **Balantidium troph, Babesia canis, Eimeria tenella, Fischoedrius elongatus (Parasites) YES**

End of box 1.

☒ **Taenia solium scolex (Parasite) YES**

This is a tapeworm, he will start on Rascal for 2 bottles.

☒ **Gaffkya tetragena, Klebsiella pneumoniae, Proteus vulgaris, Veillonella dispar, Staph aureus, Troglodytella, Salmonella para, Strep mitis, Sphaerotilus natans, Pseudomonas aer (Pathogens) YES**

Ten positives out of forty tested. This is a good result.

Six weeks later

Although Mel's clinical test was done the same day, the results have just arrived in the mail. They are NEGATIVE for HIV. We will send him a copy.

Summary: Mel has learned the secret of HIV/AIDS illness. He is capable of steering a wise path. We wish him well.

11 Anne Burgad HIV

Anne is a 44 year old woman with shoulder pain, elbow pain, and arm pain, probably due to gallstones in her liver. She has frequent headaches. She also has lower back pain and numbness in her right hand and 2 middle fingers. Her hands seem weak. This had started about 6 years ago with a big attack of arm pain and numbness. Her foot and big toes are very painful. Her feet get numb when sitting. Sometimes she can't get her breath. I discussed cleansing her kidneys and liver.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Kidney Stones (ALL) NO**

Very unusual to find a person with no kidney stones, especially when they have lower back pain and foot pain. Most strange! We will start on kidney herb recipe, in spite of no stones being present, in hopes of curing the low back pain.

Three weeks later

☒ **Gallium and Mercury (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

She is to get all metal fillings replaced with plastic.

BLOOD TEST	Result	Comment
1. Seg/lymphs	49/41	virus
2. T4	slightly low	
3. Phosphate	slightly high	dissolving bone. Drink 3 glasses of goat milk daily. Take magnesium (300 mg) 1/day.
4. SGOT, SGPT	very low	Take B6 (500 mg) 1/day till problem is solved. Later take B6 (250 mg) 1/day.
5. Cholesterol	very low	liver problem, cancer risk. Eat butter, no margarine.
6. Total	slightly low	

protein	6.6	liver problem

One month later

She has all metal fillings out. She is experiencing worse chest “tightness.”

☐ **Mercury (Toxic Element) NO**

☒ **Babesia (Parasite) YES**

☒ **Echinococcus granulosus eggs (Parasite) YES**

☒ **Sheep liver fluke (Parasite) YES**

End box 1. Start on parasite-killing program.

One month later

She is coughing more, is more tired, and finds it difficult to breathe. (I will check for HIV.) She has been breaking out in *Herpes.*

☒ **Benzene (Solvent) YES**

She is using Camphophenique™. Will go off.

☐ **Solvents (Remainder) NO**

☒ **Sheep liver fluke (Parasite) YES at thymus; NO at liver, intestine, etc.**

☐ **Echinococcus granulosus, Babesia (Parasites) NO**

☒ **Protein 24 (HIV) YES**

She will go off the benzene list and continue on parasite program.

One week later

She is much improved with shoulder pain and headaches reduced.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

She still has pain over her sternum.

☒ **Iodamoeba, Leishmania don, Loa loa (Parasites) YES**

End of box 2. Continue parasite program. Loa loa often causes pain over heart region.

☐ **Solvents (ALL) NO**

One week later

The sore spot on her mid chest is finally gone.

☐ **Iodamoeba, Leishmania don, Loa loa (Parasites) NO**

She will prepare to clean her liver by taking 07 and peroxy (17½%) with meals.

Six weeks later

She has done 2 liver cleanses and got hundreds of stones out. Some chest tightness persists. Finger joint pain persists.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke (Parasite) YES**

Note: Sheep liver fluke returned, probably due to handling raw pork in a restaurant.

Two months later

Neck pain and back pain are present. There is obviously still a large source of bacteria, in spite of dental repair, liver and kidney cleansing. I will search for tapeworm heads.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **Moniezia scolex (Parasite) YES at pancreas; NO in white blood cells**

☒ **Moniezia eggs (Parasite) YES at liver, thymus, intestine, spleen, pancreas**

☒ **Pinworm eggs, Schistosoma jap (Parasites) YES**

Do 3 day extremely high dose of parasite program, including Rascal

Summary: Anne had a bout of HIV apparently due to sheep liver fluke invasion of the thymus. There was benzene in the thymus. She cleared this up quickly but remained in poor health. Bacteria seemed endless. But killing the tapeworm head may put an end to her various pains. The presence of tapeworm eggs all over her body implies that the tapeworm heads had "hatched" and let out their unfertilized eggs. I believe benzene causes such hatching of stages that have been in capsules.

Two weeks later

She still has the tapeworm.

One week later

She still has pieces of the tapeworm.

One week later

Tapeworms are all NO. She complains of hoarseness and shoulder pain.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

She will repeat liver cleanses. She already has over 1,000 stones washed out.

Summary: Anne's health is typical of tapeworm sufferers. She will have some very good days and think her bad health is in the past. Then she will be sick again. She has accomplished a lot for herself already. It is heartening to see her determination to get well. She will use our Cold Prevention Program: CFH capsules (thyme plus fenugreek) one a day by summer, two a day by winter, zinc tablets from Bronson Labs, one a day by winter, Oscillococcinum in case of influenza. Her chest tightness disappeared. She plans to continue cleaning her liver to completion; a taste of good health, even intermittent, keeps her focused on completion.

12 Phylis Zink HIV and Cancer

Phyllis is a 46 year old woman who drove by herself 150 miles for reasons of her history of breast cancer. It was discovered by mammogram. She had a mastectomy and they took out 3 lymph nodes two years ago and

has been followed since then by annual mammograms. She has a heart murmur, occasional pain in knees and wrists, and a long history of period-related problems. They have a water softener and use reverse osmosis (R.O.) water for drinking.

☒ **Ortho-phospho-tyrosine (Cancer) YES**

☒ **Protein 24 (HIV) YES**s

Since these results seemed impossible to her and I was afraid she might leave, do nothing about her status, and never return, I suggested she get a clinical test (P24 antigen test) for HIV.

Six weeks later

She waited 2 weeks before doing the test and it came back NO (**Negative**) for the HIV virus. This was most unfortunate since she waited another month before returning.

☒ **Ortho-phospho-tyrosine (Cancer) YES at liver and breast**

The cancer has spread to the liver.

☒ **hCG (Pre-Cancer) YES at liver, breast and blood**

☒ **Protein 24 (HIV) YES at thymus only**

Perhaps the clinical test didn't find the virus because the lab examines blood serum, not the white blood cells or their contents. A case must be further advanced for the virus to be so prevalent that the virus is in the blood serum.

☒ **Fasciolopsis (Parasite) YES at intestine, liver, thymus**

Adults in the liver are giving her cancer; adults in the thymus are giving her HIV. However, she has no sensations over the breastbone nor chest tightness.

☒ **Fasciolopsis redia (Parasite) YES at liver and thymus**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒ **Human liver fluke (Parasite) YES high at liver, thymus, bladder, kidney, breast**

☒ **Human liver fluke metacercaria (Parasite) YES high at liver, thymus, kidney, bladder, saliva**

Notice: she could transmit these very tiny infective stages by kissing! She will start on parasite-killing program.

☒ **Benzene (Solvent) YES at liver, thymus, breast, etc.**

Brushes teeth twice a day with Colgate™, Crest™, and Tom's™ toothpastes–eats cold cereal daily–go off the entire benzene polluted list.

☒ **Isopropyl Alcohol (Solvent) YES at liver, thymus, breast, etc.**

Remainder not tested. She will check her cosmetics for propanol and make her own hair spray. She will switch shampoo to borax.

Seven days later

She is having some loose bowels, probably due to parasite-killing herbs.

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Regular leaded gasoline, Petroleum ether (Solvent) YES**

Put gas in her car yesterday. She will be much more careful.

☒ **Methyl Ethyl Ketone (Solvent) YES**

Instead of stopping cold cereal, switched to a health brand, will stop.

☒ **Titanium, Thallium, Germanium (Toxic Elements) YES**

Tooth fillings.

☐ **Toxic Elements (Remainder) NO**

See dentist immediately to remove all metals; save grindings for me to add to my thallium collection.

Summary: Phyllis cleared up her HIV and cancer in 7 days. But will she complete her program of getting well again? Thallium is to the body what termites are to a wood frame house—just a question of time before health collapses.

13 Ray Broyles Cancer and HIV

We first saw Ray two years ago. He was age 40 at that time and had just had an unusual experience. He had always been healthy and energetic. Then for no reason he passed out. He began vomiting, felt extremely weak and had other strange symptoms. His regular doctor prescribed a tranquilizer,

Oxazepam™, after ruling out numerous possibilities. However, these attacks recurred, and he lost about 10 pounds in a few months. I did not suspect nor test for cancer. I found the parasite, Trichuris, and heavy metals from tooth fillings as well as tungsten from his electric hot water heater. He was put on a parasite program. He became well but did not clear up the metal problems. He did not stay on a maintenance program for killing parasites. We did not see him till recently. He had no further episodes of passing out but was unable to recover from a recent flu.

This time the parasite test revealed *Fasciolopsis* in the liver. He was put back on the parasite-killing recipe. The cancer test, ortho-phospho-tyrosine, was **Positive**, and tungsten was showing its presence in all his body tissues. He soon got rid of his cancer and by changing his water sources and doing dental work he got rid of the tungsten problem. (He stopped all use of electrical frying pans and toasters.) He felt fine, his former self, and was released with food and body product restrictions.

We saw him again a half year later for frequent burping and difficulty swallowing. There was some similarity to his original attacks. There was pain over his chest and heart area, but I did not suspect HIV at that time. The parasite test showed heartworm and dog tapeworm eggs. The cancer test was Negative.

He was put on a high dose parasite-killing program and dental repair was recommended. This cleared up his health problems, again, temporarily. He was not given food or product restrictions. A half year later he became ill again with prolonged flu and pressure on his chest.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☐ **Fasciolopsis and all stages (Parasite) NO**

I did not search his tissues, only the white blood cells. Could I have missed a few?

☒ **Sheep liver fluke redia (Parasite) YES at thymus, penis**

☒ **Sheep liver fluke metacercaria (Parasite) YES at pancreas only**

☒ **Pancreatic fluke (Parasite) YES at thymus, pancreas**

☐ **Human liver fluke (Parasite) NO**

☒ **Benzene (Solvent) YES at thymus**

Uses Nivea™ brand cream after shaving—will go off entire list of benzene containing products.

☒ **Wood Alcohol (Solvent) YES high at thymus and pancreas**

Others not tested at this time. He was to switch off commercial beverages and will take Milk Thistle capsules temporarily, to assist the liver. And he will return to a high dose parasite-killing program followed by a maintenance program. He must avoid eating meats in restaurants.

Three days later

☐ **Protein 24 (HIV) NO**

Virus is gone but he is still very ill.

☒ **Benzene (Solvent) YES**

Has not stopped eating cold cereals.

Ten days later

His pains are gone. His digestion continues to be a problem. I suspect tapeworm heads have been released in his liver by the solvents; they are shedding eggs. He feels well enough to return to work. He will add Rascal to his daily routine for 2 weeks to kill tapeworms.

☒ **Decane, Methyl Butyl Ketone (Solvent) YES**

Hasn't stopped eating processed foods

☒ **Toluene (Solvent) YES.**

Summary: Ray's patience has paid off, in spite of imperfect compliance. If he had accepted the tranquilizer a few years ago, without pursuing the true cause of his illness, namely parasites and solvents, he would be a permanent invalid today.

14 Sybil McAsh HIV

This 22 year old woman says her main problem is upper and lower back pain. Due to this pain, she finds it difficult to milk or do her upholstery. Four years ago she had mononucleosis, and she has never really gotten well from it. She also complained of the following: 1) her ears feel shut at times

and wet; 2) her hands are sometimes numb; 3) she is gassy; 4) her legs hurt frequently; 5) her knees burn after walking; 6) the arches on her feet hurt; 7) she experiences cramping and clotting as well as headaches and a short temper when she menstruates. Except for a few "weird" symptoms, this seemed like a simple case of kidney stones and liver stones. It was quite surprising, then, to see that:

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus; NO at vagina**

She has no pain over her sternum, but she has chest tightness when she breathes. She has the HIV virus, although there are NO risk factors for her. I deliberated for some time before breaking the news to her. I explained the logic of it but perhaps she was too upset to comprehend it.

☒ **Fasciolopsis (Parasite) YES at intestine and part of thymus**

☒ **Fasciolopsis redia (Parasite) YES at the same part of thymus as above**

Others not tested

☒ **Xylene, Styrene (Solvents) YES**

☒ **Benzene (Solvent) YES at both parts of thymus**

☐ **Solvents (Remainder) NO**

She will start on parasite program. She will go off the list of items polluted with benzene. She will go off commercial beverages and drink milk, water, single herb teas, fresh squeezed fruit juices and homemade tomato juice without salt added. She will stop using styrofoam cups. We will deal with kidney stones later.

Two weeks later

She states that she suffers from bloating each time she eats or drinks. We will plan to clean her liver. She also gets severe headaches.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Protein 24 (HIV) NO**

She is very pleased, as I am, to have vanquished this virus. However, regaining the health of her thymus is still a challenge.

☐ **Benzene (Solvent) NO**

☒ **Decane, TCE (Solvent) YES**

She will be more careful in food selection, avoiding cookies and cakes from the store. She will start on the kidney herb recipe to improve her back and leg pains.

Summary: Sybil got rid of her benzene toxicity and also the HIV virus. She is on day 12 of the parasite program. Her metal tooth fillings, as well as her husband's, appear corroded and tarnished on the top surface. She is to remove all metal from her mouth to improve thymus function so she can regain her normal immunity.

15 Tina VanWinkle HIV

This is a young couple belonging to a religious group where the common risky behaviors are unthinkable. Tina has been well until recently. This winter she has already had 2 courses of antibiotics and can't get rid of her cough. She feels pain in the chest when she lifts an object. She also had "walking pneumonia" this winter. She is chronically congested in her head as well, all of which is unusual for her. When she placed her hand over her sternum to illustrate this pain, I suspected HIV/thymus disease. They have several young children.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus, vagina and uterus**

☒ **Fasciolopsis (Parasite) YES at thymus; NO at liver**

No other parasites or stages were tested in order to save office time for her husband.

☒ **Benzene (Solvent) YES high everywhere**

She has high levels of benzene throughout her body. She is eating various brands of cold cereal daily. She will stop immediately. She will avoid other items on the benzene list, although she had not been using most of them.

Husband, Alfred

He has no obvious health problems and complains about nothing. He smokes (a little).

☒ **Benzene (Solvent) YES at the liver; NO at thymus**

This is quite unusual. Benzene nearly always accumulates at the thymus.

☒ **Isopropyl Alcohol (Solvent) YES at liver**

He uses no body products, other than shampoo. His main source of propanol must be cold cereal.

☐ **Protein 24 (HIV) NO**

☒ **Ortho-phospho-tyrosine (Cancer) YES at liver and lung**

Note: He has cancer developing at the liver! They both (as well as their children) will stop eating cold cereal. They will start parasite-killing program. They will avoid the benzene list.

Thirteen days later

Tina no longer has chest tightness, but her cough has gotten croupy and worse.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Protein 24 (HIV) NO**

We are all very pleased.

☒ **Hexane dione (Solvent) YES**

Stay off commercial beverages.

☒ **Methyl Ethyl Ketone, TCE (Solvents) YES**

☐ **Solvents (Remainder) NO**

Note that her benzene problem is gone.

Alfred

Her husband, Alfred, seemed put out and put upon with all the restrictions I placed on him. However, he did accomplish his purpose.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Carbon Tetrachloride (Solvent) YES**

Stay off cold cereal and commercial beverages. Others not tested.

Summary: This young couple averted disaster, narrowly, as each filled up on solvents by eating cold cereals and drinking commercial beverages. Hopefully, they will be able to teach their children how to avoid both cancer and HIV by avoiding polluted food and products.

16* Lenzy Perez HIV

Lenzy is a young man, age 28, who has come to correct his HIV **Positive** status. We assured him that in 6 weeks he would get an HIV-NEGATIVE test result if he followed instructions meticulously. He seems incredulous but willing to try. He brought the test results under a code number. The test was done and confirmed at Anonymous AIDS Antibody testing lab. He has a chronic sore throat and some anxiety but otherwise is not ill.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Benzene (Solvent) YES at thymus and penis**

☒ **Kerosene, Methylene chloride (Solvents) YES**

He will go off cold cereals and all commercial beverages. He will be vegetarian for 3 months. He will be off the benzene-pollution list I gave him.

☒ **Fasciolopsis (Parasite) YES at thymus only; NO at liver and intestine**

☒ **Fasciolopsis unincubated eggs (Parasite) YES at thymus, penis, spleen, semen**

☒ **Sheep liver fluke cercaria (Parasite) YES at thymus, penis, spleen**

☒ **Pancreatic fluke (Parasite) YES at thymus**

☐ **Human liver fluke and all stages (Parasite) NO**

He will start the parasite-killing program. He was concerned that his friend was using marijuana and it might be polluted. I tested it for benzene. It was YES (**Positive**). He will alert his friend immediately.

Seven days later

His sore throat is gone. He feels better. He still has a complexion problem on forehead.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

He is now HIV-free.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☐ **Human liver fluke and all stages (Parasite) NO**

He is very happy but incredulous also.

☒ **Bismuth (Toxic Element) YES at thymus**

Off colognes and all fragrant products.

☒ **Palladium (Toxic Element) YES**

Tooth metal.

☒ **Mercury (Toxic Element) YES high at thymus and numerous other tissues**

☒ **Gallium (Toxic Element) YES at thymus**

Tooth metal.

☒ **Lead (Toxic Element) YES at thymus**

We will test water.

☒ **Lutetium, Zirconium (Toxic Element) YES at thymus**

He will go off commercial deodorant and other body products. He will continue on parasite program. He needs to have all metal removed from his mouth.

Seven days later

His clinical doctor repeated the HIV antibody test. It was POSITIVE again, as you would expect an antibody test to be.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

He is on day 14 of the parasite program.

☒ **Benzene (Solvent) YES at the edge of thymus**

☐ **Solvents (Remainder) NO**

He will be more diligent about avoiding the benzene list and will bring personal products for testing.

☒ **Bismuth (Toxic Element) YES**

He has brought several fragrance varieties for testing, but I prefer he not use any commercial variety.

☒ **Warts, Candida, CMV, Treponema, Capsules of bacteria (Pathogens) YES**

☐ **Pathogens (Remainder) NO**

End of box 1 and 2. Note: He picked up a small amount of benzene but has not developed numerous infections; only 5 pathogens, total, out of 67 tested! This is as good or better than average for a non-HIV infected person.

Seven days later

He is feeling much better than he did at first. His dental appointment is scheduled.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Denatured alcohol, Petroleum ether (Solvents) YES**

He will be more careful when putting gas in his car. He is now on a parasite maintenance program. His complexion is clear. He looks well.

☒ **Lead (Toxic Element) YES**

☐ **Lead (Toxic Element) NO in his drinking water**

☐ **Bismuth (Toxic Element) NO**

Uses the cologne tested to be bismuthfree.

☐ **Zirconium (Toxic Element) NO**

☒ **Proteus mir:, B strep, Histoplasma, Salmonella ent, Lepto ent, Haem inf, Bacillus anth (Pathogens) YES at thymus**

☐ **Pathogens (Remainder) NO**

End box 1 and 2. This is a very good record for an average person but not as good as his previous

record. Four of these are tooth bacteria. He will do dental work soon.

☒ **Uric Acid, Cysteine and Cystine, all 3 phosphates (Kidney Stones) YES**

He has an unusually large number of kidney stones. He has not been drinking milk for over a year; he has read it causes mucous and could make his sore throat worse. I reassured him his throat would clear up after dental work. He also needs to reduce phosphate in diet (meat, bread, cereal, sodas) and eat more fruits and vegetables. He plans to buy a vegetable juicer. He will start to drink milk if he digests it OK. He may wait until his stomach parasites are killed so he can digest it better. He will start on kidney herb recipe to dissolve these deposits and also take magnesium oxide, 300 mg, per day. He is ready for HIV antigen test. We will send requisitions.

One week later

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO.**

☐ **Protein 24 (HIV) NO**

He will do an HIV antigen test. We did not send requisitions earlier.

One week later

He looks good and feels very well.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Mycoplasma, Histopl cap, A strep, Proteus (Pathogens) YES**

This is the average number of infections for a well person. He has not completed his dental work yet.

One week later

His clinical HIV antigen test results are back. It states he is NEGATIVE. He is very pleased. He recently had a regular blood test by his clinical doctor; it showed a T cell count of 787.

☒ Chlamydia tr, Coxsackie B4, Bacillus anth, Pneumocystis carn, Spirillum rub, Trepon pall (Pathogens) YES

He has 6 YES tests out of about 70; this is better than the average healthy person. He has completed his dental work.

Summary: Lenzy says he is enjoying his new lifestyle. He would like someone to talk to about all of this, though, and I hope he finds a few other cured cases with whom to share his joy and anxiety over recurrence. He is planning an expansion of his massage clinic and plans to bring in products to be tested for benzene so that he isn't selling this "deathtrap" to anybody. He is a uniquely moral person.

17 Dan Holt HIV and Anemia

This is a 40 year old man with anemia. For the last 1-2 years he has had a chronic coldflu syndrome. He is over stressed. He is in engineering. He has pain in the pancreas area and over the heart. He experiences “hot flushes.“ He has dry skin and lower back pain. He drinks a lot of decaffeinated beverages. He has additional bizarre symptoms.

☒ **Asbestos (Toxic Element) YES**

Will test clothes and hair dryers.

☒ **Silver (Toxic Element) YES**

Tooth fillings.

☒ **Gold (Toxic Element) YES**

In his glasses and tooth fillings.

☒ **Thulium (Toxic Element) YES**

In his vitamins.

☒ **Palladium (Toxic Element) YES**

Tooth fillings and glasses.

☒ **Zirconium (Toxic Element) YES**

Deodorant and toothpaste.

☐ **Toxic Elements (Remainder) NO**

Remainder were NO. He will start on kidney herb recipe and get plastic rimmed glasses and arrange to get metal tooth fillings replaced by plastic.

BLOOD TEST	Result	Comment
1. RBC	low	anemia, parasites
2. Creatinine	slightly high	kidney

3. Uric acid	slightly high	kidney
4. Calcium	low	He will drink 2% milk, 3 glasses/day and take magnesium oxide, 1 a day (300 mg, from Bronson Labs).
5. SGOT, SGPT	low	Take B6 (500 mg) one/day.
6. Cholesterol	very low	cancer risk

Three weeks later

☒ **Cysteine, Cystine (Kidney Stones) YES**

He has been on kidney herbs for 4 weeks. Continue up to 6-8 weeks.

☒ **Echinococcus granulosus cysts adult (Parasite) YES**

☐ **Echinococcus granulosus eggs (Parasite) NO**

☒ **Chilomastix (Parasite) YES**

☐ **Parasites (Remainder) NO**

Will start on parasite program

One month later

☐ **Cysteine, Cystine (Kidney Stones) NO**

☐ **Chilomastix, Echinococcus all stages (Parasites) NO**

☐ **Asbestos, Zirconium, Silver, Gold, Thulium (Toxic Elements) NO**

Start on thioctic acid (100 mg), 1 per day.

☐ **Solvents (ALL) NO**

He says he feels very well. All his symptoms are resolved. Client released. He will stay on vitamin E (400 mg), B_6 (250 mg), vitamin C (1000 mg) magnesium (300 mg), thioctic (100 mg) daily.

One month and 2 weeks later

He now has thrush, which his wife has also. He has had it for 6-8 weeks and is on a prescription drug for it.

☒ **Protein 24 (HIV) YES at thymus**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis adults and redia (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES at thymus, liver, and penis**

☒ **Benzene (Solvent) YES high**

He uses Tom's™ toothpaste and rubber cement; he will stop. He will repeat parasite-killing program at higher dose. He will avoid rare beef.

Two months later

Thrush has returned. He was feeling very well until recently. He has not eaten beef for 22 years or any meat except chicken, turkey and tuna fish. He will go off all but fish and seafood.

☒ **Protein 24 (HIV) YES at thymus**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus only**

☐ **Fasciolopsis adult and remaining stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☒ **Methylene chloride (Solvent) YES at thymus**

Drinks Celestial Seasonings™ tea.

☐ **Solvents (Remainder) NO**

We will test his beverages. He will start on a 5 day high dose parasite program again.

Two weeks later

He still has thrush and general fatigue. He has done the 5 day high dose parasite program and is still on a maintenance program.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus, penis; NO elsewhere**

☐ **Fasciolopsis adult and remaining stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Candida (Pathogen) YES**

☒ **Hexane (Solvent) YES**

Still drinking Celestial Seasonings™ tea.

☒ **Toluene (Solvent) YES**

☐ **Solvents (Remainder) NO**

Go off commercial beverages.

One day later

He still has Candida (yeast infection).

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Fasciolopsis (Parasite) YES at thymus**

☒ **Fasciolopsis redia and miracidia (Parasite) YES**

☒ **Sheep liver fluke cercaria, redia, and miracidia (Parasite) YES**

He was eating turkey, frozen and cooked. He will stop.

☒ **Pancreatic fluke (Parasite) YES**

☒ **Candida (Pathogen) YES**

Five days later

☒ **Benzene, Xylene, Grain Alcohol (Solvents) YES**

☐ **Solvents (Remainder) NO**

He will go off benzene list more carefully.

Five days later

He is still fatigued.

☒ **Protein 24 (HIV) YES**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES**

Others not tested.

Five days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Solvents (ALL) NO**

☐ **Candida (Pathogen) NO**

Perhaps he has finally conquered this problem by staying off all meats and commercial beverages.

One month later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Petroleum ether (Solvent) YES**

Car problem.

☒ **Methyl butyl ketone (Solvent) YES**

☐ **Solvents (Remainder) NO**

He is still using Celestial Seasonings™ teas.

Summary: Mr. Holt was one of my early clients with HIV illness; I did not suspect it nor test for it until he got thrush (Candida in his throat). It was quite difficult for him to eradicate it because his benzene sources were obscure. But he was diligent and finally was successful.

18 Linda Holt HIV

This 37 year old woman is the wife of Dan Holt and had a lot of

symptoms. Her eyes are itchy and runny. She suffers from sinus infections tions and ringing in the ear. Her throat is sore due to asthma and asthma drugs and she has a yeast infection in her throat. Her neck is stiff and the muscles are sore Her shoulders are tense. She suffers from chest congestion, asthma, and had pneumonia two years ago. Her heart area feels constricted. Her stomach is bloated and aching. She has constant lower back pain. Her feet are achy at the end of the day. Her sleep is affected by her breathing and worries. Her energy level is up and down and affected by her asthma. She has frequent headaches. She often has urinary tract infections. She has had depression off and on for the past 20 years. She has a weight problem. She is on Vanceril™, Ventolin™, Seldane™, Humibid LA™, Intal™, Medrol™ (4 mg), Beconase™, Anacin™, and Acetominophen™. She is allergic to cats, dogs, fish, some foods, horses, dust, mold, and grass. (I suspect Sheep liver fluke and *Ascaris*.)

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Benzene (Solvent) YES high**

She will start parasite program and go off items on the benzene-pollution list.

Two months later

She has swelling across her abdomen.

☐ **Protein 24 (HIV) NO**

☒ **Ortho-phospho-tyrosine (Cancer) YES cervix; NO elsewhere**

☒ **Fasciolopsis (Parasite) YES at liver; NO elsewhere**

☒ **Fasciolopsis eggs (Parasite) YES at blood and cervix**

☐ **Fasciolopsis remaining stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

Original guess was wrong.

☒ **Wood Alcohol (Solvent) YES at cervix**

Drinks root beer.

☒ **Isopropyl Alcohol (Solvent) YES at cervix; NO at liver**

☐ **Solvents (Remainder) NO**

Go back on parasite program. Avoid propanol-containing products.

Two months later

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Fasciolopsis (Parasite) YES at thymus**

☒ **Fasciolopsis eggs and redia (Parasite) YES**

☒ **Sheep liver fluke adult, cercaria, miracidia (Parasite) YES**

☐ **Pancreatic fluke adult (Parasite) NO**

☒ **Pancreatic fluke stages (Parasite) YES**

☒ **Wood alcohol, Regular gasoline, Benzene, Grain alcohol, Toluene (Solvents) YES**

☐ **Solvents (Remainder) NO**

She will go on high dose parasite program, then on maintenance program. She will be off benzene list and commercial beverages.

Five days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Parasites (ALL) NO**

☒ **TCEthylene (Solvent) YES**

Off Celestial Seasonings™ tea.

☐ **Solvents (Remainder) NO**

One month and 3 weeks later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ ***Ascaris* (Parasite) YES**

Cause of asthma.

☒ ***Ascaris* mega (Parasite) YES**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke miracidia (Parasite) YES at liver**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

☒ **Methylene chloride, Pentane, Methyl ethyl ketone (Solvents) YES**

She will definitely go off commercial beverages, definitely.

BLOOD TEST	Result	Comment
1. FBS	slightly high	cleanse liver
2. Phosphate	high	dissolving bone. She will drink 3 glasses of 2% milk daily and take 1 magnesium (300 mg) daily.
3. LDH	high	liver? heart? cancer?
4. RBC	slightly high	check cobalt toxicity
5. Eos	very high (8%)	parasites

One month later

She is congested. She has been on parasite maintenance program, 2 times a week.

☐ **Protein 24 (HIV) NO**

☒ **Styrene (Solvent) YES**

Stop using styrofoam products.

☒ **Petroleum ether (Solvent) YES**

Stop pumping gas.

☒ **Decane (Solvent) YES**

Off cold cereal.

☐ **Solvents (Remainder) NO**

☒ **Beryllium (Toxic Element) YES high**

☒ **Benzalkonium (Solvent) YES**

Wash plastic cups before using. She does not use toothpaste.

☒ **Chromate (Toxic Element) YES**

No source found.

☒ **Mercury high, Cerium, Tellurium high (Toxic Element) YES**

Tooth fillings.

☒ **Barium (Toxic Element) YES high**

Lipstick.

☒ **Vanadium (Toxic Element) YES high**

Search for gas leak in house.

☒ **Lutetium (Toxic Element) YES**

Ventilate painted room.

☒ **Formaldehyde (Toxic Element) YES**

Foam mattresses. Throw them out.

☐ **Toxic Elements (Remainder) NO**

Needs to remove metal from mouth, fix a gas leak in the home, get away from gasoline and paint fumes and throw away foam mattresses. Notice how many of these would worsen her asthma.

Summary: Ms. Holt and her husband were undoubtedly infecting each other with the flukes and had to both be free of them before either could stay well. Hopefully, Ms. Holt will work at her health until she can be off some of her drugs and actually begin to feel better. In a family setting one is faced with other person's parasites and pollution in addition to your own. She has done an excellent job.

19 Claudia Holt HIV

This is the 13 year old daughter of Linda and Dan Holt. The parents are concerned about the HIV virus for their children. Claudia has no health problems.

☐ **Protein 24 (HIV) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at one part of thymus and vagina only**

☐ **Fasciolopsis remaining stages (Parasite) NO**

☒ **Benzene (Solvent) YES**

She will start parasite program and go off the items on the benzene-pollution list.

One week later

☒ **Benzene (Solvent) YES higher than before**

☒ **Benzene (Solvent) YES high in Future™ floor polish, NuFinish™ (once a year car polish)**

They were keeping these items in a closet; will put them in the garage and never again use polish with bare hands.

☐ **Fasciolopsis and all stages (Parasite) NO**

Two months later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Hexane dione (Solvent) YES**

Drinks ginger ale, switch beverages. Note: benzene is gone.

One month later

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Fasciolopsis eggs and cercaria (Parasite) YES**

☒ **Sheep liver fluke adult and miracidia (Parasite) YES**

☒ **Pancreatic fluke (Parasite) YES**

She will go off meat and start parasite program again.

☒ **Isopropyl Alcohol (Solvent) YES**

Cosmetics.

☒ **Benzene, Ether, Toluene (Solvents) YES**

☐ **Solvents (Remainder) NO**

She will stay off commercial beverages.

Five days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Pancreatic fluke and stages (Parasite) YES**

☐ **Sheep liver fluke and stages (Parasite) NO**

☒ **PCB (Toxic Element) YES high**

Go off all detergents.

One month and one week later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Wood Alcohol (Solvent) YES at pancreas**

☒ **PCB (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

Summary: Notice how Claudia can easily kill her parasites but promptly picks them up again. I suspect fast food meats to be her main source of infection. She may be typical of the general population, picking up benzene on a daily basis but eliminating it shortly. Only after a time of several years will the thymus be so damaged and liver detoxification mechanisms be so weakened that benzene begins to pile up and set the stage for AIDS.

20 Sidney Holt HIV

Sidney was away at college and was not seen until after the rest of the family. He has severe allergies for which he takes several medications He is trying to hold a job besides going to school. He has stiffness of joints, shoulder pain, lower and upper back pain, knee pain, and a few others. He wears a splint to keep from grinding his teeth.

☒ **Cysteine (Kidney Stone) YES**

☐ **Kidney Stones (Remainder) NO**

He will begin with our kidney herb recipe to remove his sulfur crystals and get relief from stiffness and lower back pain.

Two weeks later

He has not gotten any pain relief. In fact, his fatigue has worsened.

☒ **Protein 24 (HIV) YES at thymus, penis and brain**

We did not discover this at first visit because of focusing on regular problems and not suspecting HIV!

☒ **Benzene (Solvent) YES**

Uses Vaseline Lip Therapy™—will go off.

☒ **Fasciolopsis (Parasite) YES at thymus and intestine**

☒ **Fasciolopsis redia (Parasite) YES at thymus and blood**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus and brain**

Others not tested. He will start on parasite-killing program. He will avoid benzene-polluted products.

Two months later

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

He has done well. He has his old energy back and can concentrate on studies.

Three months later

He has felt better than in a long time. He is not even getting colds or flu, like others around him. He will stay on parasite maintenance program.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Methyl butyl ketone (Solvent) YES**

☐ **Solvents (Remainder) NO**

He will switch to milk and water and fresh squeezed juices, no commercial beverages.

Summary: Sidney has done an exemplary job of changing his lifestyle. He appreciated knowing the cause of his problems, which were much too numerous for his age. He was also very thankful to have an understanding of this disease in order to escape it in the future.

21 Ralph Smith Multiple Cancer and HIV

Ralph, age 43, came to our office because of his sarcoidosis which was diagnosed six years ago, although he had it earlier than that. At that time, he had pain on the center front chest so that he couldn't breathe deeply. He was put on cortisone for it and the pain was reduced, but it is still minimally present. This location suggests the thymus. He is still on Prednisone.™

☒ **Protein 24 (HIV) YES at thymus and penis; NO in semen and saliva**

☒ **Ortho-phospho-tyrosine (Cancer) YES at thymus, intestine, lung, bronchii**

He has both cancer and HIV! He stated that he had been tested for HIV antibody twice already, both times with Negative results.

☒ **hCG (Pre-Cancer) YES in all tissues**

He is pre-cancerous throughout his body! This was a shock.

☒ **Fasciolopsis (Parasite) YES at thymus and liver**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus, liver, semen, penis**

Other flukes not tested. Start on parasite program.

☒ **Isopropyl Alcohol (Solvent) YES high at liver**

Since he does not eat cold cereal nor use body products, his only source is shampoo. Considering his high levels, there must be an unknown source of propanol. He will be watchful. He will switch off commercial shampoo.

☒ **Benzene (Solvent) YES high throughout his body**

Go off the benzene list. This youngish man had tried many things to improve his health. His medical file is ½ inch thick. It seems incredible that so massive a cancerous state could be missed by clinical routines.

Five weeks later

☐ **Protein 24 (HIV) NO**

Very good news.

☒ **Ortho-phospho-tyrosine (Cancer) YES at intestine only**

☒ **hCG (Pre-Cancer) YES at intestine, lung, bronchii**

☒ **Fasciolopsis (Parasite) YES at intestine and liver; NO at thymus**

☒ **Fasciolopsis cercaria (Parasite) YES at intestine and liver; NO at thymus**

☐ **Benzene (Solvent) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

He is still using his favorite shampoo but will switch.

Summary: Ralph has solved part of his problem, the HIV virus and benzene pollution. But the propanol level was still high and the flukes were still thriving (due to eating hamburgers) so the cancer continued. He is determined, though, to cure it all.

22 Bruce Whitlow HIV

This is a 34-year-old male who has a long history of chronic sinus

infections and allergies. He reported that his main problems were: chronic sinus and ear problems. He was getting “bubble shots” from Dr. Schaffer a few years ago. Another doctor did a RAST test. He is now on weekly allergy shots. He feels tired and foggy headed. He had elbow soreness in his right arm and he broke his right arm 4 times. He has a weight problem. He quit smoking a month ago. He suffers from lower back pain. He gets headaches, 1-2 times a week. He has had tinnitus on the left side for 10 years. He has to urinate frequently and has a history of prostate infection. He has no pets.

BLOOD TEST	Result	Comment
1. CO2	high (28)	search for air pollutant
2. Uric acid	high	kidney problem
3. Calcium	slightly low (9.1)	He will increase his milk consumption and take magnesium (300 mg) 1/day and B6 (250 mg) 1/day.
4. LDH	slightly low	fatigue
5. Iron	very low	parasites
6. Cholesterol	slightly high	liver gallstone cleanse
7. Triglycerides	slightly high	kidneys
8. WBC	low	bone marrow toxin
9. RBC	low	anemia—parasites
10.Platelet count	slightly high	parasites
11. Urinalysis	OK	no urinary tract infection

☒ **Uric Acid, Mono and di Calcium phosphate (Kidney Stones) YES**

Start on kidney herb recipe.

Twenty days later

He reported that his lower back is better.

☐ **Kidney Stones (ALL) NO**

☒ **Mercury (Toxic Element) YES high at bone marrow and lungs**

Tooth fillings.

☒ **Rhodium (Toxic Element) YES at bone marrow and lungs**

Tooth fillings.

☒ **Strontium (Toxic Element) YES at bone marrow and lungs**

Toothpaste

☒ **Zirconium (Toxic Element) YES at bone marrow and lungs**

Off deodorant.

☒ **Vanadium (Toxic Element) YES at bone marrow and lungs**

Cause of red skin on face—search for gas leak in home. We will test his home air for vanadium after he fixes his gas pipes. He needs all metal removed from his dentalware.

☒ **Fasciolopsis adult, miracidia (Parasite) YES**

☒ **Fasciolopsis redia, cercaria (Parasite) YES at bile duct**

☒ **Trichinella, Ancylostoma (Parasite) YES**

Remainder untested. Start on parasite program.

Seventeen days later

Gas leak has been fixed.

☒ **Mercury, Rhodium (Toxic Elements) YES**

Has not done dental work yet.

☒ **Strontium (Toxic Element) YES high**

Off toothpaste.

☐ **Vanadium (Toxic Element) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Ancylostoma, Echinococcus, Sheep liver fluke, Dipetalonema (high), Dipylidium caninum, Plasmodium vivax, SchistosomaLeishmania tropica, Necator, Plasmodium falciparum (Parasites) YES**

Increase parasite treatment with a 5 day high dose program. This is an unusually high number of parasites, especially after several weeks of parasite treatment. We must test for HIV/AIDS.

☒ **Protein 24 (HIV) YES**

☒ **Benzene (Solvent) YES**

Off benzene-pollution list.

Two weeks later

He reported that his sinus problem has not improved.

☐ **Rhodium (Toxic Element) NO**

☒ **Vanadium (Toxic Element) YES high**

Has another gas leak.

☒ **Zirconium (Toxic Element) YES**

Still on toothpaste.

☒ **Strontium (Toxic Element) YES high**

Uses toothpaste and has not done dental work.

☒ **Eimeria, Diphyllobothrium (Parasites) YES**

☐ **Parasites (Remainder) NO**

Continue on parasite maintenance. He plans to clean his liver to get rid of allergies. He is starting on 07 and peroxy for this purpose.

One month later

He has done 3 liver cleanses. He has been feeling a lot better. Energy is up. He got out a total of 750 stones. He took 14 wormwood for 3 days, plus Black Walnut—30 drops 4 times daily.

☐ **Protein 24 (HIV) NO**

☐ **Eimeria, Diphyllobothrium (Parasites) NO**

☐ **Vanadium (Toxic Element) NO**

He fixed second leak.

☐ **Zirconium (Toxic Element) NO**

☒ **Strontium (Toxic Element) YES**

Still using toothpaste.

☒ **Mercury, Rhodium (Toxic Element) YES**

Has not done dental work. He is leaving on vacation to Europe for a month. He is very pleased with his new energy.

Summary: We did not see Bruce after this, but he stopped in for some vitamins and told the receptionist he was very well. He was back at his old job. He had a wonderful vacation. He was living carefully as we had taught him, and he planned to come back for follow-up when he had managed to do his dental repair.

23 Brandi Rosette HIV and Cancer

This 3-month-old baby is ill. She is filled with mucous. She has already had pneumonia once. She frequently does not want to feed—she is on Enfamil™ with iron. She saw her clinical doctor yesterday, he is giving her antibiotic shots twice a week and told her parents he is at a loss to understand her illness. She has very little leg motion. She does not sleep much.

☒ **Protein 24 (HIV) YES**

☒ **Ortho-phospho-tyrosine (Cancer) YES**

The baby has cancer and HIV, how tragic.

☒ **Isopropyl Alcohol (Solvent) YES at liver and thymus**

☒ **Benzene (Solvent) YES**

The baby has been on a lotion, Forever Living Aloe Heat Lotion™ since shortly after birth. This lotion tested YES (Positive) to both benzene and propanol when rubbed into my arm!

☒ **Fasciolopsis (Parasite) YES at liver and thymus**

☒ **Fasciolopsis eggs (Parasite) YES at saliva**

☒ **Strep pneu, EBV, Influenza, B strep, Proteus, Gardnerella vag, Chlamydia tr, Candida, CMV, Resp Sync v (Pathogens) YES**

One half of box I tested. Note: She is YES (Positive) to 10 out of 15 pathogens tested; this qualifies as AIDS. She will start on parasite-killing program for babies.

Mother, Argella

☐ **Protein 24 (HIV) NO**

☒ **Ortho-phospho-tyrosine (Cancer) YES at liver**

Cancer of the liver is in the mother.

☒ **hCG (Pre-Cancer) YES at one part of liver only; NO in WBCs**

☒ **Isopropyl Alcohol (Solvent) YES**

Will go off body products. Other solvents not tested

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Sheep liver fluke adults (Parasite) YES**

Others not tested. Note: this is unusual, not to have the adults in the liver. But it is nearly always liver cancer where this unusual situation is seen.

Father, Fred

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Benzene (Solvent) YES throughout his body**

☐ **Isopropyl Alcohol (Solvent) NO**

Other solvents not tested. They will keep the baby off all body products except olive oil. She will get only fruits and vegetables and milk, no crackers and other processed foods. The whole family will go off propanol and benzene polluted foods.

Summary: This case nearly brought tears to the eyes of all of us. They have not returned. Parasites and pollution are claiming the life of this beautiful child.

Later: This story has a happy ending. The baby recovered her health; the family was perfectly observant of the rules to keep her healthy. She is now a happy, growing infant.

24* David Adair HIV and Lung Cancer

This is a very ill-appearing tall man, with labored breathing and hot

hands to the touch. He was concentrating poorly as we greeted each other. His parents drove him here from a neighboring state for his HIV Positive diagnosis on the recommendation of a friend. He is extremely lethargic, but not able to sleep. Very little history was taken because he was barely able to sit in a chair.

☒ **Protein 24 (HIV) YES at thymus and penis**

☒ **Ortho-phospho-tyrosine (Cancer) YES at bronchii**

Also has lung cancer. He was diagnosed HIV Positive 5 weeks ago, after several bumps appeared on his right leg. But he had not been well for two years and has moved back to his parents' home.

☒ **Benzene (Solvent) YES at thymus**

☒ **Methylene chloride (Solvent) YES at thymus**

☒ **Acetone (Solvent) YES high at thymus**

☒ **Kerosene (Solvent) YES high**

He will go off commercial beverages and drink only milk, water and homemade fruit and vegetable juices. Note: no propanol was found; yet he is producing ortho-phospho-tyrosine in his lung. Could this be an error? Or did I fail to test for propanol? Perhaps it was only present in the liver, not the white blood cells, so I failed to catch it. He was cleaning paint brushes in kerosene recently; he will never do this again. His parents will cook for him and buy the new products he needs.

☒ **Fasciolopsis eggs (Parasite) YES at thymus and penis**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

He will start parasite program. He will switch from soap and detergent to borax concentrate. He will use only our body products. Note: there is no adult fluke in either liver or thymus; his clinical drug for HIV may have killed it. He will be vegetarian for 3 months.

The next day

He is feeling very ill, barely able to sit for the appointment. His mother is anxious, sitting upright. His father is standing, pacing the floor with his hands together.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

Both the virus and cancer are gone. This quick result may be due to his having only fluke eggs in the body when he arrived yesterday.

☒ ***Herpes*** **simplex 1, Trich vag, Nocardia, Borellia burg, B strep, A strep, Haemophilus inf, Coxsackie B4, Coxsackie B1, Histoplasma, Campyl pyl, *Bacillus cereus*, Bacteroides fr, Staph aureus, Plantar wart, Gardnerella, Propionobacter, Adenovirus, Strep pneu (Pathogens) YES**

☐ **EBV, CMV, Flu, Resp Sync Virus, Chlamydia, Shigella, Proteus, Salmonella (Pathogens) NO**

End box 1. Note: he has 19 out of 27 pathogens in an active stage, obviously AIDS. He will use our LG, 1 tbsp. 4 times daily. Also vitamin C, 3 grams a day. L-G is an immune booster we use for serious viral conditions.

They left for home, feeling that a test that shows NO (Negative) for HIV without showing any improvement in symptoms must surely be worthless and they must prepare for their son's death.

Eight days later

He is less lethargic today.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **PCB (Toxic Element) YES high**

Off all detergents; may eat on paper plates and cups using plastic cutlery to avoid soap residue on dishes.

☐ **Solvents (ALL) NO**

Is complying very well with instructions.

☒ **CMV, Gardnerella, B strep, Bacteroides fr, Salmonella ent, Histoplasma cap (Pathogens) YES**

☐ **EBV, Flu, Resp Sync Virus, Chlamydia, Shigella, Proteus, (Pathogens) NO**

Note: he has only 6 positives out of 27 in box 1! He is improving.

☒ **Anaplasma, Strep pyog, Mycobact TB, Shigella dys, Campyl fetus, Strep G, Clostridium sept (Pathogens) YES**

☐ **Mycoplasma, Candida (Pathogens) NO**

End box 2. Note: he has only 7 positives out of 40 in box 2. He is making good progress. I suspect teeth are source of most of the bacteria.

Twelve days later

He looks better. He walks without apparent neuropathy. He is taking his own notes on this visit. He

has moved back to his own apartment.

☒ **TCE (Solvent) YES**

Drinks flavored coffee—will stop.

☐ **PCB (Toxic Element) NO**

Uses borax for everything. He is on parasite maintenance program.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **A strep (Pathogen) YES at tooth #17**

Left lower wisdom tooth.

☒ **Klebsiella (Pathogen) YES at tooth #17 and 1**

Upper right wisdom tooth.

☒ **Corynebacterium, Campyl fetus (Pathogens) YES tooth #1**

☒ **Pneumocystis carinii (Pathogen) YES at lungs**

Note: he has only 5 pathogens that are growing, out of 67 tested, and these are mainly at 2 tooth locations. He needs to see dentist for cavitations at teeth #1 and 17.

☒ **Asbestos (Toxic Element) YES**

No clothes dryer or hair blower in apartment—test house air.

☒ **Bismuth (Toxic Element) YES**

Using cologne—he will go off.

☒ **Copper, Mercury (Toxic Elements) YES high**

Tooth fillings.

☒ **Palladium (Toxic Element) YES**

Tooth fillings.

☒ **Arsenic (Toxic Element) YES high**

Remove all pesticide. Remaining toxins not tested. He is advised to remove all metal from his mouth in addition to having cavitations done.

Ten days later

He is smiling now, walking briskly, and taking charge of his own case. He says he has more energy. But his right leg is a problem. He has difficulty walking on it. It is considered to have neuropathy by his clinical doctor. A new dark spot has appeared beside the old spot on his shin. It is thought to be Kaposi's sarcoma by his clinical doctor. His doctor says he has permanent HIV neuropathy. His breathing is still labored and audible.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at skin; NO in thymus, liver, intestine**

Cause of Kaposi's.

☒ **Fasciolopsis redia (Parasite) YES at skin, blood, bladder**

☒ **Sheep liver fluke cercaria (Parasite) YES at skin, bronchii**

☒ **Pancreatic fluke adults (Parasite) YES at skin, penis and bronchii**

☒ **Human liver fluke (Parasite) YES at skin and bronchii**

He has been eating at Arby's™ but will stop. He will go on our 5 day high dose parasite program. Note: the parasites are growing in the skin, causing the purplish lumps to appear. He did not get his cancer or HIV back because he did not have propanol or benzene in him. He must have another solvent, though. Will check.

☐ **Moniezia tapeworm head (Parasite) NO**

☒ ***Herpes* 1 (Pathogens) YES at skin**

☒ **Resp Sync Virus, B strep, Staph aureus, Adenovirus, Nocardia, Candida (Pathogens) YES at skin and bronchii**

He needs to get his dental work done.

☒ **Wood Alcohol, Methylene chloride (Solvents) YES at skin**

He has been drinking an herb tea blend. He will stick to single herbs.

☒ **Arsenic (Toxic Element) NO**

Carpets were steam cleaned.

☒ **Asbestos (Toxic Element) YES**

He brought air samples.

☒ **Asbestos (Toxic Element) YES bedroom air, kitchen air**

☒ **Asbestos (Toxic Element) NO living room air, bathroom air**

The kitchen has a radiator; the bedroom is next to the kitchen. We will test the paint on the kitchen radiator for asbestos with a wet towel rubbing.

Nine days later

His breathing is still audible. He has made a dental appointment; is on his way there. He has done a 5 day highdose parasite program and is on maintenance again.

☒ **Pinworm eggs, Strongyloides larvae (Parasites) YES**

☐ **Parasites (Remainder) NO**

☒ **Petroleum ether, Regular gasoline (Solvents) YES**

Gassed up car this morning. He will be more careful at gas stations.

Seven days later

He appears normal in walking and in energy but his breathing is still audible. His leg is worse, with increased purple blotches.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Hexane (Solvent) YES**

He has been using artificial creamer for coffee but will stop.

☒ **Asbestos (Toxic Element) YES**

Brought paint chips from radiator in the kitchen—are YES (**Positive**) for asbestos—remove radiator.

☒ **Campylobacter pyl and Campylobacter fet (Pathogens) YES**

Causes varicose veins. May contribute to purple blotches.

☒ **Salmonella para (Pathogen) YES**

☒ **Strep G, Diplococcus pn, and Staph mitis (Pathogens) YES**

Tooth bacteria.

☒ **Mycobacter TB (Pathogen) YES**

Lung bacteria

☒ **Klebsiella, Corynebact diph, Blepharisma, Anaplasma (Pathogens) YES**

He is in process with dental work and appears well enough to repeat the clinical HIV test soon.

One month later

He has not been ill; he looks well. He had part of his dental work done this morning, but there is still quite a bit more to do.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

We will give him a requisition to do his clinical HIV antigen test today.

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **TCE (Solvent) YES**

Eats flavored croutons—will stop. He is on the parasite mainten-ance program, 2 times a week.

☐ ***Herpes* zoster, Candida, Measles (Pathogens) NO**

☒ ***Herpes* simplex 1, Mycoplasma (Pathogen) YES at thymus**

☒ **CMV (Pathogen) YES**

I picked some possible infections but only got 50% YES (**Positive**), definitely not the picture of AIDS. His legs have healed; his doctors decided not to biopsy after all.

Ten days later

His clinical HIV test results arrived. They are NEGATIVE.

Five weeks later

He had remaining cavitations done yesterday and is scheduled for metal removal from dentalware in several weeks. His symptoms of “HIV neuropathy” are probably due to mercury toxicity. He is also very stiff after sitting. He also lost his peripheral vision. He has not had any illness in the past month. He has started drug testing studies at a hospital. His T count is still under 300. He has been on AZT for 6 months.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Benzene (Solvent) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

Is still using prescription shampoo; will use borax. He will stay on parasite maintenance program. Next time we will check for tapeworm stages and toxins.

Summary: David got rid of his cancer and HIV virus in 24 hours but getting rid of his AIDS was much more difficult. With his parents' assistance and his own stick-to-it-ness he succeeded.

25 Verna Albright HIV

Verna, age 30, came for rather mild sounding symptoms such as fatigue and insomnia. She felt lightheaded and often depressed. It all started with an acute sore throat and influenza about 6 months ago, and she can't seem to recover. She is on the birth control pill but it does not prevent her severe menstrual pain. She had acute mononucleosis a few months ago.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and vagina**

This Positive HIV test is quite a shock to both of us. I reassured her that it can be quickly cleared up and will not come back provided she understands the illness well enough to avoid it. She seems angry with my finding. It would be best to schedule a regular clinical test for her.

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at liver, thymus, blood**

☒ **Sheep liver fluke eggs (Parasite) YES at liver, thymus, blood**

☒ **Sheep liver fluke (Parasite) YES at liver, thymus, uterus**

This is the probable cause of menstrual pains (other parasites not tested.

☒ **Benzene (Solvent) YES at thymus and vagina**

☒ **Hexane (Solvent) YES**

Remainder not tested.

Summary: Verna seemed quite eager to leave the office in spite of our reassurances. She has not

returned in 4 months. We scheduled clinical tests for her but received no test results back. We hope she returns eventually. Her anger is understandable.

26 Milton Essey HIV

Milton, age 21, came with his mother, perhaps against his will, since he wrote very little on his symptom sheet. His mother said they had been doctoring for 7 years already and could not find his problem. He has chronic stomach problems and nausea and fatigue. He can't eat until after one o'clock in the afternoon to reduce distress. I suspect roundworm and Salmonella.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus, blood and genital tract**

☒ **Benzene (Solvent) YES**

Uses no benzene polluted products but chews tobacco which may have benzene—I have asked for a sample. Other solvents not tested.

☒ **Fasciolopsis (Parasite) YES at thymus; NO at liver, colon, etc.**

I should have checked stomach. My error.

☒ **Fasciolopsis redia (Parasite) YES at thymus and liver**

Other parasites not tested. He will start on parasite-killing program. He will remove all solvents, cleaners, Vaseline, and automotive things from his house.

Five days later

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Mycoplasma (Pathogen) NO**

☐ **Benzene (Solvent) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

☐ **Solvents (Remainder) NO**

Summary: We were all thrilled with Milton's (or perhaps his mother's) accomplishment. I thought they were both so upset and angry with my findings that they would not return. But he carried out his instructions perfectly. They removed a lot of "automotive stuff" in cans from their basement. He didn't say much at either visit, but his smile said it all at the end. I hope he also eliminates isopropyl alcohol and that his quest for normal health is ended.

27 Alma Olivas HIV

Alma is 26 years old and has had a fever of unknown origin for several years. She brought considerable paper work documenting her past illnesses. She has night sweats, is nauseated, and her neck feels swollen. She is extremely fatigued.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and vagina**

☒ **Fasciolopsis (Parasite) YES at thymus and intestine**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus and blood**

Other parasites not tested.

☒ **Benzene (Solvent) YES**

Uses Vaseline™ and will stop.

☐ **Solvents (Remainder) NO**

Her husband, Cruz

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Fasciolopsis (Parasite) YES at intestine only**

☐ **Fasciolopsis other stages (Parasite) NO**

☐ **Solvents (ALL) NO**

Note: There are no reproductive stages of Fasciolopsis in Cruz due to the absence of solvents. They will both start on parasite-killing program and avoid benzene-polluted products.

Two weeks later

Alma's fevers continue on and off. She has had a very bad cold.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Benzene (Solvent) NO**

☒ **Palladium, Tellurium (Toxic Elements) YES**

☐ **Toxic Elements (Remainder) NO**

She will replace her metal tooth fillings to improve her immunity.

☒ **mono-Calcium Phosphate (Kidney Stone) YES**

☒ **Kidney Stones (Remainder) NO**

She will change her diet to include 3 glasses of milk, at least 2% and increase fruit and vegetables. She will reduce meat consumption and eat nothing rare. She will start on kidney herb recipe.

Summary: This may have been a very useful experience for Alma and Cruz. In 2 weeks they learned how to rid themselves of parasites and avoid HIV and cancer for the future. Since they are from several states away, they may not return. Hopefully, they are sticking to their new lifestyle.

28 Bill Lippencott HIV

Bill is a graduate student in physics and needs superior health to accomplish his goals. When his mood or concentration is not at its peak his performance is poorer and quite noticeable to himself. He is health conscious and has no risky behaviors. We saw him last fall, 4 months ago for a mood and energy problem and now it is back.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and penis**

This was very shocking news. However, he was able to understand the explanations that followed and felt reassured that he would not be victimized by this disease.

☒ **Benzene (Solvent) YES at thymus, penis**

☐ **Solvents (Remainder) NO**

He will go off the benzene-polluted list of products.

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus, blood**

He will take our parasite-killing program.

Eleven days later

☐ **Protein 24 (HIV) NO**

☒ **Methylene chloride (Solvent) YES and in corn flakes**

Benzene is gone but he picked up a new food solvent.

One month later

He can tell he is not feeling right again.

☐ **Solvents (ALL) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at liver, thymus and brain**

☒ **Pancreatic fluke (Parasite) YES at pancreas**

☒ **Sheep liver fluke (Parasite) YES at pancreas**

☒ **Sheep liver fluke miracidia (Parasite) YES at thymus**

Note: Bill has picked up rather a lot of fluke parasites. The source is uncertain. He will do a 5 day high dose parasite program.

One month later

☐ **Protein 24 (HIV) NO**

☒ **TCEthylene (Solvent) YES**

☒ **Pentane (Solvent) YES**

Will stop drinking apple juice, the probable source.

Two months later

His bowel movement is strangely disturbed, very much slowed down but not hard or difficult (I suspect tapeworm.)

☒ **Hexane (Solvent) YES**

☒ **Taenia solium scolex (Parasite) YES at intestine and muscles; NO in white blood cells!**

☒ **Hymenolepis nana, Hymenolepis dim cystic (Parasites) YES**

These intermediate stages of tapeworms are buried in the muscle but have been activated, possibly by the erosive action of the powerful solvents, pentane, hexane and benzene he has had exposure to. He will take a heroic dose of parasite herbs.

Two weeks later

He still has tapeworm activity.

☒ **Isopropyl Alcohol, Acetone, K-1 kerosene (Solvents) YES**

They are drinking Springdale Spring Water™ (it tested **Positive** for benzene, isopropyl alcohol and acetone). He will switch to tap water and kill tapeworm stages again with a new formulation called Rascal.

Summary: This young man was beginning to be ill with HIV disease but conquered it before serious damage was done to the thymus. Notice that in spite of his best efforts to avoid toxic food and products, he continues to suffer from them. There is very little safe food available that does not require cooking. And, in Bill's case, even the water was polluted. Only a massive clean up policy mandated by the government can stop the tide of pollution flooding our food and water.

Three weeks later

He is feeling better but has some shoulder pain. He took a super high dose of the parasite herbs for 3 days.

☒ **Taenia solium scolex (Parasite) YES at intestine**

☒ **Decane (Solvent) YES**

☐ **Solvents (Remainder) NO**

He needs to clean his liver and stay on Rascal as part of his parasite maintenance program.

Two weeks later

☒ **Decane (Solvent) YES**

Has been eating cholesterol-free food; will stop.

☒ **Gasoline (Solvent) YES**

29,30 Amy & Charles Furtner HIV

Amy Furtner is a young mother of three children. She was referred to us by her doctor for mysterious illness. She had already seen numerous clinical doctors who wanted to put her on antibiotics, anti-inflammatories, antidepressants and the like. Since she had been a very active healthy person, neither she, nor her husband Charles wanted to settle for this. Her husband was with her. Her main problem was pain in her joints (every joint I could name) but she also had belching and muscle wasting which seemed more ominous. The children appeared healthy but Charles had chronic fatigue. Amy had already taken out amalgams and root canals and tried various detoxifying routines and had gotten significantly better after that. She is now 100% better than she was, Charles said, but still has a lot of pain.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and vagina, NO elsewhere**

They were very shocked. They said the referring doctor would not like this. He wouldn't give her an HIV test although they had asked for one.

☒ **Fasciolopsis adults (Parasite) YES at thymus, NO at intestine and elsewhere**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus, blood, vagina, NO at intestine and elsewhere**

☐ **Fasciolopsis remaining stages (Parasite) NO**

Other parasites not tested.

☒ **Benzene (Solvent) YES at thymus, NO at blood, vagina, intestine**

☒ **TCEthylene (Solvent) YES at kidney, NO elsewhere**

☐ **Solvents (Remainder) NO**

She will start on parasite program, together with the whole family. She wants to bring her children for testing next time. She will be off the benzene pollution list.

Twelve days later

Soon after starting the parasite program she felt pressure on her upper chest and the front of her neck. She used to have these symptoms a year ago.

☐ **Protein 24 (HIV) NO**

She and her husband are happy with the news.

☐ **Fasciolopsis and all stages (Parasite) NO**

Continue on parasite program as per instruction sheet.

☒ **Uranium (Toxic Element) YES at lungs and trachea**

Her husband was quickly checked for uranium also. He too was YES (**Positive**) at lungs and trachea. They will try to improve ventilation through crawl space.

☐ **Solvents (ALL) NO**

She has one child, about three years old, with her. The child was NO (**Negative**) for benzene.

Seven days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke and all stages (Parasite) NO**

☐ **Pancreatic fluke and all stages (Parasite) NO**

☒ **Oxalate, mono-Calcium Phosphate, Cysteine (Kidney Stones) YES**

☐ **Kidney Stones (Remainder) NO**

She will stop drinking tea and go on kidney herb recipe. She will start to drink 3 glasses of 2% milk unless her symptoms worsen. She thinks her other doctor will not like this; he thinks milk causes a lot of problems. I suggested she sterilize her dairy foods herself.

☐ **Uranium (Toxic Element) NO**

They opened the crawl space windows.

Sixteen days later

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

She has the virus back again. She did not continue the parasite program after the last visit. Will do so.

Two weeks later

She has all three children with her. Her eyes are giving her problems.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **TCEthylene, MEK (Solvents) YES very high**

She has been drinking store bought fruit juices. Will stop.

☐ **Solvents (Remainder) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke adults (Parasite) NO**

☒ **Sheep liver fluke cercaria (Parasite) YES at thymus, vagina only**

☐ **Pancreatic fluke (Parasite) NO**

Others not tested.

Charles Furtner

We will test her husband to check for possible sexual transmission.

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke adults (Parasite) YES**

☒ **Sheep liver fluke cercaria (Parasite) YES at thymus, blood, penis**

☐ **Pancreatic fluke (Parasite) NO**

Note: sexual transmission seems very likely.

Child Debbie, about 3

☐ **Solvents (ALL) NO**

☐ **PCB (Toxic Element) NO**

☒ **Fasciolopsis adults (Parasite) YES**

☒ **Fasciolopsis redia (Parasite) YES**

☒ **Fasciolopsis miracidia (Parasite) YES**

She will be put on parasite program, going up to 4 wormwood capsules and 6 drops of Black Walnut Hull tincture.

Child Brian, about 6

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis adult (Parasite) YES**

☒ **Fasciolopsis eggs (Parasite) YES**

☐ **Fasciolopsis other stages (Parasite) NO**

☒ **PCB (Toxic Element) YES high**

☒ **Acetone (Solvent) YES high**

☒ **Petroleum ether (Solvent) YES high**

Car fumes? They will go off detergent and store bought fruit juice for the whole family. Brian will start parasite program, going up to 6 wormwood capsules and 10 drops Black Walnut Hull tincture.

Child Beverly, about 10

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES at thymus**

☒ **TCEthane (Solvent) YES**

☒ **Petroleum ether, Toluene (Solvent) YES high**

☒ **Hexane, TCEthylene (Solvent) YES**

☐ **Solvents (Remainder) NO**

She will stop drinking fruit juice, and avoid gasoline smells which she is fond of. Mother will go off detergent use.

☒ **Fasciolopsis adult (Parasite) YES at thymus, NO at intestine**

☒ **Fasciolopsis redia (Parasite) YES**

☒ **Fasciolopsis other stages (Parasite) NO**

She will be on parasite program going up to 6 wormwood capsules and 10 drops of Black Walnut Hull tincture. Note how close to having the HIV virus she is. Perhaps she already has been getting it intermittently.

Amy Furtner, thirteen days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Xylene (Solvent) YES**

Off “organic” apple juice, homemade OK.

☐ **Solvents (Remainder) NO**

☒ **A. strep (Pathogen) YES at tooth #17**

Probable cause of joint pain.

☒ **Proteus (Pathogen) YES**

Always present with oxalate kidney stones. Stay on kidney herbs six weeks.

☒ **Clostridium tet (Pathogen) YES at tooth #17**

Cause of stiffness in muscles.

☒ **Pneumocystis carinii (Parasite) YES**

☐ **Pathogens (Remainder) NO**

She will get upper left wisdom tooth X-rayed and cleaned up.

Summary: Amy could be proud of her parenting. She got her three children back to perfect health. She said she could hardly remember when they had been happy or playful. Now, only thirteen days after starting treatment, they were playing with each other. She and her husband love to watch them from the side: they don't hit each other; they seem content with themselves and their own things. Her joint pain is no better. Hopefully, the dental clean up and parasite maintenance program will be the last of her problems.

Charles Furtner

Back to the first visit. He has no health problems, except occasional fatigue.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES at thymus**

☒ **Methylene chloride (Solvent) YES at kidney**

☒ **MBK (Solvent) YES**

Other solvents not tested.

☒ **Fasciolopsis miracidia (Parasite) YES at blood, intestine**

☐ **Fasciolopsis adults and other stages (Parasite) NO**

☐ **Sheep liver fluke and stages (Parasite) NO**

He will go on parasitekilling program and benzene removal along with Amy to protect her and the family as well as himself.

Twenty five days later

Amy had stopped the parasite program, and so had he.

☒ **Protein 24 (HIV) YES**

He was shocked by this result.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES**

He uses rubber cement. Will bring it in for testing and switch brands. He will return to parasite program and benzene restrictions.

Two weeks later

Amy's tests were NO.

☒ **Protein 24 (HIV) YES**

But Charles still has the virus.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Benzene (Solvent) NO**

☒ **Xylene, Toluene (Solvent) YES**

Other solvents not tested.

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke adults (Parasite) YES**

☒ **Sheep liver fluke cercaria (Parasite) YES at thymus, blood, penis**

☐ **Pancreatic fluke (Parasite) NO**

Note: Both Fasciolopsis adults and benzene are missing from this HIV incident, so it seems quite likely that the virus can survive for short periods without its parasite host.

Thirteen days later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **TCE (Solvent)** YES

☐ **Solvents (Remainder) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Fasciolopsis redia (Parasite) YES**

☒ **Sheep liver fluke adult (Parasite) YES**

☐ **Pancreatic fluke (Parasite) NO**

Summary: Here we see how a whole family becomes host to fluke parasites. The parents probably transmit it to the children by kissing and transmit it to each other as well. But they all have "fluke disease" due to solvent build up. We cannot expect our bodies to detoxify solvents; it is an unreasonable expectation since these solvents are unnatural to the biosphere; therefore we must avoid them. This family showed exemplary compliance and intelligence.

31* Allan Gies HIV

Allan is a young man of 38, diagnosed with HIV virus three years ago.

He came from two thousand miles away specifically for his HIV status. A former girlfriend also has HIV Positive status, and he believes he “picked it up” from her. He has been in a doctor's care since then. He appears well. On his symptom list he mentions chest tightness, rashes, occasional night sweats, fatigue, a weight loss of 20 pounds since infection. His only medication is preventive antibiotics. He found a dentist to remove his mercury amalgams before arriving. He has brought a recent blood test with him:

BLOOD TEST	Result	Comment
WBC	very low (3.4)	bone marrow toxin
RBC	very low (3.2)	anemia–parasites and bone marrow toxin
MCV	high (101)	*Ascaris*?
Platelet count	low (131)	bone marrow toxin
Lymphs	low (17%)	bone marrow toxin
Eos	very high (7%)	parasites
Phosphate	low (2.3)	needs vitamin D

He has also had an immune cell analysis. His helper/suppresser ratio is near zero.

☒ **Protein 24 (HIV) YES at thymus**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **hCG (Pre-Cancer) NO**

☒ **Aflatoxin (Toxic Element) YES high at thymus, elsewhere**

We will test his foods for aflatoxin.

☒ **Benzene (Solvent) YES**

He will go off benzene list.

☒ **Fasciolopsis (Parasite) YES**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Human liver fluke (Parasite) NO**

This low level of fluke infestation probably accounts for his small number of symptoms.

☒ ***Ascaris*** **(Parasite) YES**

☒ **CMV, Mycoplasma, Candida (Pathogens) YES**

☐ ***Herpes*** **1, Bacteroides fragilis, Haemophilus infl (Pathogens) NO**

It is unusual for *Bacteroides fragilis* to be absent when *Ascaris* is present. I also tested a dozen other pathogens, of which he had six, suggesting AIDS. He has had thrush for some time. He will start on the parasite program.

He has brought water samples from home, as well as air samples.

☒ **Hot water sample (Environment) YES in white blood cells**

His hot water has something toxic in it.

☐ **Cold water sample (Environment) NO**

He plans to live with a relative when he returns home in order to avoid both the water and a pet he has.

Two days later

☐ **Protein 24 (HIV) NO**

His virus is gone.

☐ **Aflatoxin (Toxic Element) NO**

Stopped commercial fruit juices. They probably contained aflatoxin from the inevitability of some moldy fruit getting into the batch intended for juice making.

☒ **Mercury, Nickel (Toxic Elements) YES at thymus**

His dentist apparently did not get all the amalgam out. He will need to repeat dental work. He is dismayed. Start on thioctic acid, two, 3 times per day.

☒ **Arsenic (Toxic Element) YES**

We tested his dust sample from home to find the source of arsenic in his immune system, it was NO (**Negative**). He will ask motel service to stop using pesticide in his room.

☒ **Wood Alcohol (Solvent) YES**

Stop coffee.

☐ **Benzene (Solvent) NO**

He is complying with benzene list.

☐ **Nocardia, Beta strep, Alpha strep, Mumps, Staph aureus (Pathogens) YES**

Out of 18 tested this is an improvement already!

Two days later

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

These parasites are gone.

☒ **Aflatoxin (Toxic Element) YES high**

Suspect grapes.

☒ **Benzene (Solvent) YES**

Suspect bacon.

☒ **Oxalate (Kidney Stones) YES**

☐ **Kidney Stones (Remainder) NO**

Start kidney herbs.

☒ **Samarium, Tellurium, Gallium, Barium, Iridium, Tantalum, Rhodium, Thallium (Toxic Elements) YES**

Only dental fillings could give these metals.

☒ **Anaplasma, Bordetella, Besnoitia, Central spores, Clostridium sep, Coryne xer (Pathogens) YES**

Out of 12. He is not improving further, due to dental problem.

Five days later

His hot water that he tested Positive to was analyzed.

☒ **Tungsten, PCB (Toxic Elements) YES in hot water**

☐ **Cadmium, PVC, Lead (Toxic Elements) NO in hot water**

He was sent to be retested for HIV using the Protein 24 test.

Four days later

☒ **Benzene (Solvent) YES**

He is still eating benzene polluted foods like ice cream. Will stop. His clinical Protein 24 test for HIV was still positive.

Summary: Allan had to leave for home at this point. We were both disappointed at the clinical results. This was my first attempt to retest so early (nine days); perhaps it takes longer than that for the clinical test to confirm mine. He will also start on vitamin D (50,000, two per week forever) to raise his serum phosphate level. Allan did a perfect job of killing parasites and getting rid of HIV. But correcting his immune problem will depend on redoing dental work to get thallium and mercury out of his body, and staying off benzene polluted items.

Eight weeks later (based on saliva sample)

He is still free of HIV but is getting frequent infections. He has not redone dental work yet nor distanced himself from pet. Must get on with this.

Six weeks later

Allan has tested NEGATIVE in a clinical Protein 24 antigen test. We are pleased with his vigilance. He is staying off toast and taking B2 daily.

32,33,34 Jane, Donald Elliot, Dog HIV

We saw Jane six months ago for cancer, which she cleared up at that time. Now she returned with her husband, Donald. She was concerned about his fatigue and irritability that she felt was not normal. She had stayed irregularly on the parasite-killing program but had been using commercial body products and no diet restrictions. She is concerned about her own choking spells during mealtime.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

Cancer has not returned.

☒ **Protein 24 (HIV) YES**

This was both shocking and distressing. Her immediate thought was could she have gotten HIV from Donald. I assured her that sex was not a primary source. Most likely she picked up HIV through a parasite stage still alive in the rare steaks they are both fond of.

☒ **Isopropyl Alcohol (Solvent) YES**

Off the isopropyl alcohol list.

☒ **Benzene (Solvent) YES**

Off the benzene list.

☒ **Fasciolopsis (Parasite) YES at thymus**

Go on high dose parasite program.

Husband, Donald

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus, penis, liver, prostate; NO at intestine**

Donald was also shocked and mystified over his possible source of the virus. He wondered whether he could be getting it from their pet dog.

☒ **Benzene (Solvent) YES at thymus**

He will go off the benzene list.

☐ **isopropyl Alcohol (Solvent) NO**

☒ **Fasciolopsis (Parasite) YES at thymus and intestine**

He will start on parasite program. He wanted their dog tested. They will bring him on Sunday, when there are no people around.

Dog, Buster

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

This is my first observation of HIV in a pet. Dogs and cats are not natural hosts for *Fasciolopsis*.

☒ **Benzene, isopropyl Alcohol, others (Solvents) YES**

They will bring in his food for testing; there is some in the car because they are from two states away.

☒ **Benzene, others (Solvents) YES in dog food**

Donald is furious over pollution in pet food. They will purchase several varieties and find a clean one.

☒ **Fasciolopsis (Parasite) YES**

I suspect solvents make this possible. They purchased several other dog food brands, but all had solvents. They will feed Buster table scraps.

Seven days later

Jane

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

She is very relieved.

☐ **Benzene (Solvent) NO**

Although the source was not identified.

☒ **Isopropyl Alcohol (Solvent) YES**

She has not switched shampoo but will try.

☐ **Fasciolopsis and all stages (Parasite) NO**

She will stay on parasite maintenance.

Donald

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Benzene (Solvent) YES**

There may be a chemical in his office that has benzene. He will bring several for testing.

☐ **isopropyl Alcohol (Solvent) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

Buster

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Benzene (Solvent) YES**

He is still getting some commercial feed. He is a big dog; there aren't enough table scraps.

Summary: Both Jane and Donald got rid of their virus and parasites before their dog did, probably because of the benzene problem for Buster. But they plan to find pure food for him so he is no longer infectious. They would like to know if he was really their source of infection. They have not stopped eating red meats but cook it thoroughly now. This was my first encounter with a pet carrying HIV. It seems a likely source for them since the dog licks them and he is a house dog.

35 Alita Sokolis HIV

Alita Sokolis is 25 years old and came in with a variety of pains in unusual places. She had seen 3 clinical doctors and 2 specialist doctors for the pain over her ovaries. A laparoscopy revealed nothing. She has a history of asthma and pain and tightness in her chest (this is suggestive of HIV). She also has constant headaches.

☐ **Ortho-phospho-tyrosine, hCG (Pre-Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and vagina**

☒ **Fasciolopsis (Parasite) YES at intestine, thymus, ovary and uterus**

Finding the adult human intestinal fluke in the ovaries is extremely rare. Probable cause of pain at ovaries.

☒ **Fasciolopsis eggs (Parasite) YES at thymus, ovary, uterus and saliva**

☒ **Sheep liver fluke (Parasite) YES at liver, thymus and ovary**

Others not tested. Alita has a dreadful infestation of large flukes. She will start on the parasite-killing program.

☒ **Benzene (Solvent) YES throughout her body**

Others not tested. She will go off the benzene list. She has been using Blistex™.

Two weeks later

She feels much better but has begun to have headaches on one side of her face (right side). Chest pain is gone but slight pain over ovaries is still present.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☒ **Pancreatic fluke (Parasite) YES**

Ate a hamburger recently but will stop eating them.

☒ **Wood Alcohol (Solvent) YES**

Won't drink Kool-Aid™ and artificial sweeteners.

☒ **t-Butyl Nitrite (Solvent) YES**

☐ **Solvents (Remainder) NO**

☒ **Antimony (Toxic Element) YES**

Off colognes.

☒ **Vanadium (Toxic Element) YES high**

Search for gas leak in home.

☒ **Thallium (Toxic Element) YES**

☐ **Germanium (Toxic Element) NO**

Thallium may be coming from pesticides, not tooth fillings, since germanium is NO. Will repeat at next visit.

☒ **Fiberglass (Toxic Element) YES high**

Search for a hole in wall or ceiling of home. Others not tested.

Summary: Alita has improved her health greatly and cured her HIV infection. Now that she sees better health is possible, she is determined to make the necessary changes to recover from all her problems.

36 Renee Williams HIV

We have seen Renee several times a year for the last 10 years. In this time she has made changes when a crisis occurred but nothing fundamental. They still have a water softener. They still are cooking with aluminum and copper pots. She still has a mouth full of mercury. She wears a lot of make-

up and metal on her skin. She also has a stressful life with a full-time job. Each health crisis seems a bit more severe than the last one. Today she has arrived with numbness in her hands. This implicates heavy metals in the brain, particularly mercury from her numerous corroded tooth fillings. However, I will check for solvent toxicity today since she has a very short appointment and I have stressed the tooth fillings in the past.

☒ **Isopropyl Alcohol (Solvent) YES**

May have cancer.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

A relief.

☐ **Protein 24 (HIV) NO**

☒ **Mycoplasma, E. coli, A strep, Myco TB, Plantar wart, Diplococcus pn, Papilloma, Anaplasma (Pathogens) YES**

☐ **Pathogens (Remainder) NO**

This is more than the average number of active bacteria for a well person. I recommend getting her metal tooth fillings replaced and a course of parasite treatment as well as replacing her cosmetics with propanol-free varieties. I believe this is falling on deaf ears, however.

Six weeks later

Renee is much worse. Her hands are hot and swollen. Her legs are sore. She has seen her clinical doctor who recommends vigorous treatments for rheumatoid arthritis.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

Does not surprise me but startled her—disbelief soon calms her.

☒ **Fasciolopsis (Parasite) YES at thymus**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus and heart**

☒ **Fasciolopsis miracidia, redia, eggs (Parasite) YES**

☒ **Sheep liver fluke and miracidia (Parasite) YES**

☐ **Pancreatic fluke (Parasite) NO**

Others not tested. She agrees to start the parasite-killing program.

☒ **Pathogens (8 Tested) YES**

She is Positive to 8 out of 8 pathogens tested. This is AIDS. She doesn't hear what I am saying.

☒ **Benzene, isopropyl alcohol (Solvents) YES**

I encouraged her to stay off the benzene list and propanol-containing products. She is asked to follow-up in 5 days.

Eleven days later

Renee's hands are no better but my first concern is her thymus health.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

This convinces her that all my tests are invalid since her hands are no better. But she is also afraid to leave this unconventional approach because it has served her so well for 10 years.

☒ **Fasciolopsis adults and cercaria (Parasite) YES at thymus**

☒ **Pancreatic fluke (Parasite) YES at thymus**

Continues to eat fast food hamburgers.

☒ **isopropyl Alcohol (Solvent) NO**

Good progress—found propanol-free cosmetics.

☒ **Benzene (Solvent) YES**

Possibly nail polish.

One week later

Swelling in her hands persists.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Uric Acid (Kidney Stone) YES**

Start on kidney herb recipe. Stay on parasite maintenance program.

Two weeks later

Joints of hands are hot and swollen. She can make no progress without removing the mercury and heavy metals from her dentalware and getting rid of benzene so her natural immunity can conquer the bacteria in her joints.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis cercaria (Parasite) YES**

Still eating hamburgers.

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

She will continue on the parasite program.

☒ **Benzene (Solvent) YES**

Eats ice cream. She is advised again to get metal removed from her dentalware.

Summary: Renee is very close to permanent invalidism, taken from her high activity level and put in a wheelchair. She has delayed too long with all the necessary changes. Will she conquer her ice cream and hamburger habit? We hope it won't be too late. Notice that she became free of the HIV virus while she still had adults and cercaria in the thymus. Is it the other stages that bring the virus?

37 Neil York HIV

We have seen Neil, age 67, for four years, along with his wife. They stay in moderately good health, especially Neil. But today he complains of fatigue, nothing specific. He describes his chest as feeling “drawn.”

☒ **Gold (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

He has never replaced his gold dentalware. I suggest going off peroxide and toothpaste to reduce gold erosion until he gets them replaced. Also start on thioctic acid (100 mg), 4 a day, to draw gold from his tissues.

Two months later

He has not improved. His respiratory problem is worse. He is worried about asthma.

☒ **Gold (Toxic Element) YES**

Must get on with dental work.

☒ **EBV (Pathogen) YES**

☒ **Protein 24 (HIV) YES**

Note: I missed this test at his earlier visit, although there was a clear chest symptom! My error.

☒ **Fasciolopsis (Parasite) YES at thymus**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus, penis**

Others not tested.

☒ **Benzene (Solvent) YES**

Using car polish with bare hands.

☒ **Isopropyl Alcohol (Solvent) YES**

Will switch to our shampoo. He will repeat a 5 day parasite program. He will go off benzene products.

Two weeks later

☒ **Ortho-phospho-tyrosine (Cancer) YES**

☐ **Protein 24 (HIV) NO**

He now has cancer instead of the HIV virus.

☒ **Fasciolopsis (Parasite) YES at liver; NO at thymus, etc.**

☐ **Benzene (Solvent) NO**

☒ **Isopropyl Alcohol (Solvent) YES**

He will go off all products on the propanol-polluted list. He will repeat a 5-day parasite program.

Two weeks later

☐ **Solvents (ALL) NO**

He is feeling much better

Summary: We are quite endeared to Neil because he appreciates us so much. He had a close encounter with HIV virus which would have given him AIDS in half the usual time because of his metal problem. Hopefully, he will part with that corroded gold soon

38 Delia Heron HIV

This 30-year-old woman had a baby 7 months ago. After delivery she got more and more tired. Her first child is 5. She had one problem after another after this second baby. She has only been home 2 weeks at a time since then, always needing to be hospitalized. Finally, she had open heart surgery and got a valve put in. A clot in her leg occurred and infections in the valve. She was rehospitalized. Her latest hospitalization was for general illness but culturing showed nothing. She is feeling very bad all the time.

Today, she has just arrived from the hospital where she was released at 9 am. This is a very young looking, frail woman with a very blonde complexion. Even as a child medicine was not tolerated. She is very allergic to penicillin; she got desensitized to it but got more reactive to it later when she was given some.

She now has an aortic valve due to bacterial endocarditis (I suspect a chronic tooth infection). She has a tooth that is broken off, but it didn't get fixed. She had braces in her teens. She has been having diarrhea recently since she was started on Cleocin™ antibiotics.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus, liver, brain, etc.**

She and her parents are incredulous that she could be HIV Positive. They are very devout. They may not take me seriously after this disclosure.

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus; NO elsewhere**

☒ **Fasciolopsis redia (Parasite) YES at thymus; NO elsewhere**

☐ **Sheep liver fluke (Parasite) NO**

☒ **Mycoplasma, Papilloma #4, Resp Sync Virus, CMV, Staph aureus, Proteus, Haemoph, Adenovirus, Nocardia, Salmonella, Bstrep, Gardnerella, Chlamydia, *Bacillus cereus*, Strep**

pneu, Histoplasma (Pathogens) YES

☐ **Influenza A and B, *Herpes* simplex, Papilloma plantar, Trich, Coxsackie 4, Borellia, Campyl, Bacteroides fr (Pathogens) NO**

This is certainly the picture of AIDS (16 positives out of 25 tests).

☒ **Benzene (Solvent) YES at thymus**

Will stop using toothpaste and other products on benzene list.

☒ **Isopropyl Alcohol (Solvent) YES at thymus; NO at liver**

☒ **PCB (Toxic Element) YES high**

Off detergent—switch to borax.

☐ **Solvents (Remainder) NO**

☒ **Mercury (Toxic Element) YES high**

Needs tooth fillings out. She will begin parasite program

One day later

Her father called to say Delia was having burning over her chest. This is a typical result of killing parasites in the thymus. I encouraged him to interpret this as a good result.

One week later

She is very weak but able to sit.

☐ **Protein 24 (HIV) NO**

She now has a chance to survive.

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Pentane (Solvent) YES**

Drinks Classic Coke™ and Pepsi Free™—will go off.

☐ **PCB (Toxic Element) NO**

Switched off detergents.

☒ **Mycoplasma, Flu A and B, CMV, Chlamydia, B strep, A strep, Resp Syn, Gardnerella, Propion, Papilloma #4, Campyl Haemoph, Histoplasma, Trich, Proteus, *Herpes* simplex,**

Adenovirus, Staph aur, Strep pneu, Bacteroides fr, EBV, Papilloma, Borellia, Nocardia, Coxsackie B4, *Bacillus cereus* (Pathogens) NO

☒ **Shigella flex (Pathogen) YES**

Cause of stomach problem—take citric acid 1/8 tsp., 4 times daily in water, juice or boiled milk; also Lugol's iodine, 6 drops 4 times daily in ½ glass water (after meals and bedtime).

☒ **Salmonella, Coxsackie B4 (Pathogens) YES**

Her picture has improved greatly. She has only 3 infections out of 29 tested. We will encourage her to get dental work done so she can recover. She will begin taking Milk Thistle, 3 a day and thioctic, 4 a day.

Summary: We saw Delia only twice. At her first visit we could see she had both benzene and propanol accumulated in her tissues. In addition, she had PCBs at high levels and mercury at high levels. She was a very ill person with no time to lose. However, she did not return and we have heard no more about her. We had not sufficiently warned her about meat eating and all the benzene polluted products. I fear she got her illness back and decided that our treatment was worthless. Notice that isopropyl alcohol has not accumulated in the liver; it is present in the thymus! What are the factors determining which organ lets it accumulate? Does the parasite precede the solvent to the chosen organ?

39 Sandra Carson HIV

Sandra is 29 and was diagnosed as HIV Positive at a hospital in a neighboring town. She will bring in her medical summary. She also has a long list of pains, including chest pain. During her menstrual period her whole body hurts from top to toe. She has a chronic headache.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES high at thymus and vagina**

She feels pressure over breast bone.

☒ **Fasciolopsis (Parasite) YES at thymus; NO at liver, intestine**

☒ **Sheep liver fluke cercaria (Parasite) YES at thymus, vagina, blood**

☒ **Pancreatic fluke (Parasite) YES at pancreas**

She will start on parasite-killing program.

☒ ***Herpes* simplex 1, Gardnerella, Adenovirus, Propiono, CMV, Bacteroides fr, Proteus,**

Campyl pyl, Shigella, Haem inf, B strep, *Bacillus cereus*, Salmonella, Borellia, Trich, Nocardia, A strep, Coxsackie B 1, Staph aur, Histoplasma, Strep pneu, Papilloma 4, Chlamydia, Coxsackie B 4, EBV (Pathogens) YES

☐ **Influenza A and B, Resp Syn V, Plantar wart (Pathogens) NO**

This is certainly the picture of AIDS. She is Positive to 25 out of 28 pathogens tested.

☒ **Benzene (Solvent) YES at thymus and vagina**

Switch from Colgate Tartar Control™ toothpaste to baking soda for tooth cleaning (at that time no baking soda tested **Positive** to benzene). Observe the rest of the benzene pollution list.

Three days later

She felt an unusual sensation over her upper breast bone for a while after starting on parasite herbs, but now it is gone. Probably due to parasite-killing; this is common.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

She no longer has the HIV virus; it took her only 3 days to accomplish this. We will give her requisitions for retesting soon.

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke cercaria (Parasite) YES at thymus**

Ate hamburger against instructions, but will stop.

☐ **Pancreatic fluke (Parasite) NO**

☐ **Solvents (ALL) NO**

She will start on kidney herb recipe for her lower back pain.

Summary: Sandra did not return after her second visit, probably for financial reasons. Her friend was paying the bills. She had already financially ruined herself. Possibly she did not wish to have her HIV status changed since she did not wish to go off Social Security support. She was not well enough to hold a job. If her HIV status had changed she may have lost all means of survival. We hope she is abiding by the rules for living that we gave her and that she can enjoy life again. We, in turn, lost an opportunity to prove to the clinical profession that she had reverted to HIV-NEGATIVE status.

40 Shirley Stafford HIV and Liver Cancer

Shirley has a healthful lifestyle, without alcohol or nicotine. But she developed a pain over the upper midchest (she put her hand right over the thymus gland) and visited her regular doctor. The doctor wanted her to have a mammogram. Her left arm feels heavy. She also has low back pain that runs down her left leg.

☒ **Protein 24 (HIV) YES at thymus and vagina**

This was almost self-evident, considering the chest pain. My explanations seemed odd to her. She has no known risk factors.

☒ **Ortho-phospho-tyrosine (Cancer) YES at liver only**

She has cancer of the liver as well.

☒ **Fasciolopsis (Parasite) YES at liver and thymus; NO at intestine**

☒ **Fasciolopsis redia (Parasite) YES**

Others not tested. She will start on parasite program.

☒ **Benzene (Solvent) YES**

Go off all items on the benzene list.

☒ **Isopropyl Alcohol (Solvent) YES at one part of the liver only; NO at WBCs!**

Note: I could have easily missed the propanol if I had not searched the liver for it. She will go off shampoo and use ours.

Two weeks later

Shirley has not been ill since the last visit. Her arm feels normal now: it had felt heavy before. The pain over her breastbone is gone now.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Kerosene (Solvent) YES**

Be more careful when pouring it.

☐ **Solvents (Remainder) NO**

☒ **Asbestos (Toxic Element) YES**

Will test home air. Suspect washing machine belt.

☒ **Formaldehyde (Toxic Element) YES**

New recliner chair and foam pillows.

☒ **Mercury (Toxic Element) YES at thymus**

☐ **Toxic Elements (Remainder) NO**

She is advised to replace her metal tooth fillings with metal-free plastic ones. She will do away with new furniture.

Two weeks later

Her low back pain is unimproved. She has brought 2 belts for testing. One of the belts was YES for asbestos. She will start on kidney herbs for low back pain.

Two weeks later

She has scheduled her dental work.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **hCG (Pre-Cancer) YES**

☒ **isopropyl Alcohol (Solvent) YES**

She began using Listerine™; will stop.

☒ **Arsenic (Toxic Element) YES**

☐ **Asbestos (Toxic Element) NO**

The new belt is asbestos free. She will remove pesticide from home.

Summary: It is always a delight to work with a client who can dispose of new furniture or carpets without regrets when health is at stake. Our culture teaches us to value our material things, not our health. Shirley was inspiring to our office with her ease of choosing health before gold crowns and expensive new furniture.

41 Helen Douthet HIV and Cancer

We have seen Helen in the past five years for painful joints, high blood pressure, and thyroid problems, but she has been in reasonably good health. After a long absence, she arrived at the office looking very pale and thin. She has just returned from the Mayo Clinic. She said they were unable to diagnose her with anything significant in spite of her critical condition. She had not made an appointment but was only purchasing vitamins. I coaxed her to take my first test panel.

☒ **Ortho-phospho-tyrosine (Cancer) YES at thymus, bone marrow, liver, intestine and brain!**

☒ **Protein 24 (HIV) YES at thymus, brain, pancreas, blood**

She has widely disseminated disease. How could this be missed by clinical medicine?

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus, bone marrow and liver**

☒ **Fasciolopsis redia (Parasite) YES at thymus, bone marrow, and blood**

☒ **Benzene (Solvent) YES**

She will begin parasite program immediately and go off benzene and isopropyl alcohol containing products and return in 2 days for a follow-up. She seemed too ill to do more testing now.

Two days later

She looks exceedingly ill, can barely walk.

☒ **Ortho-phospho-tyrosine (Cancer) YES at thymus, intestine**

☒ **Protein 24 (HIV) YES at thymus and bone marrow**

Notice how both illnesses have shrunk their territory in her body.

☒ **Fasciolopsis miracidia (Parasite) YES**

Continue parasite program.

☒ **Benzene (Solvent) YES high**

The level is much higher than two days ago, she has obviously had a recent high exposure. She has brought some cans, her water and an air sample (of house dust) to test.

☒ **Benzene (Solvent) YES in Scotchguard™ for fabrics (a spray can), laundry room air (laundry room has an odor), and in her filtered water at sink (purified drinking water)**

☐ **Benzene (Solvent) NO in Carbona™ spot remover, Energine™ cleaning fluid and plain cold tap water**

In view of the possibility that the purified drinking water is contaminated with benzene, she will use purchased drinking water. She does not trust her tap water. She is still an emergency case and needs to follow-up in 3 days.

Three days later

She seems a bit better.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis redia (Parasite) YES at thymus, bone marrow**

She has had discomfort over her middle abdomen to the point of pain during this week.

☒ **Benzene (Solvent) YES and in WD40™**

Uses it on exercise bike—will stop.

Four days later

She is still very ill but feels some improvement. She has partly cleaned the house of chemicals. She has had a “full” feeling on front of neck, still noticeable.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

She will not eat pork or beef and will not handle meat in the house. She does not eat turkey or chicken because of her sensitivity to Salmonella (gets sick right away).

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Benzene (Solvent) YES high**

She is using facial cleanser, a heating pad, shower water, shampoo, Polysorbate 80™. She will stop until we test each one for benzene.

☒ **Strep pyog, Pseudomonas aer, Diplococcus pn, Gaffkya (high), Clostridium (high) (Pathogens) YES**

Remainder not tested. Note: all five of these are typically found in teeth. She has a mouth full of metal—mostly gold. She had too many infections (5 out of 6 tests), so I did not continue testing. The implication of AIDS was obvious. She resisted suggestion of dental work. But she will call the dentist regarding cavitations at teeth #1 and #32. I tried to impress on her the need for speedy removal of tooth infections and benzene.

Four days later

Although Helen is not interested in removing the metal from her mouth, she has just returned from seeing the dentist. The dentist found no X-ray evidence of any tooth abscess or cavities, but Helen did have several cavitations cleaned. She is feeling considerably better for the first time.

☒ **Benzene, xylene, acetone, wood alcohol, isopropyl alcohol (Solvents) YES**

She will switch to grain alcohol as general cleanser and continue parasite program.

Three days later

She is still getting some low days. She still weighs under 100 pounds but feels she may have gained one pound.

☐ **Benzene, ether, isopropyl alcohol (Solvents) NO**

☒ **Dipetalonema, Echinococcus, E. hist, Echinoporyphium, Fishoedrius (Parasites) YES**

☒ **Pancreatic fluke (Parasite) YES**

Remainder: NO (Box 1). She tested YES for cholesterol crystals and needs to cleanse her liver of gallstones.

Five days later

She is feeling better than 1 week ago, but she still has her ups and downs.

☒ **Fishoedrius, Myxosoma (Parasites) YES**

☒ **Necator (human hookworm) (Parasite) YES high**

☒ **Moniezia (Parasite) YES high**

Tapeworm head, probably escaping from its cyst after solvent action.

☒ **Leishmania mex, Taenia sag (Parasites) YES**

☐ **Parasites (Remainder) NO**

☒ **Mycoplasma (Pathogen) YES high (systemic)**

Probable cause of general aching.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus**

☒ **Isopropyl Alcohol (Solvent) YES high**

Went back to using commercial shampoo.

☐ **Benzene (Solvent) NO**

☐ **Solvents (Remainder) NO**

Stay on parasite maintenance program.

Five days later

☒ **Benzene (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

Using untested body chemicals. Will stop.

Six weeks later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **TCE (Solvent) YES**

Off commercial beverages.

☐ **Solvents (Remainder) NO**

Stay on parasite program.

Six weeks later

She is very much better. She has been on chelation treatment for 1 week. She is on a parasite maintenance program.

☐ **Solvents (ALL) NO**

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke (Parasite) YES**

☒ **Pancreatic fluke (Parasite) NO**

She will stay off rare meat.

Summary: Helen had a very close brush with death. Her great dependence on body chemicals of all kinds (lotions, etc.) contributed to this near tragedy. At one point her weight was 93 pounds, and I feared we had seen her for the last time. If she had followed her friends' advice to hospitalize herself or had returned to the Mayo Clinic, she would not have survived. Although she appeared well at the last visit, her failure to remove dental metal could shipwreck her health in the future.

42 Sing Tong HIV

This 27-year-old man came in complaining of fatigue, minor depression, and occasional swimmer's ear. He was concerned about his HIV status and wanted to be tested in my unconventional way in spite of getting an HIV Negative result recently.

☒ **Protein 24 (HIV) YES high at thymus and blood**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES**

Off the benzene-pollution list.

☐ **Fasciolopsis adults, eggs, miracidia (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus and blood**

☒ **Fasciolopsis redia (Parasite) YES at one part of thymus and blood**

☒ **Echinococcus granulosus (Parasite) YES**

☐ **Parasites (Remainder box 1) NO**

☒ **E. coli (Pathogen) YES at blood**

Constipation or a fissure or even hemorrhoids can let these colon bacteria into the bloodstream.

☒ **Klebsiella (Pathogen) YES at one part of thymus (the same), blood and penis**

☐ **Pathogens (Remainder) NO**

He worked in a restaurant for 7 years and handled a lot of meat. He will start on parasite-killing program.

One week later

He has more energy. He felt a sensation over the thymus the first few days on the parasite program. This is common.

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Echinococcus granulosus eggs (Parasite) YES**

☐ **Echinococcus granulosus adult (Parasite) NO**

☒ **Gyrodactylus, Leucocytozoon, Leishmania mex, Plasmodium falc, Schistosoma, Trypanosoma lew, Trichinella (Parasites) YES**

☒ **Taenia pisiformis cysticercus (Parasite) YES**

Has tapeworm disease.

☐ **Parasites (Remainder box 2) NO**

He will increase parasite program to 4 capsules of cloves, 3 times daily for 4 days.

☐ **E. coli, Klebsiella (Pathogens) NO**

☒ **Thorium (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

He will seal cracks in basement floor. Note: benzene is gone. He is eating more healthful food, also. He has cleaned the house and basement of all solvents, paint, varnish and cleaners.

One week later

Sing feels fine.

☐ **Echinococcus all stages, Gyrodactylus, Leucocytozoon, Leishmania mex, Plasmod falc, Schistosoma, Trypanosoma, Trichinella, Taenia pis (Parasites) NO**

He will stay on parasite maintenance program.

☐ **Thorium (Toxic Element) NO**

Has put in a crawl space fan.

☐ **Benzene (Solvent) NO**

☒ **Shigella flex (Pathogen) YES**

☒ **Strep G (Pathogen) YES**

Needs cavitation cleaned at tooth #1.

One month later

☐ **Solvents (ALL) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

Summary: Sing was a model HIV client. He had previously been given an HIV antibody test that was NEGATIVE, but he was not surprised to find he was POSITIVE when he came to us. He was anxious to understand all the features of HIV-illness and to learn how to take care of himself. Although he had vanquished the virus in 6 days, he returned to improve his immunity and he did accomplish everything in about 6 weeks.

43 Jimmy Smith HIV

This 45-year-old man has had strep throat for about 2 weeks and can't clear it up. His ears have painful stabs with pain running down his neck on both sides (obviously tooth infections). He has a tingling on the front top chest wall. He experiences pain in his left heel when getting up in the morning, but it's not acute during the day. He has soreness in the base of his breastbone. He experiences headaches (needs a liver cleanse). He has stiffness and reduced motion at his elbows and general body stiffness. He will take the kidney herb recipe for his foot pain.

☒ **Proteus (Pathogen) YES**

Off nickel–probably tooth metal–take histidine, 1/day, 500 mg. Histidine is a nickel chelator but this is not a good solution for a dental problem, of course.

☒ **Papilloma, Plasmodium, Hemophil inf (Pathogens) YES**

He is testing **Positive** to the first four pathogens in a row, suggesting HIV illness—will check.

☒ **Protein 24 (HIV) YES**

We will postpone kidney cleanse and do parasite program.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at thymus, intestine; NO at liver**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus, kidney**

☒ **Benzene (Solvent) YES**

☒ **Isopropyl Alcohol (Solvent) YES**

Others not tested. They might have paint thinner in the house. We will test air. He uses nothing on the benzene list. He will switch off his shampoo and use ours. He will start on parasite-killing program.

One week later

☐ **Solvents (ALL) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☒ **Cystine, phosphates (Kidney Stones) YES**

He eats a lot of meat, namely phosphate; he will switch to fish that at least have built in bones (calcium). Start on kidney herb recipe.

Three weeks later

His throat feels better but he has minor sternal pain occasionally (probably heart parasites). There is no change in his ankle and heel pain. Soreness at the base of breast bone persists. He has fewer headaches and less stiffness.

☐ **Toxic Elements (ALL) NO**

Surprisingly good.

☒ **Acanthocephala (Parasite) YES**

Do a 5-day high dose parasite program and start on readiness program for liver cleanse.

☒ **Dirofilaria (Parasite) YES**

Dog heartworm, cause of chest pain.

☒ **Loa loa (Parasite) YES**

Also causes chest pain. Others not tested.

One month later

Jimmy has tingling and soreness over his chest wall and neck again. He had 1-2 weeks that were OK.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Sheep liver fluke (Parasite) YES at thymus**

Probable cause of tingling.

☒ **Sheep liver fluke metacercaria and cercaria (Parasite) YES**

He will avoid eating meat in restaurants and stick to fish and seafood. He will repeat a 3 day high dose parasite program.

☒ **Benzene (Solvent) YES**

Off ice cream.

☒ **Xylene (Solvent) YES**

Off Sprite™.

☒ **TCEthylene, Acetone, Toluene (Solvents) YES**

Probably 7UP™. He will avoid all commercial beverages.

One month later

He still has tingling over his abdomen occasionally and a lot of bloating. He also had the flu for a

week again.

☒ **TCE (Solvent) YES**

Drank a small amount of pop again—will stop.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Mycoplasma, Candida (Pathogens) NO**

☒ **CMV, Gardnerella, Adenovirus, B strep, Shigella, Nocardia, Trich vag, Borellia, Plantar wart, Coxsackie B1, Strep pneu, A strep, *Herpes* zoster, Salmonella ent, Staph aureus, *Bacillus cereus*, Histoplasma, Proteus mirab, (Pathogens) YES**

End of box 1. This is the picture of AIDS, but without HIV.

☒ **Fasciolopsis redia (Parasite) YES at thymus**

☒ **Fasciolopsis cercaria (Parasite) YES**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Clonorchis (Parasite) YES**

He has been eating McDonald's hamburgers and will definitely stop this time. He will repeat the 5 day high dose parasite program and start on maintenance after that.

Two weeks later

He had continuous influenza. He is on Kephalexin™ antibiotic and cough medicine.

☐ **Solvents (ALL) NO**

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Iridium (Toxic Element) YES at thymus**

Tooth fillings—remove metal from mouth.

☒ **Hafnium (Toxic Element) YES at thymus**

Source unknown.

☒ **Palladium high, Nickel high at thymus, Gadolinium at thymus, Scandium (Toxic Elements) YES**

Tooth fillings.

☒ **PVC (Toxic Element) YES at thymus**

Works with building materials.

☐ **Toxic Elements (Remainder) NO**

He needs all dental metal replaced with metal-free plastic.

☒ ***Herpes* zoster, Mycop, EBV, Bacillus cere, Human papilloma 4, Lepto int, Eikanella, Lacto acid, Klebsiella, Gaffkya, Bacill anthrac, Anaplasma, Mycob. TB, Pseudo aer, Strep mit, Tobacco mosaic virus, Haemoph inf (Pathogens) YES**

This is the picture of AIDS.

Summary: Jimmy has done an excellent job of removing solvents from his foods and products. He has gotten rid of the HIV virus but not his AIDS. He has been advised to get the metals out of his mouth in order to stop them from fluxing into the thymus. We are waiting anxiously for him to complete this job so his immunity can recover.

44 Stella Rowley HIV and Cancer

This 23-year-old woman came in because of her chronic yeast infection, menstrual cramps she has suffered from "all her life," migraines, bunions, and heart arrhythmia. She also noted that she has sinus problems during the fall and spring. Her right wrist is sore. She has occasional constipation and diarrhea; her right knee is sometimes sore. She is on several medications for her various ailments, way too many for her age.

☒ **Ortho-phospho-tyrosine (Cancer) YES**

☒ **Protein 24 (HIV) YES**

She has both cancer and HIV illness unbeknownst to her, but she is not too surprised. I am surprised at her calmness.

☒ **Isopropyl Alcohol (Solvent) YES high**

Eliminate propanol polluted products like cold cereal and shampoo.

☒ **Benzene (Solvent) YES high**

Off benzene list.

☐ **PCB (Toxic Element) NO**

Summary: She arrived with HIV test results that were NEGATIVE. Apparently, however, she had the intuition that something was quite wrong with her but could not get it established clinically. We recommended a vegetarian diet for her, which appealed to her anyway. She has not returned, and three months have passed. Hopefully, she has followed some of the advice we gave her. Her finances may not have been adequate for her to return for follow-up.

45 Dawn Generes HIV

This 51 year old woman had the following problems: 1) her feet kill her. She works at a hospital and is on her feet all day. At night there is a cramp in them. They burn and ache all the time. She has tried different shoes. The pain is not in her toes but higher up, to about 6 inches above the ankle, mostly on her right foot. This started about 5-10 years ago and has worsened in the past 2 years; 2) her sinuses are clogged and she feels like there is something in her throat; 3) she has a low energy level; 4) she is holding water in her hands and feet; 5) she has lower back pain, for which she sees a chiropractor; 6) her knees hurt; 7) she has elbow pain—it hurts her to pick up a quart jar; 8) her left hip and leg are painful; 9) she has gum disease; her front teeth are badly eroded and she has loose teeth.

She will go on a tooth program which consists of:

- Flossing 1 time/day (use monofilament nylon fish line, 2 to 4 pound test)
- Brushing 2 times/day. At one brushing use potassium iodide (white iodine, see *Recipes*) from a pharmacist. Use 4 drops on a tooth brush. At second brushing use 17½% hydrogen peroxide, food grade, again 4 to 5 drops on tooth brush. If spilled on skin, wash it off.
- Also, take 3 glasses of 2% milk/day (sterilized by boiling), 1 magnesium oxide (300 mg)/day; 500 mg B6/day, and vitamin D 1/day for three weeks, then 2 a week forever. Obtain vitamin D from dentist (50,000 units).

She will start on kidney herb recipe.

One month later

Her legs are very restless. She works the night shift and will use ornithine to sleep and arginine as a caffeine substitute to keep awake.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Ancylostoma duod, Dientamoeba, Echinostoma rev, Eimeria ten (Parasites) YES**

Has pigeons and chickens.

☐ **Parasites (Remainder) NO**

Stay on parasite-killing program.

Six weeks later

She is experiencing pain over her sternum.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☐ **Fasciolopsis adult (Parasite) NO**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus, vagina, blood**

☐ **Pancreatic fluke (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☒ **Isopropyl Alcohol (Solvent) YES at thymus; NO at liver!**

☒ **Benzene (Solvent) YES high at thymus and vagina**

☐ **Solvents (Remainder) NO**

Note: The propanol is in her thymus, not her liver. She does not eat junk food or drink commercial beverages so has no other solvents in her! She will go off the benzene list, off shampoo and hair spray. She will use our varieties.

Six weeks later

She is “fantastically better,” she says.

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Sheep liver fluke cercaria (Parasite) YES at blood; NO at liver and thymus**

She had a roast beef sandwich at Hardee's™ a few days ago. Go on 3 day high dose parasite program followed by maintenance, and stay off restaurant meats.

☐ **Isopropyl Alcohol (Solvent) NO**

☐ **Benzene (Solvent) NO**

☒ **Beryllium (Toxic Element) YES**

Gasoline, car exhaust.

☒ **Gold (Toxic Element) YES**

Change wrist watch to plastic.

☒ **PCB, Holmium (Toxic Elements) YES**

Switch to borax and washing soda instead of detergent.

☒ **Formaldehyde (Toxic Element) YES high**

There is no foam furniture or mattresses in the house—they are remodeling the hospital where she works.

☐ **Toxic Elements (Remainder) NO**

Summary: Dawn has succeeded in every way to improve her health, a tribute to her intelligence and good attitude.

46 Diane Barron HIV

This 22-year-old woman had numerous serious problems. She had a chest X-ray that showed spots that are thought to be tuberculosis. She suffers from cataracts in one eye and sinus problems. She has a hearing loss in her left ear and her throat is frequently dry and sore. Her shoulders have dull aching pain and her wrists crack with sharp pains as well as her hands. Her chest feels heavy, congested and she has occasional sharp pains there. She has an irregular heartbeat, possibly mitral valve prolapse. She suffers

from stomach ulcers and easily feels nauseated. She has chiropractic adjustments weekly for sharp pain between the shoulders. Her leg muscles ache and twitch, especially when she is tired. Her knees pop easily and ache. She may have bunions and her feet ache. She sleeps a lot but also has occasional insomnia. Her energy level is consistently low and her concentration is much less than it used to be. She has frequent bad headaches that make her sick to her stomach. She has frequent urinary tract infections. She suffers from depression and bulimia. She works in a dental office. This is an odd assortment of symptoms, especially for so young a person, typical of HIV illness.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES**

☒ **Fasciolopsis (Parasite) YES at intestine only**

☒ **Fasciolopsis eggs (Parasite) YES at thymus, vagina, and blood**

☒ **Fasciolopsis other stages (Parasite) NO**

Other parasites not tested. Start on parasite program.

☒ **Benzene (Solvent) YES at thymus and vagina**

She uses essential oil shampoo. Will stop and use our recipe.

☒ **Solvents (Remainder) NO**

Note: She has no build-up of other solvents yet. Presumably her liver can still detoxify them quickly.

One month later

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

Continue parasite program.

☒ **Arsenic (Toxic Element) YES**

Pesticide Deacon™ everywhere in the house; remove.

☒ **Radon (Toxic Element) YES high**

House is partly over crawl space and partly over basement—she should open crawl space vents.

☒ **Molybdenum (Toxic Element) YES**

Automotive chemicals?

☒ **Gold (Toxic Element) YES**

☒ **Gadolinium (Toxic Element) YES**

☐ **Toxic Elements (Remainder) NO**

She has no gold tooth fillings, but works with gold crowns in dental office that give off vapor and dust.

☐ **Benzene (Solvent) NO**

☒ **Hexane (Solvent) YES**

Off commercial beverages.

☒ **Acetone (Solvent) YES**

Dental glue.

☒ **Ether (Solvent) YES**

Dental materials.

☒ **Methylene chloride (Solvent) YES**

Commercial beverages.

☒ **TCEthylene (Solvent) YES**

Flavored foods.

☒ **Her house air, and office air (Unknown pollutant) YES**

Note: She has some pollutant in her house air as well as office air. She will try to clean them up by removing all chemicals.

☒ **Candida (Pathogen) YES**

Yeast. Needs to raise her immunity.

Summary: Diane has gotten rid of her HIV virus but still has a lot of cleaning up to do before she gets as well as a young person of 22 should be. She needs to eliminate radon from her home or move. She needs to change her occupation to a less hazardous one. She needs to remove all metal from her mouth and body. I will discuss these items in the future as she gets more adjusted to her current restrictions. She is doing well and staying free of benzene.

47* Gene Liggan HIV

This 36-year-old man has been suffering from fevers and night sweating for several months. He recently ran a temperature of 104°. This went on for a week; the attacks lasted 4-5 hours, then he had one week of remission, then another week of attacks. He saw a clinical doctor who did many tests. He feels very good now in comparison. His HIV virus was found about 4 months ago. He stopped drinking and smoking. He lost about 16 pounds during that ill period, but has gained it back. He had his mercury fillings taken out a year ago when he began seeking out alternative therapies for his mysterious illness. He has a rash on his left cheek and chronic thrush. He brought a thick file with medical records. He has been health conscious for some time and is happy to find us.

☒ **Babesia (Parasite) YES**

☒ **Echinococcus granulosus eggs and cysts (Parasite) YES**

He has a dog now but has had cats in the past.

☒ **Fasciolopsis (Parasite) YES at thymus, kidney**

☒ **Fasciolopsis miracidia (Parasite) YES at thymus, kidney**

☐ **Fasciolopsis other stages (Parasite) NO**

He has been trying to get AZT. Note: miracidia are not in the blood, possibly due to taking a sulfa drug recently for about 3 days (he is on it preventively).

☐ **Ortho-phospho-tyrosine (Cancer) NO**

A few days ago his immunologist gave him a tuberculosis shot, pneumonia, and tetanus shot.

☒ **Protein 24 (HIV) YES**

☒ **Trich (Pathogen) YES**

Cook and eat in metal-free pots and cutlery to reduce nickel intake.

☒ **Shigella flex, Proteus, EBV, A strep, CMV, Papilloma 4, Coxsackie B1, Troglo, Pseud aerug, Strep G, Plasmod cyno, Staph aureus (Pathogens) YES**

He has 13 YES (not counting HIV) out of 27 tested. This is mild AIDS. He has had shooting pains in certain teeth.

☒ **Benzene (Solvent) YES throughout his body**

He has done a lot of painting and remodeling. He will clear his house of all old paint cans, old brushes, etc. We will test house air for benzene. He will start parasite program.

Three days later

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

He is very pleased but somewhat incredulous.

Three days later

He has been very energized (more so than in the last 2 years); he has to force himself to go to bed, yet he is relaxed and his mood is good. He sleeps well. Cheek skin is better. He has minor fissures at the corner of his mouth. He has no night perspirations anymore. His fevers seem gone. He had been at 102°-104° He also had a very low temperature at times (94°-95°). He is not coughing much at all anymore. He feels his chest is very clear; he quit smoking 4 months ago but it did not clear up his chest.

☐ **Protein 24 (HIV) NO**

☐ **Babesia, Echinococcus all stages (Parasites) NO**

☒ **Haemoproteus, Multiceps ser, Prosthogonimus, Pneumocystis car, Trypanosoma gam (Parasites) YES**

He had a duodenal ulcer, was on Xantac™ and Mylanta™ by the bottle, then a lot of baking soda about a year ago. Rem aining parasites (box 2) NO.

☒ **Adenovirus (Pathogen) YES**

Remainder box 1: NO.

☒ **Strep pneu (Pathogen) YES at two teeth**

☒ **Anaplasma (Pathogen) YES**

Remainder box 2: NO. He is still on antibiotics. This is no longer the picture of AIDS.

☐ **Benzene (Solvent) NO**

☒ **Uranium (Toxic Element) YES high**

Living quarters are very dusty. He has ringing in his ear and some pain at 2 teeth. Needs to do dental work.

One month later

He has gained 10 pounds. He has felt less stressed and his energy was very good until yesterday. Some days he is still slightly lethargic. His minor rash on his cheeks persists. His tongue is very sore and swollen. He has not done dental work yet.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **Leishmania mex (Parasite) YES**

Other Leishmanias: NO.

☒ **Haemophilus infl, Shigella (Pathogens) YES**

☐ **Pathogens (Remainder) NO**

One month later

His thrush has cleared up, but he has a slight headache and lower leg pain.

BLOOD TEST	Result	Comment
1. T cells and T-helpers	Low	
2. Monos	high (12%)	
3. Chloride	high	
4. Calcium	very low	He will drink 3 glasses of 2% milk/day and take magnesium oxide (300mg), one a day.
5. BUN,Creatinine	slightly high	kidney problem
6. SGOT, SGPT	very high	possibly due to drugs

He works with other people; they have a lot of respiratory problems. He will go on the respiratory health program:

1. CFH 2/day in winter (this is a combination of thyme and fenugreek herbs).
2. One Bronson Zinc tablet (60 mg) daily.
3. Oscillococcinum when chills are felt.

☒ **Kerosene (Solvent) YES**

☒ **Methylene chloride (Solvent) YES**

Has been drinking soda, will stop.

☐ **Solvents (Remainder) NO**

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES at pancreas**

☐ **Sheep liver fluke adults (Parasite) NO**

☒ **Sheep liver fluke miracidia (Parasite) YES at liver; NO elsewhere**

Repeat 5-day high dose parasite program. Go off beef (he has been eating some prime rib rare beef).

☒ **Candida (Pathogen) YES**

☐ **Protein 24 (HIV) NO**

Is free of benzene. He will do an HIV antigen test at clinical lab.

Five days later

His temperature is 102° today. He also has an injured ankle. He has been having a normal or low temperature in the mornings, but it goes up about a degree in the evenings. He isn't feeling as well as he should, with a lot of aching in his legs, especially from the knees down.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis eggs (Parasite) YES at thymus only**

☐ **Fasciolopsis other stages (Parasite) NO**

Continue on parasite program.

☐ **Candida, Shigella, Salmonella, (Pathogens) NO**

☒ **Mycoplasma, Influenza A and B (high) (Pathogens) YES**

Note: His influenza is activated and he will be on Oscillococcinum for five days.

One week later

His clinical HIV antigen test result has arrived. It is Negative.His temperature in the morning is 98.8°. He went to the emergency room the other night with wheezing and was diagnosed with bronchitis. He was put on antibiotics.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

Continue parasite maintenance program and *Pet Parasite Program*. He has a cat.

☐ **Solvents (ALL) NO**

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Staph aureus, Strep G (Pathogens) YES at tooth #1**

Needs cavitation cleaned.

Summary: Gene was quite elated with his HIV Negative status. He is advised to see dentist to clear bacteria which are a chronic drain on his health. He will continue on his restricted lifestyle and come in for a checkup every month.

48 Valri Nesbit HIV

This 27 year old woman came in with a long list of problems including tinnitus, a low grade fever for several months, a general feeling of illness for several months, the source of which no clinical tests can uncover. She has chest pain at midsternum (probably HIV) and has been nauseated a lot lately. She has intermittent tachycardia (heart problem), tingling of the hands and feet, a minor sleep problem and a daily headache. She is on oral Mycostatin™ for her vaginal

yeast infection which she has had for a long time. This all began after moving to a new building at work.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and vagina**

☒ **Fasciolopsis (Parasite) YES at thymus**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus and blood**

☐ **Fasciolopsis other stages (Parasite) NO**

☒ **Benzene (Solvent) YES**

She uses Vaseline Lip Therapy.™ She will remove all solvents from her basement and kitchen and other sources. She will start a parasite-killing program and go off the benzene-pollution list.

Two weeks later

Her fevers subsided but she is still feeling sick with hot flushes. She still feels sternal pain radiating out on each side of the breast bone.

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Dog heartworm (Parasite) NO**

☒ **Loa loa (Parasite) YES high**

Source of sternal pain and heart problem. Remaining parasites not tested.

☐ **Benzene (Solvent) NO**

☒ **Mercury (Toxic Element) YES**

☐ **Toxic Elements (Remainder box 1) NO**

Valri has made a lot of progress in 2 weeks. She will get metal tooth fillings replaced with plastic

Three weeks later

She feels better but still has a low-grade fever (about 99°). Her sternal pain is gone. She has fatigue

and muscle aches as well as headaches in the afternoon when she starts to feel hot.

☒ **Mineral oil (Toxic Element) YES**

Off all lotions and soaps. Use our recipes.

☐ **Solvents (Remainder) NO**

☒ **Lead (Toxic Element) YES high**

Test water and air.

☐ **Toxic Elements (Remainder box 2) NO**

She is on the parasite maintenance program.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Loa loa (Parasite) NO**

She will start on kidney herb recipe.

Two weeks later

She went back to work. Her water tested YES (**Positive**) to lead by commercial lab test which her husband ordered immediately when she told him about it after her last visit. She has ear pressure.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Loa loa (Parasite) NO**

☒ **Fasciolopsis adults (Parasite) YES at intestine**

Ate hamburgers. Others not tested.

☒ **Wood Alcohol, Toluene, Methyl ethyl ketone (Solvents) YES**

Off commercial beverages.

☒ **Methyl butyl ketone (Solvent) YES**

Off flavored foods.

☐ **Solvents (Remainder) NO**

Note the return of Fasciolopsis, but not in the thymus or liver. It is in the intestine, where it "belongs." Note: there is no benzene or propanol in her.

☒ **Candida (Pathogen) YES**

Yeast; she needs to raise her immunity.

One month later

She is doing a lot better and has no more fever; she has returned to a normal life and is not eating fast food meals or red meats.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Fasciolopsis redia (Parasite) YES**

☒ **Sheep liver fluke cercaria, eggs (Parasite) YES**

She is on parasite maintenance program but is eating turkey, and chicken; will stop.

☒ **Influenza (Pathogen) YES**

☒ **Candida (Pathogen) YES**

Has been on Mycostatin™ for the past 3-4 months.

☒ **Pentane (Solvent) YES**

Possibly in beer she drank last night.

☐ **Solvents (Remainder) NO**

Summary: Valri did an admirable job of curing her illnesses. The restrictions may eventually be too constraining for her so that she will repeatedly get HIV and/or cancer. Hopefully, our meat supply will get cleared up of this parasite in the not-too-distant future. At her last visit, her husband, John, came with her, in order to clear the whole family of this parasite.

Husband, John

☒ **Lead (Toxic Element) YES**

They are working on the lead-in-water problem. (He had been incredulous of our results with Valri until the lab reported presence of lead, he stated.)

☒ **Carbon Tetrachloride (Solvent) YES**

Uses disinfectants.

☐ **Solvents (Remainder) NO**

☒ **PCB (Toxic Element) YES**

Off detergent. He will stop drinking commercial beverages.

☐ **Fasciolopsis and all stages (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Sheep liver fluke cercaria (Parasite) YES**

He has always eaten rare steak but will stop.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

Fortunately for Valri, John is supportive at least when he is able to observe the testing and follow the logic himself. Together, they may be able to keep Valri well.

49 Joseph Haidu HIV

Joseph arrived from the southwest for his HIV Positive condition. I assured him that he would be completely well soon. He has limited time (six days) in this area. He is seeing a clinical doctor frequently, is on antibiotics preventively, and is quite anxious about his condition. He is about 35. He does not appear very ill.

☒ **Protein 24 (HIV) YES at thymus and penis**

☐ **hCG (Pre-Cancer) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Fasciolopsis adults (Parasite) NO**

☒ **Fasciolopsis eggs (Parasite) YES throughout body and in saliva**

We will get a saliva specimen for microscope study.

☒ **Sheep liver fluke (Parasite) YES at thymus; NO at liver**

Others not tested.

☒ **Benzene (Solvent) YES throughout his body**

☒ **Isopropyl Alcohol (Solvent) YES at liver and thymus**

He will start on parasite-killing program. He will go off the benzene list and propanol containing body products such as shampoo.

☒ **Wood Alcohol (Solvent) YES**

☒ **Decane (Solvent) YES**

☐ **Solvents (Remainder) NO**

He will go off commercial beverages.

☒ **Mercury, Nickel (Toxic Elements) YES at thymus**

Tooth fillings.

☒ **PCB (Toxic Element) YES at thymus**

Off detergent. Others not tested. He is advised to remove all metal from his mouth and replace it with metal-free plastic. Joseph appears dismayed over this necessity. He plans to postpone this action.

☒ **Influenza, EBV, CMV, Resp Syn V, Plantar Wart, B strep, Histopl cap, Adenovirus, Haem inf, Campyl pyl, Staph aur, Propio, Bacillus cer, Coxsackie B-1, Nocardia, Proteus mir, Strep pn, A strep, Gardner vag (Pathogens) YES**

☒ ***Herpes* zoster, Hep B (Pathogens) YES at thymus**

End of box 1. This is obviously AIDS, since he has 21 YES out of 27 tests.

Two days later

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☐ **Benzene (Solvent) NO**

☒ **Hexane dione, Grain alcohol (Solvents) YES**

He has used no alcoholic beverage. However, he is taking our Black Walnut Hull tincture drops in the parasite program, which are 25% alcohol. Must take it in warm beverage.

☒ **Salmonella typhi, Eikanella cor, E. coli, Clostr tet, Bacill anth, Erwin coro, Blephar, Coryne dip, Neisseria, Coryne xer, Strep pyog, Sphaerot nat, Strep G, Trep pall, Veillon disp (Pathogens) YES**

End box 2. He has 15 YES out of 40 tested, obviously still the picture of AIDS.

Two days later

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Protein 24 (HIV) NO**

☒ **isopropyl Alcohol (Solvent) YES**

Used Listerine™.

☐ **Benzene (Solvent) NO**

☒ **Butyl Nitrite (Solvent) YES**

Source unknown. Others not tested.

☒ **Sodium Fluoride (Toxic Element) YES**

In Listerine™?

☒ **Thallium and Germanium (Toxic Elements) YES**

This is a surprise! And explains, in part, his extremely low immunity even after the benzene and parasites are gone. He will save the dentist's tooth grindings for me to test for thallium.

☒ **Antimony (Toxic Element) YES**

Used Kiss My Face™ soap.

☒ **Aluminum (Toxic Element) YES**

Soap.

☒ **Fiberglass (Toxic Element) YES**

Is at a friend's house and will leave soon.

☒ **Radon (Toxic Element) YES high**

Possibly from friend's house.

☒ **PVC (Toxic Element) YES**

Possibly from friend's house.

☒ **Formaldehyde (Toxic Element) YES**

Got a foam mattress from the hospital will throw out.

Two days later

This is a follow-up to assess Joseph's improvement in immunity.

☐ **Isopropyl Alcohol (Solvent) NO**

☐ **Benzene (Solvent) NO**

☒ **TCEthylene and several more food solvents (Solvent) YES**

Others not tested. He has been drinking Celestial Seasonings™ tea and bottled water (probable sources).

☒ **Pancreatic fluke adults (Parasite) YES at thymus**

☒ **Pancreatic fluke stages (Parasite) YES at thymus**

Others not tested. He has eaten a hamburger (probable source). He is advised to be a vegetarian for 3 months to eliminate hazard of reinfection.

☒ **Pathogens (MANY) YES**

He tested positive, again, to 25 of 27 tests, a most devastating picture of AIDS. He was advised to return as soon as possible to this area in order to get his dental work done so his immunity can increase.

Summary: Joseph has accomplished his goal of eliminating the HIV virus but has not accomplished his goal of recovering from AIDS. He will probably be ill soon and will need to be hospitalized. Hopefully, he will get his dental work done before he is incapacitated and terminally ill.

50 Lil Zwick HIV

Lil has been coming to our office for 1½ years for assorted problems. She had already cleared up a number of toxic pollution problems resulting from pesticide in their well water and arsenic and gas leaks in the house. She has also gone through a parasite-killing program, liver cleansing, and

kidney cleansing. She had complete dental work to remove metal and infections. She appeared in robust good health today but complained of a burning sensation at the top of her esophagus that she attributed to heartburn (she put her hand over her thymus, I suspect HIV).

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Protein 24 (HIV) YES at thymus and genital tract**

☒ **Fasciolopsis (Parasite) YES at thymus and vagina**

☒ **Benzene (Solvent) YES at thymus and vagina**

Will avoid meats and all the items on our benzene list. The source is not obvious.

☒ **Bismuth (Toxic Element) YES**

Off skin lotion.

☒ **Aluminum (Toxic Element) YES**

Off deodorant.

☒ **PVC (Toxic Element) YES**

Source of PVC unknown. She will go back on the parasite program. She will also avoid isopropanol.

Six weeks later

Her chronic fungus problem is much better.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Parasites (All flukes) NO**

☒ **Taenia solium scolex (Parasite) YES**

Tapeworm, start on Rascal for 3 bottles.

☒ **Influenza (Pathogen) YES**

All other respiratory pathogens were NO.

Summary: She feels like her old self again, able to work hard, physically; she has no more "heartburn." Notice how easy it is to acquire the HIV virus or a precancerous condition and how

easy it is to get rid of it. Many healthy persons have probably gone through the cycle of getting it and losing it numerous times.

51 Marilyn Werdick HIV Illness and Pancreatic Cancer

Marilyn Werdick came with a diagnosis of pancreatic cancer at age 50. It happened suddenly, with stomach trouble two months ago. She thought it was due to her pain medicine for lower back pain. CAT scan showed area of pancreas that was suspicious. Biopsy showed pancreatic cancer. Surgery was begun but they just sewed her back up. She is on morphine. She is still smoking but promised to stop.

☒ **Protein 24 (HIV) YES at thymus, vagina, pancreas**

☒ **Ortho-phospho-tyrosine (Cancer) YES at pancreas**

☒ **Fasciolopsis (Parasite) YES at liver and thymus**

☒ **Fasciolopsis eggs (Parasite) YES at thymus, NO elsewhere**

☐ **Sheep liver fluke (Parasite) NO**

She has no sensations over the breast bone.

☒ **Gardnerella, flu, Plantar Wart, Strep pn, Trichomonas, Adenovirus, Campylobacter, Alpha Strep, Proteus v, Papilloma 4, *Bacillus cereus*, Nocardia, Staph aureus (Pathogens) YES**

☐ **Bacteroides fr, Haemoph inf, *Herpes* 1, CMV, Borellia, EBV, Shigella, Histoplasma, Chlamydia, Coxsackie B4, Salmonella, Resp Sync V (Pathogens) NO**

Stopped here (this is less than half the test). This shows AIDS-like lost immunity. Too many pathogens are growing in her. Her body must be full of solvent.

☒ **Benzene, Wood Alcohol, Hexane, Pentane, isopropyl Alcohol (Solvents) YES**

She was started on parasite-killing program. She will be off all commercial beverages and cosmetics and benzene sources.

Four days later

She missed her appointment.

Twelve days later

She died (telephone call).

Summary: Marilyn had none of the risk factors associated with HIV. She was just an ordinary middleage woman who didn't drink alcoholic beverages. If she had acted quickly, she would most likely have survived and gotten reasonably well again. Perhaps she missed her appointment because of embarrassment over not being able to stop smoking. Maybe I was too hard on her about it. We did not hear any details surrounding her death. Notice the adult fluke in the thymus where T cells are made. The thymus is a small gland and the fluke is a large parasite; it is like having an elephant in the kitchen. How could the thymus do its work? People often feel strange sensations at the top of their breastbone when flukes are in it, but she didn't.Cancer and HIV illness are first cousin diseases. Cancer results when propanol builds up in the body. AIDS develops when benzene builds up.

52 Harlan Wilson HIV

This 76-year-old man has been coming to our office for the past year, for a variety of ailments including heart disease and pain in his hips as well as his hearing loss. He had already done a parasite-killing program and had cleaned up his teeth. Suddenly he tested POSITIVE for HIV infection in my office in a routine test.

☒ **Protein 24 (HIV) YES**

☒ **Campylobacter, Coxsackie virus, Nocardia, Chlamydia, Staph aureus, Klebsiella, Gaffkya, Clostridium tet (Pathogens) YES**

☒ Wood Alcohol (Solvent) YES

Off commercial beverages and chemical sweeteners.

☒ **Benzene (Solvent) YES**

☐ **Solvents (Remainder) NO**

☒ **Fasciolopsis eggs (Parasite) YES at thymus**

☐ **Fasciolopsis adults and other stages (Parasite) NO**

He has been eating hamburger and pork sausage. He will go on a parasite-killing program. He had neglected the maintenance program for several months. His pulse is irregular; he will stay off caffeine.

One week later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Wood alcohol (Toxic Element) NO**

☒ **Nocardia, Chlamydia, Coxsackie 4, Gaffkya, Klebsiella (Pathogens) NO**

☒ **Staph aureus, Clostr tet (Pathogens) YES**

Tooth bacteria, cause of heart problem. He is much better. We will search for teeth responsible next time.

One month later

His pulse is still irregular. He is on new heart medication from his clinical doctor.

☒ **Chlamydia, Bacter fr, Coxsackie B1 (Pathogens) YES**

☐ **Pathogens (Remainder box 1) NO**

☒ ***Ascaris*, Treponema (Parasites) YES**

☐ ***Ascaris* megalo (Parasite) NO**

☒ **Staph aureus (Pathogen) YES high**

Probable cause of heart disease. Remainder not tested. *Ascaris* worms always bring Bacteroides fragilis bacteria and the Coxsackie viruses. He has not seen dentist yet.

Five months later

He had a check up recently with his clinical doctor who pronounced him well and told him that his blood test was good.

☐ Protein 24 (HIV) NO

☐ Ortho-phospho-tyrosine (Cancer) NO

☒ hCG (Pre-Cancer) YES at intestine

He is just beginning a cancer!

☒ Fasciolopsis adults (Parasite) YES at intestine and one part of the liver

He has been eating hamburger and chicken. He will go back on parasite program, 5-day high dose.

☒ **Isopropyl Alcohol (Solvent) YES**

Has been using commercial shampoo; will switch to borax.

Summary: Notice how easy it is to pick up the intestinal fluke parasite and how easy it is to start a cancer or get HIV from it. But it also takes isopropyl alcohol to start a cancer and benzene to start HIV. Hopefully, our meat supply and other foods will be cleared of parasites and solvents soon, so the risks are removed.

53 Joyce Stegeman HIV, Breast Cancer, Colon Cancer

Joyce has been going to a clinical doctor for 2 months, but no diagnosis has been reached. She reported the following problems: 1) fatigue; 2) hunger and nausea both; 3) warmth in head (mild fever?), occasional chills; 4) sounds like wind tunnel inside the head (roaring); 5)loose bowels, 3 to 4 times daily; 6) weight loss; 7) weakness; 8) tired and restless at same time; 9) some numbness. Slight inflammation of the liver was seen by one doctor.

☒ **Fasciolopsis (Parasite) YES at gallbladder, liver, thymus; NO at intestine**

☒ **Fasciolopsis redia (Parasite) YES**

☒ **Ortho-phospho-tyrosine (Cancer) YES at colon and breast**

She had intense stinging in her colon and in both her breasts and under armpits 2 months ago, but it went away.

☒ **Protein 24 (HIV) YES**

This came as a surprise. She was tested clinically for HIV a few months ago; it was NO (**Negative**). She seemed relieved to hear these findings; that is, that she was HIV Positive; she thought she'd had it for some time.

☒ **Dipetalonema, Echinococcus granulosus, Fischoedrius, Haemoproteus, Toxoplasma (Parasite) YES**

Start on parasite program.

Four days later

☐ **Fasciolopsis (Parasite) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES at muscle, bone, thyroid, thymus**

She is using Tom's™ fennel toothpaste. Will go off.

☒ **Tin (Toxic Element) YES at muscle, bone, thyroid, thymus**

Toothpaste.

Three days later

☐ **Tin (Toxic Element) NO**

☒ **Benzene (Solvent) YES**

She has been off toothpaste. She will go off the whole benzene list. She is too fatigued to go to work.

Six days later

She is feeling more like herself. No hot spells, but she is not well.

☐ **Benzene (Solvent) NO**

☐ **Protein 24 (HIV) NO**

☒ **Dipetalonema, Pancreatic fluke (Parasite) YES; remainder of box 1 NO**

Summary: Joyce had both cancer and the HIV virus. Small wonder that her symptoms were too confusing for clinical doctors to reach a diagnosis. By the time I saw her I was routinely testing everybody for Protein 24 in their white blood cells (immune system); P24 is a small chip off the core of the virus. When the intestinal fluke was gone, both cancer and HIV were gone! She had the solvent benzene accumulated in her; propanol was not tested at the first visit so it can't be ruled out of the picture. Joyce got her health back. Her illness had made her financially broke, so she did not come back. She was only in her early 30's. We hope she is staying off benzene and propanol sources.

54* Alex Solis HIV

Alex is a short, stocky person, brought by his sister from a nearby state. Alex is somnolent, sleeping 23 out of 24 hours. He did not speak for himself but was able to walk alone. He has been HIV POSITIVE for about a year. In the past he was very healthy. He was hospitalized for 6 weeks in Kentucky and is on medication for Toxoplasma, TB, etc.

☒ **Protein 24 (HIV) YES at thymus and penis; NO at urine, saliva, etc.**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

There is no cancer or precancer.

☒ **Fasciolopsis (Parasite) YES at intestine, thymus; NO at liver**

☒ **Benzene (Solvent) YES at thymus, intestine; NO at liver**

He will start parasite program and go off all benzene-polluted products on my list. Since his sister is very health-oriented, the source of benzene in such high quantities was not obvious. They will bring in their water supply for testing.

Two days later

☐ **Protein 24 (HIV) NO**

The virus is gone.

☒ **Benzene (Solvent) YES**

We're not sure where this is coming from—he is drinking a tonic made by a relative, using cold tap water and fresh herbs; also using spring water (fresh from the spring). Both of these are here for testing:

☒ **Benzene (Solvent) YES in Tonic, YES in Water**

This came as a shock since they do not live near a toxic dump. The sample bottles may be contaminated. They will immediately get new samples and have them sent overnight mail.

☒ **Candida, Influenza, Mycoplasma, Salmonella ent, CMV, Hepatitis B (Pathogens) YES**

6 out of 8 pathogens tested YES. This low immunity indicates AIDS. Note: It was especially easy for Alex to kill all parasites, taking only 2 days, instead of 5. Perhaps his herbal concoction is also a parasiticide. But he will stop using it and switch to using faucet water immediately.

One day later

☐ **Protein 24 (HIV) NO**

☒ **Benzene (Solvent) YES**

☐ **Benzene (Solvent) NO in faucet water**

They have also been drinking distilled water from the grocery store. They will go off this and use ONLY faucet water.

☒ **Aluminum (Toxic Element) YES**

☒ **Mercury (Toxic Element) YES**

Needs to remove metal from mouth.

☒ **Asbestos (Toxic Element) YES high**

Sister is using a hair blower; will stop.

☒ **Cobalt, PCB (Toxic Elements) YES**

Off detergent. They will use pure borax only, for all purposes and use no detergent.

☒ **All 6 drugs, Vitamin B6 (Samples) YES**

His white blood cells are working on removing one or more things in these. Change brands and bring in for testing.

Two days later

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

☒ **TCEthylene, Hexane dione (Solvents) YES high**

Restaurant food.

☐ **Solvents (Remainder) NO**

Note: Alex is well enough to sit for a longer period of time for testing. The entire solvent test was done this time, not only the benzene test. Note how few other solvents he has, a tribute to his sister's home cooking and food selection.

☒ **Oxalate, all Phosphates, Uric Acid (Kidney Stones) YES**

Start on kidney herbs. Note how many kidney stone varieties he has!

Two days later

Memory and mental function is very much better. Fatigue is slightly better. He is still sleeping 21 out of 24 hours. He is able to smile. He converses a bit with his sister.

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

☒ **Wood Alcohol (Solvent) YES**

☐ **Solvents (Remainder) NO**

☒ **PCB (Toxic Element) YES**

Was using some Dr. Bronner's Baby Supermild Soap™; will stop and use borax only.

☒ **Radon (Toxic Element) YES**

Move into a different hotel room. End of box 1.

☐ **Pneumocystis carinii, TB, *Paragonimus* Westermanii (Parasites) NO**

☒ **Taenia solium scolex (Parasite) YES in liver**

☒ **Taenia pisiformis cysticercus (Parasite) YES in liver**

Start on Rascal; take 4 capsules, 3 times daily for about 3 weeks.

Three days later

He feels he is getting better. Still sleeping about 16 hours out of 24. He speaks to me for himself. He produced an entire sentence.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **Urocleidus (Parasite) YES**

☒ **Trypanosoma gambiense, Trypanosoma equip (Parasites) YES**

Sleeping sickness.

☒ **Trypanosoma lewisi, Trypanosoma brucei, Trypanosoma rhodesiense, Trichuris (Parasites) YES**

☐ **Trypanosoma cruzi (Parasite) NO**

☒ **Naegleria (Parasite) YES high**

Note: Naegleria is a brain parasite. He has 2 kinds of “sleeping sickness.” He has been in Africa in the past. These infections may account for his extreme somnolence. He is continuing the parasite program.

Two days later

☒ **Trypanosoma lewisi, Trypanosoma brucei (Parasites) YES**

☐ **Trypanosoma cruzi, Trypanosoma rhodesiense, Trypanosoma equip, Trypanosoma gambiense (Parasites) NO**

☐ **Naegleria (Parasite) NO**

☒ **Schistosoma mansoni (Parasite) YES high**

☐ **Protein 24 (HIV) NO**

☐ **hCG (Pre-Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **Benzene (Solvent) YES in water samples**

Water samples of both spring water and cold faucet water were sent from his home. Both tested YES for benzene. This seems extremely enigmatic to his sister. She will remove all possible source of pollution after she gets home and we will then retest the water for her. Since Alex is improving, they have my permission to be away on a 1 week vacation.

One week later

Alex is walking about and converses with his sister and others who speak to him. He is very much better.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Histoplasma, Chlamydia trachomatis, *Herpes* simplex 1, Adenovirus, 2 Coxsackie viruses, Measles (Pathogens) YES**

End box 1. Note: He still has 7 out of 27 pathogens tested; he still has low immunity but not AIDS.

Two days later

He is conversant when awake but is still sleeping approximately 18 hours.

☐ **Taenia pisiformis cysticercus (Parasite) NO in all tissues**

☒ **Taenia saginata cyst (Parasite) YES at liver**

He will stay on Rascal as originally directed. Then he will take it 2 days a week.

Summary: Alex is ready to go home. He will stay in his sister's home until follow-up time in one month. His sister has done an admirable job in reclaiming Alex from his imminent comatose condition. Hopefully, they will not run into a polluted-water problem while at her home. They will

continue their parasite program and diet and product restrictions. They were given blood test requisitions at last visit; will test for HIV antigen P24. They are very pleased with Alex's new found health.

About ten days later

Report received from clinical laboratory for Alex Solis: HIV antigen NEGATIVE.

55 Calvin Parker HIV

This 34 year old man was diagnosed as HIV POSITIVE about 5 years ago. He started taking AZT 4 years ago. He is alternating between AZT and DDI plus Bactrim™. He was referred by a cancer client. He is not visibly ill.

☒ **Protein 24 (HIV) YES at thymus, kidneys, semen and urine**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Fasciolopsis (Parasite) YES at thymus, liver and intestine**

☒ **Fasciolopsis eggs (Parasite) YES high at urine and saliva**

Others not tested. Start on parasite program.

☒ **Benzene (Solvent) YES at thymus only (low level)**

He will go off all benzene-polluted items on my list.

One week later

He is getting a CBC and T cell count every 3 weeks. He is on day 7 of the parasite program.

☐ **Fasciolopsis and all stages (Parasite) NO**

☒ **Hexane dione (Solvent) YES**

Flavored food.

☒ **Ether (Solvent) YES**

He will be more careful when pumping gasoline.

☐ **Solvents (Remainder) NO**

He does not have benzene in him today; this is good progress.

☒ **Silver (Toxic Element) YES**

☒ **Thallium (Toxic Element) YES high**

Remainder not tested. Thallium is probably coming from his metal tooth fillings, probably as a pollutant of mercury. He needs all metal removed from mouth.

☒ **Influenza, Shigella flex, Adenovirus, Mumps, Coxsackie B4, Histoplasma (Pathogens) YES**

☒ **Haemophilus infl (Pathogen) YES at part of thymus only**

☒ **Staph aureus (Pathogen) YES at part of thymus only**

☒ ***Herpes* simplex 1 (Pathogen) YES**

Also visible in mouth. End of box 1. He has 9 out of 27 tests positive, moderate AIDS. He will take 1 dose of Oscillococcinum at bedtime for flu.

Two weeks later

He has a dental appointment. He has not had an illness, and this past week his energy returned.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Methyl propanol (Solvent) YES**

Will test chocolate which is his weakness.

☒ **Formaldehyde (Toxic Element) YES**

Will test house air.

☐ **Toxic Elements (Remainder) NO**

☒ **Staph aureus, Clostridium sept, Pseudomonas, Clostridium bot, Erwinia caro, Strep G, Haemophilus inf, Troglody-tella, Mycobacterium TB, Treponema pneu, Pneumocystis carn, Veillonella, Sphaerotilus natans (Pathogens) YES**

End box 2. At least 5 of these are tooth bacteria; they should disappear after dental work.

One week later

He has had no illness. All the metal is out of his mouth. He still has plastic crowns (maybe they will be OK and not need replacement). He is feeling very much better with less fatigue. He found a

dentist near his home to do the necessary work.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Solvents (ALL) NO**

☒ **Formaldehyde (Toxic Element) YES and in living room air**

He has 2 pieces of new fabric furniture in living room; he will separate furniture placing them into two different rooms and test the air in each room to find out which piece is fuming formaldehyde. He has been on Rascal for a week.

☐ **Taenia pisiformis, Taenia solium (Parasites) NO**

☒ **Staph aureus, Haemophilus influenzae, *Herpes* zoster (Pathogens) YES**

☐ **Pathogens (Remainder) NO**

He has only 3 infections growing in him out of 67 tested! This is better than average. The dental work has had a profoundly beneficial effect. He is ready for his clinical HIV antigen test.

One week later

He has had no illness.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Aflatoxin (Toxic Element) NO**

☐ **Formaldehyde (Toxic Element) NO**

Removing furniture worked! Stay on Rascal, take 1 day a week.

☐ **Herpes zoster (Pathogen) NO**

One month later

His clinical test results came back POSITIVE for HIV.

*Summary: Calvin was an exemplary client; he did everything correctly. What went wrong? Why did his clinical test say **Positive** when mine said Negative? There are several possible explanations, but the best course of action is to repeat my test, correct any regression that might have occurred, and then repeat the clinical test once more.*

56 Maurice Johnson HIV

Maurice is a 44 year old man with a prostate problem. He gets up more than once during the night to urinate. He had a severe prostate infection in his early 20's. He has been experiencing swelling for about 6 months. He also has occasional lower back pain. He will start on the kidney herbs for these symptoms. He will take it full strength for 3-4 weeks and then ½ half strength for 3 months. He also experienced some chest pain 3 years ago, so severe he thought it was a heart attack.

☒ **Protein 24 (HIV) YES**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Benzene (Solvent) YES**

☒ **Fasciolopsis (Parasite) YES**

Start on parasite-killing program. He will avoid all items on the benzene-polluted list.

One day later

☐ **Protein 24 (HIV) NO**

☒ **Isopropyl Alcohol, 1 Methyl Propanol (Solvents) YES**

Shaving supplies and mouthwash.

☐ **Benzene (Solvent) NO**

☐ **Solvents (Remainder) NO**

☒ **Schistosoma haematobium (Parasite) YES**

Probable cause of prostate problem.

☒ **Taenia pisiformis cysticercus (Parasite) YES**

☒ **Dirofilaria immitis (Parasite) YES**

Probable cause of chest pain experience.

☐ **Loa loa (Parasite) NO**

Others not tested.

☒ **Antimony (Toxic Element) YES**

Off colognes and fragrant body products.

☒ **Fiberglass (Toxic Element) YES**

Check insulation, make sure it is covered, no holes.

☒ **Aluminum, Aluminum Silicate (Toxic Elements) YES**

Off deodorant and soap.

☒ **Mercury (Toxic Element) YES**

Needs all metal out of mouth.

☒ **PCB (Toxic Element) YES**

Off detergent, use borax only.

☒ **Nickel (Toxic Element) YES**

Tooth fillings.

Summary: Since Maurice is from another far away country, he cannot return for several months to follow-up. He plans to be very compliant. He was not surprised at his HIV Positive status and, in fact, is somewhat relieved to hear about his real problem. It was easy for him to shed the parasite and the HIV virus and to avoid benzene.

57 Orlo Kremer HIV and Kaposi's

(Orlo Kremer's file covering his first few visits was lost, so I am writing this introduction from memory.)

Orlo is a terminally ill young man in his mid-thirties who was brought to our office by his friend. During critical periods his friend would bring him to his own home and care for him. Orlo had no interest in alternative therapy but his friend did, and insisted on his taking vitamins and herbs. This had gone on for several years before coming to my office. In his near terminal state, Orlo offered little resistance physically but still resisted emotionally. His diagnosis had never been clear but his friend suspected

AIDS. Not until Orlo broke out into purple spots all over his right arm was Kaposi's diagnosed.

Upon arrival, Orlo was barely ambulatory, breathing with difficulty but he had not stopped smoking. His friend appealed to me to come down as hard as possible on Orlo for this. Normally, this loses me a client. But I would lose him shortly anyway, so I took Orlo aside and told him in no uncertain terms that he would die, yes die, if he did not quit. He must quit this very day. I asked his friend, when they were back together, NOT to purchase cigarettes for him when so requested. Orlo tested YES (**Positive**) to HIV, as expected, and was started on the parasite program. At the next visit he was still smoking. But his friend was relentless in his persuasion and by his third visit Orlo had quit. His friend was very happy. We shared his joy.

Next visit (new file)

His skin looks better, purple spots are fading, but he is feeling no better. His appetite is good. He still has night sweats.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **4 Leishmanias (Parasite) NO**

☒ **Candida, Nocardia (high), Mycoplasma (Pathogens) YES**

☒ **Moniezia scolex, eggs (Parasite) YES**

Start Rascal.

Eleven days later

He was sick last week, just feeling bad; is staying with friend.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Moniezia scolex (Parasite) YES at pancreas, NO at white blood cells**

☒ **Moniezia eggs (Parasite) YES at pancreas and white blood cells**

☐ **Moniezia main body (Parasite) NO**

☐ **Other tapeworm eggs (ALL) NO**

Two weeks later

He has bad diarrhea. He has been in the hospital. He has gained 13 pounds. He feels well in spite of being sore and achy. He has been living at home. There is a dog in the house.

☒ **Fasciolopsis eggs (Parasite) YES in saliva, semen, spleen, urine**

We will take a saliva sample to search under microscope.

☒ **Human liver fluke adults (Pathogen) YES**

☐ **Sheep liver fluke (Parasite) NO**

☐ **Pancreatic fluke (Parasite) NO**

☒ **Benzene (Solvent) YES**

Off ice cream.

☒ **Decane (Solvent) YES**

Remaining solvents not tested. He will go off cold cereal. He will go back on the 5 day high dose parasite program. He has been eating hamburgers at restaurants. He will go to stay with friend.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

Two months later

He looks no better. His arm is covered with purple spots, at least a dozen, some as large as quarters.

☒ **Fasciolopsis adult (Parasite) YES at skin**

☒ **Sheep liver fluke (Parasite) YES at skin**

☒ **Pancreatic fluke (Parasite) YES at skin**

With all three of these large flukes in his skin, it is no wonder he has purple spots.

☒ **Necator americanus larva, Taenia pisiformis cysticercus, Taenia solium scolex (Parasites) YES**

☐ **4 Leishmanias (Parasite) NO**

☐ **Protein 24 (HIV) NO**

He does not yet have the virus back; perhaps the redia stage is necessary for this; perhaps benzene is essential also.

☐ **Benzene (Solvent) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **hCG (Pre-Cancer) YES high everywhere**

☒ **Isopropyl Alcohol (Solvent) YES high**

Off shampoo and cold cereal. Others not tested.

☒ **Arsenic (Toxic Element) YES**

Pesticides in house. Must be removed.

☒ **Cobalt (Toxic Element) YES**

Detergent. Go back to borax and washing soda.

☒ **Vanadium (Toxic Element) YES**

Gas leak. They will find it immediately.

Summary: We would have liked to show a picture of beautifully recovered skin, but that desire could not be accomplished in time for this book. We admire both Orlo's efforts to comply, and his friend's efforts to save Orlo's life. This has been going on for a number of years, and I hope they succeed.

58* Roy Ferguson HIV

Roy, age 29, was first seen six months ago regarding his HIV Positive status. Two years previously he began to be ill. Last year he had shingles and thrush. He brought with him a considerable number of blood test results, done as recently as a few months ago, showing a CD4 count of 300/mm³ and a CD4/CD8 ratio of 0.18. He also had tested **Positive** to HIV. He appeared healthy.

☒ **Protein 24 (HIV) YES in numerous tissues**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **hCG (Pre-Cancer) YES at intestine only**

☒ **Fasciolopsis (Parasite) YES at thymus and intestine; NO at liver and bone marrow**

☒ **Benzene (Solvent) YES**

This was a very short initial visit, confirming his status. He will start on parasite-killing program and stay off the benzene-pollution list. He will eat only fish and seafood for 3 months. He will bring in suspicious products for testing that he is using and are not on the benzene list.

One week later

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Benzene (Solvent) YES at thymus only**

He has been off all products on the benzene list. But he has used Halls Plus™ with liquid center for congestion and has eaten Bryer's™ Strawberry yogurt. He will stop this.

☒ **Hepatitis B, Salmonella ent, CMV, Borellia, Shigella flex, Papilloma #4, Influenza, Bacteroid fr, A strep, Strep pn, Chlamydia trach, Measles, Gardnerella vag, Campyl pyl, Mycoplasma, *Herpes* Simplex 1, Respiratory syn v, B strep, *Bacillus cereus*, Histoplasma cap, EBV (Pathogens) YES**

End box 1. He tested **Positive** for 21 out of 29 pathogens, definitely AIDS. He will take 1 tbsp. of LG 4 times daily and continue the parasite program.

One week later

Neck glands are down, no longer swollen. Energy is slightly up.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Benzene (Solvent) NO**

☐ **Isopropyl Alcohol (Solvent) NO**

☒ **Methyl Ethyl Ketone (Solvent) YES**

☒ **Hexane (Solvent) YES**

☐ **Solvents (Remainder) NO**

He will be more careful to avoid flavored and processed foods.

☒ **Regular gasoline (Toxic Element) YES**

☒ **Mineral oil (Toxic Element) YES**

Uses Aubrey™ products, will stop.

☒ **Haemophilus inf, Salmonella ent, Borellia, Chlamydia trach, Nocardia, Mycoplasma, B strep, Papilloma #4, Plantar wart, Coxsackie B1 (Pathogens) YES**

Note: He still has 10 out of 29 pathogens, a considerable improvement, but still indicative of AIDS.

One week later

His tongue shows a little improvement.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Benzene (Solvent) NO**

☒ **Candida, Corynebacterium dipth, Bordetella pertussis, Corynebacterium xerosis (Pathogens) YES**

Only 4 out of 29 pathogens are active.

One week later

Tongue still sore but improved. He feels fine.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Taenia pisiformis cysticercus (Parasite) YES at muscles**

☒ **Taenia solium (Parasite) YES at muscles**

He is too fatigued to hold a job.

☒ **Mineral oil (Toxic Element) YES**

Stop soap and lotion. Use our recipes.

☒ **Grain Alcohol (Solvent) YES**

He is using our Black Walnut Hull tincture. His liver can't even oxidize these few drops in an hour! Must put them in warm beverage.

☐ **Solvents (Remainder) NO**

One week later

He has had no illness; feels quite well. Tongue is about 50% improved.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Taenia pisiformis cysticercus (Parasite) NO everywhere**

☒ **Taenia solium scolex (Parasite) YES at muscle**

Start on Rascal; take for 2 bottles.

☐ **Benzene (Solvent) NO**

¨ Isopropyl **Alcohol (Solvent) NO**

☒ **Candida, Coxsackie viruses (both), Chlamydia (Pathogens) YES**

He is ready for clinical testing for HIV antigen.

One week later:

He has had some lower back pain; will start on our kidney herb recipe.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☒ **Benzene (Solvent) YES**

He suspects a new personal product he is using. He will stop using it.

¨ **Isopropyl Alcohol (Solvent) NO**

☒ **Aflatoxin (Toxic Element) YES in liver**

He will be much more careful to avoid moldy food. I suspect beer. He will do without beer.

☒ **Taenia solium cysticercus (Parasite) YES at muscle**

Continue Rascal for a third bottle, then for 1 day a week as maintenance. Note: because of the great risk of exposure to benzene-polluted products, Roy will continue follow-ups weekly for a while.

One week later

His clinical test result was NEGATIVE for the HIV antigen. His tongue is improved and less sore, but still deeply furrowed. He has not been ill this week.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine, hCG (Cancer) NO**

☐ **Aflatoxin (Toxic Element) NO**

Has been off peanut butter; keeps his bread in freezer; uses no vinegar.

☒ **Candida (Pathogen) YES**

We will make a new tongue swab to capture his remaining tongue pathogens on a permanent slide. He is no longer POSITIVE to his earlier slide. Roy is overjoyed at his good results and knowing that his careful adherence to the new lifestyle will protect him.

Summary: Roy was an exemplary client. Fortunately, he was not too ill to take charge of his lifestyle and was able to comply promptly. He never missed an appointment and was an inspiration to us all. He cleared his HIV virus in the first week (probably the first few days) but clearing the AIDS took longer. Once a client has been declared free of disease, it is all too easy to feel overconfident and begin to take small risks. For this reason, we do not recommend the clinical test until six weeks have passed free of the virus. Roy will continue to follow up once a month, sooner if ill.

59* Laurence Iverson HIV

Laurence Iverson is a very pleasant young man who came for his HIV

Positive status. He was not ill although several minor ailments were recurrent. For example cold sores, night sweats, thrush, and enlarged lymph nodes. Five years earlier he had a Salmonella infection, and was put on megadoses (30-40 grams per day) of vitamin C. He was also on Zovirax,™ Erythromycin,™ Zoloft,™ and Ativan.™ He had been instructed to be off tobacco, alcohol and IV drugs. A blood test done in early 1994 was **Positive** for HIV by EIA screening. Supplemental tests were also positive. CD4 count was 510 cells, and CD8 was 1140, giving a ratio of .45. The blood test was repeated, and CD4/CD8 was 26. He arrived at our office three weeks after this last blood test.

☒ **Protein 24 (HIV) YES**

☒ **Fasciolopsis cercaria (Parasite) YES at thymus**

☐ **Fasciolopsis (other stages) NO**

☒ **Benzene (Solvent) YES**

☐ **Isopropyl Alcohol, wood alcohol (Solvent) NO**

☒ **Ergot, Sterigmatocystin, Zearalenone (Mold toxins) YES**

☐ **Other mold toxins NO**

☒ **Mercury (Toxic Element) YES**

☒ **Shigella (Pathogen) YES at thymus**

He was instructed to zap once a day to kill remaining cercaria, take vitamin B2, 100 mg, three, 3 times daily to detoxify his benzene accumulation immediately. He was to prevent reinfection, and avoid benzene polluted products, and follow the diet rules concerning dairy. He was to take niacinamide 500 mg, 3 twice daily to detoxify ergot, and avoid moldy food. He was put on the Bowel Program (page **Error! Bookmark not defined.**), also vitamin C and Super B 50 complex. He was to switch his drinking water from purchased to filtered tap water. All supplements were to be supplied by our office to avoid risk of pollution. No other supplements were to be taken.

Ten days later

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

☐ **Ergot, Sterig, Zear (Mold toxins) NO**

☒ **Shigella, Salmonella (Pathogens) YES**

He had picked up Salmonella. He was given Lugol's solution and hand sanitation was reviewed.

Eighteen days later

He was still in the middle of dental mercury removal. He had started himself on LG and was free of cold sores. His toenail fungus was improved.

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

☐ **Bacteria (All) NO**

Three and a half weeks later

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

☐ **Bacteria (All) NO**

He was scheduled for a blood test, including PCR.

Seven days later

The PCR test was Negative.

Summary: my policy is to do a PCR test six weeks after the first Negative benzene result. Laurence did everything correctly and received a well deserved result on schedule

60* Andrew Nelson HIV

Tall and athletic-looking, Andrew was without the energy of a feather. He was immediately put in a hospital bed. Testing was done on a saliva sample.

☒ **Protein 24 (HIV) YES**

☒ **Benzene (Solvent) YES**

☒ **Formaldehyde (Toxic Element) YES**

☒ **Zearalenone (Mycotoxin) YES**

His new suit (formaldehyde source) was removed from the closet. All his supplements were stopped (he had been using a weight gain powder that tested **Positive** to benzene). In the hospital he was given plain Mexican home cooking; no brown rice, chips, or popcorn. He was on Isoniazid, Zoloft, Pyrazinamide and Bactrim for tuberculosis and on Quinadex and Lanoxin for heart fibrillation. He was to stop all his medications immediately and zap instead. His medications had benzene, isopropyl alcohol or wood alcohol pollution, a cruel irony indeed.

He was put on vitamin B2 (100 mg, 9 per day).

Two days later

☒ **Benzene (Solvent) YES**

He will stop all his supplements and medications, stop hospital soap and baking soda.

Two days later

He feels fine, is getting up for walks downtown. Numbness in toes is worse. He is to stop all personal products like toothpicks (they contain mercury).

Two days later

He has left for home due to boredom and wellness. No symptoms. He wants to get back to work. He promises to stay off health potions, off untested medications, keep zapping and do the parasite maintenance program. He will follow up with a saliva sample sent to us every week at first.

He stayed free of benzene for six weeks, then stopped sending samples.

Four months later

He did a blood test ordered by his clinical doctor including CBC and differential, basic immune profile, and two HIV tests. His *T cell* helper to suppressor ratio was still low (0.2) but P24 antigen test was NEGATIVE. And PCR antigen (quantitative) was 30,000.

Summary: Andrew didn't stay long enough to realize he had more toxic things to clean out of his life. He needs to remove Freon and copper to normalize his T cell counts. But he had unusual intelligence and courage. He changed a six week stay to a six day stay and still succeeded.

61* Clyde Rightweiser HIV

Clyde, age 30, was diagnosed with HIV six months ago. He has headache, lower abdominal pains and neck pain.

☒ **Protein 24 (HIV) YES**

☒ **Benzene (Solvent) YES**

☒ **Shigella, Staph (Pathogens) YES**

☒ **Mercury, PCB (Toxins) YES**

He will zap the parasites immediately; take 1 gm vitamin C with each meal, 300 mg vitamin B2, 3 times daily. He will stop smoking by switching to chewing our “smoking herb blend.” He will start dental work at once.

Two days later

☐ **Protein 24 (HIV) NO**

☒ **Benzene (Solvent) YES**

☐ **PCB (Toxic Element) NO**

Four days later

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

He quit smoking marijuana eight days ago. He is feeling better.

Nine days later

Lots of stomach cramps as soon as he eats.

☒ **Salmonella (Pathogen) YES**

Eat only sterile dairy food. Use Lugol’s 4 times daily after meals and bedtime. Wash hands with alcohol rinse. Headaches are better. Eye pain persists.

Eight days later

☐ **Benzene (Solvent) NO**

☐ **Staph (Pathogen) NO**

His amalgams are out.

☐ **Salmonella (Pathogen) NO**

He must stay on Lugol’s, at least once a day, to help prevent reinfection. His abdominal pain is gone; he still has back pain.

Eight days later

Abdominal pain returned, sleeping poorly, losing weight, constipation.

☒ **Staph (Pathogen) YES**

Dentist has not treated cavitations yet.

☐ **Benzene (Solvent) NO**

Thirteen days later

His *T cell* count is up from 11 to 20, according to a test ordered by his clinical doctor.

☐ **Protein 24 (HIV) NO**

☒ **Staph (Pathogen) YES**

Is still getting dental work done.

Three weeks later.

The HIV-1 antigen test (quantitative) is **Negative**.

*Summary: Clyde did not stay well consistently after getting a Negative HIV result. If he neglected vitamin B2 he would be **Positive** for benzene, showing that he was still getting it. He continued to pick up Shigella, which gave him diarrhea. Taking untested medicine for the diarrhea gave him benzene, which in turn reduced his ability to fight Shigella, a vicious cycle. All in all his health deteriorated in spite of no longer having the virus.*

62* Eugene Wald HIV

Eugene Wald was diagnosed with HIV three years earlier. He immediately began to investigate and try all the alternative therapies he could find, even in Mexico, including ozone, peroxide, and live cell therapy. He appeared in good health and was active in his profession. He was taking bee pollen and numerous other exotic supplements. He had his amalgams replaced. He brought his latest blood test which showed: a rather high CO2 level implying an air toxin. His uric acid was slightly high, perhaps because his LDH was slightly high (187 in a range of 94-250). His total protein was slightly high (8.0) and cholesterol too low (131). He had

already started the parasite program.

☐ **Protein 24 (HIV) NO**

☐ **Ortho-phospho-tyrosine (Cancer) NO**

☒ **Benzene (Solvent) YES**

He agreed to go off everything on the benzene list. It grieved him to give up his bottled water.

☒ **Shigella (Pathogen) YES**

He was to sterilize all dairy foods.

☒ **Chlorine (Toxic Element) YES, and high**

He was to stop using bleach and to run his cold water through a filter pitcher.

Nine days later

☒ **Benzene (Solvent) YES, and high**

☒ **Wood alcohol, (Solvent) YES**

☐ **Isopropyl alcohol (Solvent) NO**

☒ **Mercury, lead (Toxins) YES**

☒ **Ergot, aflatoxin (Mycotoxins) YES**

He was quite upset that he still had benzene; we asked him to bring in all his special products for testing and everything he put on or in his body. He was using dental floss, which could explain the mercury. He was to bring in water and dust samples from his home; stop eating all nuts and grocery bread.

☒ **Adenovirus, beta strep, alpha strep, Bacteroides fr., bacillus anth., Candida (Pathogens) YES**

He obviously still had AIDS (7 out of 7 tests positive).

Three days later

His product test results were:

Sample name	Benzene	Propyl alcohol	Wood alcohol	PCB	Lead
bee pollen	N	N	POS	N	

black chalk	N	N	N	N	
colostrum	POS	N	N	N	
contact lens solution	POS	N	N	N	
honey POS for ergot					
IM B12 shot	N	N	N	N	
IV B complex	N	POS	N	N	
IV vitamin C	POS	N	N	N	
mixed nuts	N	POS	N	N	
olive oil	N	N	N	N	
pygmy dirt	N	N	N	N	
royal jelly	N	POS	N	N	
V8 vegetable juice	POS	POS	N	N	
water, kitchen, cold					POS
water, kitchen, cold, filtered					N
water, kitchen, hot					POS
water, shower, cold, filtered					POS
water, shower, cold, unfiltered					N
water, shower, hot, filtered					N
water, shower, hot, unfiltered					POS

Ironically, he was “mainlining” benzene into his body with an intravenous health treatment procured in Mexico (but made from U.S. ingredients). He stopped all the polluted health supplies. One confusing result was the cold shower filtered water; it was **Positive**, while the unfiltered water was **Negative**. Perhaps the filter needed changing, or Eugene mixed his samples up, or we mixed the results up. In any event it was not worth rechecking because Eugene immediately started looking for a new place to live, and brought in water samples from the new place before he signed the lease.

He had to leave on vacation and when he returned…

Four months later

- **Protein 24 (HIV) NO**

- **Benzene (Solvent) NO**

He had been well all this time. We scheduled a clinical P24 antigen test. It came back **Negative**.

Eight months later

☐ **Protein 24 (HIV) NO**

☐ **Benzene (Solvent) NO**

☒ **Copper (Toxic Element) YES, high**

☒ **CFC (Freon) (Toxic Element) YES at thymus**

☒ **Penicillium conidia, penicillium spores (Fungi) YES, at lungs**

To get the CFC out he was given a complicated program. Because Freon is not biodegradable, we first ozonate it by drinking ozonated water (three glasses a day—the tube from a small ozonator is dropped into a glass of water and left to bubble for two or three minutes). Within minutes we can find CFC in the liver; evidently it has been mobilized from the tissue where it lay marooned. To help it out of the liver drink two cups each day of the Liver Herbs (page 582); failure to do so often causes digestive distress.

From the liver the CFC travel to the kidneys for excretion. But it is marooned again without more help! This time the Kidney Cleanse (page 579) comes to the rescue. So finally, a batch of CFC leaves your body. Next day another batch can be unloaded, and so on for six to eight weeks.

Eugene replaced his Freon refrigerator with a non-Freon variety. He had the Freon removed from his car's air conditioning system. He bought an ozonator and started removing his body's Freon accumulation.

The fungus growth in his lungs might explain his asthma attacks. The source of copper was not determined.

But he was still free of benzene, so we ordered a PCR antigen test for him. The results came back **Negative**.

Summary: Eugene's zeal for health inspired us all. He can now sustain his energy beyond that of the average person: well into the evening. But we discourage this. Better to sustain it into the later years.

63* Fred Dizon HIV

Fred Dizon, about 40, was a handsome young man in the prime years of his life. He stated he had been HIV Positive for 7 years. He had only begun to have illness in the last year and was now living at home. His father was terminally ill with cancer and when he and his parents arrived in summer

1996, we gazed with admiration at the mother. She had no time—not a speck of time—for self pity. There was work to be done and she dove into it like a fighter plane.

Fred was given initial instructions to avoid the benzenelist in the book, kill parasites regularly, and do the starting blood tests. After this, he was on his own while their attention was focused on his father.

A few problems could easily be seen on his blood test results. Potassium and calcium were too high, indicative of a thyroid problem.[31]

BLOOD TEST	Result	Comment
Potassium	5.1 meq/l	(3.5-5.3) Somewhat high
Calcium	10.2 mg/dl	(8.5-10.3) Somewhat high
Gobulin	3.2 g/dl	(2.2—4.2) Somewhat high
WBC	8.0 thous/mcl	Quite good
RBC	4.4 mill/mcl	Quite good
Patelet count	419 thous/mcl	Somewhat high

His globulin level was slightly elevated implicating vanadium toxicity at the liver. This would undoubtedly come from his dentalware, besides a gas stove and a refrigerator.

Of his 8,000 WBC per mm3, 46% were neutrophils and 35% were lymphocytes. This gives 2784 lymphocytes per mm3. The monocyte level was quite high (15%) showing chronic viral infection. The Tlymphocytes showed the typical problem for HIV Positive persons: the CD4's (helpers) were much lower in number than the CD8's (suppressers), instead of the other way around as is normal. His ratio was: CD4/CD8 = 0.62.

We compared this with an earlier blood test done in March '95, during a bout of illness. Again his WBC had been slightly high (8.9) as well as his platelet count (521). At that time, too, his lymphocytes had been 35% and monos 16%. His T cell ratio had been slightly better, 0.7. He had lost a little ground since then.

In spite of his extra duties and stress at this painful time in his life, Fred

freed himself of benzene at once—in a day. They moved into their RV, and cooked outdoors, staying outside most of the time. The refrigerator was moved outdoors. They got rid of all foam bedding. Fred wanted to live. He resented none of the restrictions.

Although his blood chemistry tests were done the first day, the viral load test was not done until 2 weeks after their arrival. But the results had gotten lost somehow so the lab was called to obtain them. The lab reported a *Negative* result! But this seemed too good to be true, after only 2 weeks, so it seemed best to repeat the test. A week later, a second test was done. It too, indicated a *Negative* result for the PCR viral load (RNA quantitative). The family was still sure there was some mistake. This disbelief was no doubt a blessing for them both, as they were only three weeks into the HIV recovery program. He had only been off all benzene-polluted products for three weeks, along with killing parasites. Besides this he stopped eating brown rice, snack chips and popcorn. His food was tested for benzene, isopropyl alcohol, and zearalenone before he ate it.

His father slipped away near the end of September. We wondered whether he got the good news about his son's progress and understood it before he died. We hoped so. Fred's improvement was beginning to show; he was less fatigued.

A urine phenol test was suitably low:

☒ **Phenol (random urine) 6 mg/L (2-75 is considered a normal range)**

This showed that he had not been getting benzene in minute doses, chronically, in some form, since benzene is excreted as phenol. He was obviously not allowing himself small indiscretions, like a tiny bit of favorite junk food or supplements. Soon Fred no longer needed naps during daytime. He grew impatient to leave for home and resume work.

But his mother waited patiently while grieving. Our hearts went out to her as we bolstered her decision to have Fred stay until all dental work was completed. Only this could keep him safe for her.

Syncrometer® tests still showed copper, cobalt, vanadium, the malonates, urethane and bisphenol-A (an estrogenizer).

By October, all metal and plastic had been drilled out of his teeth. Several had been extracted and replaced with acrylic partials. His front teeth were full of holes where plastic had been removed. He was keeping them well brushed with white iodine.

After this, a new immune analysis was obtained. The T cell ratio was now 0.9, a remarkable improvement! Then they left for home, before the final cleanup of dentalware by air abrasion.

The new viral load test had been postponed till he could arrange it at home where insurance would pay the bill.

Delays ensued, as they do for an active young man. But in spring, 1997, the new blood test results arrived at my office.

- **HIV 1 (P24 antigen) Negative**

- **HIV 1 (RNA by PCR, quantitative) less than 400 copies/ML**

This is a **Negative** result.

Summary: Fred was a model patient. But with a return of health, over-confidence and impatience returned, too. And he left before all work was complete.

Fred needs to return and finish his dental cleanup to perfection. He needs to be searched for amalgam tattoos and for plastic remnants. These would be removed by air abrasion with baking soda—a few minutes work, without anesthesia! This could elevate his T cell ratio further, I believe. What about replacements? He could then fill the holes with common ZOE. Some might fall out and need replacement in a year's time. At least the holes would not need to be enlarged. Perhaps, by then, something more permanent, yet safe, will be available.

If not, it could wait. If a couple of teeth get infected and need to be pulled during the year, so what? Life and health are worth more than a few teeth. A new partial could be made that included the newly extracted ones.

Congratulations, Fred. And our deepest respect and sympathy to Fred's mother.

This is not a success story. Be prepared! But it is important to report our failures so we all can learn.

Doris represented the growing class of transgender persons in society. She came at the eleventh hour, so to speak, in fact, at the last minute of the eleventh hour. Life was already beginning to slip according to hospital personnel.

But there is always a chance that we can snatch it back. Only if the heart can do no more, the liver can do no more, and the kidneys can do no more will all our efforts fail. How can we ever know? We must try. And her loved ones agreed. They were unwilling to let go a life so young and so beautiful. They took her out of the hospital where nothing could be done except “watching” and brought her where a great deal could still be done. Her caregiver would see to that.

It had been her second recent hospitalization and she had lost 30 pounds. It was her lungs, both times. She was on five medications, but only antibacterials and antifungals now. Everything else was deemed past usefulness by her USA doctors. She arrived in the summer of 2000. We were only taking “hopeless” cases. Our goal was to find out why they were considered hopeless and whether the barrier of hopelessness could be broken. We ordered the usual blood tests plus a viral load test for HIV and an immune analysis. The viral load was over the top of the testable range, over 750,000. The ratio of CD4’s to CD8’s was not obtained, nor was the actual number of white blood cells or lymphocytes.

Our first task was not to kill parasites and lower the viral count but to immediately find which organ was the weakest link in her chain to survival. Clinical medicine is not advanced enough to decide this scientifically. A blood test, appearances, physical assessment and guesswork is all it has for this crucial time.

We guessed lungs, which rattled with labor, but nevertheless selected blood for testing first with the Syncrometer® since that would give us a more systemic picture.

☒ **PCB (Toxic Element) YES, at blood**

☒ **Benzene (Toxic Element) YES at blood**

These two solvents were so plentiful they were now circulating to every organ via the blood.

☐ **PCB (Toxic Element) NO at the white blood cells in the blood**

☐ **Germanium, organic (Nutrient) NO at the white blood cells in the blood**

☐ **Selenite (Nutrient) NO at the white blood cells in the blood**

☐ **Beta glucan (Immune Factor) NO at the white blood cells in the blood**

☐ **Asbestos (Toxic Element) NO at the white blood cells in the blood**

☐ **Benzene (Solvent) NO at the white blood cells in the blood**

The neutrophils (phagocytes) were not "eating" any of the two solvents. And there was no germanium or selenite in them. There was none of the essential beta glucan, either.

☒ **Asbestos (Toxic Element) YES at blood**

☒ **Ferritin (Iron Storage) YES at blood white blood cells**

The white blood cells were coated with sticky ferritin, due to asbestos, which had not being phagocytized. We started her immediately on levamisole, 50 mg, (two, 3 times daily before meals). I saw her caregiver run to the pharmacy at the end of the block.

☒ **Protein 24 (HIV) YES at blood**

☒ **Reverse transcriptase (HIV Enzyme) YES at blood**

☒ **Fasciola (Parasite) YES at blood**

☒ **Fibronectin (Cell Glue) YES at blood**

We interrupted testing of blood here since we could already see the severity of the condition. The rather large Fasciola fluke stages had access to her very blood now, shedding fibronectin into the whole circulation. Yet she could walk, talk and smile still. She could take care of her own basic functions. There was hope. We turned to her lungs.

☒ **Paragonimus (Parasite) YES at both left and right lungs**

☒ **Pneumocystis (Fungus) YES at both left and right lungs**

☒ **Sorghum mold (Fungus) YES at both left and right lungs**

☒ **Fasciola (Parasite) YES at both left and right lungs**

☐ **Fasciolopsis (Parasite) NO at both left and right lungs**

☒ **Chaetomium (Fungus) YES at both left and right lungs**

☒ **Cobalt (Toxic Element) YES at both left and right lungs**

☒ **Vanadium (Toxic Element) YES at both left and right lungs**

Fasciola was playing a prominent role not yet understood, and the lungs did have some problems, but most items tested were **Negative** (and not listed above). Our guess was wrong. The critical organ could not be the lungs. We did not yet know what it was. She was switched to benzenefree, PCB-free, asbestos-free, dye-free, lanthanide-free food. All body products were stopped. They were given the list of supplements to start on and instructions for the plate-zapper, which they should bring with them next day. There would be 10 tsp. of Black Walnut Hull tincture to take plus cloves and wormwood, daily. Doris and her caregiver smiled their good-byes. They were back next day, with all chores completed and plate-zapper in hand.

One day later

☒ **Asbestos (Toxic Element) YES (as before) at blood**

☒ **Potato Ring Rot (Fungus) YES at blood**

☒ **Chaetomium (Fungus) YES at blood**

☐ **Fasciola (Parasite) NO at blood**

☐ **Fibronectin (Cell Glue) NO at blood**

Evidently the 10 tsp. of Black Walnut Hull tincture had done its job on Fasciola promptly. Since Fasciola is responsible for fibronectin presence, it was gone too.

☒ **Protein 24 (HIV) YES**

☒ **Reverse transcriptase (HIV Enzyme) YES as before**

☒ **Sorghum mold (Fungus) YES**

☒ **Paragonimus (Parasite) YES**

☒ **Pneumocystis (Fungus) YES**

The first task was to clear the blood of all this obstructionist fungus flotsam and jetsam. They started plate-zapping with a blood slide on the plate, followed by a white blood cell slide, these two to be alternated every 20 minutes for the rest of the day. Her skin at the wrists was full of PCBs, as were her hands. In fact, every skin location tested was PCB-**Positive** except for a location just in front of each heel. We put her copper tubes there, to be connected to her platezapper. A blanket could cozy her feet. Sitting in an easy chair while zapping, she could be entertained and coaxed to eat a little more and join in the life around her. She could finish this plate-zapping task at home, so after learning the set-up they left for the comforts of their motel room. Next day, she had already zapped four hours in the morning before they arrived.

One day later

She looked and felt better, was eating better. We tested her first for flu and Salmonella at her whole body. We wanted to anticipate any “side effects” of killing the large flukes in such numbers. Both were Negative. So the defenses against these two after effects had worked (homeographic bottles for flu and Salmonella on the plate).Then we tested her blood again to follow up on her treatment so far.

☐ **Protein 24 (HIV) NO at blood**

☐ **Reverse transcriptase (HIV Enzyme) NO at blood**

☐ **Potato Ring Rot (Fungus) NO at blood**

☐ **Pneumocystis (Fungus) NO at blood**

☐ **Paragonimus (Parasite) NO at blood**

☐ **Chaetomium (Fungus) NO at blood**

☐ **Sorghum mold (Fungus) NO at blood**

☐ **Asbestos (Toxic Element) NO at blood**

☐ **Salmonella (Parasite) NO at blood**

☐ **Holmium (Toxic Element) NO at blood**

Her zaps had been good ones. If the voltage had been too low, holmium would have been left behind. She had made a clean sweep of her blood. What next? Lungs? Thymus? Bone marrow? Where could we have the greatest impact? We chose thymus, testing by Syncrometer® first:

☐ **PCB (Toxic Element) NO at thymus**

☒ **Benzene (Toxic Element) YES at thymus**

☒ **Fast Garnet (Dye) YES at thymus**

☐ **Asbestos (Toxic Element) NO at thymus**

☐ **Holmium (Toxic Element) NO at thymus**

☐ **Thulium (Toxic Element) NO at thymus**

☒ **Fasciolopsis (Parasite) YES at thymus**

Next, searching topically at the skin over the thymus and at many chest locations, we found:

☒ **Fasciolopsis (Parasite) YES everywhere**

Searching deeper at one of these chest locations, a vein with valve was located, a lymph vessel, a lymph vessel valve, the connective tissue and the adipose (fat) layer. At each location a Fasciolopsis was present. We could conclude that Fasciolopsis was everywhere under her skin. We must kill them

slowly. But did she have time? Her benzene level seemed to be waning. But what was the extent of her PCB contamination? We began testing at the crown of the skull, which often appears to be a collecting point when PCBs are circulating in the body:

☒ **PCB (Toxic Element) YES at the crown of the skull**

☒ **Fasciola (Parasite) YES at the crown of the skull**

☒ **Fasciolopsis (Parasite) YES at the crown of the skull**

Next we began searching topically on her upper arm, where bone marrow could be contacted through the skin electrically:

☒ **PCB (Toxic Element) YES at upper arm**

☒ **Benzene (Toxic Element) YES at upper arm**

☒ **Fasciolopsis (Parasite) YES at upper arm**

☒ **Fasciola (Parasite) YES at upper arm**

☒ **Potato Ring Rot (Fungus) YES at upper arm**

☒ **Zearalenone (Mycotoxin) YES at upper arm**

We could conclude she was making a part of her benzene herself from zearalenone, which in turn is made by Potato Ring Rot fungus that had taken over killed Paragonimus nearby. All of this is going on in her bone marrow.

☒ **Fast Garnet (Dye) YES at upper arm**

Her bone marrow was saturated with this dye. We moved up and down the arm over the bone, it was the same. We chose the thymus for zapping next leaving the bone marrow for a later time. In retrospect, perhaps we should have chosen the bone marrow.

One day later

The next day she felt “fluey” and more fatigued. We must have done some significant fluke killing. We tested for flu and Salmonella. Flu but not Salmonella was **Positive**. She increased her flu protection by zapping at flu frequencies. Of greater concern was her Pneumocystis level. It had gone wild, especially at the right lung. She had a small temperature elevation, 100˚ F. We checked her five medications; one of them, her Diflucan, had Fast Garnet and other azo dyes in the color coating. We rushed out to search for a Mexican equivalent that would test free of dyes. We recommended staying in bed to keep warm, while zapping the thymus at both the arteries (group A) and veins and lymphatics (group L). (These “groups” refer to a patterned bottle of water used for zapping.)

One day later

Her caregiver arrived with a saliva sample for testing, leaving her warm in bed at home. Her

temperature was holding at 100˚ F. She was much better according to him. And her presence was not needed for testing, since it can be done in absentia, even in detail, on the saliva sample. Her caregiver was already expert at platezapping. He would zap Doris at kidneys and lungs next.

One day later

Next day, all went well. She was eating, drinking and zapping.

One day later

We skipped Sunday and resumed testing Monday, again on a new saliva sample. Both kidneys were clear of everything now. Both lungs were clear, even of Pneumocystis. But the white blood cells in the lungs still had their cargo of this fungus. They were stalled. She needed more selenite and germanium. We gave her our office supply while her caregiver ordered more.

The left side of the thymus was clear of everything too; even Fast Garnet was leaving. The white blood cells had their beta glucan again, their interleukin 12, their germanium and selenite. They were still busy with Fast Garnet. P24 was already **Negative** but reverse transcriptase could still be found. At the right side of the thymus everything was clear too, but here the white blood cells were still handling holmium.

She was zapping genital locations now. Here there was left over HIV virus, Fast Garnet and Pneumocystis. The killing action of Fast Garnet could easily be seen at the white blood cells in all these organs. The normal ratio for the gene bcl-2 and bax is one to one. In cancer, where cells are stimulated to grow much too fast, bcl-2 activity outstrips bax by many multiples. For Doris, bax outstripped bcl-2, 3 to 1, just the opposite. Her white blood cells here were being scheduled to die (called apoptosis), wherever Fast Garnet was present.

We had not yet learned to take out this toxic dye specifically at one location, with homeography. We could only zap, fast and furiously. She could do it at home, to save time for more zapping. Her caregiver got in 10 hours a day, while tending to all her other needs, not the least of which were emotional.

Two days later

Enough progress had been made. Then why was she still so groggy? And her skin, already too rosy when she arrived, was showing patches of red color. Were the symptoms related? We searched at brain and skin to find out.

The treacherous worm Ascaris (microscopic larvae) was still everywhere. We dared not kill it too fast. Although some immunity had been returned to her thymus, parts of bone marrow, lungs and some genital organs but there was none yet in her brain and skin. Everywhere were Ascaris larvae and eggs. Still her body tackled them bravely. One of the larval stages releases treponema (syphilis). Treponema was booming in her brain. They were plentiful at the blood too, and spine, so walking would be difficult soon unless they were conquered.

We gave her a new zapper, with an additional built in frequency, near the Ascaris and treponema frequencies. It worked better. In onehalf day of special frequency zapping, treponema was gone. It left behind red patches. My opinion was that they were the “allergic” aftermath of killed larvae.

Just at this time her family came to visit. They had never seen a platezapping setup. It looked like a scene from a science fiction movie to them. Never having seen patchy red skin before either, they insisted on rushing her to the ER (hospital emergency room in USA). A week ago they had left in a similar rush. What is a family to do?

But the ER still confirmed she was in the process of dying. In the hospital she was forced to eat the usual dyefilled jellos and puddings, chemical potatoes, coke and similar body-atrocities. Her family could be forgiven but the medical establishment cannot. After a few days in the hospital, she had lost so much ground everybody was appalled. Despite their concern they were providing nothing of real use; their IVs were pitifully poor and would, of course, be themselves contaminated with bacteria, *Ascaris* eggs, even azo dyes, not to mention PVC. After pronouncing death imminent to her caregiver, he knew again there was nothing to lose. He had gotten "Power of Attorney", meanwhile, so he picked her up and carried her bodily outside. Straight into a waiting taxi headed for the border. The Mexican hospital was ready. In isolation, although it was not necessary any more (the P24 and reverse transcriptase had been **Negative** for some time) they had the peace and quiet they needed.

As soon as she arrived back in Mexico; her caregiver put her back on the zapper. She could sense with closed eyes what was happening. Her caregiver brought a saliva sample for testing. A complete blood test was done. The Mexican doctor was kind and encouraging, his presence exuded love, a commodity less known in United States hospitals.

The saliva test showed she was somewhat reinvaded by HIV, *Ascaris* eggs and treponema but not drastically. The most damaging was benzene and Fast Garnet, picked up again in large quantities from the hospital food and IVs.

Fearing the worst, her caregiver took a "last" photo of her. He was zapping at blood, WBC, A, L, and genital organs continuously, while the right plate held pneumocystis, treponema, sorghum mold, yeast, flu and Salmonella, potato ring rot and candida.

The saliva sample showed Fast Garnet, again, in every organ we tested. But reverse transcriptase (HIV) was now quite rare, in fact, only in the brain. She was semi-comatose.

Fig. 119 Viral load more than 750,000.

The blood test results had arrived. Both BUN and creatinine were over the top of the range; she was beginning to have kidney failure. Her total protein was down to 5.7; she needed albumin by IV at once. Both calcium and phosphate were somewhat elevated showing that the thyroid and parathyroid

glands were now involved. Her body was teeming with clostridium bacteria, seen by the low uric acid level. There were plenty of dead parasites for them to consume. Potassium was quite low; it would cause fatigue. Triglycerides were too high, associated with kidney distress. And carbon dioxide was too low, evidence of over acidic conditions. But the liver was strong as were the adrenals; blood sugar was fine. She was immediately started on an IV of albumin and potassium; it should have been done days earlier, it would have been so easy for the United States emergency room to add it to their IVs. But they had done only a scanty chemistry in her blood test, as though such things did not matter. It would be a race for her life now.

The first week back

The nurses watched. The doctor examined. Her caregiver zapped and we tested. Day by day, her organs were getting cleared again. Suddenly at the end of one week her skin started to clear. She became lucid. She wanted to take care of herself. We were jubilant.

Five days later

She could sit up and eat unassisted. We thought we were on the home stretch toward recovery.

Her HIV test result had just arrived from two days before. Her viral count was a mere 3,460. Her caregiver beamed and told her family there was great hope, almost certain success.

Fig. 120 Viral load 3,460

But it was not to be. Her total protein level stubbornly refused to come up in the most recent test in spite of dose after dose of albumin. In fact it was dropping. The liver whose job it is to make albumin was inundated in cobalt, vanadium, and other amalgam-related chemicals. At that time we could not do homeography. Now we would simply pull the cobalt and vanadium out of the liver using such drops. It is not an uncommon emergency situation, for which there has never been a solution. She was inundated in these metals but we dared not use EDTA because of her previous kidney condition. The latest test actually showed the kidneys had

improved so much they were no longer to be considered in failure. But we couldn't risk setting them back. The thyroid and parathyroid had improved; the potassium level was normal again; adrenal function was back. Still, the bone marrow could not make red blood cells. It may have been missing a kidney factor or liver factor required to do this job. The purchase cost of these factors would be prohibitive for the caregiver. Her family was destitute. We ordered them for her ourselves. The red blood cell count was at 3.1. We opted for a transfusion just a bit early. Maybe this would oxygenate her tissues enough to let the liver make albumin again; this was our reasoning. The Fast Garnet she had picked up in just a few hospital days in the United States stayed tightly stuck in her bone marrow. We could have used our 40-vitamin B2 "trick". Forty vitamin B2 (300 mg) capsules can take out the azo dyes from any one location, like liver or brain, in her case bone marrow. But Fast Garnet does not respond as well as other azo dyes. And the risk was diarrhea. We couldn't risk that, either.

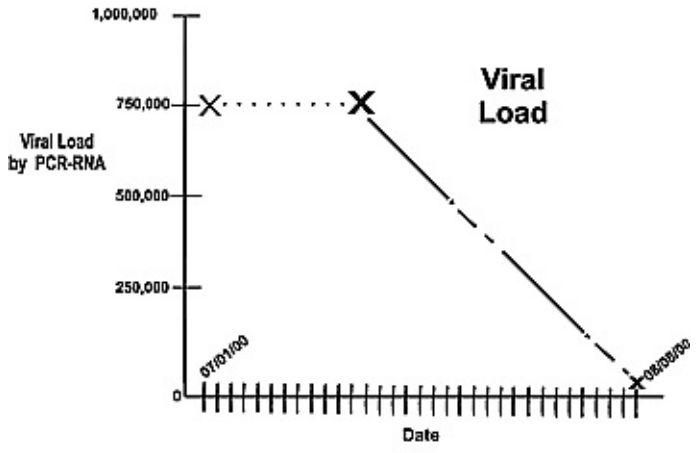

Fig. 121 Viral load drop in five weeks

Now, a year later, we would simply take the dye out of the critical organs with homeographic drops, all in one day. At that time we couldn't. We could only wait for her transfusion blood of special blood type to arrive. In the United States this is easy; it could have been done while in the ER. In Mexico there is often a shortage and a waiting period.

One unit of blood arrived. She was hooked up at once. That would tide her over a waiting period for the next unit.

She improved every day, with normal thoughts, speech and actions. But her strength did not come up in spite of albumin doses. Her appetite was good; she was gaining a bit of weight, the best sign of all.

Suddenly she was gone. After a cheerful evening of chatter and hope, her

caregiver said goodnight to her at midnight. At 3 a.m. her heart beat its last. She was gone forever.

Summary: She had been essentially free of the HIV virus for two weeks. Her AIDS had improved a lot. Was it a blood crisis that the United States refused to fix and Mexico was unable to fix? Or was it something quite unknown and mysterious that had her in its grasp? We will never know.

She was happy in the last few days, hopeful and not in pain, with a loved one nearby. She was not full of tubes–a better way to go than in the United States. We loved her. The devotion of her caregiver shone like a beacon. But our ignorance of life's real parameters showed pitifully. And it seemed to me that if her clinical help had incorporated our principles this story could have had a happy ending.

65 Annamarie Stevenson HIV

Annamarie Stevenson was in the prime of her life, and still is. At age 52 (give or take a little) she has a lot to contribute to society with her job, her community life, and her family. With her children raised she can now "enjoy life" and "reap the rewards" of being a conscientious, responsible citizen. Or can she?

In the spring of 2001, while doing our program, we saw her blood test result suddenly worsen. Her WBC had again dropped, this time to 2.9. Her RBC also dropped further, to 3.03. Together, they mean she had bone marrow damage to the extent of needing a transfusion. Now! Not later. It was time to be very alarmed. Why was this happening to her?

Her viral count had been "below detection" for a long time. What was destroying her bone marrow now, if it was not the HIV virus?

Annamarie was diagnosed **Positive** for HIV two years earlier, shortly after her husband died of AIDS. She was put on the most suitable cocktail of drugs at that time and became **Negative** promptly. Her viral count had never been very high. Why did she deteriorate since then, since the virus was being kept to a negligible level? Why was her health failing?

Why were her WBC and RBC dropping, in spite of being **Negative** for

the virus? This was baffling and disappointing to her.

She came to us four months ago to cure herself. The first thing we did was schedule a new viral count, immune analysis, and blood chemistry. The results for her first test were:

BLOOD TEST	Result	Comment
Viral load	<400	Negative
WBC	3.3 thousand	(4.0-10.0) Low
RBC	3.13 million	(4.2-5.4) Low
Patelet count	305 thous/mcl	(150-400)
Neutrophils	54.7%	(40-70)
Lymphocytes	33.2%	(20-40)
Monocytes	10.5%	(0-12)
Eosinophils	1.0%	(0-5)
Basophils	0.6%	(0-2)

Calculating how many lymphocytes she has (33.2% of 3.3) we get 1,100, which is only slightly low and all due to her overall low level of WBCs. If you had been trained as a doctor and hematologist you would think first: why is the WBC count so low?

Her blood chemistry was exceptionally good, as we see here:

BLOOD TEST	Result	Comment
Sodium	138	(132-146)
Potassium	4.5	(3.3—5.3)
Chloride	100	(96-106)
BUN	15	(5-24)
Creatinine	0.9	(0.8-1.2)
Glucose	92	(65-115)
Bilirubin, Total	0.5	(0-1.5)
Albumin	4.0	(3.5-5.0)
Globulin	3.1	(calculated)

Total Protein	7.1	(6.1-8.2)
AST	18	(0-60)
ALT	19	(0-60)
Alkaline Phosphatase	84	(0-135)
Calcium	9.3	(8.6-10.4)

These are excellent results. Her health should not be failing at any location. Next, her immune analysis test showed:

BLOOD TEST	**Result**	**Comment**
Lymphocyte count, total	1096	(1000-3100)
T Helper (same as T4 or CD4)	32.3%	(32-62)
T Helper, total count	354	(32.3% of 1096)
T Suppressor (same as T8 or CD8)	37.9%	(14-38)
T Suppressor, total count	415	(37.9% of 1096)
Helper Suppressor Ratio	0.9	(calculated as $\frac{354}{415}$)

Annamarie was certainly in good health. Then why were the WBC and RBC very low, the total lymphocyte count rather low, and the number of suppressor lymphocytes higher than the helper lymphocytes? Even if you were a lay person or an auto mechanic or some bewildered visitor from Mars your first suspicion would be this: “There is a serious problem in the bone marrow where WBCs and RBCs are being made”. Yet our medical doctors do not analyze the patients’ bone marrow. On the other hand, if something were just plainly killing them after they were already made, the leftovers of large numbers of killed RBCs would be detected (elevated bilirubin). And they are not. So the primary problem is probably a toxin that prevents their formation. Perhaps, secondarily, some killing or blood loss is taking place, too, and we should be on the lookout for evidence. Several chemicals come to mind: benzene, lead, chemotherapy-type chemicals.

You might suspect that the problem had spilled over to the thymus since the lymphocyte types are programmed there. And something is killing the T-Helpers or preventing them from being programmed as such or shortening their life span. Could it be the T-Killer Cells? After all, that is

their job. The T Suppressors are killers, killing every cell that displays viruses and there are certainly too many suppressors and too many virus-filled T-Helpers.

Are the killer cells on the rampage and trying to increase their numbers? It would be reasonable; in biology when an organ has a big task to do, it makes itself bigger. Or is there another reason for the growing numbers of T8 cells? After all, we have cancer-like diseases where the eosinophils go up too high (eosinophilia), where platelets go up too high (thrombocytosis), and where the total WBC goes too high (leukemia). Tumor tissues show these same phenomena. The suppressors might be doing something similar. If so, some mutations might be expected. We could search for these, as in cancer. We should expect cell division stimulants, too, and search for them.

A killer chemical in the bone marrow could account for the lowered WBC, lowered RBC, and lowered lymphocytes, but probably not for the inverted ratio of T4 to T8s. Besides a mutation, other explanations might exist. If it were the HIV virus itself (but that is being kept **Negative**) could some of them be sneaking past the drug cocktail to reach the T4s and dispatch them? It's possible, but the huge amount of dispatching needed is out of line with the few viruses left (in a **Negative** blood sample). And a **Negative** viral load would not explain the burgeoning T8s either. There has to be another contributor.

Since you already know the true sequence of events in HIV/AIDS disease, from the earlier explanation in this book, let us see if you can predict the outcome of the tests that were done for Annamarie.

After starting on our program she put HCl in all her food and beverages and also sonicated it. She immediately stopped getting benzene in her food, it was all tested by Syncrometer® until she had learned to wash it correctly. She switched to cold tap water from bottled water. Her tap water from home, both hot and cold, tested **Negative** for benzene and PCB. She stopped using all body products and supplements she had grown fond of and had brought with her. Her soap and shampoo were now borax water (and citric acid conditioner). Her dishwashing soap and laundry soap were borax, too.

She got started zapping her blood, arteries, WBC, lymph vessels, thymus,

and bone marrow according to the zapping schedule. Her family helped her to get eight hours of zapping in. The PCBs poured out (urine tests were **Positive** for it now) through the kidneys. Kidney magnets were in place each day. She was on the supplement list that goes with this program. It included the parasite killing herbs.

In six weeks she could have been completely cured, with no need for cocktail drugs. What would you expect to see on her next blood test results that we received about three weeks into her program?

1. Would you expect the WBC to go up or down?
2. Would you expect the RBC to go up or down?
3. Would you expect the viral load to go up or down?
4. Would you expect the CD4 to CD8 ratio to go up or down?

After the first month her blood test results were:

1. The WBC went up to 3.85. The lymphocytes were now up to 1424.
2. The RBC went up to 4.0. A lower benzene level could explain all this.
3. The viral load would stay the same, due to being on “drug cocktail”, so was not even repeated by us. It could wait for her doctor at home to schedule.
4. The CD4 to CD8 ratio, though expected to rise, was not tested since this test would be done at home too, where it would be free of charge.

Her blood chemistry continued to be very good. One item, uric acid, was now abnormally low (1.2). This could have been due to the folic acid supplement she was taking, which is known to lower uric acid. But, more likely, it reflected on the clostridium bacteria in a feeding frenzy over killed large parasites.

In a few weeks she had learned everything she needed to know and could continue on her own at home. She elected to leave early.

Then she had her follow-up test with her doctor. What would you expect to see?

Two weeks later

On her blood test at home, her viral load was **Negative** as expected "on cocktail". Her WBC, which her doctor repeated, was a wonderful 4.3! although the lymphocytes were down to 1259. So it was the others, the phagocytes, which were holding on to their gain. Something at home was seriously wrong for her lymphocytes. But what? She was not eating any dyes in food, so the CD4 to CD8 ratio had come up nicely to 1.1, very significant.

She had gotten partial dentures and hardened them herself at home in a saucepan. They were not seeping anything. This was tested by Syncrometer®. She was cooking right, drinking tap water that had tested free of PCBs, benzene, copper and lead when she first came. The cocktail drugs themselves can take a dreadful toll on health, of course, but was there anything else? There seemed to be a mystery factor.

Three weeks later

Annamarie knew she was losing ground again at home in spite of her new good habits. She sent us an electronic saliva sample. (Making a bottle copy of your own saliva is quick and easy, and entirely safe, since it contains no actual saliva, see directions on page 85).

Three weeks later

We had analyzed her saliva sample along with new water samples we requested. Her saliva test showed there was so much PCB in her body it was actually afloat in her blood! Her thymus gland was full of benzene again! Just from living at home? Dyes were notably absent. This meant her food was properly chosen and treated. It could not have brought her benzene and PCB. Was it her water? Her dentures? Her drugs? We requested a set of five water samples, taken on five different days and a pill of each of her two types of drug.

We analyzed her water samples. We were horrified. Three out of five water samples were **Positive** for PCB and benzene, both! We faxed her these results within an hour of completing them together with this message:

Dear Annamarie,

Please move away from your home immediately. We would like to see you save your life. If you have a water softener, please take it out immediately; PCBs often come from that source. But if not, there is no solution. You will need to move from your house. Yours sincerely.

We heard nothing for a week; then her reply, together with some new blood test results. What would you expect?

One week later

The viral load was still <400. The WBC was 2.9 (the extreme danger zone she had seen at the beginning of this story; she should be living in a bubble now). The lymphocyte count was 1231. It was now the ordinary phagocytes that were missing, not the lymphocytes. The benzene was doing its deadly job on the ordinary neutrophils that do our phagocytosis. The RBC was 3.03, which is almost transfusion level (3.0). Fortunately her hemoglobin level was still good, due to taking lots of vitamin B12 and folic acid.

But the CD4 to CD8 ratio had continued to improve; it was now 1.2, a significant improvement. She was not getting any more azo dyes. This much was under her control. Her dye-seeping teeth were gone and all her food was free of them. She was continuing to remove it from CD4 and CD8 cells in her organs with homeographic drops.

Then we read her letter.

“I read in my newspaper that barge cleaning had been done on the Ohio River and an accidental spill required the EPA to investigate for possible benzene contamination. They of course said there was nothing to fear… I live within one mile of this area and our water supply is from the Ohio River…”

Run, Annamarie, run. Don’t stop—don’t look around. Survivors run. But will she?

Society has let her down. She believes our agencies like FDA and EPA are watching out for terrible toxins that might get into the drinking water. She is just beginning to wonder about it. It is not so easy to move to another home ‘away from Ohio River water’ when you are nearly penniless from

health problems.

If she were to request testing of her water for PCB and benzene, would the agencies respond? If she were an important politician, demanding some response, would the agencies select a test that, though legal, would not be sensitive enough to detect them? In fact, might they do several tests so they could, legally, choose the **Negative** one to report?

If one out of three legally required tests were **Positive**, would they be legally permitted to throw this one away without telling her?

Would she be better off sending her own samples, privately, to labs in Switzerland and France for honest testing at a sensitivity level that is better than just the "legal level" allowed in the United States?

For answers to some of these questions read the water regulations and results that come regularly from your own water department. Get more information about them from the references they cite. If you have HIV/AIDS, try to learn more about your water!

Ten weeks later

Another blood test report arrived. Can you guess the results? (Hint: She is in control of dyes herself. She may or may not have moved away from PCB-water. She is cleaning her produce with hot water washes but not with a zappicator.) WBC 3.3 (higher), RBC 3.13 (higher), lymphocytes 1363 (higher), T-Helper 577 (higher), T Suppressor 413 (lower), Helper/Suppressor ratio 1.4 (higher). Well done Annamarie, so far… We can guess she is living away from home. We hoped to find out soon.

Two months later

Annamarie sent the results of her next blood test. She was holding a job though still fatigued. She had been living with relatives and friends so far (hooray!). What would you expect had happened to her WBC, etc.?

She also sent a set of five water samples from home in the hope the benzene had finally cleared up. Her five water tests were **Negative** for benzene and PCBs; she could go home ─ but with what assurance that there would be no repeat?

Now the results: WBC 4.2 (higher), lymphocytes 1424 (higher), RBC 3.21 (higher), T-Helper 654 (higher), T-Suppressor 367 (lower), Helper/Suppressor ratio 1.8 (higher). Congratulations, Annamarie!

The extremely low RBC was still mysterious. A saliva sample revealed there was still mercury and thallium attached to her RBCs, from her earlier amalgam-days.

Summary: we asked Annamarie to return briefly. We used a toothbrush zappicator to remove the amalgam remnants from her mouth. We also used homeographic drops that specifically took mercury and thallium out of her RBCs. All this took three days. Her energy bounced up. Will it stay up? What does the future hold for her?

66 Sally Hoye HIV

Sally was a tall, stately woman from Kenya, Africa. She was in the USA on business, which brought her to Chicago every 6 months. She had heard about the superior dentistry offered in Mexico and wanted to have her amalgams changed to plastic. She called us to make the arrangements. We responded that we do not recommend this anymore because the plastic cannot be hardened enough to prevent seeping of dyes and unpolymerized plastic. She arrived anyway, quite suddenly. She had no health problems, only trying to do what was best for her health, so I suggested she leave a saliva sample with us to test for cancer and HIV; dental decisions could wait for the results.

Business could not wait, so she delivered the sample and left. This is what I found:

☒ **Protein 24 (HIV) YES at saliva**

☐ **Reverse Transcriptase (HIV Enzyme) NO at saliva**

☒ **SV 40 (Virus) YES at saliva, very high**

☒ **Copper (Toxic Element) YES at saliva, very high**

☐ **Apiol (Food Antigen) NO at saliva**

☒ **Fast Garnet (Dye) YES at saliva**

☐ **remaining dyes in my test set of 5 dyes NO**

☒ **PCBs (Solvent) YES very high at saliva**

☒ **Benzene (Solvent) YES very high at saliva**

☐ **Asbestos (Toxic Element) NO at saliva**

Searching next at her lymph:

☒ **PCBs (Solvent) YES at lymph**

☒ **Benzene (Solvent) YES very high at lymph**

☐ **Asbestos (Toxic Element) NO at lymph**

☐ **Copper (Toxic Element) NO at lymph**

☒ **Apiol (Food Antigen) YES at lymph**

☒ **Melanin (Body Pigment) YES at lymph**

☒ **Pyrrole (Toxic Product of Blood Destruction) YES at lymph**

☐ **Phenol (Toxic Product of Benzene Detoxification) NO at lymph**

☒ **Fast Garnet (Dye) YES at lymph**

☐ **remaining dyes NO**

A food antigen acts like an allergen; it can give you an allergic reaction, unbeknownst to you. Apiol is one of them. It is found in all of the popular cooking oils for which reason these foods are OFF the diet.

Melanin is our natural body pigment (color). We all make, and need, some of it, but not so much that it can be detected in the lymph. To make it, the body uses a copper-based enzyme (tyrosinase). Evidently, high levels of copper stimulate this enzyme.

Pyrrole comes from blood or chlorophyll when these are destroyed, such as by burning animal or plant material. They each break up into bits of blood and further into pyrrole. Cigarette smoke and eating smoked meats could bring it into the body. It is not normally detected unless you smoke. Yet Sally did not and never had smoked.

Phenol is the detoxification product of benzene. Its presence is understandable since she had benzene accumulations. It destroys living tissue but it is not clear if it acts as an antigen. It is not clear whether excess melanin, pyrrole or phenol act as antigens.

Next, at her blood:

☐ **PCBs (Solvent) NO at blood**

☐ **Benzene (Toxic Element) NO at blood**

☒ **Copper (Toxic Element) YES at blood**

☐ **Apiol (Food Antigen) NO at blood**

☐ **Protein 24 (HIV) NO at blood**

☐ **Reverse Transcriptase (HIV Enzyme) NO at blood**

☐ **SV 40 (Virus) NO at blood**

☒ **Melanin (Body Pigment) YES at blood**

☐ **Pyrrole (Toxic Product of Blood Destruction) NO at blood**

☐ **Phenol (Toxic Chemical) NO at blood**

☐ **Fast Garnet (Dye) YES at blood; remaining dyes NO**

Notice how clean your blood is kept, typically. Doing a blood test would reveal very few problems. Saliva or lymph is much more revealing. But her high copper and melanin levels could be spotted in the blood as well as the dye.

Next, at the cerebrospinal fluid (CSF):

☐ **PCBs (Solvent) NO at CSF**

☐ **Benzene (Solvent) NO at CSF**

☒ **Copper (Toxic Element) YES at CSF**

☐ **Apiol (Food Antigen) NO at CSF**

☒ **Melanin (Body Pigment) YES at CSF**

☐ **Pyrrole (Destroyed Blood) NO at CSF**

☐ **Phenol (Toxic Chemical) NO at CSF**

☐ **Protein 24 (HIV) NO at CSF**

☐ **Reverse Transcriptase (HIV Enzyme) NO at CSF**

☐ **SV 40 (Virus) NO at CSF**

☒ **Fast Garnet (Dye) YES at CSF**

☐ **remaining dyes NO**

The cerebrospinal fluid is also kept clear of most toxic things, but must yield to high copper levels, the production of too much melanin and Fast Garnet dye. We might assume that she can still detoxify the other dyes as well as PCBs and benzene. Or is she eating a lot of a certain red food?

Is her thymus gland being affected? These are the test results:

☒ **PCBs (Solvent) YES at thymus**

☒ **Benzene (Solvent) YES very high at the thymus**

☒ **Asbestos (Toxic Element) YES at thymus**

☒ **Fast Garnet (Dye) YES at thymus**

☒ **Fast Green (Dye) YES at thymus**

☒ **Fast Red Violet (Dye) YES at thymus**

☒ **DAB (Dye) YES at thymus**

☒ **Sudan Black B (Dye) YES at thymus**

☒ **Copper (Toxic Element) YES at thymus**

☒ **Cadmium (Toxic Element) YES at thymus**

☒ **Thulium (Toxic Lanthanide Element) YES at thymus**

☒ **Cobalt (Toxic Element) YES at thymus**

☒ **Chromium III (Toxic Element) YES at thymus**

☐ **Mercury (Toxic Element) NO at thymus**

☐ **Silver (Toxic Element) NO at thymus**

These results change the picture. When PCBs, benzene, asbestos, numerous heavy metals excluding mercury and silver, and numerous azo dyes are found together, it signifies clorox. Her thymus is full of the liquid bleach used to disinfect her drinking water. Her immune system will be destroyed by these.

☒ **Protein 24 (HIV) YES at thymus**

☐ **Reverse Transcriptase (HIV Enzyme) NO at thymus**

☐ **Rev Protein (HIV Product) NO at thymus**

☒ **SV 40 (Virus) YES at thymus**

She has both viruses at the thymus. Is she showing parasitism here?

☒ ***Fasciolopsis buski*** **(Parasite) YES very high at thymus**

☒ **Fasciola (Parasite) YES at thymus**

☐ ***Ascaris lumbricoides*** **(Parasite) NO at thymus**

☐ ***Ascaris megalocephala*** **(Parasite) NO at thymus**

☒ **Paragonimus (Parasite) YES very high at thymus**

☒ **Eurytrema (Parasite) YES very high at thymus**

☐ **Clonorchis (Parasite) NO at thymus**

☒ **Strongyloides (Parasite) YES very high at thymus**

☐ **Echinostoma revolutum (Parasite) NO at thymus**

She has excessive parasitism right at the thymus where the waterborne immune-destroyers are. Will this bring her multiple food allergies next? Will Fasciolopsis shed so many *Bacillus cereus* bacteria, each making tyramine that ordinary good food will be turned into “bad” allergenic food?

☒ ***Bacillus cereus*** **(Bacterium) YES at thymus**

☒ **Tyramine (Bacterial Toxin) YES at thymus**

☒ **Apiol (Food Antigen) YES at thymus**

☒ **Pyrrole (Destroyed Blood) YES at thymus**

☒ **Phenol (Toxic Chemical) YES at thymus**

☒ **Melanin (Body Pigment) YES at thymus**

The food phenolic, apiol, is being accumulated at the thymus. The other items come from other sources. Is the bone marrow already involved in this chain of events?

☐ **PCBs (Solvent) NO at bone marrow**

☒ **Benzene (Solvent) YES very high at bone marrow**

☐ **Asbestos (Toxic Element) NO at bone marrow**

☒ **Copper (Toxic Element) YES at bone marrow**

☐ **Lead (Toxic Element) NO at bone marrow**

☒ **Thulium (Toxic Lanthanide Element) YES at bone marrow**

☒ **Chromium III (Toxic Element) YES at bone marrow**

☐ **Mercury (Toxic Element) NO at bone marrow**

☒ **Cadmium (Toxic Element) YES at bone marrow**

☒ **Cobalt (Toxic Element) YES at bone marrow**

☐ **Vanadium (Toxic Element) NO at bone marrow**

☒ **Fast Garnet (Dye) YES at bone marrow**

☐ **remaining dyes NO**

The evidence of her cloroxed water is just beginning to develop at her bone marrow. Is it promoting parasitism in the bone marrow?

☒ **Fasciolopsis (Parasite) YES at bone marrow**

☐ **Fasciola (Parasite) NO at bone marrow**

☐ **Clonorchis (Parasite) NO at bone marrow**

☐ **Eurytrema (Parasite) NO at bone marrow**

☒ **Paragonimus (Parasite) YES at bone marrow**

It would take more than a miracle to kill all these, considering the amount of bone marrow in each of us. Only the return of her own immunity can save her from disaster lying ahead.

☐ **SV 40 (Virus) NO at bone marrow**

☐ **Protein 24 (HIV) NO at bone marrow**

☐ **Rev Protein (HIV Protein) NO at bone marrow**

The viral enzyme seems to be able to spread without the presence of virus. When the exact bone marrow location that had the enzyme was searched, both viruses were actually present. The same situation was seen for *Bacillus cereus*. A few bacteria can produce a lot of tyramine, which was being shipped about by the body fluids.

☒ **Reverse Transcriptase (HIV Enzyme) YES very high at bone marrow**

☐ ***Bacillus* cereus (Bacterium) NO at bone marrow**

☒ **Tyramine (Bacterial Toxin) YES at bone marrow**

This will give her food allergies of a special sort, called food phenolics. The first one appears to be apiol, again.

☒ **Apiol (Food Antigen) YES at bone marrow**

☒ **Phenol (Toxic Chemical) YES at bone marrow**

☒ **Melanin (Body Pigment) YES at bone marrow**

☒ **Pyrrole (Destroyed Blood) YES at bone marrow**

Soon more body tissues will begin to shred as the phenol accumulates. More food substances will turn into allergens as tyramine spreads.

Next, at lymph.

☒ **Thymus Tissue (Body Organ) YES at lymph!**

It doesn't belong here; it has shredded away from the thymus gland. Are other organs shredding, too?

☒ **Hypothalamus Tissue (Brain Organ) YES at lymph**

☒ **Pituitary Tissue (Brain Organ) YES very high at lymph**

☐ **Pancreas Tissue (Body Organ) NO at lymph**

☐ **Vagina Tissue (Genital Organ) NO at lymph**

☐ **Ovary Tissue (Genital Organ) NO at lymph**

☒ **Fimbria Tissue (Genital Organ) YES at lymph**

A genital organ is shredding, too.

☒ **Fallopian Tube Tissue (Genital Organ) YES at lymph**

☐ **Uterus Tissue (Genital Organ) NO at lymph**

The erosion (shredding) of hypothalamus and pituitary glands is well underway and possibly accelerating because complement C3 is already depleted. It is keeping the blood and cerebrospinal fluid clear of antigen at its own expense. Erosion of fimbria and fallopian tube is also underway.

☐ **Complement C3 (Arm of the Immune System) NO at lymph**

It should have been there. It is present in all healthy people.

There are also fused cells of all these shredding organs swimming in the body fluids. The tests were for thymus-fallopian tube, hypothalamusfallopian tube, and many more not shown. But the combination that forms a TUMOR NUCLEUS is absent. This would have been a fusion of hypothalamus, pituitary and pancreas. She is making hypothalamus-pituitary-thymus combinations and others. The paths of HIV disease and cancer diverge at this point. But it (getting cancer) could still happen—rather more easily, once one disease is already established. This explains the close relationship between these diseases.

With hypothalamus and pituitary cells fusing to the thymus, we could expect considerable interference with the thymus' activities. Its precise nature is not yet clear.

☒ **HGH (Human Growth Hormone) YES high at thymus!**

This hormone is never normally detected here. What kind of growth is being stimulated? Only future research can tell. Other hormones coming from the pituitary transplant in the thymus have not been researched yet. This ends the study of her electronically copied saliva sample.

She came right back from Chicago to cure her beginning HIV disease. But she had an emergency message from her family in Kenya and had to leave the next day. Certainly, dental work was not the only high priority now. Finding safe water at home was most urgent.

She was advised to find a water supply that had been chlorinated with chlorine gas and had not been "boosted" with liquid clorox. That seemed like a tall order to her. She sent two samples of common foods, in case these were the sources of the five immunity-destroyers. They were *Beurre de Karite Shea* butter and *Zomi* Palm Oil. Here are their test results (positive means the product has the indicated toxin).

Toxin	Beurre de Karite Shea Butter	Zomi Palm Oil
PCBs	Negative	Negative
Benzene	Negative	Negative
Asbestos	Negative	Negative
Dyes	Negative	Negative
Heavy Metals	Negative	Negative
Apiol	Positive	Positive
Gallic Acid	Negative	Negative
Phenol	Negative	Negative
Phloridzin	Negative	Negative
Chlorogenic acid	Negative	Negative

Summary: Sally was shocked and horrified at her newly found HIV positive status, but not panicked. She planned to find out as much as she could about her water supply. She would send us samples to test until she found a safe supply. Then she would move there. As for the 2 foods, she should stop eating them. She should send samples of other oils or butter until she finds one without

apiol. She planned to do this. Maybe she can do it all before her return.

67 Suzanne Bertorelli Cancer and HIV

Suzanne Bertorelli and Stephen Cornell (the next “true story”) were business partners in South Africa. They came to the USA to establish new business contacts and check into new supply sources. They owned a factory where the line-cleaners and disinfectants used were tested for harmful solvents and other toxins. This represents a hopeful new development in manufacturing and a much-awaited change by their healthminded customers.

It was especially tragic when Suzanne was diagnosed with ovarian cancer. Of all persons, she expected herself to escape this modern epidemic. She came to us to cure her cancer and to find out why her extrahealthy lifestyle had failed her. She brought a water sample from home, a dust sample and some common foods she ate.

Her saliva test showed these results.

☒ **PCBs (Solvent) YES at saliva**

☒ **Benzene (Solvent) YES at saliva**

☒ **50 Heavy Metals (Toxic Elements) YES at saliva**

☒ **Azo dyes (Toxic Dyes) YES at saliva**

☒ **Clorox (Laundry Bleach) YES at saliva**

☐ **Asbestos (Toxic Element) NO at saliva**

This looked suspiciously like evidence of clorox-contaminated water. We shifted our attention to her water sample. Would she already have the HIV virus, too, besides cancer?

We tested her water sample.

☒ **PCB (Solvent) YES in water**

☒ **Benzene (Solvent) YES in water**

☒ **Asbestos (Toxic Element) YES in water**

☒ **Clorox (Laundry Bleach) YES in water**

☒ **Uranium (Toxic Element) YES in water**

Yes, she was getting the familiar five immunity-destroyers from her water. All the more important to test for HIV/AIDS now when she could still reverse it all.

☒ **Protein 24 (HIV) YES at saliva**

☒ **Reverse Transcriptase (Virus Enzyme) YES at saliva**

☐ **SV 40 (Virus) NO at saliva**

☒ **SV 40 (Virus) YES at lymph**

☒ **Reverse Transcriptase (Virus Enzyme) YES at lymph**

☐ **Protein 24 (HIV) NO at lymph**

☐ **Rev Protein (HIV Product) NO at lymph**

☐ **Reverse Transcriptase (Virus Enzyme) NO at thymus**

☐ **Protein 24 (HIV) NO at thymus**

☒ **SV 40 (Virus) YES very high at thymus**

☐ **Melanin (Body Pigment) NO at thymus**

☐ **Phenol (Toxic Chemical) NO at thymus**

☐ **Apiol (Food Antigen) NO at thymus**

☐ ***Bacillus* cereus (Bacterium) NO at thymus**

☐ **Tyramine (Bacterial Toxin) NO at thymus**

For the HIV virus to show up in the saliva or lymph (above) there must be quite a large colony somewhere, but they were not at the thymus. We will search more thoroughly for them.

☐ **Protein 24 (HIV) NO at bone marrow**

☐ **Reverse Transcriptase (Virus Enzyme) NO at bone marrow**

They were not at the bone marrow.

☐ **Protein 24 (HIV) NO at vagina**

☐ **Reverse Transcriptase (Virus Enzyme) NO at vagina**

☐ **Apiol (Food Antigen) NO at vagina**

☐ **Protein 24 (HIV) NO at uterus**

☐ **Reverse Transcriptase (Viral Enzyme) NO at uterus**

☐ **Apiol (Food Antigen) NO at uterus**

☐ **Protein 24 (HIV) NO at left and right ovaries**

☐ **Reverse Transcriptase (Virus Enzyme) NO at left and right ovaries**

☒ **Apiol (Food Antigen) YES at right ovary; NO at left ovary**

The left ovary had the OPT (cancer). It had developed in an ovarian cyst she had battled for 2 years. But the other ovary had the food antigen.

☒ **Fast Red Violet (Dye) YES at left ovary (with the cancer)**

Inside the cyst was a fluid collection, to be expected since it had accumulated the dye, Fast Red Violet. This is the dye that causes effusions. She also had silicone there, probably from her toothpaste. And a huge amount of gold. She had loved gold and wore a lot of very "pure" gold. Tin and strontium were both there, also from toothpaste. Isopropyl alcohol was present and an exceptionally high amount of uranium. There had been a lot of uranium in her water, and perhaps even more in her erstwhile amalgam fillings. The food antigen, phenylalanine, was collected there as in all ovarian cancers.

But apiol had collected in her right ovary. The right ovary did not have a cyst, nor did it have a Fast Red Violet accumulation, nor cancer.

☐ **Protein 24 (HIV) NO at both fallopian tubes**

☐ **Reverse Transcriptase (Virus Enzyme) NO at both fallopian tubes**

☒ **Protein 24 (HIV) YES very high at both left and right fimbria**

The fimbria is the "finger-like" extension at the end of the fallopian tube that "catches" the egg that is released by the ovary. Finally, the large population of HIV viruses was found.

☒ **Reverse Transcriptase (Virus Enzyme) YES high at both fimbrias**

☒ **SV 40 (Virus) YES at fimbria**

☒ **Rev Protein (HIV Protein) YES at fimbria**

☒ **Pyrrole (Destroyed Blood) YES at both fimbrias**

☒ **Phenol (Toxic Chemical) YES at both fimbrias**

☐ **Apiol (Food Antigen) NO at both fimbrias**

☐ **Melanin (Body Pigment) NO at both fimbrias**

The food antigen did not necessarily precede the viruses, nor did melanin.

☒ **Fasciolopsis (Parasite) YES at fimbria**

☒ **Paragonimus (Parasite) YES at fimbria**

☒ **Eurytrema (Parasite) YES at fimbria**

All 3 parasites were present together here, possibly feeding on blood to make pyrrole. As the body spontaneously killed them, they supported fungus growth, which used the body's copper, depositing it again when they were killed. So a lot of copper accumulated there, triggering melanin formation. It seems these events may be the early beginnings of parasite-caused disease. Later, food allergies would develop, as the bacterium *Bacillus cereus* is released from Fasciolopsis. The bacteria form tyramine, which floods the local area, changing any loose amino acids or sugars into the non-biological form (D-amino acids or L-sugars, even D-thyroxine). The body swiftly traps these abnormal molecules in an allergic reaction to eliminate them but not without an inflammation developing. That is a possible scenario for the beginning events we see here.

How did so many parasite varieties get to the fimbria? Possibly from their favorite lair nearby, the colon-plus-2-picofarad location, halfway up the left colon. From here they proceeded to the fimbria when the water-borne immunity-destroyers accumulated here.

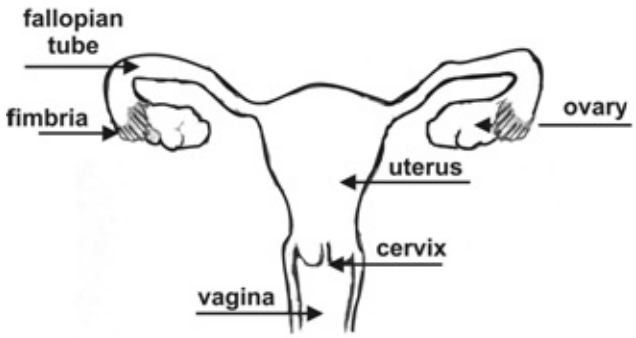

Fig. 122 Picture of female organs

☒ **Protein 24 (HIV) YES at colon + 2 pF**

☒ **Reverse Transcriptase (Virus Enzyme) YES at colon + 2 pF**

☒ **Fasciolopsis (Parasite) YES at colon + 2 pF**

☒ **Eurytrema (Parasite) YES at colon + 2 pF**

☒ **Paragonimus (Parasite) YES at colon + 2 pF**

Suzanne was advised to do special enemas. A Lugol's enema or a Black Walnut Hull tincture enema kills them rather easily, but, of course, they extrude their eggs at once. Only a steady course of antiparasite herbs and zapping can eventually overcome them when parasitism is advanced. And only

with the help of the immune system. This means, first and foremost, getting away from cloroxed water.

Suzanne was fortunate in having a factory. A water sample from the factory was shipped at once. It tested free of clorox. She would be able to use this water while she found a new residence. But she had just recently moved. And just recently exchanged all her amalgams at great cost. Unhappiness reigned. Yet, no risk could be taken to continue accumulating Fast Red Violet dye from her new plastic fillings in her ovarian tumor. Extraction of plastic teeth was the only failsafe way to stop this dye from entering the ovaries. In a week she had it all done and was recovering nicely. No replacement could even be contemplated. Any dental impression compound placed in her mouth, even for a few minutes, would certainly be absorbed. All the dye, silicone and aluminum in such compounds would be transported straightaway to the ovaries and fimbria.

Summary: Before she left she had zapped herself free of parasites in most of her genital organs, but not yet the fimbria. She still had 24 teeth to chew with and that would do, a good trade for a life free of fear. But will she solve the water problem in time to keep her gains?

68 Stephen Cornell HIV

Stephen, Suzanne's business partner was tested next.

☒ **Benzene (Solvent) YES at saliva**

PCBs, heavy metals, dyes and asbestos did not show up here. He was excreting more, evidently. There was no evidence of Protein 24, SV 40, or reverse transcriptase at the saliva, lymph or thymus. But they were somewhere since the lower abdominal lymph (lymph + 1 μH) showed the presence of SV 40. A search at the genital organs revealed these results:

☐ **Protein 24 (HIV) NO at both testes, penis, prostate, left and right vas deferens, sperm (semen)**

☐ **Reverse Transcriptase (Virus Enzyme) NO at both testes, penis, prostate, sperm**

☒ **Reverse Transcriptase (Virus Enzyme) YES at left vas deferens**

☐ **SV 40 (Virus) NO at penis, prostate**

☒ **SV 40 (Virus) YES at left testis, left vas deferens, sperm**

But this was not all. The preference for his left side suggested brain involvement. We searched the brain next.

☒ **Reverse Transcriptase (Virus Enzyme) YES at the right side of the medulla, a brain organ**

☐ **Protein 24 (HIV) NO at right medulla**

☒ **SV 40 (Virus) YES at right medulla**

☒ **Rev Protein (HIV Protein) YES at right medulla**

Both viruses were here! Why?

☒ **Fasciolopsis (Parasite) YES at right medulla**

☒ **Paragonimus (Parasite) YES at right medulla**

☒ **Eurytrema (Parasite) YES at right medulla**

All three parasites were here. Was there no immunity to fight them?

☒ **Apiol (Food Antigen) YES at right medulla; NO at left medulla**

Apiol would consume the complement C3 here and leave the right medulla wide open to attack.

☒ **Melanin (Body Pigment) YES at right medulla**

☒ **Copper (Toxic Element) YES at right medulla**

The right medulla housed the expected parasites, bringing in their wake the Aspergillus and Penicillium family of fungus growth. This brought about a copper deposit which triggered melanin formation. Meanwhile, apiol was collecting here, the first food phenolic to become an allergy for him. Complement C3 was being consumed by the allergen so the problem in the brain could be expected to spread. We will search further.

☒ **Complement C3 (Immune Factor) YES at left medulla; NO at right medulla**

It should be everywhere.

☒ **Aspergillus and Penicillium (Fungus) YES at right medulla**

☒ **SV 40 (Virus) YES at pineal gland**

This gland regulates our day and night cycles.

☐ **Reverse Transcriptase (Virus Enzyme) NO at pineal**

☒ **Copper (Toxic Element) YES at pineal**

☒ **Eurytrema (Parasite) YES at pineal**

☒ **Gallic acid (Food Antigen) YES at pineal**

This is the trigger for the SV 40 virus. It is another food phenolic that had become an allergen for him.

Summary: Stephen had already weathered some severe bouts of illness, not knowing why or where they were coming from. He lived an ordinary low-risk life. Now, with brain parasitism, it all made sense. He would see to it that the drinking water for both of them would be safe. He would kill parasites and zap his organs until he returned in the fall to follow up on his early HIV disease.

For us, the last 3 patients were especially tragic. I must now contemplate the probability that all of Africa, including the rich and elite, might pass away although most appear well enough today.

Finale

I hope you reach the same conclusions as I did from these case histories:

HIV is not caused solely by sexual or blood contact with an infected person. People with no such exposures, even small children and babies, have it. It comes with a parasite that you can pick up easily in your daily routine. It is way too prevalent, and we are all at risk!

It is amazing how easy the HIV virus is to eliminate –*Fasciolopsis buski* is one of the first to succumb to the parasite-killing herbs—but it is just as easy to get reinfected. Nor does getting rid of HIV bring relief, since the thymus has been attacked, immunity has been lost, and AIDS has progressed.

If you have HIV you are halfway to having cancer because the same parasite causes both. The same SV 40 virus is present for both. All cancer needs now to develop is inflammation in the pancreas so the tumor nucleus can be completed.

Eliminating HIV does not cure AIDS. Benzene, metals, asbestos, PCBs, and dyes do the damage.

You can beat AIDS with a complete program of lifting the burdens on your immune system (clean water, food, body, dentalware, home). Your body will "miraculously" heal.

One thing that is not clear is why it seems more young people are contracting HIV/AIDS than older people. My explanation is that more young people use the list of benzene-polluted products. Young people eat more fast foods, drink more bottled water, use more food supplements and get more dental work. Also, the gay men I see often drink beer, use lubricants, "rush" and marijuana, all of which are benzene sources. But is that all?

The solution for worldwide benzene pollution stands out clearly. **Separate the petroleum industry from the food industry. Monitor the chlorination of**

water. Use modern testing methods to monitor food, feed and water for solvent residues, dyes and heavy metals. This would return the parasite to its former status as an intestinal fluke, unable to invade other organs. I hope these case histories have provided the incentive to begin this clean up program.

Zappers

Being able to kill your bacteria and other invaders with electricity seems like a panacea, especially when you can do it all in three, seven-minute sessions. But killing things that your body should have been able to kill itself, or things that should not have gotten in in the first place, tarnishes this concept. Nevertheless, it is a superb help when the complete picture is kept in mind. This means respect for the immune system, understanding our extreme dependence on it for survival of our species.

The evolution of the zapper from the earlier frequency generator is described in *The Cure For All Diseases*. The advantage of not needing to know the frequency of the pathogens you wish to kill makes it exceptionally useful.

No matter what frequency your zapper is set at (within reason), it kills large and small invaders: flukes, roundworms, mites, bacteria, viruses and fungi. It kills them all at once, in seven minutes, even at 5 volts. But the current does have to reach them and there are certain hard-to-reach places: for instance the eyes, the appendix, the testes, the inner ear bones and most of the contents of the intestine.

How does it work? I suppose that a Positive voltage applied anywhere on the body attracts Negatively charged things such as bacteria. Perhaps the battery voltage tugs at them, pulling them out of their locations in the cell doorways (called *conductance channels*). But doorways can be Negatively charged too. Does the voltage tug at them so they disgorge any bacteria stuck in them? Perhaps it just closes these doorways. How would the Positive voltage act to kill a large parasite like a fluke? These questions cannot be answered yet, although the evidence is clear: a sudden release of parasite eggs into the blood, bits of parasite in the white blood cells, and later, the appearance of mold just where the flukes had been. Killing action is also suggested when a large fluke can no longer be heard on the Syncrometer® in seven minutes. Only further research will find more facts.

Another earlier question has a clear answer, too. Is the killing effect due to immune system stimulation? The answer is, yes. The empowering effect on white blood cells is seen when they suddenly possess parts of the fluke and bacteria, when minutes before zapping they did not.

Other fascinating possibilities are that the intermittent Positive voltage

interferes with electron flow in some key metabolic route, or straightens out the ATP molecule disallowing its breakdown. Such biological questions could be answered by studying the effects of positive electrical pulses on pathogens in a laboratory.

The most important question, of course, is whether there is a harmful effect on you. I have seen no effects on blood pressure, mental alertness, or body temperature. It has never produced pain, although it has often stopped pain instantly. This does not by itself prove safety. Even knowing that the voltage comes from a small 9-volt battery does not rigorously prove safety although it is reassuring. The fact that thousands of zappers are in use suggests safety, too. And finding that one of its mechanisms is through the immune system, makes it even more appealing. Viruses and bacteria disappear in three minutes; damaged tapeworm stages, flukes, roundworms in five; and mites in seven. People who are not ill need not go beyond this time, although no bad effects have been seen at any length of treatment.

The first seven-minute zapping is followed by an intermission, lasting 20 to 30 minutes. During this time, bacteria and viruses are released from the dying parasites and start to invade you instead. Such releases form the basis of “detoxification illness”, which must be controlled and counteracted. Each parasite has its own bacterial and viral escapees.

The second seven-minute session is intended to kill these newly released viruses and bacteria. If you omit it, you could catch a cold, sore throat or something else immediately. In fact,if you do, you know you killed some serious parasites. Again, viruses are released, this time from the dying bacteria. The third session kills the last viruses released.

A fourth and fifth session may be very beneficial, too, especially when we see bits of protein called “prion protein” streaming from killed flu viruses. But not enough experiments are completed to be certain that everyone needs extra sessions. Remember HIV/AIDS patients will be plate-zapping for 20-minute sessions anyway. So, the need for more regular zapping sessions is not yet indicated

Do Not Zap If You Are Pregnant
Or Wearing A Pacemaker.

These situations have not been explored yet. Don't do these experiments

yourself. Children as young as eight months have been zapped with no noticeable ill effects. For them, you should weigh the possible benefits against the unknown risks.

That is all there is to it. Almost all. The zapping current is most effective for the blood and lymph, two rather salty (conductive) fluids. But it does not reach deep into the eyeball or testicle or bowel contents. It does not reach into your gallstones, or into your living cells where Herpes virus lies latent or Candida fungus extends its fingers. To reach deeper, the herbal parasite program and homeography must be added to the zapper treatment.

HIV and AIDS victims have many organs saturated with PCBs and benzene, two insulators. You cannot pass enough electricity through your hands or wrists due to these insulators, nor will it penetrate the thymus effectively.

To reach specific organs like the thymus, electrically, with a significant effect, you will need to do plate-zapping and use foot electrodes. You merely need to put a sample of thymus tissue on the zapping plate.

For HIV sufferers, copper pipe electrodes are placed under the feet just in front of the heels. The choice of copper is important because it is the most conductive metal, besides silver. The pressure of your feet on the pipes helps the current penetrate. Hand pressure is hard to keep up. A flat electrode provides too little surface for contact and produces too little pressure under the foot. But blood and lymph are still the most important locations to zap. These are reachable by regular zapping (without a plate). Using foot electrodes helps greatly, for both plate-zapping and regular zapping.

In earlier books a circuit was described that produced a totally Positive electrical field at all times, called “Positive offset”. But many zappers were built with small substitutions when the exact components were not available. This often brought the resulting electrical field too close to Negative so that brief excursions into the Negative field were inevitable. Even very brief “Negative spikes” are undesirable. For this reason the circuit given here has an additional component, a Positive offset resistor. With this addition, it is easy for the builder to measure the Positive offset on an oscilloscope. It will be ¼ volt. **Anyone purchasing a zapper should ask for this measurement. The consumer should also request copper electrodes of tubular design and plates of correct dimension (3¼ to 3½ inches square) and composition (aluminum).**

Although wrist straps are convenient, not enough research has been done to accurately compare effectiveness with the tubular design of electrodes. A very ill person should use the copper tube electrodes, of correct dimension, correctly placed (see picture) and not risk poor conductance.

Zapping once a day is now a common routine for many persons. The elderly seem to be keeping more alert for years. For many it is a daily pain-reliever, fatigue-lifter, or mystery-helper. For the ill, zapping all day, continuously, for a month or more has often brought significant improvement. Only further research can shed light on how all this happens.

Just as amazing as its action is the simplicity of the circuit design. Even a complete novice could build one.

Building A Zapper

You will be given two ways to build a zapper: the **shoebox** way and the **breadboard** way. The breadboard way for a 1000 Hz (1 kHz) zapper.

Both have ¼ volt Positive offset. You will be able to test your zapper (or any commercially made one) for its Positive offset feature simply by observing it on an oscilloscope.

Hints for absolute novices: Don't let unusual vocabulary deter you. A "lead" is just a piece of wire used to make connections. When you remove a component from its package, label it with a piece of tape. A serrated kitchen knife works best, as does a large safety pin. Practice using the micro clips. If the metal ends are L-shaped bend them into a U with the long-nose pliers so they grab better. Chips and chip holders (wire wrap sockets) are very fragile. It is wise to purchase an extra one of each in case you break the connections. The "555" timer is a widely used component; if you can't locate this one, try another electronics shop.

The Shoebox Way

This circuit has been improved since the one given in earlier books.

A resistor has been added that gives every pulse an added Positive offset of ¼ volt. You no longer need to operate your zapper so daringly close to a Negative voltage.

To build your zapper you may take this list of components to any electronics store (Radio Shack part numbers are given for convenience). You may also order

a kit, see *Sources*.

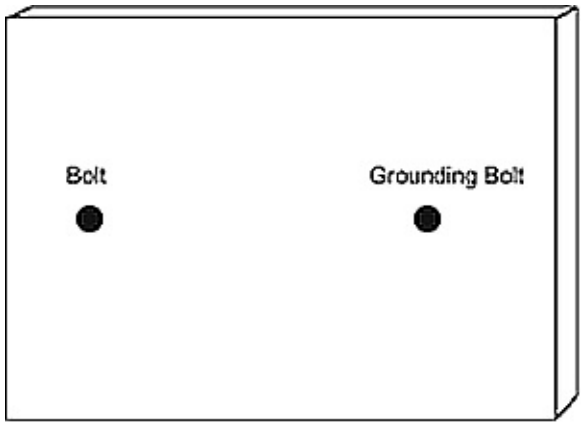
Parts List for 30 kHz Zapper Circuit Shoebox Way	
Item	**Radio Shack Catalog Number**
Shoebox	
9 volt battery	
9 volt battery snap connector	270-324 (set of 5, you need 1)
on-off toggle switch	275-624A micro mini toggle switch
If not available, choose any toggle switch with holes in the contact points or Radio Shack 275-612	
1 KΩ resistor, brown-black-red-gold	271-312(500 piece assortment) use 2
3.9 KΩ resistor, orange-white-red-gold	Use 2 from the 500 piece assortment
39 KΩ resistor, orange-white-orange-gold	From 500 piece assortment
low-current red LED	276-044
.0047 uF capacitor	272-130 (set of 2, you need 1)
.01 uF capacitor	272-131 (set of 2, you need 1)
555 CMOS timer chip (TLC 555)	276-1718 (you may wish to buy a spare)
8 pin wire-wrapping socket for the chip	900-7242
If only 16 pin sockets are available, cut one in half OR leave half empty.	
short (12”) alligator clip leads	any electronics shop, get 10
If not available, use 14” length from Radio Shack, 278-1156	
Micro clip jumper wires	278-017 (you need 2 packages of 2)
If not available, use mini-clip jumper wires 278-016	
2 bolts, about 1/8” diameter, 2” long, with 4 nuts and 4 washers	hardware store
2 copper pipes, ¾” diameter, 4” long	hardware store

sharp knife, pin, long-nose pliers, tape, 4 twist ties or rubber bands

Assembling The Zapper

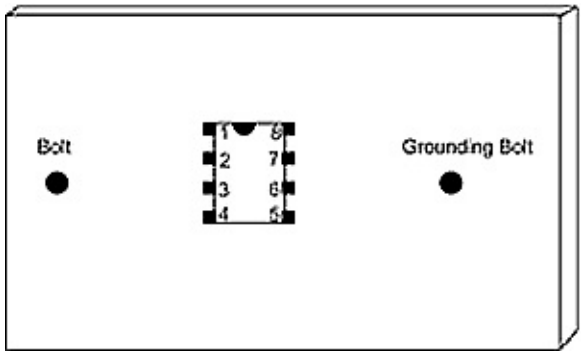
1. You will be using the lid of the shoebox to mount the components. Save the box base to enclose the finished project.

2. Pierce two holes near the ends of the lid. Enlarge the holes with a pen or pencil until the bolts would fit through. Mount the bolts on the outside about half way through the holes so there is a washer and nut holding it in place on both sides. Tighten. Label one hole “grounding bolt” on the inside and outside.

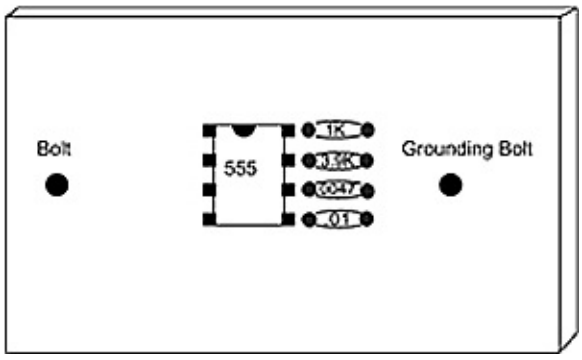


3. Mount the 555 chip in the wire wrap socket. Find the “top end” of the chip by searching the outside surface carefully for a cookie-shaped bite taken out of it or an imprinted dot. Align the chip with the socket and very gently squeeze the pins of the chip into the socket until they click in place.

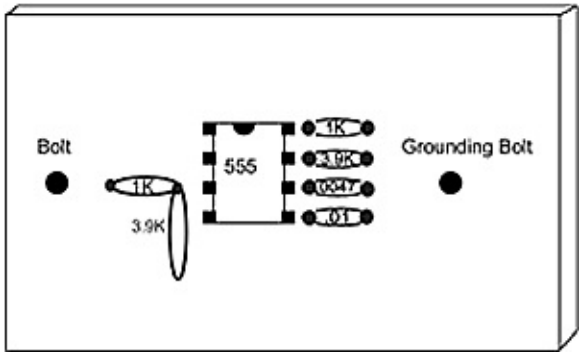
4. Make 8 pinholes to fit the wire wrap socket. Enlarge them slightly with a sharp pencil. Mount it on the outside. Write in the numbers of the pins (connections) on both the outside and inside, starting with number one, near the “cookie bite”, as seen from outside. After number 4, cross over to number 5 and continue. Number 8 will be across from number 1.



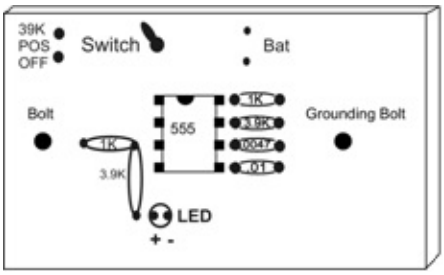
5. Pierce two holes ½ inch apart very near to pins 5, 6, 7, and 8. They should be less than 1/8 inch away. (Or, one end of each component can share a hole with the 555 chip.) Mount the .01 uF capacitor near pin 5 on the outside. On the inside connect pin 5 to one end of this capacitor by simply twisting them together. Loop the capacitor wire around the pin first; then twist with the longnose pliers until you have made a tight connection. Bend the other wire from the capacitor flat against the inside of the shoebox lid. Label it .01 on the outside and inside. Mount the .0047 uF capacitor near pin 6. On the inside twist the capacitor wire around the pin. Flatten the wire from the other end and label it .0047. Mount the 3.9 KΩ resistor near pin 7, connecting it on the inside to the pin. Flatten the wire on the other end and label it 3.9 K. Mount the 1 K Ω resistor and connect it similarly to pin 8 and label it 1 K.



6. Pierce two holes ½ inch apart next to pin 3 (again, you can share the hole for pin 3 if you wish), in the direction of the bolt. Mount the 1 KΩ resistor and label inside and outside. Twist the connections together and flatten the remaining wire. This resistor protects the circuit if you should accidentally short the terminals. Mount the 3.9 KΩ resistor downward. One end can go in the same hole as the 1 KΩ resistor near pin 3. Twist that end around pin 3 which already has the 1 KΩ resistor attached to it. Flatten the far end. Label.



7. Next to the 3.9 KΩ resistor pierce two holes ¼ inch apart for the LED. Notice that the LED has a Positive and Negative connection. The longer wire is the anode (Positive). The flattened side of the red dome marks the Negative wire. Mount the LED on the outside and bend back the wires, labeling them (**+)** and (-) on the inside.



8. Near the top pierce a hole for the toggle switch. Enlarge it until the shaft fits through from the inside. Remove nut and washer from switch before mounting. You may need to trim away some paper with a serrated knife before replacing washer and nut on the outside. Tighten.

9. Next to the switch pierce two holes for the wires from the battery snap connector and poke them through. Do not attach the battery yet.

10. An inch away from the switch pierce two holes ¼ inch apart. Mount the 39 KΩ resistor on the outside and label it inside and outside as “39 K, Positive offset.” Flatten the wires on the inside.

Now to Connect Everything

First, make slits at each corner of the lid with a knife. They will accommodate extra loops of wire that you get from using the clip leads to make connections. After each connection gently tuck away the excess wire through the most convenient slit.

1. Twist the free ends of the two capacitors (.01 and .0047) together. Connect this to the grounding bolt using an alligator clip.

2. Bend the top ends of pin 2 and pin 6 (which already has a connection) inward towards each other in an L shape. Catch them both with a alligator clip and attach the other end of the alligator clip to the free end of the 3.9 KΩ resistor by pin 7.

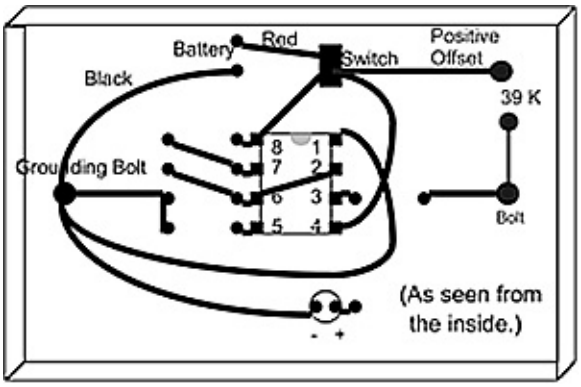
3. Using an alligator clip connect pin 7 to the free end of the 1 KΩ resistor attached to pin 8.

4. Using three micro clips connect pin 8 to one end of the switch, pin 4 to the same end of the switch, and one end of the offset resistor to the same end of the switch. (Put one hook inside the hole and the other hooks around the whole connection. Check to make sure they are securely connected.) Connect the free end of the offset resistor to the bolt using an alligator clip.

5 Use an alligator clip to connect the free end of the 1 KΩ resistor (by pin 3) to the bolt. It is the **output resistor**.

6. Twist the free end of the 3.9 KΩ resistor by pin 3 around the plus end of the LED. Connect the minus end of the LED to the grounding bolt using an alligator clip.

7. Connect pin number 1 on the chip to the grounding bolt with an alligator clip.



8. Attach an alligator clip to the outside of one of the bolts. Attach the other end to a handhold (copper pipe). Do the same for the other bolt and handhold.

9. Connect the minus end of the battery snap connector (black wire) to the grounding bolt with an alligator clip.

10. Connect the plus end of the battery snap connector (red wire) to the free

end of the switch using a micro clip lead. Attach the battery very carefully. Before attaching the battery to its snap connector, cover one terminal with tape. After snapping in one terminal, remove the tape to attach the other terminal. This is to prevent accidental touching of terminals in a backwards direction. If the LED lights up you know the switch is ON. If it does not, flip the switch and see if the LED lights. Label the switch clearly. If you cannot get the LED to light in either switch position, double-check all of your connections, and make sure you have a fresh battery. Even if it does light up, check every connection again.

11. Finally tie up the bunches of wire pushed through the slits in the corners with twistties or rubber bands and replace the lid on the box. Slip a couple of rubber bands around the box to keep it securely shut. For safer storage, place it inside a larger box.

Note: Having gained this much experience, you may prefer to build your next zapper on a piece of cardboard folded in the shape of a bench, ⌐¬, and able to fit inside a shoebox for more protection.

Could you build this zapper the breadboard way? Yes, and use the 30 kHz parts list.

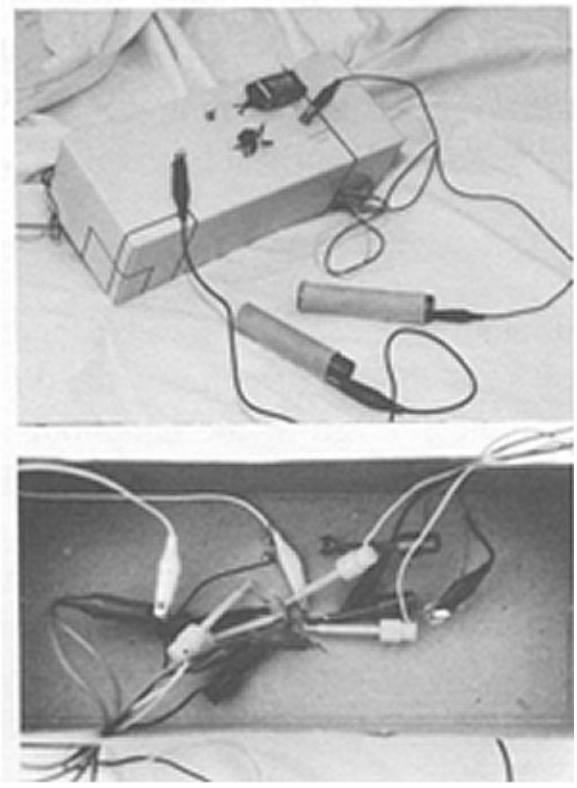


Fig. 123 Zapper under construction

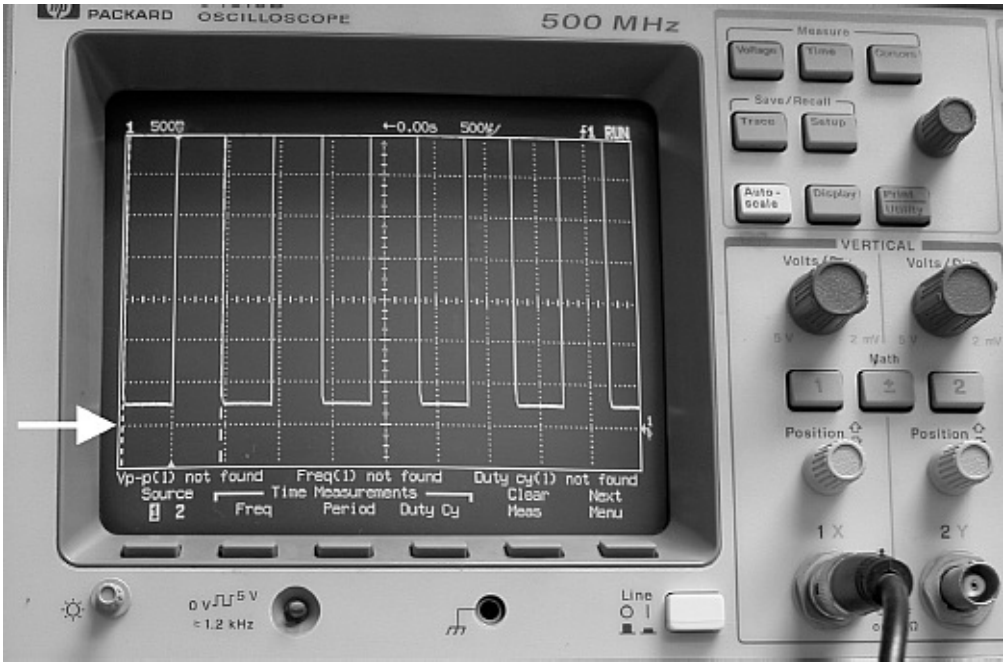
- Optional: measure the frequency of your zapper by connecting an oscilloscope or frequency counter to the handholds. Any electronics shop can do this. It should read between 20 and 40 kHz. The shop can also read the voltage (peak to peak) and the amount of Positive offset (on the .5 volt-per-division scale). The voltage output should be about 8 volts.
- Note: a voltage meter will only read 4 to 5 volts because it displays an average voltage.
- Optional: observe the square wave pulses without holding on to the handholds. They begin to rise from a base voltage of about ¼ volt. This is the "Positive offset". The tops and bottoms of each pulse are flat, each lasting about the same time (50%) called the duty cycle. The rise and fall of each pulse is vertical, without a spike in the Negative direction. When you grasp the handholds (called "under load") the peak-to-peak voltage drops considerably, and the shape has rounded instead of square corners for each pulse. This is a reflection on your body's capacitance; it is normal.
- Optional: measure the current that flows through you when you are getting zapped. You will need a 1 KΩ carbon resistor and oscilloscope. Connect the grounding

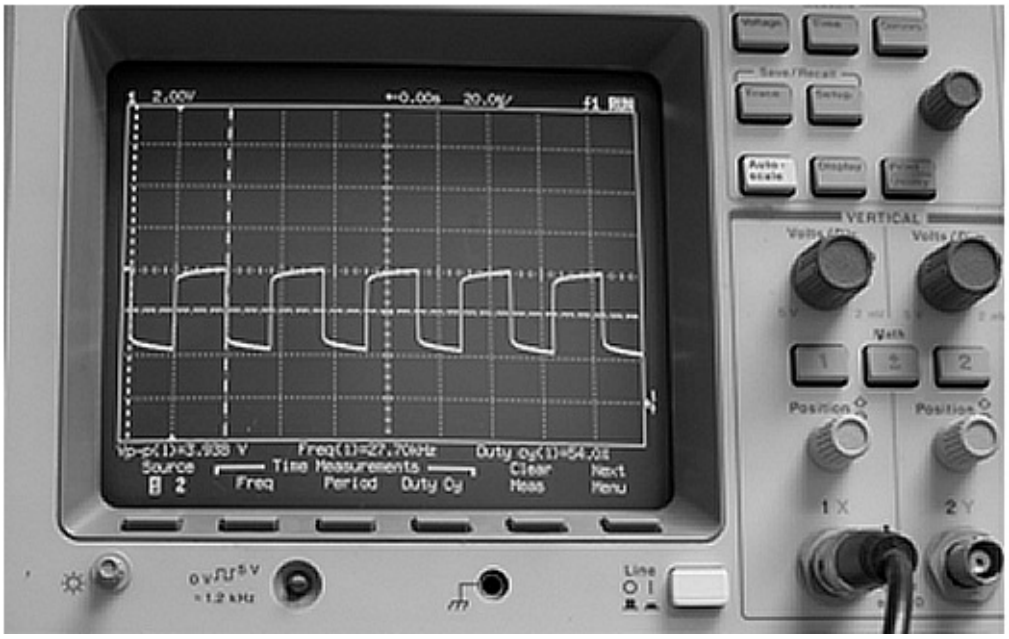


At a range of .5 volts per division, it is easy to see the offset. Before the unit is turned on, the zero line is

found at arrow on left side of screen. (Also see arrow at right side). Turning it on shows the elevated bottom edge of each pulse. Also, no spikes go below the zero line into the Negative field at any time.

Fig. 124 Zapper output with ¼ volt Positive offset

bolt on the zapper to one end of the resistor. Connect the other end of the resistor to a handhold. (Adding this resistor to the circuit decreases the current slightly, but not significantly.) The other handhold is attached to the other bolt. Connect the scope ground wire to one end of the resistor. Connect the scope probe to the other end of the resistor. Turn the zapper ON and grasp the handholds. Read the voltage on the scope. It will read about 3.5 volts. Calculate current by dividing voltage by resistance. 3.5 volts divided by 1 KΩ is 3.5 ma (milliamperes) of current.



Duty cycle, voltage and frequency are less important than absence of Negative spikes and presence of the extra ¼ volt Positive offset.

Fig. 125 Zapper output under load shows effect of body capacitance

Give this to an electronics person to build in a project box.

Fig. 126 Zapper schematic

Using The Zapper

1.Wrap handholds in <u>one</u> layer of wet paper towel before using. More will reduce the current. Grasp securely and turn the switch on to zap. Keep a bottle of water handy to keep them wet.

2. Zap for seven minutes, let go of the handholds, turn off the zapper, and rest for 20 minutes. Then seven minutes on, 20 minutes rest, and a final seven minutes on. This is the routine for **regular** zapping.

3. For plate-zapping, stay connected for 20 minutes at any one tissue location, and move on to others after that.

Testing The Zapper

Trying the zapper on an illness to see “if it works” is not useful. Your symptoms may be due to a non-parasite. Or you may reinfect within hours of zapping. The best way to test your device is to find a few invaders that you currently have. (This is described in the *Syncrometer® Science Laboratory Manual*). This gives you an exact starting point. Then zap yourself. After the

triple zapping, none of these invaders should be present. If they do survive, especially the larger ones like Fasciola flukes, they are undoubtedly saturated by an insulating substance such as PCBs, Freon or benzene. For this reason, plate-zapping is chosen.

Plate-Zapping

By passing the zapper current through a capacitor plate in the same manner as the Syncrometer® current, a similar effect can be observed. The item placed on the plate directs or invites the current; in fact, nothing else will be zapped. My interpretation is that the capacitor plate on the resonance box has a "standing wave" relationship to an identical capacitance in your body (actually, a capacitance-inductance unit), making the resistance between them essentially zero. For this reason the dimensions and composition of the capacitor plates are important. Nearly all the current will go to this location in your body. The standing wave relationship can be seen for the Syncrometer® where the addition of two picofarads capacitance to the plate destroys resonance, but the further addition of two microhenrys inductance restores it again.

Making A Plate-Zapper

I have experimented and gotten good results from two configurations. One uses two sardine can lids to form a single plate. The second uses two pieces of aluminum as separate plates. The advantage of the first configuration is that it is easy to make from items around your home. The advantage of the second configuration is you can do two locations at once. Theoretically, a three-plate, or four-plate, or fifty-plate configuration would increase efficiency even more, but it would also bring a proportional increase in detoxification illness.

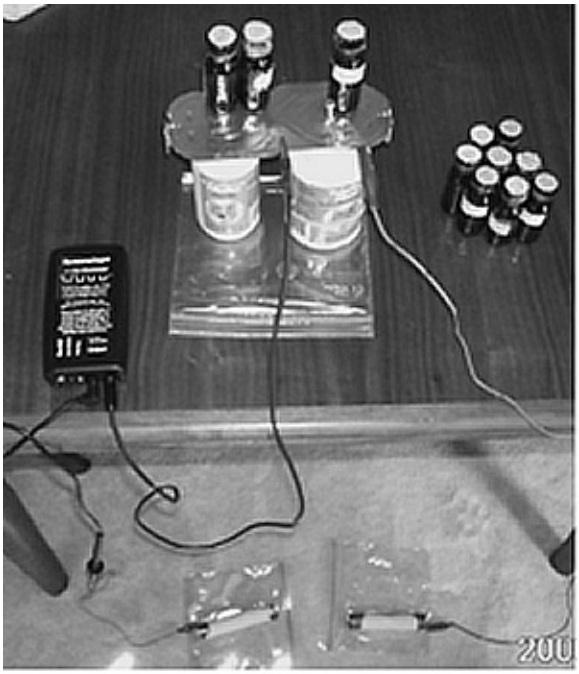
Only make plate-zappers as described below.

Other shapes, sizes and compositions have either not been tested or not been found useful.

Single Plate Zapper

The easiest plate zapper to build uses sardine can lids (not other cans). After careful washing and unrolling to make the surface as flat as possible, you mount

them on the lids of empty vitamin bottles (the kind with plastic caps). Make a nail hole near the center of each lid and bottle cap. Find sheet metal screws to fit the holes. Tighten the can plates to the lids just enough to be still movable by finger touch.



From any zapper connect the positive output to your plates. In this picture the zapper and plates are connected to foot electrodes (copper pipes).

Fig. 127 Homemade plates

Place your two lids so they overlap slightly. They are held together tightly by the grip of an alligator clip lead. Fasten the other end of the alligator clip to the bolt of your homemade zapper (**Positive** side). Now attach a second alligator clip lead from the same plate to a copper pipe. A third alligator clip lead goes from your homemade zapper grounding bolt to the second copper pipe as usual.

The two can lids must be very securely connected at all times, such as by one of the alligator clips. Use copper pipes to contact your body for best penetration. The high frequency and layer of wet paper prevent the copper from penetrating your skin.

Double Plate-Zapper

Get two 1/32-inch (1 mm) thick aluminum plates. They should be 3¼ to 3½ inch (8-9 cm) square. Drill a hole in the center of each one and mount on a

cardboard or plastic box with bolts. Place them about 2-3 inches (5-8 cm) apart.

Run a lead from the Positive output of your zapper to each of the plates (two leads altogether, clip them directly onto the edge of each plate). Then run a lead from each plate to a copper pipe. There is a lead from the Negative output of the zapper to the second copper pipe as usual. You will need five alligator clip leads altogether.

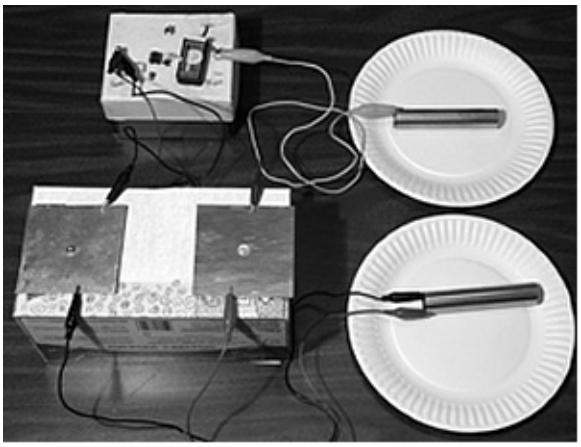


Fig. 128 Double plate-zapper

Plate-Zapping Tips

Because you should use your feet to zap, you may wish to put the copper tubes on the floor. The tubes will be wrapped with wet paper towel, so to protect your floor, one trick is to shove paper plates inside plastic bags underneath the tubes.

With plate-zapping a 9 volt battery will wear out even quicker than for other arrangements. Of course, your body is benefiting from this greater energy input by converting it in some way for itself. You need to check the battery voltage after every zap at first. If the battery voltage ends up at 8.9 or lower, you will have to repeat the last zap. Start each zap at no less than 9.4 v. Expect to drain about .4 volts from the battery for each zap using this dual plate arrangement. Get rechargeable batteries, a battery charger, and a voltmeter all of which will save you money and delays.

For detailed instructions see the *Plate-Zapping Schedule*.

The Zappicator

Attaching a zapper to a loudspeaker brings the electric pulses to the magnet

that makes the speaker's paper cone vibrate. The paper cone vibrates the air at the same frequency. We can hear this if the electric pulses are at the correct frequency for our ears, which is from 20 Hz to 20,000 Hz (vibrations per second).

If we attach a zapper to a speaker we would not hear any sound, because the zapper outputs a frequency of about 30,000 Hz (too high), although the vibrations continue. Each pulse is shorter now and might reach the molecules themselves, the way a passing train can rattle the dishes in your cupboard. If the correct frequency is found you could "rattle" a specific molecule and perhaps destroy it without harming the neighbors. That was the theory. But experiments showed that the incoming pulses had to be totally Positive (100%) and the circular magnet around the speaker had to be producing a North Pole magnetic field to have such an effect. Moreover, if an actual current was running through the loudspeaker, the whole phenomenon vanished!

I experimented with other frequencies, hoping to find one that not only destroyed bacteria and viruses, but "bad molecules" like phenolics in food. I found 1,000 Hz worked well, which surprised me because I expected a much higher frequency.

I could not understand the physics involved, but there were no exceptions. Only the single lead attachment worked, from the (+) output of the zapper to the (+) end of the speaker. If the (-) end was used at all, this unusual chemistry does not occur. The loudspeaker must be acting as if it were an antenna, suggesting that resonance is involved in finding and destroying the "bad molecules." Fortunately I did not find evidence that "good molecules" like vitamins and organic minerals were affected. They let the pulses pass through unnoticed, like open gates letting through the traffic. But "bad molecules," like food allergens, PCBs, benzene and phenol were destroyed. In fact, phenol appeared after benzene disappeared. After this, wood alcohol appeared as if phenol molecules had broken in half. With longer zappication even this wood alcohol disappeared producing formaldehyde, and this broke down further to formic acid. Some significant "chemistry" is going on during zappication.

Zappicating food is so beneficial you are encouraged to build this device. The circuit is just like the zapper, but with a few component changes to lower the frequency to 1000±5 Hz.

There will be no sound because no current is flowing. But a very tiny voltage and the 1 kHz frequency are affecting all the food that touches the plate or

touches other food that is touching the plate. That is easy to see on a frequency counter.

The zappicator circuit will also have the Positive offset feature, namely, a special resistor to produce a ¼ volt offset, so no Negative voltage could ever be delivered accidentally. It will produce a frequency of 1000 Hz, instead of 30,000.

Building The Zappicator

The zappicator has two parts:

- **a speaker box where food is placed and**
- **a 1 kHz zapper to supply power to the box**

First we will build the 1 kHz zapper. We will build it on a breadboard to avoid the tangle of wires, clip leads, and the soldering of other methods.

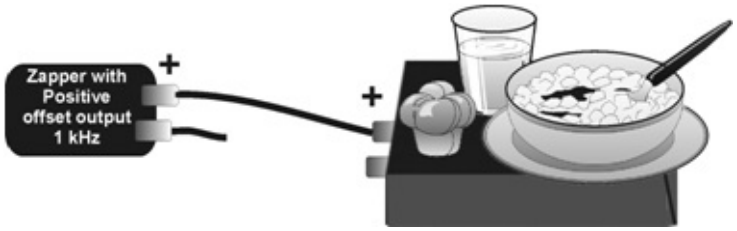

Fig. 129 Zappicator with speaker box and 1 kHz zapper

The Breadboard Way

Instructions for making a 1 kHz zapper:

Parts List for Zappicator Circuit	
Item	**Radio Shack Catalog Number**
9 volt battery	
9 volt battery snap connector	270-324 (set of 5, you need 1)
on-off toggle switch	275-624A micro-mini toggle switch
If not available, choose any toggle switch with holes in the terminals, OR Radio Shack 275-612	
1 KΩ resistor, brown-black-red-	271-312 (500 piece assortment)

gold (2)	
2.2 KΩ resistor, red-red-red-gold	use one in the assortment
4.4 KΩ resistor	use one of the 4.7 KΩ resistors in the assortment (yellow-violet-red-gold)
144 KΩ resistor	use two of the 270 KΩ resistors in the assortment (red-violet-yellow-gold)
39 KΩ resistor (for Positive offset) orange-white-orange-gold	use one in the assortment
low-current red LED 2 ma	276-044
.0047 uF capacitor (2)	272-130 (set of two)
555 CMOS timer chip (TLC 555)	276-1718 (you might want to buy a spare
alligator clip leads (2)	any electronics shop
Or use Radio Shack 278-1156 (set of 10)	
Breadboard	276-175 (called Experimenter Socket)
breadboard wires	276-173
2 copper pipes, ¾ inch diameter, 4 inches long	plumbing store
Long nose pliers, scotch tape, wire stripper	

The total cost, as of 2002, was about $29.00 not including the copper pipes.

The breadboard is a plastic pad with holes in it. If you look closely at the Radio Shack “Experimenter Socket,” you can see the rows are lettered A through J, while the two outermost rows are X and Y. The columns are numbered 1 through 23. Any other breadboard will work, too.

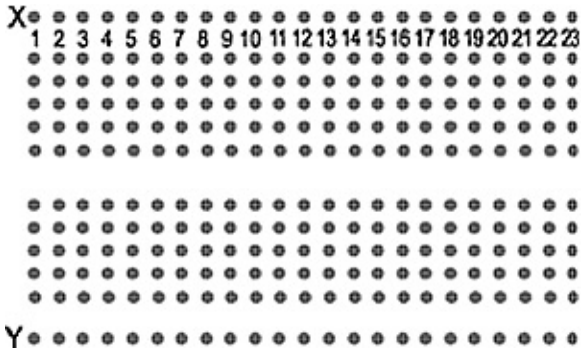
The components connect by contacting a metal board below the holes. Here are some tips for the novice builder:

If the end of a wire is not bare, use a sharp knife to scrape off about a quarter-inch (1 cm) of the plastic insulation. When stripping wire, if you accidentally cut some of the wire strands off, then cut them all off and start fresh. Hopefully you will succeed before you run out of wire!

If the wire is solid, great, but if it is stranded then twist it with your fingers to help keep the strands together.

When you push a wire (either solid or stranded) into a hole in the breadboard,

you should feel it go in securely. If you tug the wire gently it should not come free. If you turn the breadboard upside down and shake it, nothing should fall out. Sometimes (especially with stranded wire which is flexible), the wire will bend instead of going in. Just straighten it out and try again. Hold the wire as close to the end as possible to prevent bending.



Breadboard

You don’t need to know this, but if you are wondering how the rest of the breadboard works, holes A1 through E1 are connected internally, A2-E2 are connected to themselves, A3-E3, and so forth. Also F1-J1, F2-J2, etc. Finally, X1-X23 and Y1-Y23 as mentioned above. To connect different rows or across the center groove, jumpers are used, of different lengths, called breadboard wires.

The resistors, capacitors, and LED have long, bare wires. Don’t let them touch each other; check each one before attaching the battery. You can cut them shorter if you wish. (You can buy wire cutters, but you can also just use household scissors although cutting wire may dull the scissors.)

The resistors and capacitors have no orientation so can go in any way. But the 555 chip does, it has a small circle or dot in one corner. Also, the LED has a flat side on its rim (hard to see but easy to feel) that tells you which way it goes.

If you bought the Radio Shack resistor assortment you may be wondering how you tell them apart! The answer is by the color of the bands on the cylinder. There is a chart on the back of the package, but to make it easy, the 1 KΩ resistor is brown-black-red-gold; the 2.2 KΩ resistor is red-red-red-gold; the 4.7 KΩ resistor is yellow-violet-red-gold; the 39 KΩ resistor is orange-white-orange-gold and the 270 KΩ resistors are red-violet-yellow-gold. All the resistors in the assortment end with a gold band, so when reading the colors, start at the non-gold end.

The 555 timer chip is sensitive to static electricity. A good way to make sure you are not charged with static electricity is to touch a metal cold water pipe or faucet before handling the chip.

Although you are working with bare wires and electricity, there is little chance of harming yourself. During assembly the battery is not connected. Even while you are using the zapper, there are no voltages higher than the nine volts of the battery in this circuit. Still, take care not to come in contact with the components while the battery is connected in order not to make a spark or damage a component.

Plug in all the components as shown in the pictures.

Attach the battery last. Do this very carefully to avoid accidentally contacting its terminals backwards. Cover one battery terminal with tape first. Then snap in the free terminal. Remove tape and snap in the other terminal.

If you have a voltmeter and wish to check the output you will find it measures approximately 4.5 V. That is because the zapper is switching between nine volts and zero volts about 1000 times per second. The average of nine and zero is 4.5 V.

Step-by-Step Assembly

1. Examine the 555 timer chip. Find the dot or “cookie bite” at one end. This starts the numbering system for the legs, called “pins”. The pin nearest to the dot is #1. Count them all. Find the 8th row on the breadboard and insert the chip across the “aisle” or groove as shown. Ease the chip in gently. If the pins refuse to go in evenly on both sides you may ease it out again with your fingernail and press the pins a bit closer together. The chip should lie flat against the breadboard when in place. Each pin connects to the row of 5 dots it is in. Identify the row of dots for each pin.

2. Insert the red wire of the battery snap connector. This will bring Positive (+) electricity to the whole row of 23 dots, called X, at the edge of the board.

3. Insert the black wire of the battery snap connector. This connects all the dots on the other edge, called Y, to the Negative (-) side of the battery. This is also called “ground”. Do not attach the battery yet.

4. Insert the jumper (red) that will bring the (+) electricity to pin 8.

5. Insert the jumper that connects pin 1 to ground. Jiggle the jumpers till they go in smoothly or try a different one. Also try bending the wires slightly inward

for easier fitting. You have now completed *Diagram A*.

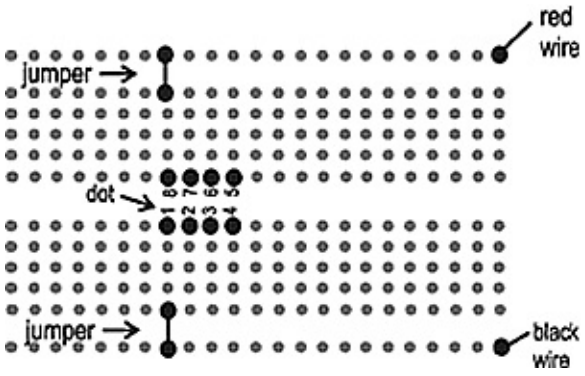


Diagram A

6. Connect pin 8 to pin 7 through a 1 KΩ resistor (brown-black-red-gold). Since this is a very short distance the ends of the resistor will seem too long. Bend one end over and down to make a "hairpin". Then cut both ends about ½ inch (1 cm) from the end of the resistor; then insert.

7. Connect the row of dots at pin 7 to pin 6 through a 270 KΩ resistor (red-violet-yellow-gold). Again, bend one end of the resistor in a hairpin; cut the other end off to make them even. Insert. Repeat with a second 270 KΩ resistor right beside it. This "parallel" configuration reduces the resistance to half, namely, 135 KΩ. This value is close enough to 144 KΩ as required on the parts list. This value works as well.

8. Next, you need to connect pin 2 on the 555 chip to pin 6. To do this, choose a jumper (green) that can take you away from the crowded conditions, all the way to row 15 from row 10.

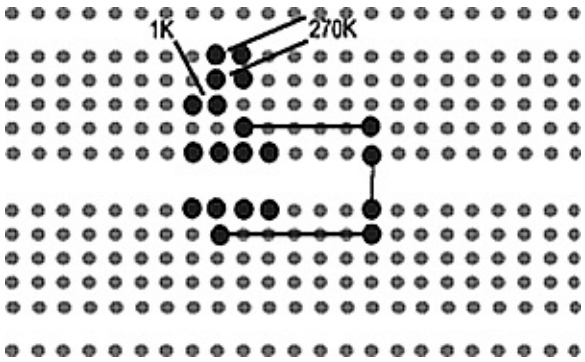

Diagram B

9. Then jump from here across the aisle (orange). From here jump to the row of dots at pin 2 (blue). Now pin 6 is connected to pin 2. You have completed *Diagram B*. (Some of your previous connections are omitted for clarity.)

10. Connect pin 6 to another outlying row, such as row 17, through a capacitor, .0047 µF. Push the end at pin 6 in first; then bend the other end slightly inward to insert easily.

11. Insert the other capacitor, also .0047 µF, between pin 5 and the same row. After solid insertion straighten out the wires and make sure no wires are touching other wires inappropriately. If any insertion is especially difficult, use long nose pliers to grasp a wire near its end for firmer pushing.

12. Connect the outlying ends of the capacitors (row 17) to ground using a jumper that crosses the aisle (white).

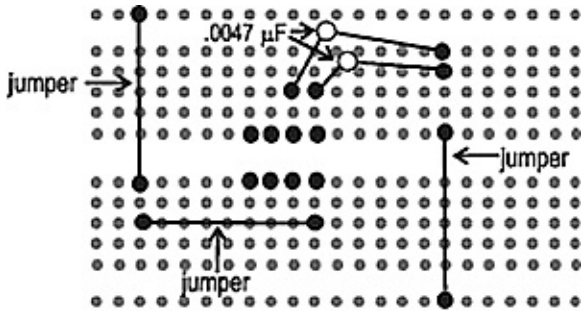

Diagram C

13. Pin 4 also gets energized by the battery. Connect pin 4 to an outlying row (row 3) with a jumper (gray). Connect the same row to the (+) side of the battery with a jumper. You have now completed *Diagram C*.

14. Now to connect the LED. Connect pin 3 to an unused row, such as 14,

through a 2.2 KΩ resistor (red-red-red-gold). Find the flat side of the red dome on the LED. The flat side has the shorter wire.

15. Insert the longer wire of the LED at row 14, the shorter wire at ground. The flat side is grounded. You have now completed *Diagram D.*

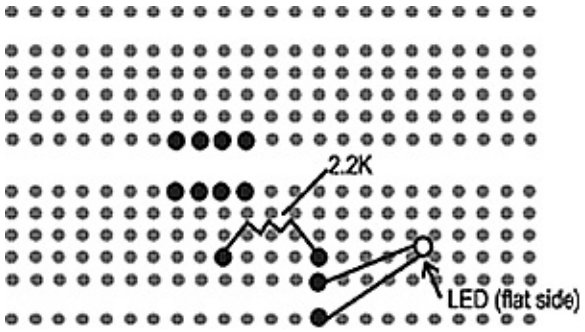

Diagram D

16. Pin 3 is the **output**. We will connect this to one copper pipe that contacts the body, but we will do this through an output resistor. Connect pin 3 to an outlying row, such as 2, through a resistor of 1000 Ω (brown-black-red-gold). This resistor protects the circuit if you accidentally short the two copper pipes as you hold them.

17. Connect an extra long jumper at row 2; it must reach to the outside of the box that will hold your zapper. Choose a light color that symbolizes the hot (+) wire. You have now completed *Diagram E*

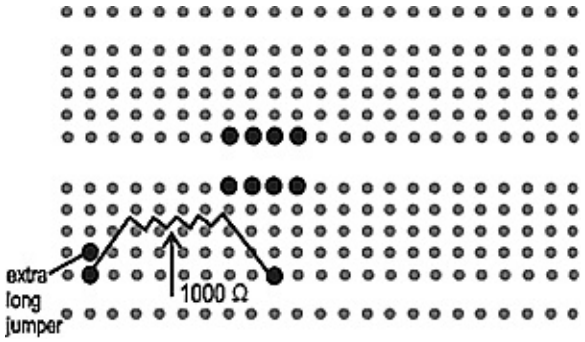

Diagram E

18. Pin 1 is already grounded. Connect another extra long jumper to the ground row, using a dark color (green) that symbolizes ground. This will connect to the other copper pipe that contacts the body.

19. Now to add the offset resistor. Connect the 39 KΩ resistor between the

battery and the output at row 2. This completes *Diagram F*.

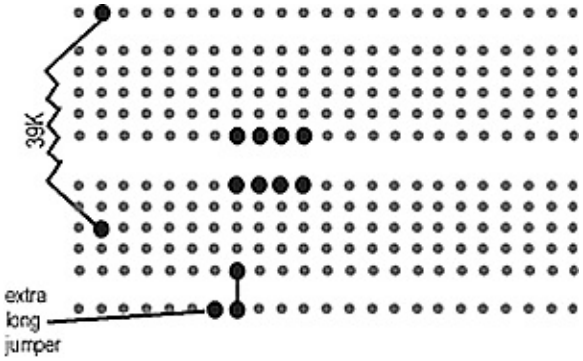

Diagram F

20. To include a switch, pull out the red wire of the battery snap connector from its seat in the breadboard. Cut the red wire in half. Strip ½ inch of insulation from each newly cut end. Practice using the wire stripper on a different piece of wire first. Twist the bare ends into a tight form. Insert one end in the hole of one switch terminal. Make a tight connection. Connect the other bare end to the other switch terminal.

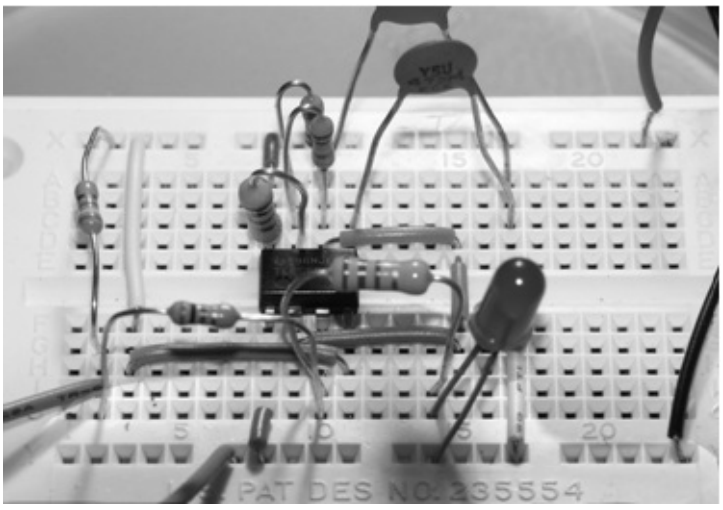

Fig. 130 Finished breadboard zapper (1 kHz) for zappicating foods.

If possible, ask an electronics shop to solder these 2 connections for greater durability. Reinsert the red wire in the breadboard.

21. Connect the battery, but do this VERY CAREFULLY. Remember to cover one battery terminal with tape until the other terminal is safely seated in its holder. Then remove tape and seat the other terminal. You could destroy the chip

if you touched the wrong terminals briefly.

22. The LED may now light. If it does not, throw the switch.

23. For protection you may place your zapper inside a plastic container with lid. Mount the switch and battery on the outside for convenience.

Troubleshooting

If the LED still doesn’t light, it may be in backwards. Disconnect the battery, tape over one terminal, turn the LED around, and reconnect the battery. Being in backwards does not harm the LED. If it still does not light, or flickers, suspect the switch connections. Remove the switch or solder it.

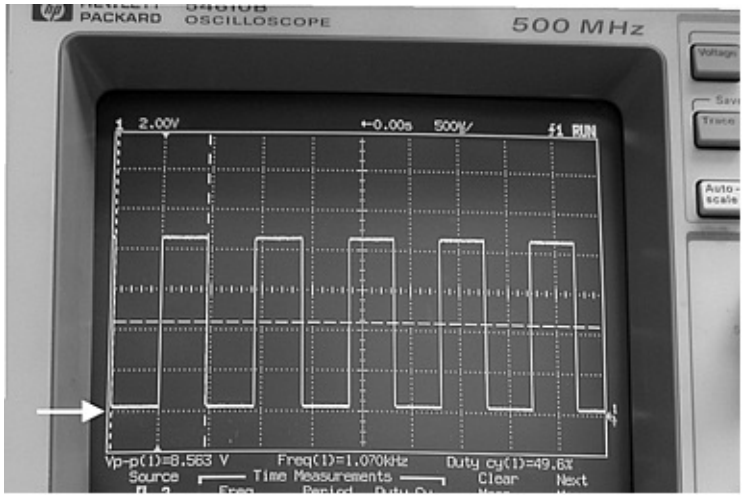
If the battery gets hot, disconnect it immediately! Check that there are no bare wires touching each other. Double-check that your wiring matches the picture. You may have drained the battery a lot, so replace it with a new one.

If everything looks perfect, but the LED still doesn’t light, you may have a defective component. That’s why the Parts List advises getting a spare 555 timer chip. The 555 is the most likely component to fail. Disconnect the battery and try swapping chips (pay attention to which corner has the circle). None of the rest of the components are likely to fail, but you can try swapping them if you like.

Make sure your battery is fresh. Use a battery tester.

Seeing the Output

An oscilloscope shows you a high-speed picture of how the voltage changes. You can actually “see” the zapper go from zero to nine volts and back repeatedly. And you can calculate the frequency to make sure it is about 1000 hertz (low-frequency) or 30,000 hertz (regular zapper).



The Positive offset is visible just above the zero line.

Fig. 131 Output as seen at 2 volts per division range.

Oscilloscopes are expensive, so rather than buy one, it is better to ask your local television or VCR repair shop if they would use their oscilloscope to check your zapper quickly. Here is how the zapper output typically looks. When your zapper is turned on, the bottom flat lines of each pulse should be ¼ volt above (more Positive) the zero line. To see the offset more clearly, change to .5 volts per division.

Making The Zappicator Food Box

Get these supplies:

- Zapper with a 1 kHz output, like you just made.
- Plastic carton, such as a cottage cheese or food container.
- 4 ohm or 8 ohm loudspeaker, 2” or 2½” (5-7 cm) diameter, with a North Pole face.
- one alligator-to-banana clip lead (a piece of insulated wire with an alligator clip at one end and a banana clip at the other) to fit your zapper. Whatever fits is acceptable
- compass
- roll of tape, sharp knife

Fig. 132 Choose speaker with North Pole face

Many loudspeakers on the market are South Pole. Be careful. Take your compass with you as you shop; the compass' North should be attracted to the face (see picture). A field strength of 10 to 20 gauss is preferred. This means the magnet on the speaker should be able to lift a loose chain of six paper clips. The current and watt ratings given for the speaker are not important. Some loudspeakers have "collars", or domes, or are encased, or shielded. Do not choose them. They do not work. The magnetic field is not necessarily stable either.

Dropping the speaker or overheating it could change the polarity. Check yours before use with a compass once a week.

Assemble the zappicator food box parts.

1.Find the (+) and (–) sign on the loudspeaker. You will be attaching a lead (wire) to the plus side.

2.Cut a hole, about ½ inch square in the side of the plastic carton for the lead to pass through.

3. Attach the loudspeaker to the bottom of the carton, inside, taping it down securely, or using hot glue around the edge of the cone.

4. Push the alligator clip lead through the hole and attach it securely to the (+) connection on the speaker. Attach nothing to the Negative terminal.

Fig. 133 Find the (+) sign on speaker

5. Find the (+) terminal of your 1 **kHz** zapper. You must be sure of this. If you did not build it and if it is not marked, take it to an electronics shop; the clerk can check this for you in a minute. Label it. Connect the free end of the clip lead to the (+) terminal of the zapper. If you need to use two leads to connect your speaker (+) terminal to your zapper (+) terminal, do so. Attach nothing to the Negative terminal.

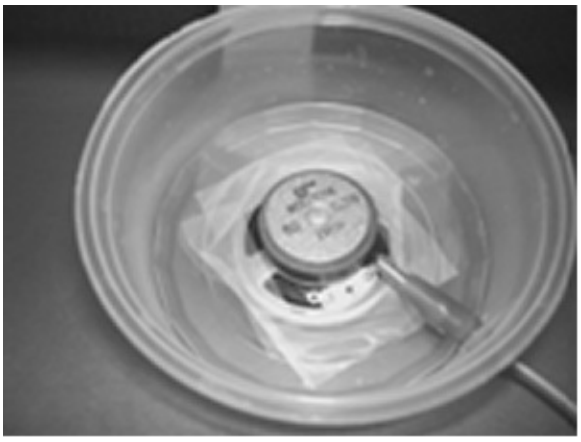


Fig. 135 Attach loudspeaker inside the carton

6. Turn carton over to give you a flat surface for food placement. Place food, packaged food, beverage glass, or filled plate on the top of the carton. It may hang over the edge. Turn zapper on for specified time.

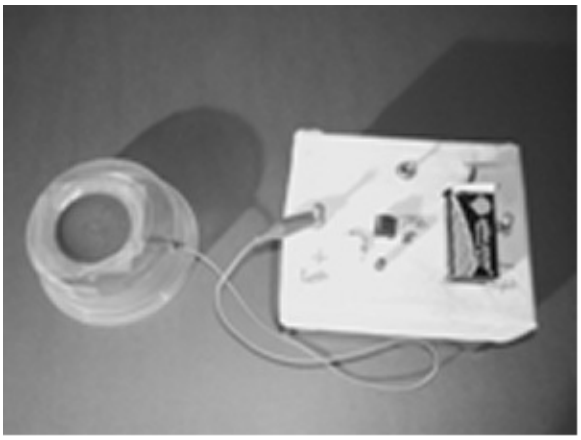

Fig. 134 Connect speaker to (+) output of zapper

Using The Zappicator Food Box

Metal objects, like cans, placed on the zappicator will become magnetized by zappicating, showing a South Pole at the base and North Pole at the top. Numerous poles are induced, not necessarily stable. The food inside the can shows the same polarity as the part of the can that is touching it (not opposite). For better quality food, it would be ideal to empty the can first and zappicate in a non-metal container.

Fig. 136 Place food on top of carton

Glass jars should have their metal lids removed before zappicating. This gives all the food a north polarization like the polarity of the speaker. Otherwise the metal lid becomes polarized so that half the entire can becomes north and the other half south.

Foods and beverages become north polarized, although they may have started

out south or without any polarity. This is because water is **diamagnetic** and takes on the same polarity as the field nearest to it instead of the opposite polarity as iron-like metals do.

Changing your food to north polarized is an extra benefit of zappication. The main goals are to destroy parasite eggs and other living things as well as harmful molecules, like food phenolics.

Attaching an ordinary zapper with output of about 30,000 Hz to a loudspeaker is almost as useful as using a 1000 Hz zapper. Some phenolics and complex "bad" molecules are destroyed, leaving the "good" ones intact. Both food and water are given a north polarization, which is beneficial.

Use the same instructions for mounting the loudspeaker. Attach a 30 kHz zapper the same way as for the zappicator.

In this chapter you learned to:

Make a zapper in a cardboard box or on a plastic "breadboard."

Make a 30 kHz zapper or a 1 kHz zapper.

Use a 30 kHz zapper with plates for better effect.

Use a 30 kHz zapper with a speaker to treat food ("food zapper").

Use a 1 kHz zapper with a speaker for better effect ("food zappicator").

Recipes

Read old recipe books for the fun and savings of making your own nutritious food. With modern appliances like grinders, blenders, juicers, and choppers, recipes that took an hour to make 10 years ago might only take 10 minutes now. Avoid the recipes that have processed (cans and packages) ingredients. When cooking from scratch you can hardly go wrong nutritionally. You only need to know that food consists of 3 parts: protein, starch and fat. Your patient should get plenty of each, with choices, but not a single mouthful of concocted food like soda pop, pretzels, chips, dips, candy or cakes. Every mouthful counts. It needs to be nutritious. And it needs to be safe.

The importance of this book is the emphasis on higher standards of food sanitation and safety. Sanitation from parasite eggs and larvae; safety from the five immunity-destroyers: asbestos, benzene, PCB, metals and dyes.

To make food sanitary and safe we have developed three chemical methods and three electrical methods. They are not equal. They have different uses. Choose carefully to suit your needs.

> But isn’t this just too much? Too much caution, care and cleanliness? Is all this really necessary? Isn’t a little dirt good for you? These are comments that we sometimes hear.

It is years of using the microscope and Syncrometer® that provides the answer.

Yes! It is necessary. We are wading in filth—our own, our animals’, and other’s. But it "looks" clean enough to us and we might think, "What we don’t see, surely can’t be so significant."Let us take a trip back in time.

A Medieval Weekend

Imagine you have just landed in a medieval town in the year 1250. The family, your ancestors, has invited you to dinner and to spend the night. You hide your car in the woods, to not attract attention, and walk ½ mile along the wide path to their home. You pass many people, all walking, leading animals, stepping over manure deposits, carrying water in buckets which are set down on

the ground to rest arms, carrying milk from the neighbors in open pails, carrying bundles of firewood and a hefty stick to fend off dogs.

You arrive just before supper. The table is half set and the milk already poured. Flies are in each glass (screens weren't invented until later). You want most to wash your hands and get a glass of water, but you change your mind. A sick person in the bedroom next to the kitchen is said to have the plague. So all you want is to wash, not drink. But there is no water for washing; only a water bucket for drinking. One dipper hangs over the rim for all to share. The washbasin is being used in the bedroom. You decide against even washing your hands.

Your relatives are very friendly, eager to hug and kiss every square inch of you. You wipe your mouth as often as possible, discreetly.

For supper you get rye bread and milk (freshly carried), a piece of meat roasted marvelously (your relatives are upper class) and for desert a hunk of cheese, delicious cheddar. You look around for cutlery. There isn't any. It's all fingers, hands and slurping. You make do. You wipe hands inside your shirt. Flies find you tasty now.

After supper you try to find some water; there must be a town supply. You walk to find it and do. It's a gathering place…for pigs and cows and sheep and dogs and you! You beg for some from the person at the rope but the people think you're wasting it on your hands and face. You dry up on your clothes feeling embarrassed. Now it's time to find a toilet. But there is none. The very young children go in a potty where mother cleans them up. Mother uses water from the basin, which is being shared next door. The older children and adults fend for themselves in a community shack. Finally you're forced. You try to look casual, just in case there was a choice. There isn't. Some giggling kids are peeking in through the cracks getting a look at the newcomer. But there is no more waiting. It's diarrhea! What? Salmonella already? Then it strikes you. There's no paper. What are others doing? Nothing. And it's an indelicate subject; you can't talk about it when you already know the answer. There's no grass, no leaves, no hay, no anything. Paper wasn't invented.

You would like to wash your hands and bottom in your own urine; that seems logical; and then rinse them in your own spit—but nobody else seems to be doing that. They merely wipe their hands on their clothes and go about their chores.

You finally emerge and get ready for bed, unwashed. So does everybody. The

flies are settling down but the mosquitoes are starting up, through all the open windows. The buzz makes a faint chorus. You hide everything including your face till you are semi-choked.

You sleep in your underwear and put out the candle as quickly as possible to stop attracting insects.

The next morning you see the darkened corners of the bedroom. You wonder if there are bedbugs and whether you got bitten.

Everybody is getting ready to go to work, and to the village school, and to the fields. But Mother stays in the house to visit with you. She laughs and tries to cheer you up with a little song as she washes dishes (which cleans her hands from the sick bed) and sweeps the floor.

This is your chance to talk. What would you say? Would you say, "My dear great-great-great-great-great-grandmother, you are doing wonderfully well. The children are beautiful and your husband is so helpful. I hope your son gets well." "Oh, yes, it’s in God’s hands," she says. That seems to bring as much relief as giving an antibiotic.

Would you tell her about germs? The importance of washing hands? Paper or something in the toilet? Wash water in the toilet? Separate water glasses (about six or seven for her to wash each day)? Flies?

Probably not; it would be too difficult to explain or put into practice. You get in your car and vanish. You’re home again.

There’s No Place Like Home

Everything looks and feels different.

You notice it when anybody doesn’t wash hands after toileting. You notice when anybody doesn’t wash hands before eating because you know where those hands have been. You notice when dirty hands are fingering the food which will soon be served.

You see a thousand counterparts of your medieval relatives. Even in the room next to the kitchen is a grown child with "chronic fatigue" on the couch. And in another room beside the kitchen the sounds and smells of bowel elimination are taken for granted. It seems rather close to food preparation but it’s an indelicate subject so is never discussed. Stains of pet "messes" are in the carpet. Smells of pesticide and laundry soap and fast food are everywhere. The cats jump on the kitchen counter to check into any food left out "for them." The dog runs about

licking everybody on the face and getting into their popcorn as they lie in front of the TV.

We have not learned. Not in 800 years. Despite knowing that sanitation eliminated plagues and epidemics of the past. Despite being able to see our enemies through a microscope. We must change. We must clean up. Clean out. Sanitize. Or give our loved ones to whatever plague comes next.

Food Sanitizers

Lugol's Rinse

Lugol’s iodine has been used for decades by travelers to foreign lands to wash their fruit and vegetables. We never thought our food in the United States could be so filthy it required iodine treatment. But it is by far the most efficient "sterilizer" no matter what the level of filth. When animal refuse is used as fertilizer or produce is grown in distant countries where different diseases abound, I would feel much safer with my trusty iodine bottle always handy. Whether I am cooking or eating I can always sanitize most food in minutes.

Lugol's iodine solution
Water

Fill a sink or a bowl with a measured amount of water. Draw a line here, so future treatments do not require measuring again. **Add one drop Lugol's per quart (or liter) of water.** Dip lettuce, spinach and any other produce so everything is well wetted for one minute or more. Rinsing is optional. (Eating traces of iodine is not harmful, but iodine is powerful so do not add it directly to the food on your plate or your beverages; it would destroy some food value and eventually become toxic.) Do not save the water for later use—it will lose its potency. If you wash so many vegetables that you can no longer see the color of the iodine it has lost its effectiveness. Add more.

Cautionary Note:

Lugol’s iodine can "crawl" out of its bottle even when it is tightly closed! It can stain the sink and counter top. If this happens use vitamin C immediately to make it colorless, then wipe away.

Keep Lugol's out of reach of children. Keep it in small (½ oz.) dropper bottles as further protection against accidental overdose.

If your Lugol's was not made from scratch, it will probably have wood alcohol or isopropyl alcohol pollution. Place your entire bottle on a zappicator for 40 minutes to destroy these. It only needs to be done once.

Cysteine-Salt Food Sanitizer

1/8 tsp. cysteine powder
1/8 tsp. salt
1 quart/L water

Stir to dissolve. Immerse produce for five minutes. No need to rinse; this is edible.

When cysteine-salt is used to sanitize a beverage, such as milk or juice, it is added directly, but it soon becomes sulfurous, and unappetizing, so drink the beverage immediately.

HCl Food Sanitizer (5% USP)

1 drop per cup water

Immerse produce. Agitate food well. Let stand several minutes. No need to rinse; this is edible (but don't put it directly in your mouth).

To kill most bacteria and parasite eggs, and to destroy traces of benzene and PCBs, add several drops directly to any food. Stir the food with a non-metal utensil while adding. Although two drops per cup is enough for clear liquids, four drops is safer when particles are present or the food is solid. Do not exceed 15 drops per meal, not counting food preparation.

The Food Sonicator, Food Zapper And Food Zappicator

These three electronic methods were described. The sonicator and zapper destroy living things, destroy live tissue bits found in milk and eggs, and destroy traces of PCBs, benzene and asbestos. They do not destroy many food phenolics or dyes. The zappicator does all these things. None of these devices destroy metals. That is because metal cannot be destroyed—only changed to a different form. Metals must be washed off food.

The zapper and zappicator are more convenient than a sonicator, allowing

foods to be placed on them in their original container or packaging, while the sonicator uses water immersion. The time of treatment is **five minutes**, except for eggs and dairy foods, which need **ten minutes**. The phenolics, phenol, chlorogenic acid, phloridzin, gallic acid, and apiol need 10 minutes. Most phenolics have not been tested yet. Because you will be avoiding foods with these phenolics, you only need to zappicate 10 minutes, but if you sense some risk, increase the time to 20 minutes. Longer times bring the added benefit of northerly magnetic polarization given to the food and to more phenolic destruction.

Beverage Recipes

Whole Lemonade

1 whole lemon
3 tbsp. honey
1 cup water (with 1 drop HCl)

Double hot wash the lemon, cut away flower and stem ends, cut in pieces and place in blender, seeds, peel and all. Add honey and water. Blend. Strain through a course plastic strainer. Freeze the pulp for future use. This recipe removes asbestos, aluminum and mercury from your body tissues. The effect can be very pronounced if you have already stopped getting these pollutants into yourself. Do not consume more than one lemon a day to prevent becoming allergic to it. In fact, do not consume more than one citrus fruit in a day.

This beverage is the perfect hiding place for even the worst of supplements. The hydrangea powder, even cysteine, thioctic acid, glutathione, and taurine can be hidden when ½ tsp. nutmeg and 4 tbsp. honey are used in the recipe.

Digestive enzymes, betaine, and even wormwood will be hidden when ¼ tsp. cloves are added.

> All honey, syrups or sugars should be zappicated to destroy phenolic food chemicals besides destroying asbestos, mold spores, and parasite eggs.

Green Dinosaur

one beet leaf, or one handful of watercress or spinach
½ grapefruit or 1 pear, peach, nectarine, ½ pineapple, several apricots or other fruit, including the seeds (choose one variety only); it should be completely ripe or cooked.
1 tbsp. honey

Don't use a rhubarb leaf or a non-edible! Beet leaves contain a lot of oxalic acid. One leaf is enough. Change variety often. Don't purchase greens at a health food store or any grocery where spraying is done on the display shelves.Give each item two hot washes although it will certainly wilt the greens, but it doesn't matter when making a drink.

Blend greens to make ¼ cup. Peel fruit. Add fruit and honey; blend again. Zappicate. Strain and save the pulp, or add enough water (plus HCl) to make it drinkable.

This beverage can draw aluminum, mercury, asbestos and copper out of the body in large amounts and into the urine. Drink a different one every day

Wheat Germ Tea

3 heaping tsp. wheat germ
1 cup water (plus 1 drop HCl)

Boil wheat germ in water for 1 minute. Strain. Drink hot or cold. Save solids to add to other cooked cereal. This beverage draws cobalt, aluminum and antimony into the urine. Drink only 1 cup a day.

Foods only need to be sonicated, food zapped or zappicated once, not each time you use them.

Straight Wheat Germ

3 heaping tsp. wheat germ

Eat it straight. Even toasted wheat germ draws cobalt, aluminum and antimony out of your body.

Phosphate Beverage

This is a clinical beverage, requiring supervision by a therapist. This pulls aluminum and mercury from your body into the urine. It can also lower blood calcium levels when it is dangerously high. Care must be taken not to lower the calcium too much.

18 gm dibasic sodium phosphate ($Na_2H\ PO_4$)
48 gm monobasic sodium phosphate ($NaH_2\ PO_4$)
100 ml water (this is 20 tsp. or a scant half cup)

The clinical dose found in a textbook is too high for our purpose. Use a small dose of ½ tsp. three times a day added to any beverage.

If you are especially prone to detox-illness, use 1 tsp. twice a day to speed up aluminum removal. Prions stay where the aluminum is. Do not take more without a physician’s supervision. Check blood calcium levels after one week. Switch to a non-clinical recipe as soon as the prion, aluminum, or high calcium crisis is over.

Baby-Coconut Juice

At a certain time of year the new coconut crop is in. The "meat" is soft and the "milk" plentiful. If you are lucky enough to be near a coconut bar where someone cracks and cleans them for you, eat two or three a week. They are full of germanium and selenium in organic form.

Blend the meat with the milk or with another juice variety. Drink the milk plain or made into eggnog. Add 1 drop hydrochloric acid to sanitize.

Coconut Whipping Cream

1 cup baby coconut meat (solids)
1 cup coconut "milk", or water (plus 1 drop HCl)

Blend until smooth. Spoon into refrigerator jar for use on cereal, pudding, fruit. If the consistency needs adjusting, add more solids or liquids.

Coconut Cream

1 cup coconut meat (solids)
2 cups coconut milk or water (plus 2 drops HCl)
½ tsp. spice (optional)

Blend until smooth. Pour into tall glass. Or use as a beverage base for any unpalatable supplement. Add supplement to blender, finishing with ½ tsp. nutmeg, cloves, turmeric or other spice.

Coconut Smoothie

2/3 cup shredded or flaked, sweetened coconut from a package
½ cup water (plus 1 drop HCl)

Zappicate entire package. Then blend coconut and water until smooth. Spoon onto cereal, desserts or homemade bread. Add more water or use more powerful blender for a drinkable beverage. This, too, will "cover" any unpalatable supplement when nutmeg or cloves are added as spices. Note: All brands of packaged coconut tested Negative for common pollutants.

Coconut Tea

½ cup shredded coconut or flakes
2 cups water (plus 2 drops HCl)
2 tsp. honey

Bring coconut and water to a boil, simmering 20 minutes. Press as much as possible through coarse sieve.

Zoom Juice

This beverage can give you too much energy. Drink during daytime.

1 tbsp. molasses, organic
1 tbsp. chlorophyll
1 tbsp. pomegranate juice or paste

Stir all into a tall glass of water. Add three drops HCl. Zappicate ingredients or the final product. Variations: Add coconut milk or goat milk instead of water. Add a pinch of citric acid. Add 1/8 tsp. watercress powder (see *Sources*).Many supplements can be hidden in this beverage. Pomegranate removes dyes from liver. Watercress powder destroys dyes even in your glass.

Mini Zoom Juice

1 tsp. molasses
1 tsp. chlorophyll

1 tsp. pomegranate juice or paste

Stir into one cup water (plus 1 drop HCl). Drink hot or cold.

Nopales Drink

1 small leaf of nopales (prickly pear cactus), sanitized with 1 drop HCl smeared with your finger
1 tsp. pomegranate paste or 1 cup pomegranate juice
1 tsp. molasses
1 tsp. nutmeg powder
3 drops HCl

Blend till smooth. Add more liquid till drinkable.

Now follows a number of dairy and egg recipes. Remember, you cannot eat dairy products the first two weeks, while on the *2-Week AIDS Program*. After that you can have only goat milk until you are well. Then you may eat other dairy foods—but only if zappicated 10 minutes.

About Eggs

Eggs, even raw eggs, are safe if you pull out the white ropey cord with a fork (this is the location of tissue bits of pituitary and hypothalamus), add 3 HCl drops per egg and zap or zappicate the rest. The presence of tissue bits suggests that hens are allergic to phloridzin and chlorogenic acid just as we are. But eggs have more problems: **malvin**, which causes seizures, and **gallic acid**, which triggers the SV 40 virus and inflames the pancreas. You can destroy these, too, if you zappicate 10 minutes or more.

When feeding a sick pet, a raw egg daily does wonders, while any number of cooked eggs does much less. Now that you know how to eat raw eggs safely, it would be great nutrition for you to eat one daily for two weeks! Be sure to add the HCl while stirring. It, too, "denatures" and destroys the live tissue bits. Drink only one daily of these super nutrition recipes to avoid becoming allergic to them. Longer periods of consumption might increase your demand on vitamin B_6—then take a 250 mg supplement daily.

Egg Nog
1 raw egg
1 cup goat milk
1 tbsp. honey
¼ tsp. nutmeg powder (freshly ground)

Coconut Egg Nog
1 raw egg
1 cup coconut "milk"
¼ tsp. nutmeg powder
1 tbsp. Agave syrup

Cream Shake
½ cup heavy whipping cream from a Natural Food Store
1 raw egg
1 tbsp. honey
¼ tsp. nutmeg
water to make 1 cup

Egg Nog Cream Shake
1 egg yolk
1 cup half & half, organic
¼ tsp. nutmeg
1 tbsp. honey

Remove the white ropey part of egg. Blend each recipe. Zappicate 10 minutes or more. Add 3 drops HCl to each. The nutmeg destroys tyramine and *Bacillus cereus* bacteria in the dairy product and in you!

About Milk

Dairy products always carry a bacterium, *Bacillus cereus*, in spite of pasteurizing. This variety of bacteria makes tyramine a special "phenolic" **that causes many other allergies to develop**. The bacteria are easily killed with nutmeg; then the tyramine disappears too. Boiled and ultra pasteurized milk does not have them. The presence of these bacteria implies Fasciolopsis parasitism, as we had already seen.

Cows, too, suffer from phloridzin and chlorogenic acid phenolics…unless it is an "old fashioned" cow being raised by traditional standards in South Mexico or on an Amish farm. These had no phenolic antigens or free roaming tissue bits.

Red Milk

1 small raw red beet, peeled
1 cup goat milk
1 Fenu-Thyme capsule

Blend the beet until drinkable or strain and use juice. Add milk and spice (plus 3 drops of HCl); then blend again. Variations: 1 turmeric capsule instead of Fenu-Thyme; use coconut milk instead of goat milk. Raw beet juice can destroy many food phenolic chemicals, including phenol itself. Taken as a relish or juice

with meals, it is a great help to the liver. Maybe that is why it is known as a liver tonic. Red beets can raise the red blood cell count, too. Nevertheless, do not overdo the amount of raw beet. A moderate amount is 1 tbsp. per meal.

Beet Popsicles

red beets, peeled and cubed

Freeze some raw beet in small plastic relish containers with lids. Cook the rest and freeze these, too. Serve one portion with each meal. Variations: serve with a tbsp. homemade horseradish sauce; use a sour cream recipe or Mom's Mayo to mix with fresh grated horseradish for the sauce.

C-Milk

Cold milk can absorb a surprising amount of vitamin C powder without curdling or changing its flavor. Try ½ tsp. in a glass of cold goat milk.

Buttermilk-C

Stir 1½ tsp. vitamin C powder into a glass of goat milk, more if it won't develop flakes. Add a pinch of sodium-potassium salt (see *Sources*). Additional seasoning may be herbs or a Fenu-Thyme capsule. Stir and zappicate. If it does not form flakes readily, try a brand that is not ultra pasteurized. Also try adding a pinch of citric acid.

Raw Certified Milk

You may be lucky enough to find this at your health food store. Raw milk has a special factor, lactoferrin. This factor is missing from the liver, spleen and bone marrow in cases of anemia and cancer. One glass of raw milk replenishes it for over a week!

Zappicate 10 minutes to destroy tissue bits of pituitary and hypothalamus as well as phenolic allergens. Add HCl too.

Ice Creams

from the grocery store are loaded with benzene and other solvents. Fortunately there are ice cream makers that do everything (no cranking)! Or try our recipe that uses a blender. Be sure not to add store bought flavors. Use all the essential oils or herb powders discussed in this book. It is your spice "cup-board" for cooking and baking. Zappicate everything.

5-Minute Strawberry Ice Cream

2 half-pints of heavy whipping cream zappicated in the carton for 10 minutes, chilled and HCl-ed.
1 package of frozen zappicated strawberries, about 10 oz.
½ cup zappicated clover honey.

Dump frozen strawberries into blender. Pour whipping cream and honey over them. Blend briefly, (about 10 seconds), not long enough to make butter! Pour it all quickly into a large plastic bowl. Cover with a close fitting plastic bag and place in freezer. Prepare it a day ahead. Try using other frozen fruits, such as blueberries and peaches. Freeze them yourself, fresh from a Farmer's Market. Keep a few berries out of the blender and stir them in quickly with a non-metal spoon before setting the bowl in the freezer. There are many ice cream recipes to be found in old cookbooks. Avoid those with processed foods as ingredients. You may add nuts if you zappicate them or shell them yourself.

Pear Slush

If you miss frozen desserts, learn to make a fruit slush in 5 minutes. Keep a variety in your freezer.

1 large pear
1 tbsp. agave syrup
1 tbsp. water

Double hot wash the pear. Peel and cut away the stem and flower end, leaving no blemishes. Place in blender with syrup and water, seeds and all (pear seeds are powerful virus killers). Scoop into serving size plastic ware and freeze. Serve frozen. Variations: add topping of *Coconut Whipping Cream*.

Coconut Slush

A few wedges of "baby" coconut
1 cup pomegranate juice
1 tsp. molasses
5 drops HCl

Grind in blender till smooth. Pour into freezable containers. Variations: When serving, pour 1 tsp. honey on top.

Complete Meal Drinks

When a meal is missed, weight is lost and the body is stressed. If you are a caregiver and your patient is refusing food, and cannot be given IV-feeding for whatever reason, you can make a drinkable replacer meal that will protect their life and health temporarily. Coax your patient to try at least one of these "total meal" drinks.

EZ Meal	**EZ Dairy Meal**
1 egg	1 egg
1 tbsp. oil (see safe oils)	1 tbsp. safe oil
1 tbsp. honey	1 tbsp. honey
¼ tsp. nutmeg (freshly ground)	¼ tsp. nutmeg (freshly ground)
sodium-potassium salt (to taste)	sodium-potassium salt (to taste)
water to make 1 cup total	goat milk to make 1 cup total
CALORIES = 255	CALORIES = 345

Mini Flax Oil EZ Meal	**Flax Oil EZ Meal**
1 egg	1 egg
1 tsp. flaxseed oil	1 tsp. flaxseed oil
1 tbsp. honey	2 tsp. oil, safe variety
¼ tsp. nutmeg (freshly ground)	½ cup coconut whipping cream (100 ml = 250 calories)
¼ tsp. cloves	
½ cup coconut milk	1 tbsp. honey
	¼ tsp. nutmeg (freshly ground)
	water to make 1 cup (optional)
CALORIES = 210	CALORIES = 550

Remove stringy part of egg white. Add 3 drops HCl (5%), mixing thoroughly with plastic fork or blender. Add remaining ingredients and blend or mix with a plastic fork. Zappicate for 10 minutes.

For a change of flavor add cardamom, coriander, licorice powder, ½ tsp. grated lemon peel, but keep the nutmeg. Also try Agave syrup, different kinds of

honey or Mexican sugar.

A sick person needs 2000 calories a day to recover, 2500 is better.

The basic recipe combines a protein (egg), a natural fat (cream, oil) and natural carbohydrate (honey, syrup). You may design your own variations.

Sweet or Salty

All granulated forms of all sugar varieties I purchased at USA grocery stores or health food stores had asbestos fibers in them! The organic and Mexican varieties shown did not. Sucrose purchased from a chemical supply company also did not. All honey had asbestos fibers except locally produced or Canadian honeys. Electrical treatment (all three kinds) destroys asbestos; it also kills sorghum mold that is present in all sweeteners tested so far. Simple boiling kills mold too.

Sorghum mold is a fungus that grows in many of our organs; it gives us tiny red "blood blisters" and I believe it is responsible for strokes in the elderly. Because it is dangerous and yet so common, it is constantly zapped while plate-zapping.

Ordinary granulated sugar in Mexico is not over-refined to a glistening white color. It has not developed D-mannitol, an antigen, and it does not have asbestos.

Because most maple syrups have gallic acid, the trigger for SV 40 virus, it must be brought to a boil to destroy it.

Dextrose is the familiar "icing" or "confectioner’s sugar". It is especially good for liver disease. When ordered from a manufacturer it had no asbestos (see *Sources*).

Agave syrup is especially free of allergens. Nevertheless, rotate the safe sweeteners so you do not get allergic to any one.

Organic sugar from Paraguay, maple syrup, locally produced honey, sucrose, agave syrup, dark Karo syrup, two Mexican sugars, and dextrose.

Fig. 137 Safe sweetening

Plain Salt

Use pure salt only (see *Sources*), like for laboratory use. Grocery store salt and sea salt as well as other kinds of salt have processing contaminants, not to mention aluminum additives, and often have *Ascaris* eggs and mold.

Two To One Sodium-Potassium Salt

2 cups pure salt
1 cup potassium chloride

Mix. Store in tightly closed glass jar with rice added to absorb moisture. Label. Use in a saltshaker without a metal lid. If you don't mind the taste, a one-to-one mixture is even more beneficial.

B-C Salt

This is the easy way to get vitamin B2 and vitamin C into all your food:

½ cup pure salt or sodium-potassium salt
1 capsule vitamin B2
½ tsp. vitamin C (ascorbic acid) powder (also try 1 tsp.)

Shake together in closed jar. Zappicate. Pour into closeable non-metal

saltshaker. When using this salt in cooking, wait until the end to add it, to preserve its vitamin power.

Spreads

Butter

Although it comes from cow’s milk, it does not have the tissue bits of pituitary and hypothalamus glands that the milk itself and cheeses have. Unfortunately, most butter is spiced—even when labeled organic. The spice includes "onion", favorite food of Fasciolopsis. But boiling destroys it, so I recommend boiling and, later, zappicating to destroy traces of dyes.

Real Butter

1 pint whipping cream
¼ tsp. watercress powder or freshly made watercress juice
8 drops HCl

Put all ingredients into a plastic container or a glass jar with enough empty space left to shake well.

Shake for 5 minutes. Soon the cream feels "thick". It gets thicker and thicker until suddenly it all separates into butter and buttermilk. Keep shaking till a solid ball of butter is formed. Pour off the buttermilk. Don’t consume this. Throw it out. It contains the dyes, asbestos and heavy metals that may have been in the cream.

Wash the butter pellet with 4 changes of very cold water or until the water remains clear. Finally, sculpt and display your butter on a serving plate or mash it into a regular butter dish. Zappicate and refrigerate. Makes about ¼ pound.

Coconut Butter

10 oz. coconut oil
2 oz. olive oil
½ capsule riboflavin (vitamin B2)
1/8 tsp. pure salt or sodium-potassium salt (to taste)

If coconut oil is solidified, melt it first by warming. Then add oils together in jar. Shake the two oils until uniformly mixed. Add riboflavin and salt. Shake again. Pour into mold or butter dish. Refrigerate. Remove from mold with hot

water.

Note about colors: coenzyme Q10 gives a butter-yellow color. Riboflavin gives lemon-yellow color. Turmeric is another safe yellow colorant. Zappicate all.

Peanut Butter

Use fresh unsalted roasted peanuts—they will be white on the first day they arrive at the health food store from the distributor. (Ask when they will arrive.) Or shell fresh roasted peanuts yourself, throwing away all shriveled or darkened nuts. Grind, adding salt and vitamin C (¼ tsp. per pint) as you go. Take your own saltshaker with built in vitamin C to the health food store where you grind it. For spreadability, especially for children, mix an equal volume of cold butter, homemade, or safe oil to freshly ground peanut butter. This improves spreadability and digestibility of the hard nut particles. This will probably be the most heavenly peanut butter your mouth has ever experienced. Zappicate when finished.

Fig. 138 Light-colored, roasted peanuts had no aflatoxin

A store bought variety should be natural, not partly hydrogenated. Before putting it in the refrigerator, turn it upside down for a day or so to let the oil mix with it. Zappicate the whole jar or add a pinch of vitamin C, vitamin B2, and several drops of HCl after opening.

Marmalade

2½ cups water
2½ quarts whole oranges
2 whole grapefruits
1 lemon
5 to 6 cups (according to your taste) safe granulated sugar

½ tsp. vitamin C

Boil water. Add oranges, grapefruits and lemon that have been double hot-washed, and put through a food processor until coarsely chopped. Bring to a boil; then cook on low heat, uncovered, about 35 minutes. Stir with wooden spoon occasionally and pick out any seeds that rise to the surface. Stir in sugar, again bringing to a boil. Simmer an additional 20 minutes. Stir in vitamin C. Ladle into sterilized glass jars. Cover with plastic lids (see *Sources*). Zappicate each jar when cool.

There are many uses for marmalade besides being good on homemade bread and butter. Try on homemade ice cream.

Preserves are easily made in minutes

1 cup fruit
1 tbsp. water
sweetening

Soak fruit twice for one minute in very hot water to remove dye, asbestos and malonic acid from spray. Peel if possible. Heat to boiling in water, stirring with wooden spoon. When done, add half as much sweetening as there is fruit and bring to boil again. Cool. Zappicate.

Fruit is often unevenly ripened. This changes its nature. I suspect this is the reason that bad chemicals like phloridzin and chlorogenic acid appear in them. Save such fruit for cooking, as in jams or marmalade because this destroys these phenolics.

Dressings

C-Dressing

½ cup safe oil
¼ cup fresh lemon juice
1 tsp. thyme, fenugreek or both. Capsules are freshest. The combination is available as Fenu-Thyme (see Sources). Use 2 capsules.
1 tsp. vitamin C powder
½ tsp. honey

Combine the ingredients in a well-rinsed salad dressing bottle. Shake. Zappicate. Refrigerate. The basic recipe is the oil and lemon juice in a 2:1 ratio.

After mixing these, add any pure spice desired.

This dressing is especially good in wintertime to protect you from colds. As little as 1 capsule a day of Fenu-Thyme alone, is quite effective, too.

Mom's Mayo

¾ cup olive oil or other safe oil
1 egg (zappicated and 3 drops HCl added)
¾ tsp. salt (pure sodium chloride or sodium-potassium mixture)

1 tsp. sugar (safe variety)
juice from 1 small lemon

Put egg, lemon juice, salt and sugar in blender. Begin blending. Add the oil slowly, while blending, so you can make your favorite consistency. Makes 1 cup.

Tomato Sauce

Use garden grown tomatoes that have not been sprayed. Only your own garden could be trusted. You will not need the double hot wash. But you do need to zappicate for food phenolics and plain bacteria.

Peel and bring to a boil with just enough water added to keep it liquid. Use non-metal utensils. Add pure salt.

Sour Cream-C

2 cups heavy whipping cream (cow, goat or coconut)
¼ tsp. citric acid
¼ tsp. vitamin C powder
pinch of pure salt

Stir until smooth. Zappicate. Refrigerate two hours before serving.

Main Foods

Use simple recipes from old cookbooks. Bake cookies, cakes and pies from scratch, using unprocessed ingredients. Do not use paper cupcake cups, the wax coating has benzene. Use aluminum-free baking powder (see *Sources*). Zappicate everything. Do not use aluminum baking pans, bowls, measuring

spoons, or foil wrapping.

Fig. 139 Use aluminum-free baking powder

Granola

6 cups rolled oats
½ cup raw wheat germ (toasted is second best)
1 cup sesame seeds
1 cup sunflower seeds (raw, unsalted)
1 tsp. cinnamon
½ cup homemade butter
½ cup honey

Fig. 140 Mexican oats are free of asbestos

Preheat oven to 250°. Toss all ingredients in mixing bowl. Spread thinly on a baking sheet and bake 20-25 minutes. Stir often in order to brown evenly. When golden, remove and let cool. Makes 12 cups. Zappicate each item first or when it’s done. You may add raisins and nuts if zappicated.

Jump Start Cereal
¼ cup wheat germ
1/8 cup pomegranate paste or molasses

Zappicate all items first. Add goat milk, coconut milk or plain water to your serving.

Yogurt

Buy a yogurt maker. Use plain yogurt as starter. Then use your own for the next batch so you stop getting apiol into it. Only pasteurized, not ultra pasteurized goat milk works quickly. When done add fresh blueberries, strawberries, or peaches all double hot-washed. Then zappicate and add HCl, 3 drops per cup.

Goat Cheese

If you were a cheese lover, you would enjoy getting it back on your menu by making it yourself. Make cottage cheese from 2 quarts of goat milk according to an old recipe. But add a tsp. of regular Blue Cheese before it all turns into curds. You can get addicted to this, so restrict yourself to alternate days. Add 3 drops HCl per cup to final product and zappicate.

Cottage Cheese "Zuppe"

Drop a carton of cottage cheese into a saucepan and cover with goat milk or cream. Add salt and any other herbs. Stir and boil for 20 seconds. When cool zappicate and add hydrochloric acid (3 drops per cup).

Fast Food Cottage Cheese

Zappicate a carton of cottage cheese for 10 minutes. Zappicate the honey dispenser and heat till flowing. Add ¼ tsp. nutmeg and 10 drops HCl to the cottage cheese, stirring it in and leaving a hole in the middle. Pour in honey. For a change, add ¼ tsp. grated lemon peel, too, or the pulp from a whole lemon or other strained beverage.

Fish & Seafood Recipes

Since all varieties of fish and seafood had Fast Garnet dye and "shrimp" antigen (the cause of lymphoma and lymph node metastases) these recipes have been omitted.

Beans, Dried Peas, Lentils & Rice

These foods have hard centers even after regular cooking. *Shigella* bacteria and *Ascaris* eggs survive there.

Nearly all samples from a supermarket or health food store also had asbestos fibers. Maybe they had been "washed", besides, since most had PCB, benzene and dye contamination. Two hot water washes does not completely clean them, but electrical treatment after hot washes did remove it all and kill all live pests.

After this, use your favorite recipe.

Meats

A big advantage has been gained from electrical treatments. All parasite eggs and stages can be killed quickly and to any depth, by any one of the three methods. You can now cook, bake, poach, or fry them the usual way. Do not grill.

Bone Marrow-Beef Broth

3 or 4 beef bones, cut to expose the bone marrow
½ lb. of a cheaper cut of beef, including sinews, gristle, cartilage

1 bay leaf
sodium-potassium salt (to taste)
5 drops HCl (5%, USP)

Place bones and meat in original package in sonicator, on food zapper or zappicator for five minutes. Place meat in large enamel pot. Save bones for later addition. Cover with cold water. Add 5 drops HCl. This will preserve the natural L-G and L-A in the meat. Bring to boil. Remove and discard foam that develops at first during cooking, using wooden spoon.

Add other ingredients and cook till done (about 1 hour). Add bones and cook five minutes more. Add 5 more drops of HCl. Cool. Eat some bone marrow as soon as cool enough. Pour off the broth. Drink one cup a day. Refrigerate. If fat solidifies at the top, do not throw this away. It belongs with the broth. Reheat it daily so it can be mixed.

Variations: Add a homegrown tomato instead of HCl.

Vegeables And Fruits

Most are sprayed with combinations of wax, dye, pesticide, antisprouter, antimold, etc. Azo dyes (Fast Green and Fast Garnet) are present in most sprays as are lanthanide metals. They penetrate the food deeply. But double soaking in hot water for one minute removes it. Even organic bananas, pears, plums and grapefruit must be double soaked this way. Peeling is not sufficient.

Then zappicate them to destroy food phenolic chemicals, parasite filth and leftover traces of sprays. Always zappicate the final product unless you know each item has already been treated.

Parasite Killer Recipes

Spice Syrup

These are essential oils made from traditional herbs. The herbs have been used for centuries to prevent illness associated with food—and are used to this day, in less developed countries, hence their use as spices. By combining them we get an antiparasite, antibacterial, even antiviral effect. All of these invaders enter us with food, and can be conquered with food, namely spices.

1 tsp. peppermint oil	1 tsp. coriander oil
1 tsp. clove oil	1 tsp. nutmeg oil
½ tsp. white thyme oil	1 tsp. fennel oil

½ cup maple syrup, boiled

Mix in glass bottle with enough room to shake. SHAKE VERY WELL before use to prevent separation of oil. If you don't, the bottom portion will not have potency.

The dose is ¼ tsp. 2 times daily. Measure accurately. Do not mix with water. Tip the spoon at the back of tongue and swallow quickly. Chase with a bit of bread until you are used to it. For children: 1/8 tsp. once a day.

General Spice Syrup Recipe

(This is not a single recipe; it is the design for all spice syrups, to make them strong enough but not toxic.)

1 tsp. of any mild-flavored spice oil OR
½ tsp. strong-flavored spice oil, such as wintergreen, white thyme, frankincense,

myrrh
2 to 4 tbsp. pomegranate paste or juice, molasses or chlorophyll
½ cup maple syrup, agave, oil, or honey

Choose up to 8 spice oils to combine with other ingredients and syrup. A final dose of ¼ tsp. will give you 1 drop of each mild spice and ½ drop of each strong spice. Do not use more than that three times per day. Too much of any one oil could be toxic.

Choose the herbs to suit your needs. Then measure the correct amounts into a pint jar. Add syrup and shake.

Maple syrup must be brought to a boil first and cooled. You may use agave syrup instead of maple syrup, but add 1 tbsp. water too, to help it mix. You may use an oil instead of syrup as the base. If you use honey instead of syrup you may also need 1 tbsp. water to help it mix.

Spice Tea

1 tsp. whole cloves
1 tsp. whole barley
1 tsp. coriander seed
1 tsp. anise, ground
1 tsp. cardamom, ground
1 tsp. turmeric powder
1 tsp. fennel seed, ground
¾ tsp. nutmeg, ground
2½ cups water

Add all ingredients to water in a non-metal saucepan and simmer 20 minutes. Strain one cupful through plastic strainer and return the solids to the saucepan; refrigerate.

Add a safe sweetening to the cup of tea. Sip over 1 to 2 hours. This is one day's portion. Do not drink more than 1 cup daily. Next day, strain another cupful and sip as before, hot or cold.

Next day, add a cup of water to the saucepan and reboil for 5 minutes to yield a third cup of tea. Finally, you may eat the solids, one-half portion in one day.

This tea replaces the same spices taken as spice syrup. You may add other spices or hide supplements in this tea. This tea kills a variety of parasites, bacteria and viruses. It can also activate the liver to produce a green bowel movement. Even "gallstones" may appear.

Prion Punch

Prion protein is in all of us repeatedly as our bodies kill flu viruses. Our WBCs eat them promptly. But if a lot of flu virus emerges after killing large flukes and many make their way to the brain, they release their own prions and light-headedness and disorientation is felt. That contributes to detox-illness. You can kill them in hours with:

2 horseradish capsules
1 tsp. fennel seed (freshly ground)
1 tsp. sage (freshly ground)
3 heaping tsp. birch bark (powdered)
1 tbsp. syrup

Make birch bark tea by simmering in 3 cups water for 1 minute. Cool. Blend dry ingredients in the birch bark tea and syrup. Drink 1 to 3 cups a day to stop detox-illness.

Electronic Pau D'Arco Tea

1 tsp. Pau D'Arco powder
½ cup cold tap water

Place both in a cup on bottle-copying plate. Attach the Positive lead (wire) from a regular zapper to the copy plate. Zap 20 seconds. Sip the water throughout the day to kill Paragonimus. You can strain out the Pau D'Arco if you wish.

Paragonimus Punch

By killing Paragonimus in different ways you reach them in different places. Note how vulnerable they are. You do not need all of these. Each herb kills some.

1 tsp. hydrangea powder
1 tsp. cloves (freshly ground)
1 tsp. nutmeg powder
7 capsules wormwood (200-300 mg per capsule)
3 drops wintergreen oil
3 drops sage oil, Clary
3 drops peppermint oil
3 drops juniper oil

3 drops frankincense
3 drops coriander oil
3 drops cardamom oil
1 tbsp. pomegranate paste or 3 tbsp. juice
1 tbsp. chlorophyll liquid
6 oz. tea made from Pau d' Arco bark
6 oz. tea made from mullein leaf

Place the powders in a tall glass. Add the drops of herbal oils. Then add the liquids, while stirring, to make an enjoyable oils. Then add the liquids, while stirring, to make an enjoyable beverage. Add coconut cream to give a smoother taste. If it is not sweet enough, add agave syrup, honey or boiled maple syrup. Treat each item electronically or the final beverage.

All oils can be substituted with 1 tsp. powder of the same herb.

If you are missing some ingredients, simply leave them out. Add them later when you do have them.

Drink this once a day in divided doses while on this program. Then cut the dosages in half and later in quarters when you are much healthier. Leave out anything you don't tolerate well.

Pau D'Arco has several other names, including Lapacho and Taheebo. Use regular or electronic tea.

If some of these herbs are already being taken in the Spice Syrup, omit them here.

Buski Tea

1 tsp. anise seeds
1 tsp. fennel seeds
1 tsp. coriander seeds
1 tsp. whole cloves
1 tbsp. barley, whole
1 tsp. nutmeg
3 cups water

Combine all ingredients except nutmeg in saucepan. Add water and bring to boil. Simmer 20 minutes. Let stand to cool. Strain 1 cup to drink; put back the solids. Add ½ tsp. nutmeg. Sweeten with any of: pomegranate, molasses, honey, or boiled maple syrup. Later, reheat for second cup, pressing the solids in

strainer with non-metal spoon. Add nutmeg and sweetener as before. This tea reaches leftover Fasciolopsis in "unreachable" places so protect yourself from detox-illness.

Zappicate each cup 10 minutes for extra potency.

Six Fresh Seeds

6 large prunes OR 6 large apricots OR 6 large apples OR
6 large pears OR 6 peaches or nectarines

After two hot washes, remove the pits or seeds, saving the fruit for other uses.

To crack open pits: find a rock or piece of cement brick. Slide it into a zippered baggie. Position it in your sink over the drain. Or, if you are near a cement sidewalk, slip the 6 pits into a zippered plastic bag. Procure a hammer. After cracking the pits, remove the seeds and place in grinder. If you are very sick choose seeds the size of your thumbnail. In the case of apple or pear seeds, use up to 30 seeds. Add:

3 tsp. wheat germ
¼ tsp. nutmeg
¼ tsp. barley flour or ground barley

Grind 1 tbsp. whole barley first in coffee grinder and store. Then grind all ingredients together. Eat within a few hours. The barley, like the wheat germ, provides the drying effect that keeps fresh seeds from clogging the grinder. Variation: add 1 tsp. sweetened coconut, flakes or shredded.

It is thought that amygdalin or "laetrile" is the active ingredient, but there is no evidence for this since clinical trials got stalled decades ago after finding it promising against cancer. Amygdalin keeps its potency; the active ingredient we seek does not.

Apricot kernels in health food stores have lost their potency, in spite of refrigeration, so you must prepare your own. Do not crack these pits ahead of time nor store seeds, although you may store pits. The Syncrometer® finds that the active ingredient is already a part of our metabolism, somewhat like a vitamin, and in similarly small amounts. Sick organs have none. The correct amount is essential for us but large amounts are toxic, somewhat like trace elements. Do not take more. Six Fresh Seedscan kill SV 40 and Fasciolopsis buski, as well as destroying many phenolics. The dose is one set of 6 kernels or

the seeds of six fruits daily for 6 days, then take 6 days off and repeat the cycle till you are much better.

Black Walnut Hull Tincture

This recipe is 4 times as strong as the original one, so it is called **Black Walnut Hull Tincture, Extra Strength**.

Your largest enamel or ceramic (not stainless steel, not aluminum) cooking pot, preferably at least 10 quarts

Black Walnuts, in the hull, each one still at least 50% green, enough to fill the pot to the top

Grain alcohol, about 50% strength, enough to cover the walnuts

Vitamin C powder
Plastic wrap or cellophane
Glass jars or bottles

The Black Walnut tree produces large green balls in fall. The walnut is inside, but we will use the whole ball, uncracked, since the active ingredient is in the green outer hull.

Rinse the walnuts carefully, put them in the pot, and cover with the alcohol. Sprinkle on 1 tsp. vitamin C. Seal with plastic wrap and cover tightly. Let set for three days. Pour into glass jars or bottles, discarding walnuts, and add more vitamin C (1 tsp. per quart). This will keep the color green. If the glass jar has a metal lid, put plastic wrap over the top before screwing on the lid. Potency is strong for several years if unopened, even if it darkens slightly. Refrigerate after opening.

When preparing the walnuts, rinse only with cold tap water. You may need to use a brush on areas with dirt. If you are not going to use all of them in this batch, you may freeze them in a zippered plastic bag. Simply refrigerating them does not keep them from turning black and useless. The pot of soaking walnuts should not be refrigerated. Nor does the final tincture need refrigeration until after it is opened.

You have just made Extra Strength Black Walnut Hull tincture. It is

stronger than the tincture made with just a few Black Walnuts in a quart jar (my earlier recipe), because there are more walnuts per unit liquid. In addition, you will not dilute it before use (although when you take it, it will usually be in water).

Exposure to air does cause the tincture to darken and lose potency. To reduce air exposure, fill the pot as much as possible, without touching the plastic wrap, while still keeping a snug fitting lid. Even more importantly, the glass jars or bottles you use to store your tincture should have as little air space as possible, without touching the plastic wrap on top. A large jar should be divided into smaller ones when you are ready to use it. The idea is not to have partial jars, with a lot of air space, sitting for longer than a month or so. To regain some green color, add several tsp. vitamin C, close jar tightly, and let stand one day.

There are several ways to make a 50% grain alcohol solution. Some states have Everclear™, 95% alcohol. Mix this half and half with water. Other states have Everclear™, that is 76.5% alcohol. Mix this two parts Everclear™, to one part water. Do not use vodka or the flask-size Everclear™; it must be 750 ml or 1liter. Smaller bottles have wood alcohol or isopropyl alcohol pollution. In all cases, zappicate the alcohol first.

Remember, never use any kind of <u>purchased</u> water to make tincture or you will pollute it yourself.

Black Walnut Hull Tincture (Regular Strength)

This is the potency I used originally. It is included here in case you prefer it or wish to treat a pet.

Fill a quart jar with the green balls. Cover with 50% alcohol. Add 1 tsp. vitamin C. Use a plastic bag to cover jar before closing tightly with lid. Let stand on kitchen counter. After three days, pour liquid into small glass bottles. Add another ¼ tsp. vitamin C powder to the top of each before closing

Black Walnut Hull Extract (Water Based)

This recipe is intended for alcoholic persons: cover the green balls in the 10-quart (non-metal) pot with cold tap water. Heat to boiling, covered. Turn off heat. When cool, add vitamin C, cover with plastic wrap, and the lid. Let stand for one day. It will be darker than the tincture. Do not dilute. Pour into freezable containers. Refrigerate what you will use in two days and freeze the rest. Add

vitamin C after thawing or during refrigeration (1 tsp. per quart).

For use: in programs calling for Extra Strength Black Walnut Hull tincture use 4 times as much of this water based recipe (8 tsp. instead of 2 tsp. Extra Strength).

Important Note: do not use bottled or purchased water to make either the tincture or extract or you could pollute it with benzene or isopropyl alcohol.

Lugol's Iodine Solution

It is too dangerous to buy a commercially prepared solution for your internal use. It is certain to be polluted with isopropyl alcohol or wood alcohol. Make it yourself or ask your pharmacist to make (not order) it for you. You cannot take this for granted; you must ask. The recipe to make 1 liter (quart) is:

44 gm (1½ ounces) iodine, granular, USP
88 gm (3 ounces) potassium iodide, granular, USP

Dissolve the potassium iodide in about a cup of water in a glass jar. Then add the iodine crystals and wait till they are all dissolved. This could take a ½ hour with frequent shaking. Then fill to the liter mark (quart) with water. Keep out of sight and reach of children. Be careful to avoid bottled water for preparation or you may pollute it yourself with isopropyl alcohol! Place a plastic bag over the top; then close tightly before storing.

Pour carefully into a plastic cup before pouring into a dropper bottle. Do everything inside the kitchen sink. Wipe stains up promptly with vitamin C.

Lugol's Iodine Drops

6 drops Lugol's iodine solution
½ glass water

This is specific for Salmonella in your body. It can be taken at any time. If taken at end of meals, it helps to sterilize the food just eaten so gives you double benefit. Do not use if allergic to iodine. (If you have had clinical treatment with iodine, such as a thyroid or kidney scan, you might have become allergic; ask your doctor in this case.) Do not add it to other beverages. Do not take throughout (except in restaurants) or before meals or with vitamins since these will become over oxidized. Do not use daily as a supplement. Keep out of reach of children. If the problem has not cleared up in two days, you are reinfecting.

Lugol’s gives the fastest relief for most food-related stomach distress; it takes about one hour.

White Iodine

88 gm (3 ounces) potassium iodide, granular, USP

Add potassium iodide to one quart/liter cold tap water. Potassium iodide dissolves well in water and stays clear; for this reason it is called "white iodine." Label clearly and keep out of reach of children. Do not use if allergic to iodine. It is useful for disinfecting the mouth but it is not as strong as Lugol’s.

Benzoquinone (BQ) (for clinical use only)

- 500 mg benzoquinone powder (not hydroquinone). (One size 00 capsule filled with powder, by hand.)
- 500 ml (1 pint) cold tap water that has been run for a full minute. Such water is safer than the regular water "for injection" since water for injection often has antiseptic contamination.

This should be made and supervised by a physician. Empty the BQ capsule into water, stirring with a plastic spoon until completely dissolved (about one minute). Further dilute this as follows: 1/2 ml BQ solution as prepared above is added to a second pint of water. All quantities can be approximated, since the final concentration should be one part per million but need not be exact. After the second dilution, the BQ solution must be used within 20 minutes. If there is further delay, the solution must be made up from the powder again. A dose of one cc (2 cc for persons over 100 lb.) is given in the muscle (IM) in the hip after cleaning skin with ethyl alcohol. This is 1 mcg. Give the shot slowly to reduce burning. Patients may exclaim over their improvement by the time the needle is out.

The BQ solution is thrown out when it is 20 minutes old. All containers are new glassware and to be used only for this purpose. Before first use, it is rinsed with tap water to remove any adhering antiseptic. It is only rinsed and drained after that—never chemically cleaned or brushed.

Bowel Improvement Recipes

Bacteria are always at the root of bowel problems, such as pain, bloating and

gassiness. They cannot be completely killed by zapping, because the high frequency current does not penetrate the bowel contents.

Although most bowel bacteria are beneficial, the ones that are not, like Salmonellas, Shigellas, and Clostridiums are extremely harmful because they have the ability to invade the rest of your body and colonize a trauma site like the thymus or a tumor. One reason bowel bacteria are so hard to eradicate is that we are constantly reinfecting ourselves by keeping a supply on our hands and under our fingernails.

1. So the first thing to do is **improve sanitation**. Use 70% (approx.) grain alcohol in a spray bottle at the bathroom sink. Or Lugol's iodine, one drop per cup water for dipping hands. Sterilize your hands after bathroom use and before meals in one of these two ways.

2. Second, take **Lugol's** solution, six drops in ½ cup water 4 times daily. This is specifically for Salmonella, which is responsible for at least half of all bowel distress.

3. Third, use **turmeric** (2 capsules, 3 times daily). This is the common spice, which I find helps against Shigella, as well as *E. coli*. Expect orange colored stool. Increase to 6 capsules (1 tsp.), 3 times daily for serious problems.

4. Fourth, use **fennel** (same dosage as for turmeric). Take turmeric and fennel together for fastest relief. Use your ingenuity to make a good tasting "cocktail" out of these herbs.

5. Fifth, take four **digestive enzyme** capsules all together, any variety.

6. Sixth, take 1 tsp. tincture or 2 capsules freeze-dried **Black Walnut**, preferably at bedtime.

7. Seventh, <u>if you are constipated</u>, take **Cascara sagrada**, an herb. Start with one capsule a day, use up to maximum on label. Take **extra magnesium** (300 mg magnesium oxide powder, two or three a day), and drink a **cup of hot water** (flavored is fine) upon rising in the morning. This will begin to regulate your elimination. Constipation is usually caused by *Clostridium botulinum*, which makes its own chemicals in your colon that inhibit acetylcholine formation. Acetylcholine is the normal driving force for intestinal movement. Use **betaine** hydrochloride capsules, three with each meal, to keep Clostridium out of your colon. Constipation can also be caused by other bowel bacteria. Certain drugs, such as morphine or similar painkillers produce constipation as a side effect. You must work hard to be sure you expel bowel contents at least once a

day.

With this powerful approach, even a bad bacterial problem should clear up in two days. If it doesn't, you are reinfecting. Throw out all the food in your refrigerator. It has been touched by hands. Keep your own hands sanitary. Eat only sterilized food. Keep fingernails short. Do not put fingers in mouth. Your tummy can feel flat, without gurgling, and your mood can be good. Remember, HIV or AIDS is not the cause of your bowel problems. You ate polluted food.

It may take all the remedies listed. Afterwards, you must continue to eat only sterilized food, until your natural immune power is restored. This means, zappicate all your foods, don't drink out of plastic bottles, and put HCl drops in all your food.

Constipation Tea

Constipation is most often caused by *E. coli* and Salmonella eaten with dairy foods. When these bacteria are added to the Clostridium already there, the problem is worsened. Make sure you are taking up to 3 capsules betaine with each meal.

There are a lot of remedies for constipation , but many people enjoy this tea:

1 tbs. senna tea leaves
½ tsp. mint leaves

Boil for one minute in a quart of water; add a dash of vitamin C and sweetener to taste. Sip through the day to avoid "belly-ache". If you purchase tea bags, zappicate them first, then snip open and throw away the bag. Use a natural tea ball.

Moose Elm Drink—also known as—**Slippery Elm**

For sensitive stomachs when nothing wants to stay down:

1 tbsp. moose elm powder (also called slippery elm)
1 cup cold goat milk (or other liquid)
honey

Start by making a paste of the powder and a tiny bit of goat milk as if it were cocoa. Gradually add more milk to consistency desired. Sweeten with honey. Zappicate. This can be drunk hot or cold. Sip one cup a day. Before you are allowed to have goat milk choose coconut cream or water for mixing.

Alginate/Intestinal Healer

¼ tsp. sodium alginate powder
1 cup water

Boil together, stirring with wooden spoon handle. Simmer till dissolved. Add to soup, stew, moose elm drink, pudding or pie filling. For intestines or stomach that are sore from surgery or cancer. Alginate is not digested—it merely forms a long ribbon of soothing gel that coats trouble spots and finds its way through the narrowest passageway to keep it open. Use 1 cup a day.

Enemas

If you should fail to have a bowel movement in a single day it is a serious matter. An ill person cannot afford to fill up further with the ammonia, the toxic amines, and toxic gasses that bowel bacteria produce. Fortunately, enemas are very easy to do. Do an enema before going to bed.

There are several kinds of enema equipment available in pharmacies; most important is NEVER to use anyone else's equipment, no matter how "sterilized" it is guaranteed to be. Get your own. Do not use the equipment used by a professional bowel-cleanser. It is impossible to completely avoid cross-contamination. You must completely avoid it.

A Fleet™ bottle, obtained at your local pharmacy, will do for a starter. This is a squeeze bottle with a plastic applicator for insertion. Dump the contents since you are unable to test it for toxins. Refill with warm enema solution.

The lubricant can be made in five minutes.

4 level tsp. cornstarch, zappicated
1 cup water

Bring this to a boil and cook for about one minute. Set in the refrigerator to cool quickly. Pour a teaspoon or more on top of a plastic bag for convenience in use. The only other lubricants are olive oil and coconut oil, first zappicated.

For many of us, the rectum and sigmoid colon have ballooned out into a pocket due to past times of constipation. This is called a *diverticulum.* This diverticulum is unreachable by the zapper and by the herbal parasite recipe. But it is just a few inches from the anus so it is quite accessible by enema.

The diverticulum walls are weak due to constant overstretching. But in just a

few weeks of assisted cleansing, the pocket will shrink and may even disappear.

Parasites and bad bacteria can escape being killed if they are in the diverticulum. Your entire bowel health can be turned around by killing the invaders of this diverticulum. Two ways of killing rectal parasites are with Lugol's or Black Walnut Tincture enemas. Alternating them is best.

Lugol's Enema

Add ½ tsp. of Lugol's iodine to 1 quart of very warm water; pour into cup-size Fleet™ bottle (giving yourself four doses), or enema apparatus. Administer enema slowly and hold internally as long as possible. Cold water will cause spasms and inability to hold it. Prepare only a cup the first time; do not force yourself to hold more than is comfortable.

Black Walnut Hull Extra Strength Enema

Add 1 tsp. of Black Walnut Hull Extra Strength to 1 quart of very warm water. Repeat as above.

Do an enema daily for one week to improve bowel function, alternating the above varieties. If you have none of these solutions available, use plain salt water, 2 tsp. per quart. In the absence of salt, use plain water. Remember, you must move your bowels or cleanse at least once a day. Hold the enema for ½ hour if possible but even one minute is useful.

Giving Yourself The Perfect Enema

Any drop you spill and everything you use to do the enema will somehow contaminate your bathroom. Yet you must leave it all perfectly sanitary for your own protection. So follow these instructions carefully.

Spread out a large plastic trash bag on the bathroom floor. Place a plastic grocery bag beside it and a paper plate on it. Set a chair nearby, too. The trash bag is for you to lie on. Lie on your back if you have nobody to help you.

Instructions on commercially available enema bottles advise you to be on your knees. This may be workable for the small squeeze-bottle of ready-made solution you can purchase. It is quite impossible, though, if you are elderly, have painful knees or are simply ill and must try to take in a whole quart from a complex apparatus.

Test the apparatus first, in the bathroom sink to see how it works. Wipe away

the grease that comes with it on the applicator; it is sure to be a petroleum product and be tainted with benzene.

Fig. 141 Enema container, tube, pinchcock

Pour a tablespoon of oil, zappicated, into the paper plate for the lubricant.

After filling the container with the enema solution, run some through the tubing until the air is out of it and close the pinchcock. Place it on the grocery bag.

Insert the applicator tube as far as you comfortably can. Then lift the container with one hand while opening the valve with the other. The higher you lift it, the faster it runs. Take as much time as you need to run it in. You may wish to set the container on the chair. Very warm liquid is easier to hold. Don't force yourself to hold it all. At any time you may close the valve, withdraw the applicator, and place it on the grocery bag.

Cleaning up the apparatus, the bathroom, and yourself: This topic is seldom discussed, but very important. Notice that some bowel contents have entered the container by reflux action, which is unavoidable. Consider the whole apparatus contaminated. For this reason you must never, never use anybody else's apparatus, no matter how clean it looks.

First, wipe the applicator tube. Then fill the container and run it through the hose into the toilet. Repeat until it appears clean; this is appearance only; you must now sterilize it. Fill it with water and add Lugol's iodine or povidone iodine until intensely red in color. Place the end of the tube in the container to soak, empty and wipe the outside of the tube with paper. Do not dry the container. Store in a fresh plastic bag. Throw away the trash bag, grocery bag and paper plate. Clean the sink with chlorine bleach. Then wash your hands with skin sanitizer.

If all went well, you may risk taking the next enema on your bed. If not take a

shower and stick to the floor location.

Organ Improvement Recipes

Lung Tea

These are the traditional herbs for ravaged lungs. Both herbs are often maligned as dangerous or toxic. Hundreds or thousands of years of simple use, as in this recipe speak otherwise. The concentrates of these herbs should, of course, be evaluated differently.

¼ cup comfrey root (*Symphytum officinale*)
¼ cup mullein leaf (*Verbascum thapsus*)
3 cups water

Combine dry herbs with water. Bring to a boil. Turn burner down to low; cook for 20 minutes. Strain and let tea cool. Add sweetening and two drops HCl per cup at time of serving. Drink ½ cup with each meal, sometimes hot, sometimes cool.

Kidney Cleanse

½ cup dried Hydrangea root
½ cup Gravel root
½ cup Marshmallow root
4 bunches of fresh parsley
Goldenrod tincture (leave this out of the recipe if you are allergic to it)
Ginger capsules
Uva Ursi capsules
Black Cherry Concentrate, 8 oz
Vitamin B6, 250 mg
Magnesium oxide, 300 mg in powder form.

Zappicate all supplies first or the final product.

Measure ¼ cup of each root (this is half your supply) and set them to soak, together in 10 cups of cold tap water, using a non-metal container and a non-metal lid (a dinner plate will do). After four hours or overnight, add 8 oz. black cherry concentrate, heat to boiling and simmer for 20 minutes. Drink ¼ cup as soon as it is cool enough. Pour the rest through a bamboo strainer into a sterile pint jar (glass) and several freezable containers. Refrigerate the glass jar.

Find fresh parsley at a grocery store that does not spray its produce (ask the owner). Zappicate the entire supply to be sure it is benzene and PCB-free. Boil the fresh parsley, after rinsing, in 1 quart of water for three minutes. Drink ¼ cup when cool enough. Refrigerate a pint and freeze 1 pint. Throw away the parsley.

Dose: each morning, pour together ¾ cup of the root mixture and ½ cup parsley water, filling a large mug. Add 20 drops of goldenrod tincture. You may flavor with 1 tsp. pomegranate paste, molasses or chlorophyll. Drink this mixture in divided doses throughout the day. Keep cold. Do not drink it all at once or you will get a stomachache and feel pressure in your bladder. If your stomach is very sensitive, start on half this dose.

Save the roots after the first boiling, storing them in the freezer. After 13 days when your supply runs low, boil the same roots a second time, but add only six cups water and simmer only 10 minutes. This will last another eight days, for a total of three weeks. You may cook the roots a third time if you wish, but the recipe gets less potent. If your problem is severe, only cook them twice.

After three weeks, repeat with fresh herbs. You need to do the Kidney Cleanse for six weeks to get good results, longer for severe problems.

Also take:

- Ginger capsules: one with each meal (three a day).
- Uva Ursi capsules: one with breakfast and two with supper.
- Vitamin B6 (250 mg): one a day.
- Magnesium oxide (300 mg): one a day.

Take these supplements just before your meal to avoid burping. If you are already taking these supplements, omit them here.

Some notes on this recipe: this herbal tea, as well as the parsley, can easily spoil. Heat it to boiling every fourth day if it is being stored in the refrigerator; this resterilizes it. If you sterilize it in the morning you may take it to work without refrigerating it (use a glass container).

When you order your herbs, be careful! Herb companies are not the same! These roots should have a strong fragrance. If the ones you buy are barely fragrant, they have lost their active ingredients; switch to a different supplier. Fresh roots can be used.

• Hydrangea (*Hydrangea arborescens*) is a common flowering bush.

• Gravel root (*Eupatorium purpureum*) is a wild flower.

• Marshmallow root (*Althea officinallis*) is mucilaginous and kills pain.

• Fresh parsley can be bought at a grocery store. Parsley flakes and dried parsley herb do not work.

• Goldenrod herb works as well as the tincture but you may get an allergic reaction from smelling the herb. If you know you are allergic to this, leave this one out of your recipe.

• Ginger from the grocery store works fine; you may put it into capsules for yourself (size 0, 1 or 00).

There are probably dozens of herbs that can dissolve kidney crystals and stones. If you can only find several of those in the recipe, make the recipe anyway; it will just take longer to get results. Remember that vitamin B_6 and magnesium, taken daily, can prevent oxalate stones from forming, but only if you stop drinking regular tea. Tea has 15.6 mg oxalic acid per cup[32]. A tall glass of iced tea could give you over 20 mg oxalic acid. Switch to herb teas. Cocoa and chocolate, also, have too much oxalic acid to be used as beverages.

Phosphate crystals are made at locations that are much too alkaline. This happens where bacteria are thriving. They are very hard to dissolve again. The kidneys are quite susceptible to bacteria and "stone" formation. Drink at least two pints of water a day to avoid making more.

Cleanse your kidneys at least twice a year.

You can dissolve all your kidney stones in three weeks, but make new ones in three days if you are drinking tea and cocoa. Keep bacteria levels down with liver cleanses, betaine and lots of fluid.

Liver Herbs

Don’t confuse these liver herbs with the next recipe for the Liver Cleanse. This recipe contains herbs traditionally used to help the liver function, while the Liver Cleanse gets gallstones out.

6 parts tanner's oak bark, *Quercus alba* (white oak bark)
3 parts gravel root, *Eupatorium purpureum* (queen of the meadow)
3 parts Jacob's staff, *Verbascum thapsus* (mullein herb)
2 parts licorice root, *Glycyrrhiza glabra*
2 parts wild yam root, *Dioscorea villosa*
2 parts milk thistle herb, *Silybum marianum*
3 parts walnut bark, *Juglans nigra*, (Black Walnut bark)
3 parts marshmallow root, *Althea officinalis* (white mallow)
1 part lobelia plant, *Lobelia inflata* (bladder pod)
1 part skullcap, *Scutellaria lateriflora* (helmet flower)

Mix all the herbs. Add ½ cup of the mixture to two quarts of water. Bring to a boil. Put lid on. Let sit for six hours. Strain and add sweetening such as Agave syrup or honey. You can make it extra good by adding coconut cream. Drink three cups a day. This gives you about ¼ cup of each herb. Put the strained herbs in the freezer and use them one more time.

Liver Cleanse

Cleansing the liver of gallstones dramatically improves digestion, which is the basis of your whole health. You can expect your allergies to disappear, too, more with each cleanse you do! Incredibly, it also eliminates shoulder, upper arm, and upper back pain. You have more energy and increased sense of well being.

It is the job of the liver to make bile, 1 to 1½ quarts in a day! The liver is full of tubes (*biliary tubing*) that deliver the bile to one large tube (the *common bile duct*). The gallbladder is attached to the common bile duct and acts as a storage reservoir. Eating fat or protein triggers the gallbladder to squeeze itself empty after about 20 minutes, and the stored bile finishes its trip down the common bile duct to the intestine.

Cleaning the liver bile ducts is the most powerful procedure that you can do to improve your body's health.

But it <u>should not</u> be done before the parasite program, and for <u>best results</u> should follow the kidney cleanse.

<u>For many persons, including children, the biliary tubing is choked with</u>

gallstones. Some develop allergies or hives but some have no symptoms. When the gallbladder is scanned or X-rayed nothing is seen. Typically, they are not in the gallbladder. Not only that, most are too small and not calcified, a prerequisite for visibility on X-ray. There are over half a dozen varieties of gallstones, most of which have cholesterol crystals in them. They can be black, red, white, green or tan colored. The green ones get their color from being coated with bile. Notice in the picture how many have imbedded unidentified objects. Are they fluke remains? Notice how many are shaped like corks with longitudinal grooves below the tops. We can visualize the blocked bile ducts from such shapes. Other stones are composites—made of many smaller ones—showing that they regrouped in the bile ducts some time after the last cleanse.

At the very center of each stone is found a clump of bacteria, according to scientists, suggesting a dead bit of parasite might have started the stone forming.

As the stones grow and become more numerous the backpressure on the liver causes it to make less bile. It is also thought to slow the flow of lymphatic fluid. Imagine the situation if your garden hose had marbles in it. Much less water would flow, which in turn would decrease the ability of the hose to squirt out the marbles. With gallstones, much less cholesterol leaves the body, and cholesterol levels may rise.

Gallstones, being porous, can pick up all the bacteria, viruses and parasite eggs that are passing through the liver. In this way "nests" of infection are formed, forever supplying the body with fresh parasite eggs and bacteria. No stomach infection such as ulcers or intestinal bloating can be cured permanently without removing these gallstones from the liver

Cleanse your liver twice a year.

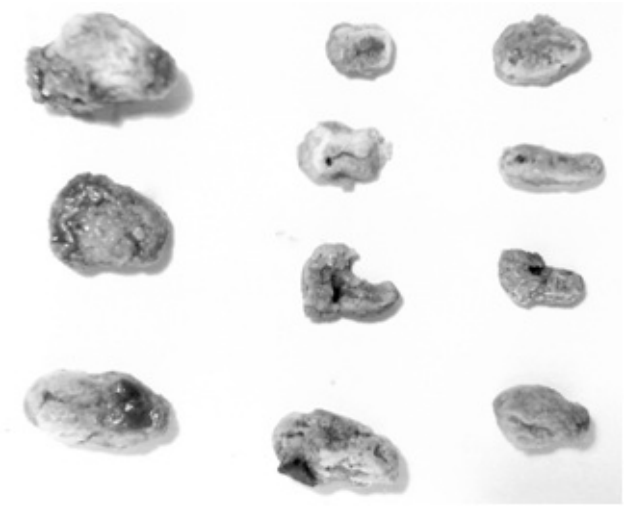

Fig. 142 These are gallstones

Preparation:

• You can't clean a liver with living parasites in it. You won't get many stones, and you will feel quite sick. Zap daily the week before, or get through the first three weeks of the parasite-killing program before attempting a liver cleanse. If you are on the *Maintenance Parasite Program*, you are always ready to do the cleanse.

• Completing the kidney cleanse before cleansing the liver is also highly recommended. You want your kidneys, blad bladder and urinary tract in top working condition so they can efficiently remove any undesirable substances incidentally absorbed from the intestine as the bile is being excreted

Ingredients

Epsom salts	4 tablespoons
Olive oil	½ cup (light olive oil is easier to get down)
Fresh pink grapefruit	1 large or 2 small, enough to squeeze ½ to 2/3 cup juice (you may substitute a lemon, adding water or sweetener to make ½ cup liquid)
Ornithine	4 to 8, to be sure you can sleep. Don't skip this or you may have the worst night of your life!
Large plastic straw	To help drink potion.
Pint jar with lid	

Black Walnut Tincture, any strength OR 2 freeze-dried capsules	10 to 20 drops, to kill parasites coming from the liver.

Choose a day like Saturday for the cleanse, since you will be able to rest the next day.

Take no medicines, vitamins or pills that you can do without; they could prevent success. Stop the parasite program and kidney herbs, too, the day before. Even stop zapping and taking drops.

Double hot wash the grapefruit (or lemon). Zappicate the oil to destroy traces of benzene and PCBs or add a few drops HCl and shake.

Eat a no-fat breakfast and lunch such as cooked cereal, fruit, fruit juice, bread and preserves or honey (no butter or milk). This allows the bile to build up and develop pressure in the liver. Higher pressure pushes out more stones. Limit the amount you eat to the minimum you can get by on. You will get more stones. The earlier you stop eating the better your results will be, too.

2:00 PM. Do not eat or drink after 2 o'clock. If you break this rule you could feel quite ill later.

Get your Epsom salts ready. Mix 4 tbsp. in three cups water and pour this into a jar. This makes four servings, ¾ cup each. Set the jar in the refrigerator to get ice cold (this is for convenience and taste only).

6:00 PM. Drink one serving (¾ cup) of the ice-cold Epsom salts. If you did not prepare this ahead of time, mix 1 tbsp. in ¾ cup water now. You may add 1/8 tsp. vitamin C powder to improve the taste. You may also drink a few sips of water afterwards or rinse your mouth.

Get the olive oil and grapefruit out to warm up.

8:00 PM. Repeat by drinking another ¾ cup of Epsom salts.

You haven't eaten since two o'clock, but you won't feel hungry. Get your bedtime chores done. The timing is critical for success.

9:45 PM. Pour ½ cup (measured) olive oil into the pint jar. Squeeze the grapefruit (or lemon) by hand into the measuring cup. Remove pulp with fork. You should have at least ½ cup; more (up to ¾ cup) is best. You may top it up with lemonade. Add this to the olive oil. Also, add Black Walnut Tincture or have freeze-dried capsules ready instead. Close the jar tightly and shake hard

until watery (only fresh citrus juice does this).

Now visit the bathroom one or more times, even if it makes you late for your ten o'clock drink. Don't be more than 15 minutes late. You will get fewer stones.

10:00 PM. Drink the potion you have mixed. Take 4 ornithine capsules with the first sips to make sure you will sleep through the night. Take eight if you already suffer from insomnia. Drinking through a large plastic straw helps it go down easier. You may use oil and lemon juice salad dressing, cinnamon, or straight honey to chase it down between sips. Take it to your bedside if you want, but drink it standing up. Get it down within five minutes (15 minutes for very elderly or weak persons).

Lie down immediately. You might fail to get stones out if you don't. The sooner you lie down the more stones you will get out. Be ready for bed ahead of time. Don't clean up the kitchen. As soon as the drink is down walk to your bed and lie down flat on your back with your head up high on the pillow. Try to think about what is happening in the liver. Try to keep perfectly still for at least 20 minutes. You may feel a train of stones traveling along the bile ducts like marbles. There is no pain because the bile duct valves are open (thank you Epsom salts!). **Go to sleep**, you may fail to get stones out if you don't.

Next morning. Upon awakening take your third dose of Epsom salts. If you have indigestion or nausea wait until it is gone before drinking the Epsom salts. You may go back to bed. Don't take this potion before 6:00 am.

2 Hours Later. Take your fourth (the last) dose of Epsom salts. You may go back to bed again.

After 2 More Hours you may eat. Start with fruit juice. Half an hour later eat fruit. One hour later you may eat regular food but keep it light. During the day take the parasite-killing herbs and zap. By supper you should feel recovered.

Alternative Schedule 1: Omit the first Epsom salts dose at 6 p.m. Take only one dose, waiting till 8 p.m. Change nothing else. Many people still get stones with one less dose. If you do not, do the full course next time.

Alternative Schedule 2: After taking the first dose of Epsom salts in the morning, wait two hours and take a second dose (but only ½ cup) of the oil mixture and go back to bed. After two more hours take another dose of Epsom salts. This schedule can increase the number of stones you remove.

How well did you do? Expect diarrhea in the morning. This is desirable. Use

a flashlight to look for gallstones in the toilet with the bowel movement. Look for the green kind since this is proof that they are genuine gallstones, not food residue. Only bile from the liver is pea green. The bowel movement sinks but gallstones float because of the cholesterol inside. Count them all roughly, whether tan or green. You will need to total 2000 stones before the liver is clean enough to rid you of allergies or bursitis or upper back pains permanently. The first cleanse may rid you of them for a few days, but as the stones from the rear travel forward, they give you the same symptoms again. You may repeat cleanses at two-week intervals. Never cleanse when you are ill.

Sometimes the bile ducts are full of cholesterol crystals that did not form into round stones. They appear as "chaff" floating on top of the toilet bowl water. It may be tan colored, harboring millions of tiny white crystals. Cleansing this chaff is just as important as purging stones.

How safe is the liver cleanse? It is very safe. My opinion is based on over 500 cases, including many persons in their seventies and eighties. None went to the hospital; none even reported pain. However it can make you feel quite ill for one or two days afterwards, although in every one of these cases the *Maintenance Parasite Program* had been neglected. This is why the instructions direct you to complete the parasite and kidney cleanse programs first.

Warning: If you do change these recipes you might expect problems. The liver is quite sensitive to details. If you plan to make changes, be sure to seek the assistance of a therapist.

This procedure contradicts many modern medical viewpoints. Gallstones are thought to be formed in the gallbladder, not the liver. They are thought to be few, not thousands. They are not linked to pains other than gallbladder attacks. It is easy to understand why this is thought: by the time you have acute pain attacks, some stones are in the gallbladder, are big enough and sufficiently calcified to see on X-ray, and have caused inflammation there. When the gallbladder is removed the acute attacks are gone, but the bursitis and other pains and digestive problems remain.

CONGRATULATIONS

You have taken out your gallstones without surgery! I like to think I have perfected this recipe, but I certainly cannot take credit for its origin. It was invented hundreds, if not thousands, of years ago, THANK YOU,

HERBALISTS!

The truth is self-evident. People who have had their gallbladder surgically removed still get plenty of green, bile-coated stones, and anyone who cares to dissect their stones can see that the concentric circles and crystals of cholesterol match textbook pictures of "gallstones" exactly.

Immunity Boosters

Ferritin Fighter

When white blood cells have phagocytized (eaten) asbestos, they become coated on the outside with ferritin. This ruins their immune function. Their outside surface has receptor sites that must be able to "see" and "feel" enemies of your body. Removing this ferritin restores their immune functions. The drug levamisole (available in other countries) can do this in less than a week (50 mg, take two, 3 times daily), but here is a recipe that works also.

1 tsp. bromelain (3000 mg) 600 GDU/gm, or papain
1 tsp. powdered hydrangea
1 capsule fennel for flavoring
½ cup water, goat milk, or coconut cream for mixing
2 drops hydrochloric acid to sterilize

Mix everything together and drink. Take this dose 3 times daily. For convenience, you can mix larger quantities of the dry (not wet) ingredients ahead of time; this reduces the odor. Cut dosage in half after a week. Do not take with meals to avoid consuming the enzymes with food. Continue for a month.

The bromelain or papain will digest the ferritin off your white blood cells, enabling them to remove asbestos, dyes, bacteria, and plastics from your tissues again. But ferritin will return to coat your white blood cells if you continue to eat or drink asbestos-polluted food or water.

Hydrangea is included because most people find it easier to take this way, than by itself. It is not essential.

Watercress (*Nasturtium officinale*) tablets can also remove ferritin. Chew 6 tablets a day.

Dye Remover Syrup

Each of these three herbs can remove azo dyes from CD4 and CD8 cells. Since each item is effective, you do not need to wait to get them all, first.

1 tsp. bay oil
2 tbsp. pomegranate paste
1 tsp. lemon oil
½ cup maple syrup, boiled

Zappicate each item in its original container for 10 minutes. Combine all ingredients in a glass jar large enough to allow for vigorous shaking. Dose: ¼ tsp. 3 times daily.

Two more herbs can do this:

2 tsp. powdered hydrangea
2 tsp. powdered olive leaf

Take these straight, stirred into a beverage that suits your taste.

Freon Removal Program

Freon accumulates in the diaphragm and skin in healthy persons. In sick persons the Syncrometer® detects it in the weakened organ. Freon in your body can be ozonated to render it capable of detoxification. This mobilizes it toward the liver.

- 1-3 glasses ozonated water. Ozonate water for five minutes. Make sure the tip of the ozonator tube is sterile by dipping in HCl-water or Lugol's-water first.
- 1-2 cups liver herb tea (see *Recipes*). Drink ½ cup tea for each glass of ozonated water drunk. This helps the liver detoxify the Freon so it can move toward the kidneys.
- kidney herb tea, 1¼ cups daily. This helps the kidneys pull it into the bladder for excretion.

It takes about six weeks to remove Freon from your body. Be sure to get a Freon-free refrigerator before you begin.

L-A Recipe

1 tsp. L-aspartic acid
1 tsp. L-lysine powder
1 1/3 cups water

If you purchase these powders already mixed you will need 2 tsp. for the recipe.

Heat, covered, till completely dissolved; it will be near boiling. Use a non-metal pan and non-metal stirring spoon. If it develops a white crystalline precipitate at the bottom, it must be reheated to get it redissolved. Add enough water to keep it dissolved. Since it has no preservatives, you must reheat it to near boiling every fourth day to kill any growing bacteria.

Dose: take 1 teaspoon 4 times daily (or 2 tsp. twice a day) if you are quite ill. Take on an empty stomach, such as before meals. Take 1 tsp. 3 times daily (if not so ill) for as long as you feel you have a viral condition. There are no side effects. Use a non-metal spoon.

Mechanism of L-A. L-A is present in all our white blood cells. It specifically helps them remove copper, cobalt, vanadium, toxic germanium, toxic selenium, toxic chromate and nickel. This set of metals is our "natural" set; those brought in by bacteria or fungus, as opposed to unnatural ones brought in by amalgam, body products, etc.

L-G Recipe

1 tsp. L-glutamic acid powder (see Sources), not glutamine
1 tsp. L-lysine powder (you may open capsules)
11/3 cups water

Prepare as for L-A. Dosage is one tablespoon 4 times daily.

Mechanism of L-G. These two amino acids combine chemically in hot water to make eight or more different dipeptides. Each is a form (isomer) of L-G. L-G travels to your thymus; this much can be observed electronically. Does it help T-cells survive? Does it do some other vital task? Today, 10 years after its discovery, some questions can be answered.

L-G is found normally present in at least ten kinds of white blood cells including lymphocytes, neutrophils, and even eosinophils. The CD4s and CD8s normally kill viruses but without L-G they do not. They seem to fill up on them or attack them but are not able to kill them. All CD4s and other white blood cells that do not have L-G present, have mercury and/or thallium stuck inside them. This is coming from amalgam deposits, located in very many places in the body. You have been robbed of your L-G making ability.

Fortunately, taking L-G as made in this recipe, helps the CD4s and others to eject their mercury and thallium. Perhaps it is the body's own heavy metal chelator. Now they can kill viruses again and get your body well. If more amalgam comes their way they again fill up on all 50 or so, metals. Most of them can be destroyed or detoxified somehow. Only mercury and thallium cannot, they remain stuck in the lymphocytes and other specialized white blood cells.

Taking repeated doses of L-G can clean up the white blood cells repeatedly but this is only permanent after amalgam has been removed from the whole body. Nevertheless, this can be accomplished in about six weeks, provided there are no amalgam filled teeth still in your mouth.

As soon as L-G returns to the CD4s they manufacture interleukin 2 again, another important immune chemical. When the CD8s get their L-G they begin killing vagrant tissue bits, tumor cells, and virus filled cells. And life is back to normal.

The Story Of L-G

A tribute to Dr. James Schaffer, M.D., of Bloomington, Indiana.

Dr. Schaffer was a pediatrician who devoted 20 years of his life to discovering L-G (lysine-glutamate). He called it "JS14". At any time of day, his office was crowded to the door with parents holding sick children. He was a gruff man but infinitely caring about his patients. On Saturdays and Sundays he worked on his pet product, JS14.

He had discovered that if you grow a culture of ordinary bacteria, Staphylococcus albus (a variant of S. aureus), found on anybody's skin, they would make a substance of great immune significance.[33] I gleaned this from reading his patent(s) on the culturing technique.[34] He discovered that by adding a little bit of an amino acid, aspartic acid, to the culture, the bacteria would make much more of this mysterious substance than without it. Are these bacteria always making this for us, on our skin, in our intestines? Do these bacteria need a special factor to make it in good quantities for us? These were questions he was trying to answer in his private lab where he worked every spare minute. He would inject some of the culture into mice and then infect them with diseases to see if they got protection from it. Indeed, they did. So he perfected JS14 for human use.

His potent immunity brew was injected just under the skin where it produced a small bubble. It became known as Dr. Schaffer's Bubble Shot. He used it for children and adults with chronic illnesses caused by *Herpes*, Epstein Barre Virus, Cytomegalovirus, and cancer. Later, he used it on porphyria, as well as a mystery disease that nobody could diagnose at that time, which turned out to be HIV/AIDS.

He was getting exceptionally good results and his excitement flowed to those around him. If that excitement had not reached me, I may not have survived to work on cancer and HIV/AIDS. I was suffering from ordinary *Herpes* simplex, but it had spread to the eyes and was spreading through my brain! Once a week I got his Bubble Shot and listened as he updated me on his research.

As soon as I was well enough, I voiced my interest in his project. This buoyed his spirits considerably. He explained that virtually all his "low immunity" patients were lacking complement C_3. But after receiving his bubble shot for some time, C_3 began to appear and the patient got well.

He showed me pictures of horses and other animals that had very quickly gotten well after his shot was given. He showed pictures of human hands eaten almost to the bone by ordinary *Herpes*. He explained they all had no complement.

Occasionally, I would be called by his office to let me know he was ill and could not make the appointment time. I realized this beloved doctor was indeed very ill, and I should learn how to make this immune booster myself.

I did not culture Staphylococcus aureus. I studied its molecular structure. It has lysine-glutamate links frequently along the chain of molecules making up its coat. Are our bodies intended to utilize these common skin bacteria after they die in such a way that we would digest these chains to make a superb immune booster for ourselves? Should I begin to experiment with Staphylococcus aureus or other "Staphs"? Perhaps such a product was already on the market? So it was! I purchased a kind of L-G and tried it as a bubble shot during those weeks that Dr. Schaffer was ill. My shot did not work well. His return was a great relief. I decided to make the culture broth and learn to culture the bacteria. But Dr. Schaffer was not well enough to teach me the techniques. In desperation I studied the recipe for his cultures from the published reports he gave me. There were large amounts of L-lysine and L-glutamic acid in it. Could they be reacting with each other in the brew to make this potent immune booster? Could this be simulating a part of the Staph molecular structure? Perhaps the Staph was not even necessary! It was a crazy idea but simple enough to try and throw out if it was wrong. I mixed L-lysine and L-glutamic acid under sterile conditions, and tried this as a bubble shot. It had some effect! I was on the right track! It was not as effective as Dr. Schaffer's bubble shot but perhaps it could be made stronger!

Then it occurred to me that this is merely food. These two amino acids are produced in the stomach and intestine by digesting protein. Are some of us with very low immunity not capable of making this mysterious substance because our stomachs are sick? I studied digestion of these amino acids. A great deal has been published about them. In fact, my stomach had been misbehaving for years. Maybe my stomach and intestines were not able to make it by digesting ordinary food. Perhaps this substance could simply be eaten instead of injected. That was the magic answer! By eating it, the potency was greatly increased. Ordinarily, the potency of chemicals is much lowered by the oral route, but in this case, it was reversed. This discovery came just in the nick of time. Bloomington's beloved Dr. James Schaffer passed away. It is a terrible loss to us all. His research was not completed. His results, his data, were voluminous, but only usable by someone intimately acquainted with it. Our mourning after him has not yet ended.

But I could treat myself: not weekly, as before, but daily! I became well. JS14 and L-G were the decisive factors in fighting my chronic *Herpes* eye infection.

The recipe is simple (see *Recipes*), a gift to you in memory of Dr. James Schaffer. Perhaps it is not the same as his Bubble Shot. Perhaps we will never know. But it came into existence as a result of his Bubble Shot and I am ever grateful.

Dental Recipes

Various kinds of dentures, including colored, can be hardened using this recipe. This means they will not seep acrylic acid, urethane, bisphenol-A, phthalates, metals, or dyes, to a detectable level. The hardening was tested with a Syncrometer® by soaking dentures of various kinds and colors in water for many hours and sampling the soak-water. Since you will not be able to test, I recommend repeating this denture-cure 3 times.

Denture Hardening

candy thermometer or other easy to read thermometer
small sauce pan; Teflon-coated is fine

Practice run: Find the 160° and 180° F marks on the thermometer. Fill saucepan 1 to 2 inches with cold tap water. Place on burner set at lowest heat. Place thermometer in water, being careful that it could not accidentally tip out and fall on the burner.

Note the time. Check the temperature of the water every few minutes. It should reach 160° F in 20 minutes, not sooner. If it went too fast, throw out the water, set burner lower and start over. When the right speed of heating is reached, you are ready to cure your denture.

Place denture in saucepan; add cold water from tap to previous level. They should be well covered. Heat as before. When 160° F is reached, turn burner to lowest setting. Water temperature should eventually reach 180°F. Remove saucepan from heat and let cool.

Pour off water and cover denture with fresh cold water. Rinse. Denture is ready.

Note:

1. If something went wrong during your first try, simply repeat the whole procedure.

2. Your mouth should have no reaction, no redness, no burning, and no odd

symptoms from wearing your dentures. If symptoms occur, repeat the hardening recipe.

3. A previous recipe gave 160°F as the maximum temperature. Since then phthalates were found to seep from dentures. They require 180°F (but no higher!).

Dental Bleach

This is for use during dental work and for occasional denture cleaning. Do not use it as a regular mouthwash or as a daily denture soak. You would get too much chlorine.

The chemical name for bleach is hypochlorite. There are different grades. The grade used for laundry is not good enough for internal use. Purchase "USP" or better quality, which means food grade. You, or your health food store, will need to order it (see *Sources*). Although you are using an acceptable grade this doesn't mean you can use any quantity you want. Bleach is very caustic. It must be diluted before you can use it without harm. Please follow these directions carefully.

1 tsp. (5 ml) bleach, USP grade (about 5% hypochlorite)
1 pint water (500 ml)

Use a plastic tsp. to measure and mix. The result is 1/100 or 1% as strong as the bleach you started with. This comes to .05% hypochlorite. This is only a quarter as strong as the .2% solution recommended by Bunyan, but is strong enough.

To store, use a glass pint jar with tight-fitting, non-metal lid or place a plastic sheet under metal lid to tighten the fit. **Keep out of reach of children**. You may add a cayenne capsule to make it distasteful and safer from accidental use. If accidentally swallowed, give milk to drink.

Make sure you are starting with (approximately) 5% hypochlorite solution, the same as household strength, when you make this recipe; do not use this recipe if you cannot verify this on the label. Do everything inside the kitchen sink. If you start with some other strength, get an expert, like your pharmacist, to help you make the correct solution.

Dental Floss

The purpose of flossing is to open the gum spaces so your antiseptic can run

down them to reach bacteria. Use fishing line (2 to 4 pound test). Zappicate package first. Double it and twist for extra strength. Floss gently, not to cut into the tooth base or cause bleeding. Commercial floss has been soaked in toxic antiseptic; the waxed or flavored kind has been dipped in petroleum products. In an emergency, use strips torn from a plastic shopping bag. Remember to brush after flossing. You will be using an oregano oil recipe for brushing.

Many persons prefer these shopping bag floss strips. Make a pile of them by cutting strips ¼" by 4". Rinse each one under the hot faucet before use.

Buy a new toothbrush. Zappicate to remove PCBs and other toxic chemicals. Wash once before first use.

Oregano Oil Tooth Powder

1 tsp. baking soda
1 drop oregano oil
1 or 2 drops peppermint oil or fennel (optional)

Mix with plastic fork. Store in closed jar. Zappicate the final product. Dip dry toothbrush in powder. This is about a one week supply. Brushing daily will keep clostridium bacteria at undetectable levels. Oregano oil straight in your mouth could make you jump with burning sensation although it does not harm you. There is no need to take it straight.

Colloidal silver is also effective for killing clostridium bacteria but does not penetrate crevices. Buy a colloidal silver maker (see *Sources*). Use four or five drops on toothbrush.

Hydrogen peroxide, food grade, and **plain salt water** are also good for brushing teeth but don’t penetrate crevices.

Dental bleach is safe for mouth contact. It must not be swallowed. Do not use it daily unless recovering from dental work. It introduces too much chlorine into your body. Keep eyes closed while brushing to avoid spatter.

If you have a sore or bleeding mouth, floss and brush only once a day. Use mouthwash the rest of the day.

Denture Cleaner

Dentures that acquire gray or fine-lined black discoloration are growing clostridium bacteria! Kill them by brushing with colloidal silver and letting them

stand without rinsing until the discoloration is gone. Salt water helps but is not strong enough by itself.

Or soak in dental bleach overnight.

Also sonicate or zap or zappicate them at least once a week.

Don’t keep partials or dentures in your mouth at night.

Denture Adhesive

1 rounded tsp. sodium alginate
1 cup water
5 drops wintergreen oil or fennel oil
3 drops hydrochloric acid 5%
2 tsp. grain alcohol

Bring water to boil. Add alginate, stirring till all dissolved. To make it thicker, boil longer. Add wintergreen and HCl. After cooling add grain alcohol. Finally, zappicate then refrigerate.

Body Care Recipes

All the commercially produced body care products are contaminated with toxic antiseptics that are themselves polluted. Traces of these, in addition to dyes and silicone, put into or onto the body numerous times a day, amounts to a toxic overload for a HIV or AIDS patient. (They are not good for healthy people, either.) Many people have lost much of their immune power and ability to detoxify foreign substances. These accumulate in the vital organs and set the stage for disease. "Health" or "natural" brands use the same polluted antiseptics!

Take care of your personal needs using only these recipes.

Use borax for all cleaning purposes: laundry (see instructions on box), dishes (use in granular form to scour), dishwasher (2 tsp.) and 1½ tsp. citric acid as the rinse, shampoo and yourself (make liquid form).

Borax Liquid Soap And Shampoo

an empty 1 gallon plastic jug
1/8 cup borax powder
plastic funnel

Make a bottle of borax liquid to fill your soap dispensers and shampoo bottle. Use citric acid to rinse and condition.

Fig. 143 Borax and citric acid for the shower

Funnel the borax into the jug; fill half full with the hottest tap water you can run. Shake a few times. Let settle. Add more hot water until it is all dissolved. In a few minutes you can pour off the clear part into dispenser bottles. This is the soap!

Shampoo: Borax liquid should feel slippery between your fingers; if it does not the concentration is too low; start over, using a heaping tablespoon in a plastic container and enough very hot water to dissolve it all. No tiny crumbs should settle to the bottom. You may make it lathery by adding a tsp. of liquid homemade soap (see recipe). To rinse, use citric acid (see *Sources*). Remove traces of benzene (petroleum residue) from citric acid by zappicating the entire bottle for two minutes first or microwaving it. Ascorbic acid, lemon juice and vinegar are all not strong enough to rinse out borax. Put ¼ tsp. citric acid in a plastic container like a cottage cheese carton. Add about one cup of water to it while under the shower when done shampooing. Leave rinse in hair for at least one minute while showering your body; then rinse out lightly. This length of time is what makes it feel silky later. After rinsing, your hair should feel soft. Borax shampoo stops scalp itching and dandruff. It will not be necessary to shampoo daily.

Baking Soda Shampoo

1 tbsp. baking soda (remove traces of benzene by zappicating the whole box for two minutes or microwaving)
1 cup very hot water

Place both in a plastic container and stir with your fingers until dissolved. This is the soap. To shampoo scoop it up over your hair by hand; if you pour it, too much runs off. This time rinsing with ascorbic acid (1 tsp. to 1 cup water) or vinegar (equal parts vinegar and water) works. Leave rinse in hair one minute. To add sheen to hair, wash a whole lemon twice in hot water; then press lemon against hair.

> It is very tempting to buy shampoo or body lotion if the salesperson "guarantees" it meets my standards. Do not! Nothing can be guaranteed unless it is tested. None of them have been tested. But, remember, pollutants are not intentionally added. Producers do not understand the pollution problem. They do not even know it exists. They truly believe their products are "pure". Only the Syncrometer® device has shown how extremely polluted they are. Make your own products. You might never go back to commercial products even after you are well.

Egg Shampoo

3 egg whites (save yolks for use later for adding to egg nog)

This probably gives the softest, silkiest hair you have ever owned. But don't blow dry it for best results.

Beat with a fork about 30 times. To shampoo scoop it up over your hair and work it into a lather. Leave it there while you shower. Rinse it out; then condition with 50% vinegar. Leave vinegar in hair a full minute, while you brush skin or massage feet. Rinse out lightly.

Natural Curl And Wave

Step out of the shower and immediately comb your hair straight back once over. Dry in the same direction, front to back, with single sweeps of the towel. After 10 sweeps, stop; it should not get too dry, yet. Dry your body and get dressed. Do nothing more, not a single touch by the comb. Sit in the sun if you have a sunny room, or go about your duties. This slow-dry lets the molecules regroup into waves and curls you never knew you had. If it fails to perform, leave it wetter next time. Do not get into a draft nor drive in the car for best results.

Hand Sanitizers

Food grade alcohol: make up a 70% (approx.) solution. Food grade alcohols are grain or cane (ethyl) alcohol. Only the large size Everclear™ bottle (750 ml or 1 liter) is free of isopropyl or wood alcohol contaminants. Purchase at a liquor store. Next, find a suitable storage bottle. Pour 95% grain alcohol (190 proof) to the halfway mark and add half as much water. If using 76% alcohol, use it straight. Pour into small spray bottle. Use alcohol for general sanitizing purposes and for personal cleanliness. In the bathroom: always clean up after a bowel movement with wet toilet paper. This is not clean enough, though. Follow with a stronger damp paper towel. This is still not clean enough; use a final damp paper towel with a spray of hand sanitizer added. Wash your hands if you merely touch the toilet seat. Remember to keep the toilet lid down while flushing. After washing hands, sanitize them too, spraying a bit on one palm, then putting fingertips of the other hand in it; scratch to get under nails, repeat on other hand. Rinse with water. **Do not use this recipe, nor keep any bottles of alcohol in the house of a recovering alcoholic.**

Lugol's iodine solution, one drop in a glass of water. Pour onto napkin and wipe hands to kill surface bacteria. This is easy to do in a restaurant. For deeper sterilization, for instance, if you are going to put your hands in your mouth to floss, put one drop in a glass of water and dip your hands in it. Unless nails are short, though, the hands will still be contaminated and infectious.

Lugol’s iodine straight: when there is no water or no paper, dab 10 tiny drops of Lugol’s solution on the palm of one hand. Rub hands together. The stain will wear off in a day.

Moist Towelettes

Always keep a few in a zippered plastic bag in the glove compartment of your car and in your purse. Cut paper towels in quarters and stack. Place in heavy-duty plastic zippered bag. Pour ethyl alcohol or Lugol's sterilizer solution (1 drop per cup) over the towels. Zip shut. Use one before touching any food.

Deodorant

Sweating removes toxins from the body. It should be encouraged. A HIV/AIDS patient should use no chemicals to retard sweating. Remember, PCBs should be sweated out. Simply wash with borax water. After you are well you may use one of these recipes.

Vitamin C water. Mix ¼ tsp. to a pint of water and dab it on.

Citric Acid water. Mix ¼ tsp. to a pint of water and dab it on.

Only a few drops of these acids under each armpit are necessary. If these acids burn the skin, dilute them more. Never apply anything to skin that has just been shaved!

Lemon juice. This acid is not as strong, use what you need.

Cornstarch. Many people need only this. Dab it on.

Zappicate supplies to destroy traces of PCB and benzene.

Baking soda. Dab it on (see *Sources* for safe varieties).

Pure alcohol (never rubbing alcohol). The only food grade alcohol is grain or cane (ethyl) alcohol. Dab a bit under each arm and/or on your shirt or blouse. If the alcohol burns, dilute it with water. Be very careful not to leave the bottle where a child or alcoholic person could find it. Pour it into a different bottle!

Pure zinc oxide. You may ask your pharmacist to order this for you. She or he may wish to make it up for you too, but do not let them add anything else to it. It should be about 1 part zinc oxide powder to 3 parts water. It does not dissolve. Just shake it up to use it. After you get it home, you can add cornstarch to it to give it a creamy texture. Heat 3 tsp. cornstarch in one cup of water, to boiling, until dissolved and clear. Cool and add some to the zinc oxide mixture (about equal parts). Store unused starch mixture in the refrigerator. Only make up enough for a month.

Oregano oil tooth powder. Dab it on. It is surprisingly effective as a deodorant.

Alcohol and zinc oxide. This is the most powerful deodorant. Apply alcohol first, then the zinc oxide.

Remember that you need to sweat! Sweating excretes toxic substances, especially from the upper body. Don't use anything on weekends. Go to the sink and wipe clean the armpits like our grandparents did. A hot washcloth might even help you sweat more. These homemade deodorants are not as powerful as the commercial varieties—this is to your advantage.

Mouthwash

Mouth odor is usually caused by Clostridium bacteria! Don't cover this up with mouthwash or fragrances. See a dentist! Search for a hidden infection. After clearing it up, floss and then brush daily with oregano oil tooth powder; this serves as a mouthwash at the same time.

Shaving Supplies

Switch to an electric shaver to avoid all chemicals. But don’t spray chemical lubricant into the shaver!

After Shaves

A quarter teaspoon vitamin C powder dissolved in 1 pint water. Keep refrigerated.

Suppositories

The coconut oil molded in pen caps can be used as a suppository. If treating hemorrhoids, add one tsp. brewer's yeast (zappicated) for every 10 suppositories.

Personal Lubricants

Heat these together: 1 level tsp. sodium alginate and one cup water in a covered non-metal pan until completely dissolved. Use very low heat and stir with a wooden spoon handle. It takes a fairly long time to get it perfectly smooth. After cooling, pour into a small dispenser bottle. Keep the remainder refrigerated.

Or, boil 4 tsp. cornstarch and one cup water until completely dissolved in a covered saucepan. Cool. Pour some into dispenser bottle. Zappicate. Refrigerate remainder. This is many people's favorite recipe.

Contact Lens Solution

Bring a scant cup of cold tap water to a boil in glass saucepan. After adding ½ tsp. pure salt and boiling again, pour into a sterile canning jar. Refrigerate. Freeze some of it. Also use as eye-drops for lubricating "dry" eyes.

Baby Powder

¼ cup cornstarch, pure (see *Sources*)

1 tsp. zinc oxide powder
1 tsp. white rice, whole grains

Place all in an all-plastic salt shaker. The rice grains are the drying agent. Baby powder should have no fragrance, not even a natural scent. It is a burden to the body. This recipe avoids the **talc** in all commercial brands. The Syncrometer® finds asbestos in talc.

Foot Powder

Use a mixture of cornstarch and zinc oxide poured into a tall saltshaker with large holes and a lid. Add long rice grains to fight humidity. Also try arrowroot starch or rice flour. If you don't have zinc oxide, use plain cornstarch.

Skin Healers

Skin Lotion

3 tsp. pure cornstarch (see *Sources*)
1 cup water

Boil starch and water until clear, about one minute. Cool. Zappicate. Pour into dispenser bottle. Keep refrigerated.

Quick Skin Softener

4 tsp. cornstarch
1 cup water

Boil starch and water until clear, about one minute. Cool.

Vitamin C Skin Softener

1 tsp. vitamin C powder (ascorbic acid); or 5 capsules, 1000 mg
3 tsp. pure cornstarch
1 cup water

Boil starch and water until clear, about one minute. Add vitamin C and stir until dissolved. Cool. Zappicate. Pour into dispenser bottle. Keep refrigerated. Apply after washing dishes and after showering.

Vitamin C powder (ascorbic acid; not the same as citric acid). Put a large

pinch into the palm of your hand. With your other hand pick up a few drops of water from the faucet. Rub hands together until all the powder is dissolved and dispensed. It may sting briefly. Do this at bedtime, especially for cracked, chapped hands.

50% Glycerin. Dilute 100% vegetable glycerin with an equal amount of water. This is useful as an after-shave lotion. Zappicate first to destroy asbestos fibers.

Vitamin C liquid. Mix ¼ tsp. vitamin C powder in one pint water (opened capsules will do). This is useful as an after-shave lotion and general skin treatment.

Cornstarch. Use on rashes, fungus, moist or irritated areas and to prevent chafe.

Dry skin has several causes: too much water contact, too much soap contact (switch to borax), low body temperature, not enough fat in the diet, or parasites.

Massage Oil

Instead of using any oil, which may be benzene and PCB polluted, and have apiol, make yourself a cornstarch solution:

4 tsp. cornstarch
1 cup water

Boil starch and water until clear, about one minute. For a lighter effect use 3 tsp. cornstarch instead of 4. Variations: Add a vitamin E capsule, 400 units, add vitamin C, 1000 mg. These additions heal skin lesions faster. Keep refrigerated.

Nose Salve

(When the inside of the nose is dry, cracked and bleeding.)

Pour ½ tsp. pure vegetable glycerin (zappicated) into a bottle cap. Add ½ tsp. water.

Applicator: use a plastic coffee stirrer or straw; cut a slit in the end to catch some cotton wool salvaged from a vitamin bottle and twist (cotton swabs, cotton balls and wooden toothpicks are sterilized with mercury which in turn is polluted with thallium, do not use them). Dip it into the glycerin mixture and apply inside the nose with a rotating motion. Do each nostril with a new applicator. Zappicate each item before use.

Lip Soother

For dry, burning lips. Heat one level tsp. sodium alginate plus one cup water until dissolved. After cooling, pour it into a small bottle to carry in your purse or pocket (refrigerate the remainder). Dab it on whenever needed. If the consistency isn't right for you, add water or boil it down further.

Cosmetics

Lipstick

A stick of raw red beet cut like a "French fry" is more convenient and useful than any recipe. Store in plastic bag in refrigerator. Use also on cheeks for rosier complexion.

Lip Crayon

½ cup coconut oil

Use this to replace "chap sticks" and "Vaseline." Zappicate coconut oil first. Pour warmed coconut oil into the caps of ballpoint pens. Cover any holes with tape. Stand them upright in holes made by a sharp pencil in a tissue box. After filling, refrigerate. When hard, release them under the hot water tap. Store in closeable plastic bag in refrigerator. Wrap each in a small piece of paper towel.

Commercial chap sticks, like most cosmetics, contain heavy metals, solvents and aluminum, not to mention the antiseptics, petroleum residues and dyes.

Black, Red And Brown Henna Hair Dye

Henna is an herb traditionally used for dying hair. You can buy the herb in bulk, or you can purchase the herb pictured, packaged specifically for hair. There are other henna hair dye preparations, often with other added chemicals and dyes, so I cannot stress this point enough: use only bulk henna herb (by the pound), or the brand shown!

A young person's hair turns black with this black dye. But older hair turns slate blue. **To get a brown color, mix red and black henna, using 2 parts red to 5 parts black powder.**

The instructions given with the box work well but take rather long. This recipe is a shortcut. It takes 20 minutes (to prepare the dye) plus 50 minutes in contact

with hair.

The recipe given is enough for short hair. For medium length, double the quantities. It will not stain the bathtub. After dying is complete, you will need to shampoo it out of your hair, so regular shampooing supplies, borax plus citric acid or baking soda plus vinegar are also necessary.
Zappicate the whole box of dye for five minutes first.

½ cup distilled white vinegar
½ cup tap water
7 heaping tsp. black henna (see *Sources*)

This recipe is very sensitive. The smallest deviation could cause failure of the dye to "take." Please be extra careful to observe details.

No isopropyl or benzene residue, nor azo dyes or metals. Comes in red and black

Fig. 144 Safe hair dye

Heat water in open, non-metal, 1 quart saucepan until steaming (not the microwave). Turn off burner. Add vinegar. Allow it to cool until just a wisp of steam is still seen coming from the saucepan. Remove 2 tbsp. to a different container, to use later. Then add henna powder. Stir with plastic spoon. It will bubble and rise at first. When thoroughly stirred, the consistency should be like thin gravy. If too thick, use up some of the solution set aside or plain hot water. If too thin, add more powder. Cover and let stand, covered, in warm place such as oven or microwave for 20 minutes (not longer). The dye is being extracted.

Meanwhile, prepare the bathroom. Fold a long piece of paper towel (three sections) in half lengthwise, and then again in half to make a long neckband. Get ready a shower cap to cover hair later, and two more single paper towels. Set comb and shampoo supplies nearby, also within reach from shower. Drape a towel or newspaper over the side of bathtub for comfortable seating. After

exactly 20 minutes, stir the henna one more time. Take the saucepan to the bathtub or shower and dip the solution over your hair by hand in small amounts. Get all the hair roots wetted before the long hair. Keep it out of your eyes by keeping them closed. Then dry your hands with the single piece of towel. Put on the shower cap. Tie the long paper "scarf" around your neck, tucking in the ends. You may want a second scarf to add to the first. Now wash your hands and clean up drips. Note the time. Keep a few paper towels handy to wipe drips off your face.

Leave it all intact for 50 minutes to one hour or 1¼ hours if time is available. During this time some dripping must occur. Wear old clothing. If your hand or finger nails have turned slightly darker after the application you already know the dye will take.

Finally, wash the henna out under the shower until no little particles can be felt on your scalp. Then shampoo and rinse, or merely rinse. Leave rinse in your hair until you finish your shower, at least one minute, this softens and adds gloss to your hair. Then lightly wash out rinse.

After stepping out of the shower, **comb hair first—straight back**. Dry hair before the rest of your body. Dry by pressing with towel in a straight-back direction about a dozen times. This puts curl in your hair. Never rub hair with towel or change the direction. For extra gloss, rub your hands with a washed lemon; then pat hair with hands in same direction. Let air dry, or sun dry, or hang hair over an electric radiator.

If you have tips to add to this recipe please send them to the publisher. They will be gratefully received.

Eyebrow Color

1 capsule Black Walnut Hull
2 drops Lugol's iodine
¼ tsp. Everclear™ alcohol (in 750 ml or 1 Liter size bottle)

Dissolve all in a plastic spoon. Apply carefully. Keep eyes closed. Do not apply dye of any kind to eyelids or eyelashes.

Eyeliner and Eyebrow Pencil

Purchase charcoal tablets from a health food store. Charcoal pencils from art supply stores contained quantities of lead, antimony and cadmium. Zappicate

tablets. You may need to wet them with water or oil first to get the charcoal to stick. You could also use a capsule of activated charcoal. Empty it into a saucer. Mix **glycerin** and water, half and half, and add it to the charcoal powder until you get the consistency you like. Use a brush for eyelashes; use a finger for eyebrows. Zappicate glycerin first.

Don't put any chemicals on your eyelids, since they penetrate into your eye. To check this out for yourself, close your eye tightly and then dab lemon juice on your eyelid. It will soon burn! Everything that is put on skin penetrates. Otherwise the nicotine patch and estrogen patch wouldn't work. Not even soap belongs on your eyelids!

Face Powder

You may use pure cornstarch. You may also try arrowroot starch or rice flour (grind your own white rice in coffee grinder). Use your fingers or a tissue to apply because applicators can carry bacteria.

Blush (face powder in a cake form)

Add 50% glycerin to cornstarch in a saucer to make a paste. Slowly add beet root powder to the desired color. To darken it, try part of a charcoal capsule. A drop of food grade alcohol will also darken it. To make 50% glycerin, add equal parts of glycerin and water. Try to make the consistency the same as your brand name product, and you can even put it back in your brand name container. Zappicate all ingredients.

Hair Spray

Remarkably, a little lemon juice (not from a bottle) has some holding power and no odor! Buy a one-cup spray bottle. Squeeze part of a lemon, letting only the clear juice run into the bottle. Fill with water. Keep it in the refrigerator. Make it fresh every week. Spraying with just plain water is nearly as good! For shinier hair, drop a bit of lemon peel into the bottle.

Housekeeping Recipes

General Sterilizers

Use chlorine bleach for the toilet, except with lung disease. When lung disease is present, use povidone iodine (available at pharmacies, it doesn't stain).

Use alcohol for the rest of the bathroom, and kitchen area.

Use 50% vinegar from a spray bottle for kitchen counters and cutting board. Put cutting board in dishwasher once a week.

For Dishes

Don't believe your eyes when you see the commercials where the smiling person pulls a shining dish out of greasy suds. Something that miraculous is either a trick or very toxic. It does not really rinse off clean. Any dish soap that you use should be safe enough to eat because you will be eating traces of it with each meal! Nothing rinses off clean. Regular dish detergents, including health brands, are now polluted with PCBs. They also contain harmful chemicals like cobalt. Even the detergent molecule itself is much too powerful (surfactant) for our delicate tissues like the pacemaker of your heart, your brain and nerve cells. Use borax for your dishes. Or homemade soap. Or get away from it all with paper plates and plastic (not Styrofoam) cups.

In The Dishwasher

Use 2 tsp. borax powder straight. If you use too much it will leave a film on your dishes. Use 1½ tsp. citric acid in the rinse cycle to reduce film. Extra hot water also helps to reduce film.

In The Sink

Fig. 145 Salt shaker makes elegant borax dispenser

Keep borax powder in a small container by the sink for scouring. Don't use any soap at all for dishes that aren't greasy and can be washed under the faucet with nothing but running water. Zappicate your old sponge or brush or cloth because it may be PCB contaminated. Zappicate new ones as you get them. Start or end each day by sterilizing your sponge (it harbors Salmonella) or start with a new one while the used one dries for three full days (stand them on end). Clean greasy pots and pans with a paper towel first. Then use homemade bar soap.

Homemade Soap

a small plastic dishpan, about 10" x 12"
a glass or enamel 2-quart saucepan
1 can of lye (sodium hydroxide), 12 ounces
3 pounds of lard (BHT and BHA are OK here)
plastic gloves
water

1. Pour 3 cups of very cold water (refrigerate water overnight first) into the 2-quart saucepan.

2. Slowly and carefully add the lye, a little bit at a time, stirring it with a wooden or plastic utensil. (Use plastic gloves for this; test them for holes first.) Do not breathe the vapor or lean over the container or have children nearby. Above all use no metal. The mixture will get very hot. In olden days, a sassafras branch was used to stir, imparting a fragrance and insect deterrent for mosquitoes, lice, fleas and ticks.

3. Let cool at least one hour in a safe place. Meanwhile, the unwrapped lard should be warming up to room temperature in the plastic dishpan.

4. Slowly and carefully, pour the lye solution into the dishpan with the lard. The lard will melt. Mix thoroughly, at least 15 minutes, until it looks like thick pudding.

5. Let it set until the next morning; then cut it into bars. It will get harder after a few days. Then package.

If you wish to make soap based on olive oil, use about 48 ounces. It may need to harden for a week.

Zappicate the lard and any oil you plan to use or you could be making PCB-soap!

Liquid Soap

Make chips from your homemade soap cake. Add enough hot water to dissolve. Add citric acid to balance the pH (7 to 8). If you do not, this soap may be too harsh for your skin, while it is excellent for cleaning the sink.

Furniture Duster And Window Cleaner

Mix equal parts white distilled vinegar and water. Put it in a spray bottle.

Furniture Polish

Use a few drops of olive oil on a dampened cloth.

Carpet Cleaner

Whether you rent a machine or have a cleaning service, don't use the carpet shampoo they want to sell, even if they "guarantee" that it is all natural and safe. Instead add these to a bucket (about four gallons) of water and use it as the cleaning solution:

Wash water	Rinse water
1/3 cup borax	¼ cup grain alcohol
	2 tsp. boric acid (see *Sources*)
	¼ cup white distilled vinegar or 4 tsp. citric acid
	1 bottle povidone iodine (optional)

Borax does the cleaning; alcohol disinfects, boric acid leaves a pesticide residue, and the vinegar or citric acid give luster. Povidone iodine kills parasite eggs. If you are just making one pass on your carpet, use the borax, alcohol, boric acid, and iodine. Remember to test everything you use on an unnoticed piece of carpet first.

Floor Cleaner

Use borax from the grocery store. You may add boric acid (to deter insects except ants). Use white distilled vinegar in your rinse water for a natural shine and ant repellent. Do not add bleach to this. For the bathroom floor use plain bleach water; follow the label. Never use chlorine bleach if anybody in the home is ill or suffers from depression. Use grain alcohol (1 pint to 3 quarts water) for germ killing action instead of chlorine.

Insect Killer

Boric acid powder (not borax). Throw liberal amounts behind stove, refrigerator, under carpets and in carpets. Since boric acid is white, you must be careful not to mistake it for sugar accidentally. Keep it far away from food and out of children's reach. Buy it at a farm supply or garden store (or see *Sources*). It will not kill ants.

Ant Repellent

Spray 50% white distilled **vinegar** on counter tops, windowsills and shelves and wipe, leaving residue. Start early in spring before they arrive, because it takes a few weeks to rid yourself of them once they are established. If you want immediate action, get some **lemons**, cut the yellow outer peel off and cover the peels with grain alcohol in a tightly closed jar. Let stand at least one hour. Use 1 part of this concentrate with 9 parts water in a spray bottle. Mix only as much as you will use because the diluted form loses potency. Spray walls, floors, and carpets wherever you see them. The lemon solution even leaves a shine on your counters. Use both vinegar and lemon approaches to rid yourself of many ant varieties.

Some ant varieties are killed by contact with **borax**; sprinkle it on their pathways.

Homemade **soap with sage** fragrance is a powerful killer for still other ant varieties. Set out the pieces along trails.

Peppermint essential oil, diluted with an equal amount of 50% grain alcohol both deters and kills ants. Place in spray bottle.

The clue to conquering ants is knowing what variety you have. Collect all these natural deterrents and test them, one at a time. For the right kind of ant, the effect can be astounding. But when one species leaves, another may take its place without you noticing. Try your whole collection again. After finding the right deterrent again, keep both deterrents in use together.

To treat the **whole house**, pour vinegar all around your foundation, close to the wall, using one gallon for every five feet. Expect to damage any foliage it touches. Reapply every six months, **on schedule**. Make sure there is no earth contact with downspouts.

A hi-tech approach is electronic (see *Sources* for an electronic pest deterrent). Plug-in devices are quite effective for some ant species. Remember, regular pesticide must be repeatedly applied, too, so is no more effective in the long run.

How To Make Test Samples

Homeographic Saliva Sample

Being able to capture the frequency pattern of a saliva sample is important to be able to transport it safely and to be able to store it for an indefinite time. You

will need:

- a small bottle that fits snugly in your hand so there is maximum surface contact between hand and bottle. A ½ oz. amber bottle of glass or plastic, with non-metal cap, works well.
- paper, such as kitchen towel, unfragranced, uncolored. Cut or tear a 2" x 2" piece (5 cm x 5 cm).
- cold tap water
- zippered plastic bag

A sample of the water and paper should be made as "controls." Dip a piece of paper in the water; shake to remove drips and place in separate zippered bag. Stuff the small square of paper in your mouth and chew till wet but not dripping. Spit it into a zippered plastic bag without touching it with your hands.

Add 4 tsp. (20 ml) water; no exact measurement is needed. Zip shut. Squish the paper wad with your fingers a few times to mix saliva and water. Set aside. (If you used too big a piece of paper there will not be enough water to do this successfully.)

Put 2 tsp. water in the ½ oz. bottle leaving room for shaking. Close.

Holding the bag in your hand, place the bottle of water on top of it (the bag). Grip both tightly. Shake 130 times vigorously (20 shakes per 5 seconds; practice this beforehand). Label the bottle "Saliva #3, Manual."

Explanation: Saliva, as you produce it, is given the number "1". After adding water, it is called #2; its electronic properties are changed. The copy of #2 is called #3; if copied by hand it is called "Manual".

Protect your copy of saliva from direct sunlight and magnetic fields. That is why the amber color was chosen. Wrap the bottle in layers of packaging material, or "bubble wrap" to keep it safe from magnets while traveling. No refrigeration needed.

Further copies made from your #3 bottle are numbered #4, #5, etc. They are not identical.

Evidently, your body is supplying the high frequency energy needed to "carry" the pattern from the saliva sample through the glass or plastic into the water. The action may be similar to homeographic copy-making.

Making Water Sample

1. Get a one qt./L pitcher or bottle for your collecting container.
2. Run about one cup water from the cold faucet into container. Do this six times during the day.
3. Whenever the container gets nearly full, pour half of it out, down the drain. Keep the remainder.
4. Continue adding samples for six days altogether.
5. Fold a piece of paper towel to make a wick. Cut it about 5 inches (10 cm) long. Stick one end into the water for only 1 inch (2 cm). Most of it will stay dry.
6. Place the wick in zippered plastic bag. Place this inside another zippered bag. For shipping use a third zippered bag. Label.

Food Table

As discussed previously, certain food phenolics and onion compounds can be very damaging. Use this table to identify which foods are safe for you to eat.

These results were found by Syncrometer testing. Foods do not always give consistent results. Ripeness, handling methods, and growing methods can make a difference to the phenolic content of food.

How to read this chart: find the food you are interested in, for example, dried apricots. They are Positive (P) for phloridzin, meaning they do contain it.

Another example is avocados. They are Negative (N) for all of these food chemicals, meaning they do not contain them.. But this does not mean they're safe for everyone to eat. Read about additional food phenolics and choose wisely.

Sometimes I find a food that acts as an antigen, but I have not identified the phenolic involved. Those foods are shown in CAPITALS

Foods in USA (Southern California)

N = Negative P = Positive N/P = Negative & Positive

oil, peanut, pure	N	N	N	N	N
oil, safflower, pure	N	N	N	N	N
oil, sesame, pure	N	N	N	N	N
oil, soy, pure	P	P			

Food Item	**Apiol**	**Phlor-idzin**	**Chloro-genic**	**Gallic**	**ONION**
oil, soy, supermarket	P	P	P	P	
oil, sunflower, pure	N	N	N	N	N

oil, vegetable	P			P	
olive leaf, powder	N	N	N	N	N
olives, black, canned	P	P	P	P	P
oranges (have caffeic acid; oranges, homegrown, tree ripened, have no caffeic acid)	N	N	N	N	N
pancakes	N	N	N	N	N
papaya	N	N	N	N	N
parsley, raw (has malvin, coumarin)	N	N	N	N	N
pasta	N	N	N	N	N
peas, baby food, from jar (have PCB, benzene, wood alcohol, chromium, PIT)	N	N	N	N	P
peas, frozen package (have PIT)	P	N	N	N	P
peas, split, yellow (have PIT)		N	N	N	
peas, black-eyed		N	N	N	
peanuts, shelled	N	N	N	P	N
peanuts, in shell	N	N	N	N	N

Food Item	**Apiol**	**Phlor-idzin**	**Chloro-genic**	**Gallic**	**ONION**
peanut butter, old fashioned	N	N	N	N	N
pears, ripe	N	N	N	N	N
pecans	N	N	N	N	N
peppers, bell, red or green, raw	N	N	P	N	N
peppers, bell, red or green, cooked	N	N	N	N	N
peppers, raw, various	N	N	P	N	N
pineapple, fresh or canned	N	N	N	N	N
plum preserves, canned		P			
pork and beans, canned	N	N	N	N	P
pomegranate juice	N	N	N	N	N
popcorn, yellow	N	N	N	N	N
potatoes, cooked, baked	N	N	N	N	N
potatoes, raw or fried	N	P	P	N	N
potato, sweet, with peel	P	N	N	N	N
potato, sweet, peeled	N				
potato chips	P	P	P	P	P
pumpkin, canned	N	N	N	N	P
pumpkin seeds, raw		N	N	N	
quassia herb powder	N	P			

radish, red, raw	N	P	N	N	N
raisins, golden (have malvin)	N	N	N	N	N
rice, white (fragrant varieties have coumarin)	N	N	N	N	N
salmon, cooked, fresh (has Fast Garnet dye, does not have SHRIMP)	N	N	N	N	N

Food Item	**Apiol**	**Phlor-idzin**	**Chloro-genic**	**Gallic**	**ONION**
sardines in oil	P	N	N	N	N
sardines, in water (all sardines have SHRIMP)	N	N	N	N	N
seafood, shrimp, crab (has SHRIMP antigen)	N	N	N	N	N
sugar, organic	N	N	N	N	N
soybeans, cooked	P	N	N	N	N
soybeverage, commercial	P	P	P	P	P
soy lecithin	P	P	P	P	
spice syrup	N	N	N	N	N
spinach, raw (has oxalate, use small portions)	N	N	N	N	N
squash, yellow, raw	N	N	N	N	N
strawberries, raw, supermarket, organic (have caffeic, cinnamic, malvin)	N	P	N	N	N
sugar cone, Mexican (has malvin)	N	N	N	P	
sunflower seeds, raw	N	N	N	N	N
syrup, agave	N	N	N	N	N
syrup, maple (has ASA)	N	N	N	N/P	N
syrup, rice, organic		N	N	N	
tahini, organic	N	N	N	N	N
tamales, canned in chile sauce	N	N	N	N	N
tapioca, small pearl (has PIT)	N	N	N	N	N
tomatoes, raw, homegrown (have malvin)	N	N	N	N	N
toothpastewith or without fluoride (has silicone, aluminum, malvin, PCB, benzene)	N	N	N	N	
tuna, canned in water, (has SHRIMP)	N	N	N	N	N
tuna, canned in oil (has SHRIMP)	P	N	N	N	N
turkey, dark meat, cooked	N	N	N	N	N
turmeric, ground	N	N	N	N	N
vanilla	N	N	N	N	N
walnut, Black, tincture	N	N	N	N	N
walnuts, raw, organic	N	N	N	N	N
watercress	N	N	N	N	N

wheat, berry	N	N	N	N	N
watermelon			P		
wheat germ, raw, toasted	N	N	N	N	N
yogurt, low fat (has benzene, aluminum, tyramine, phenyl alanine, malvin, PIT)	P	P	P	P	
zucchini	N	N	N	N	

Organ Specific Phenolics

The following food phenolics can also become allergenic (antigens) if not detoxified by the body. Each one is associated with specific organs. Scan this list and avoid ones that pertain to you.

- Acetic acid (vinegar) is antigenic for prostate, colon, liver, brain; brings metastases to these organs. Present in unripe figs, dates, as well as vinegar. Triggers Herpes I virus.
- Apiol is antigen for thymus, ovary, breast; causes metastases here, or AIDS. Found in all popular commercial oils used for cooking. (Not in oils pictured).
- ASA, acetyl salicylic acid, is antigenic for the vagina. Found in some candy, canned food. Can be destroyed with watercress powder.
- Caffeic acid is antigen for brain. Present in certain fruits, coffee. Destroyed by boiling.
- CARROT antigen is attracted to bones; causes bone metastases in cancer. Found in bottom half of carrot.
- Chlorogenic acid is antigenic for the hypothalamus. Present in unripe fruits, dairy products (cow), fried and undercooked potatoes, and coffee. Contributes to the tumor nucleus for all cancers. Destroyed by cooking.
- Cinnamic acid is antigenic for the bladder; causes urinary tract disease, metastases in cancer. Found in various fruits, cinnamon. Destroyed by cooking.
- Coumarin is antigenic for lungs and blood. Causes various blood and lung diseases, metastases in cancer. Found in spray-can fragrances, artificial vanilla, honey, rice. It can be destroyed by adding watercress powder.
- D-mannitol comes from sugars in use in USA. Causes clogged ducts and

glands.

- Gallic acid is antigen for pancreas. Present in grains and oils if preserved with propyl gallate, also in certain foods. Participates in tumor nucleus for all cancers. Destroyed by cooking.
- Malvin is antigenic for seizures and inner ear disease. Found in most blue and red fruits or vegetables, also eggs and chicken. Destroyed by cooking. (Commercially prepared or canned foods cannot be considered cooked).
- MELON is antigen for muscles; causes sarcomas.
- Menadione is antigenic for intestines and blood; causes blood disorders, diarrhea. Found in lettuce.
- ONION is antigen for medulla. Is essential for Fasciolopsis survival. Found in leeks, onions, chives, garlic, asparagus, cilantro, aloe vera, Swiss chard. Destroyed by thorough boiling.
- Phenylalanine, an amino acid, is the antigen for ovarian cancer and malignant melanoma. Found in dairy foods, artificial sugar.
- Phloridzin is antigenic for islets of Langerhans (diabetes) and pituitary gland. Present in apples, soy products, pork products, unripe fruit. Initiates tumor nucleus for all cancers. Destroyed by cooking.
- PIT stands for phenylisothiocyanate, a food phenolic. Found in broccoli, Brussels sprouts, cabbage, mustard green, collards, radishes, peas. Causes bone metastases. Destroyed by cooking.
- Pyrrole is a blood-breakdown product. Found in smoked food, smoke, chronic blood hemorrhages. Accumulates when bleeding.
- SHRIMP antigen is chemically undefined, causes lymph node metastases. Found in all fish and seafood, and in tops of carrots where green rings are seen.
- Tyramine is a bacterial toxin, made by *Bacillus cereus* present in bananas and all cows' dairy products, including pasteurized (not ultra pasteurized) products. Not in goat milk. Causes allergy development in tissues affected.
- Uric acid is a metabolic product, too plentiful in gout and folic acid deficiency. Antigenicity is not known.

As your liver strengthens, you will be better able to detoxi-fy these phenolics, and no longer have to avoid them so strictly.

18 .http://ntpserver.niehs.nih.gov/htdocs/Levels/Tr240levels.Html Evidently, gallate already had a history of causing pancreatic cancer at the time it was allowed in all our food–even bread.

19. Butter is our only source of butyric acid in the intestine. There is some evidence that butyric acid favors beneficial bacteria in the intestine and kills parasites! But remember to treat your homemade butter by zappicating, zapping, or sonicating it if the cream wasn't treated.

20. Journal Of Infectious Diseases, 167:789, 1993.

21. Barium is described in the *Merck Index* as "Caution: All water or acid soluble barium compounds are POISONOUS." 10th ed. p. 139 1983.

22. This element goes to bones.

23. The higher level of benzene in the blood of smokers was measured in 1989. The title of this report is: "Benzene in the Blood and Breath of Normal People and Occupationally Exposed Workers" by F. Brugnone, L. Perbellini, G.B. Faccini, F. Pasini, B. Danzi, G. Maranelli, L. Romeo, M. Gobbi, A. Zedde: *Amer. J. Industrial Medicine*, 16:385-399 (1989)

24. 20 Mule Team Borax™ works well for soap and is free of metals and other pollutants. Borax inhibits the bacterial enzyme *urease*. Urease is used by bacteria and yeasts that live in us to utilize our urea as a source of nitrogen for themselves.

25. Ellison, Bryan J., and Duesberg, Peter H. *Why We Will Never Win The War on Aids*, 1994; Inside Story Communications, 190 El Cerrito Plaza, Ste. 201, El Cerritos, CA 94530

26. Boric acid is available by the pound from farm supply stores or see *Sources*. Because it looks like sugar, keep it in the garage, labeled, to prevent accidental poisoning.

27. The copper in the handholds used with the Syncrometer or zapper does not penetrate the skin, probably due to the high frequency circuit used and the protective effect of one layer of paper. Silver would be better but no other metals have as much conductivity.

28. Remember, in nature, the cercaria swim to a plant and attach themselves to a leaf. There they lose their tails and are called *metacercaria*. It is the over-wintering stage.

29. Nobody has checked beef herds in the USA or the imported sources for the presence of *Fasciolopsis buski.* It is urgent to find out whether cattle, fowl and pets have become a biological reservoir and are transmitting it to some of us. *Fasciola, Strongyloides, Eurytrema, Paragonimus* and *Clonorchis* should also be searched for because I find them so frequently.

30. Antibodies to the various fluke stages or antigen tests could be used to test the public blood supply for parasite stages. I know of no existing human intestinal fluke test besides my electronic method.

31. The ranges given by the lab would include these values as “normal”. Syncrometer testing reveals that the upper part of the range actually reflects a problem that must be searched for.

113. Mellors, R.C., Kanematsu, S., *Alkaline Phosphatase Activity and Basophilia in Hepatic Cells Following Administration of Butter Yellow to Rats*, Proc. Soc. Exptl. Biol. Med., v. 67, 1948, pp. 242-46.

114. Pearson, B., Novikoff, A.B., Morrione, T.G., *The Histochemical Localization of Alkaline Phosphatase during carcinogenesis in Rats Fed p-Dimethylaminoazobenzene*, Cancer Research, v. 10, 1950, pp. 557-64.

Electricity can now be used to kill bacteria, viruses and parasites in minutes, not days or weeks, as antibiotics require.

If you have been suffering from a chronic infection or have cancer, or AIDS, learn to build the electronic device that will stop it immediately. It is safe and without side effects and does not interfere with any treatment you are now on.
